The 26 language services sports glossaries (1,311 pages) comprised the bulk of the translation projects from English to other languages. Each of the glossaries was translated into an average of seven languages. All were translated into French, Spanish, German and Russian. Other translations were in Chinese, Japanese, Romanian, Korean, Portuguese, Swedish, Serbo-Croatian, Italian, Hungarian, Finnish and Polish, depending on which languages were necessary for the given sport.

Other projects included foreign correspondence translated into English and such projects as translating "Welcome" into 22 languages and "I speak (language)" into 15 languages.

Sub-contracted translation work cost the Organizing Committee a total of \$68,670 from April 1983 through the Olympic Games—\$45,960 for freelance translators and \$22,710 for translation companies.

Through April 1984, monthly outside translation costs ranged from \$1,000 to \$3,000. But, beginning in May, costs rose substantially when it became necessary for the Organizing Committee to hire a translation company and three freelance editors to meet the deadlines set for the sports glossaries. The Organizing Committee paid \$9,000 to sub-contractors in May, \$17,000 in June and \$7,000 in July.

20.04 Plan for language services at multiple sites

The overall plan for language services was designed to deploy a staff of 715 qualified interpreters, translators and technicians to the multiple sites. The plan outlined a staff that consisted of the following:

- 15 LAOOC paid staff to supervise the various language operations.
- 43 volunteer coordinators and assistant coordinators to supervise the pool of interpreters at the venues.

2

- 556 volunteer interpreters to provide language assistance for the Olympic Family and members of the working media at the villages and the venues.
- 47 contracted conference interpreters to provide simultaneous interpretation at congresses and conferences.
- Eight contracted equipment technicians to install and maintain interpretation equipment.
- 46 contracted translators and interpreters to translate from and into French and English and provide interpretation for members of the media at the Main Press Center in the Olympic working languages. Russian was deleted from the interpretation services at the Main Press Center just prior to the Games because of the small contingent of USSR journalists attending the Games.

In the plan, language services management was to supervise three basic language functions from a command post at the Main Press Center: the translation pool, which was to be based at the Main Press Center as well; the language centers at each of the venues and athletes' villages; and simultaneous interpretation provided at the IOC and NOC meetings, IF congresses and press conferences.

2 Interpreters assist gymnastics mental-around champion Koji Gushiken of Japan and the host broadcaster.

Language Services

These functions were to be performed as part of the following language operations:

- Headquarters; Main Press Center, from 14 July to 15 August. Hours of operation; 0800—2400 and emergency 24-hour service if required. Service provided; the supervision of all language service operations.
- Olympic Arrival Center; Los Angeles International Airport, from 14 July to 28 July. Hours of operation; 0600—2200 and emergency 24-hour service as required. Service provided; assist with Olympic Family arrivals and accreditation process.
- Flying Squad; Main Press Center, from 10 July to 15 August. Hours of operation; 0700—2200. Service provided; dispatch interpreters to fulfill the language needs at the Olympic Arrival Center and to cover days off and emergency replacement as necessary at venues and villages.
- Village Language Center; all villages, from 14 July to 15 August. Hours of operation; 0700—2200 and emergency 24-hour service as required. Service provided; assist village residents, assist telephone switchboard and village operations.
- Venue Language Center; all venues, from 29 July to 11 August. Hours of operation; as required. Service provided; assist the Olympic Family, members of the media and venue operations.
- Translation Pool; Main Press Center, from 14 July to 15 August; Hours of operation; 0900—2400. Service provided; translate materials from and into English and French as required by the IOC and LAOOC.
- Press Conferences; Main Press Center, from 14 July to 15 August. Hours of operation; as required. Service provided; interpret simultaneously into English, French, Spanish and German.
- IOC/ANOC/ANOCA; Biltmore Hotel, from 22 July to 12 August. Hours of operation; as required. Service provided; interpret simultaneously at formal conferences and meetings.
- Congresses; various hotels, from July 25 to 1 August. Hours of operation; as required. Service provided; interpret simultaneously at International Federation Congresses.

20.05 Recruitment of language resources

The original goal of the Language Services Department—assuming a 30 percent attrition rate and a 20 percent rejection rate—was to recruit 4,644 foreign language-capable volunteers in 23 languages to fill 2,986 identified positions as press interpreters, VIP/NOC aides, hosts/hostesses and drivers for the Games.

After the Organizing Committee shifted the responsibility for managing VIP/NOC aides and hosts/hostesses to NOC Services and language-qualified drivers to transportation, language services concentrated its recruitment efforts primarily on press interpreters, a position for which the highest level of language skills was required. Those who qualified were retained in language services for training and an eventual Games assignment, whereas candidates possessing lesser levels of fluency were referred to NOC services and transportation to staff their host/hostess and driver requirements.

Consistent with the Organizing Committee policy, the recruitment drive to fill language-qualified positions was aimed at volunteers rather than paid staff.

Active recruitment began in January 1984. Before then, the extent of the language services recruitment program was limited to the processing of unsolicited applications, a steady stream of which had been arriving by mail at the staffing centers and forwarded to the language services office.

There were three categories of unsolicited applications: those requesting volunteer positions, those requesting paid positions and those that did not specify a preference. Those seeking paid positions and those who did not state a preference were informed by letter that language-related positions were open to volunteers only. Approximately 80 percent responded and showed a willingness to volunteer.

Unsolicited applicants played a vital role in staffing the seven 1983 pre-Olympic events, beginning with the FINA Water Polo Cup at Pepperdine University in May 1983 and continuing into October. These events served as trial runs for language services as well as all other phases of Olympic operation.

Although the volume of unsolicited applications was large and continuous, it was not sufficient to meet the language requirements of the Organizing Committee. In January 1984, the LAOOC launched the following recruiting program:

- Recruitment presentations were made at 10 college campuses in Southern California: University of California, Los Angeles; University of Southern California; University of California, Riverside; California State

University at Northridge; California State University at Fullerton; Loyola Marymount University; Los Angeles Community College; Cypress College; Claremont/McKenna; and Whittier College. These presentations targeted the foreign language departments and international clubs and organizations on campus. Campus reception was lukewarm—turnouts ranged from 20 to 500 students—and yielded mostly host/hostess and driver qualified language candidates rather than a significant number of press interpreters, as expected.

- Recruitment through the media utilized public service announcements on network television and radio and a 60-second spot on French-language radio that ran once a week for six weeks. A printed press release was issued late in the program but failed to yield a significant number of applicants.
- Recruitment presentations were made to various organizations and groups with foreign affiliations such as the Chinese Interagency Council, the Lycee Francais, the Chairman of the Foreign Language Teachers' Association and the Canadian Consulate.
- A recruitment program with the Los Angeles Unified School District was initiated whereby bilingual coordinators and teachers would be granted credit or salary points for volunteering and working during the Games.
- Special recruiting procedures were necessary to recruit volunteers qualified in languages such as Amharic, Bulgarian and Czech. For example, recruiters visited numerous ethnic restaurants and churches in various ethnic neighborhoods to find speakers of those languages who would be interested in participating in the Games.
- Word-of-mouth, however, was by far the most effective recruiting tool, since many candidates learned of the program through friends and business associates.

At the Organizing Committee staffing centers, language candidates were required to list their language or languages and how they acquired their expertise, in addition to filling out the information on the general application forms. Those from politically sensitive countries such as Eastern Bloc and Middle East nations also completed a "Sensitive Country Questionnaire" to determine where candidates should not be assigned because of protocol and/or security reasons.

Language services interviews were held at the Westwood Staffing Center. There, a team of approximately 50 volunteers, most of whom had worked as language volunteers during the pre-

Olympic events, interviewed and screened applicants in both English and the applicant's foreign language. Every interview session had Spanish, French and German interviewers, and, on a regular basis, there were interview sessions conducted in Arabic, Russian, Japanese, Mandarin and Korean. Interviews in the less widely spoken languages were scheduled as needed.

Interviewers defined an applicant's language skills with the following classifications:

- Native (native ability; completely fluent; no hesitation; no grammatical, contextual or stylistic errors).
- Good (good to perfect command of the language; little hesitation; few errors; able to express all ideas).
- Functional (adequate grammar and style; able to communicate most ideas; comprehensive accent).
- Poor (many grammar, contextual and stylistic mistakes; much hesitation; unable to express basic ideas).

Those with native or good skills were scheduled to take a test in a language laboratory to determine their qualifications as Press Interpreters or VIP/NOC Aides. Those with functional or poor skills were routed to the host/hostess or driver programs or classified as non-language applicants and were therefore referred to departments where language ability was not a factor. A press interpreter was required to have native ability in both English and the foreign language; an aide had to possess a good level of fluency in one of the two languages and native fluency in the other; and a host/hostess candidate needed functional abilities in one of the languages and native in the other.

Overall, 3,707 language candidates were recruited which, though short of language services' initial goal of 4,644, was more than sufficient to satisfy the needs of the department during the Games. Because of low attrition and rejection rates, the final recruitment target was reduced to 3,600. Also, recruitment goals shifted along with the strategy to target certain languages rather than general or mass recruitment of all languages.

20.06 Training and orientation

The Language Services Department trained 43 volunteer coordinators and assistants and 650 volunteer interpreters (555 volunteer interpreters actually worked the Games).

20.06.1 Training language coordinators and assistants

The Language Coordinator Training Program prepared volunteers who had previously demonstrated management skills for supervisory positions during the Games. This group consisted of language-qualified Organizing Committee personnel and/or interpreters who had worked during the 1983 pre-Olympic events. The Language Services Department assigned one coordinator to manage the services at each of the 26 venues and an assistant at 17 of the venues. The language program at some of the venues was too small to justify the assignment of an assistant coordinator in addition to a coordinator.

The training program for coordinators and assistants consisted of four, three-hour sessions over a six-week period and introduced the coordinators and assistant coordinators to the Organizing Committee, the international Olympic movement and language services operations. They were trained by key personnel from the Language Services Department and other departments that would work closely with language services during the Games. The training focused on how to manage a pool of interpreters—ranging in size from four to 36 interpreters—and how to utilize their resources in covering all language needs in their areas of responsibility. They were also given instruction in conducting sport-specific training to pass on to their interpreters.

20.06.2 Training interpreters

Interpreters were trained in seven groups—ranging in size from 60 to 110 individuals—by three full-time language services staff members. The groups were trained on a staggered schedule, with the first starting in early May and the last beginning its training in mid-June.

The training sequence consisted of 12 modules, grouped by topic into six sessions. It covered general Olympics material, the internal structure of the Organizing Committee and how it related to the interpreter, the definition of the interpreter's role, the protocol of interpretation, memory development and note-taking and sports-specific terminology.

Training culminated with an intensive simulation of a press interview to give interpreters first-hand experience of what to expect at the villages and venues. Also, throughout the training sequence, interpreters were given suggested exercises to work on at home.

Interpreters who completed a minimum of two sessions were awarded an Organizing Committee certificate. Although interpreters were initially

required to complete the entire 12-module training sequence, exceptions were made on a case-by-case basis to accommodate those who had scheduling conflicts. Where possible, provisions were made for make-up sessions. Nonetheless, most interpreters attended the entire sequence.

20.07 Games operations

There were 15 permanent Organizing Committee staff members, 43 volunteer coordinators and assistant coordinators, 555 volunteer interpreters, 61 conference interpreters and 30 French/English translators who worked the Games for the Language Services Department.

20.07.1 Central command of operations

The Main Press Center served as the base of operations for Language Services and was the headquarters for the associate vice president for language services who supervised all Games-related language operations. In addition, language services provided two types of service at the Main Press Center: press conference interpretation and translation. The "Flying Squad," which consisted of a pool of 102 interpreters speaking 23 languages who were on call for dispatch, also operated out of the Main Press Center. Although not all Flying Squad interpreters were ever needed at this dispatch pool at any one time, it was not uncommon to find an average of 20 interpreters on stand-by.

20.07.2 Conference interpretation

Congresses and meetings interpretation was provided at eight federation congresses, two IOC sessions, two IOC press briefings, eight IOC meetings, two ANOCA meetings and 69 press conferences at the Main Press Center just prior to and during the Games.

Interpretation services were the direct responsibility of a chief interpreter who became a paid staff member of the Organizing Committee beginning 1 June 1984. Conference interpreters were highly qualified and most of the 47 used by language services were members of the International Association of Conference Interpreters (AIIC).

A global contract for technical services for all meetings organized by the Organizing Committee with

3

simultaneous interpretation was awarded to International Simultaneous Translation Services (ISTS) of Fort Myers Beach, Florida. With offices in Canada and the United States, ISTS is the largest translation company in North America. ISTS had already had previous Olympic Games experience, having worked the Games at Montreal in 1976 and the Olympic Winter Games at Lake Placid in 1980. The level of services rendered by ISTS was very high and to the satisfaction of all concerned.

Raw data compiled for the federation congresses and IOC meetings were:

- Interpretation days, 293
- Individual interpreters, 48
- Delegates served, 1,890

The data compiled for the press conferences at the Main Press Center were:

- Interpretation days, 403
- Interpreters, 14
- Delegates served, 3,000 (estimate based on number of press conferences and average attendance)

Simultaneous interpretation services were provided at the following federation congresses and meetings:

- FINA; 25 July, Pepperdine University, Malibu. Three interpreters provided service in English and French for approximately 200 delegates.
- IHF; 25-26 July, Westgate Hotel, San Diego. Nine interpreters provided service in English, French, German and Arabic for approximately 120 delegates each day.
- FIVB; 25-26 July, Hyatt Regency Hotel, Long Beach. Nine interpreters provided service in English, French, Spanish and Arabic for approximately 130 delegates each day.

3 Simultaneous interpretation booths (top) and the Main Press Center's main interview room are staffed by specially trained interpreters.

4

4 Multi-lingual hosts and hostesses at the UCLA Village assist athletes and other members of the NOC delegations.

- AIBA; 10 August, University Hilton Hotel, Los Angeles. Four interpreters provided consecutive interpretation in English, French and Spanish for approximately 150 delegates.
- IOC Sessions; 25 and 27 July, Biltmore Hotel. Twelve interpreters provided interpretation in English, French, Spanish, German and Russian for approximately 100 delegates per session.
- IOC commissions; 20-27 July, Biltmore Hotel. Eight interpreters provided interpretation in English and French for 25 delegates per meeting.
- IOC Executive Board meeting; 19 July and 13 August, Biltmore Hotel. Two interpreters provided interpretation in English and French for 30 board members per meeting.
- IOC Medical Commission; 24 July and 13 August, Biltmore Hotel. Two interpreters provided interpretation in English and French for 25 commission members per meeting.
- IOC press briefings; 22 and 28 July, Biltmore Hotel. Two interpreters provided interpretation in English and French for approximately 75 participants per briefing.
- IOC chefs de mission meetings; 16 July at the USC Village and 25 July at the Biltmore Hotel. Two interpreters provided interpretation in English and French for approximately 100 participants per meeting.
- ANOCA Executive Council; 22 July, Biltmore Hotel. Six interpreters provided interpretation in English, French and Spanish for 30 council members.
- ANOCA; 29-30 July, Biltmore Hotel. Four interpreters provided interpretation in English and French for approximately 100 delegates per meeting.
- Press Conferences; from 14 July through 13 August, Main Press Center. Thirteen interpreters provided interpretation in English, French, Spanish and German for international journalists ranging in number from 10 to more than 600 per press conference. The median range of journalists attending each meeting was 50-70.
- FIG; 25-26 July, Los Angeles Airport Hilton Hotel. Twelve interpreters provided service in English, French, Spanish, German and Russian for approximately 250 delegates each day.
- IWF; 27 July, Los Angeles Airport Hilton Hotel. Twelve interpreters provided service in English, French, Spanish, German and Russian for approximately 200 delegates.
- FIAC; 27 July, Hyatt Regency Hotel, Long Beach. Nine interpreters provided service in English, French, Italian and Arabic for approximately 150 delegates.
- IAAF; 31 July-1 August, Westin Bonaventure Hotel, Los Angeles. Fifteen interpreters provided service in English, French, German, Spanish, Russian and Arabic. There were approximately 450 delegates and observers in attendance the first day and 280 the second day.

requested that the interpreters work past 1800 hours—the end of their seven-hour work day—but his request had not been conveyed to the interpreters (The manager of interpreters instead had decided that the secretary-general's request should be made on the spot). When the interpreters declined to work longer hours, the secretary-general terminated the meeting at 1800, as scheduled.

Costs for conference interpretation came to \$387,247—\$84,300 for interpreter fees, \$49,337 for interpreter expenses, \$29,962 for interpreter airfare, \$91,797 for interpreter housing and \$131,651 paid to ISTS.

20.07.3 Language services at venues

Each Venue Language Center (VLC) was managed by a Language Coordinator with the larger venues—17 of them—also being staffed by an assistant coordinator. Three to 32 interpreters—depending on the number of nations and languages present at a particular venue—were on call at each VLC to provide the necessary language services. Three interpreters were initially assigned to hockey—though three more were added to fill last minute requests for Punjabi and Hindi—and 32 to rowing and canoeing.

Services were provided at the venue on the field of play, in the sports medicine and first aid stations, at the mixed zone and press interview area, for doping control and ceremonies instructions, at judges' and officials' meetings and for spectator and security assistance.

Translation services were offered free of charge to the Organizing Committee, while other requests were directed to the Village Language Centers. There were few requests, other than those at the yachting venue where daily requests were forwarded to the translation pool at the Main Press Center.

More than 95 percent of the interpretation requests at the VLCs were filled in the primary language. The remaining five percent consisted of requests for languages for which interpreters were not immediately available. These requests were usually met through the use of a secondary language.

Although the great majority of interpretations went well, there were complaints that interpreters were slow and sometimes inaccurate or incomplete. For example, at volleyball, a lack of understanding of sports-specific knowledge created a controversy when an Italian interpreter quoted the Italian men's team volleyball coach as saying that members of his team had played in "pro" leagues. Although the interpretation was literally correct, it conveyed the wrong message. Italian

“pro” volleyball teams abide by amateur rules and are not professionals as the term is understood in the United States. This mistake in interpretation led to public accusations that the Italian volleyball team consisted of professional players and infuriated the coach who threatened to boycott the media if he didn't receive a public apology.

In other instances, there were cases where delegations decided to use their own interpreters because those provided them were too slow or inadequate. Other interpreters, though otherwise qualified, proved to be too timid in interview situations which showed a lack of understanding of their role as the communications conduit between the media and performer. These problems were a direct result of the overall inexperience of the volunteer interpreter staff.

Also, the casual uniforms of the interpreters presented such an informal image that athletes and officials often sought the language services of a host or hostess who wore a more dignified dress uniform and displayed a badge that indicated the bearer's language of proficiency.

Early in the Games, interpretation into French during the formal interview sessions was cancelled because of a lack of interest at most venues. Where there was interest—journalists were given the choice prior to interview sessions—French interpretation was provided.

20.07.4 Language services at villages

Interpretation and translation services were provided at the USC, UCLA and UCSB athletes' villages continuously from the opening of the villages on 14 July through the closing—UCSB on 12 August and USC and UCLA three days later.

Under the direction of the village manager and assistant manager, interpretation was provided through two shifts. At USC and UCLA, the shifts were from 0700-1445 and 1415-2200; at UCSB, the shifts were from 0500-1400 and from 1300-2200. Depending on need and the availability of interpreters, actual shifts worked were subject to change. Translation services were also available during the same operating hours although the actual work was performed at the central translation pool, located at the Main Press Center. Interpreters were also responsible for the following:

- The village telephone bank, which supported the village telephone switchboard and required interpreters to answer the telephones located in the office of the Village Language Center (VLC) during operating hours to provide instantaneous assistance to callers from anywhere within the village.
- The dispatch pool, which required interpreters to be on-call to assist as needed.
- Providing assistance to other operations, particularly to NOC envoys and aides, to chefs de missions and to coaches and athletes.

Translation services were provided free of charge to the Organizing Committee, but all others had to pay a fee for that service. Translation requests were virtually non-existent at the villages. Emergency language assistance was provided on a 24-hour basis at each village by dialing the village language service telephone number.

The USC Village Language Center was staffed by 15 interpreters per shift during operating hours each shift supervised by either the manager or assistant manager, or both-and provided service in French, German, Spanish, Arabic, Danish, Finnish, Italian, Japanese, Korean, Mandarin, Norwegian and Romanian. There were four interpreters for French, German and Spanish and two each for the others. The language of most of the NOCs staying at USC was covered by at least one interpreter continuously from 0700-2200, with extensive coverage at all times in French, German and Spanish. The interpreter staff was cut back to 30 to 36 because of the Eastern Bloc Olympic boycott.

The UCLA Village Language Center covered the language needs of all NOCs staying at the village by providing service in 11 languages with a staff of 14 interpreters per shift. Instead of splitting shifts, the manager and assistant manager alternately worked 24 hours on and 24 hours off and were on call daily from 2200-0700. There were four interpreters each for French, German, Greek, Portuguese and Spanish; three for Mandarin; two for Serbo-Croatian; and one each for Bulgarian, Italian, Polish and Turkish.

At UCSB, the Village Language Center provided services in the 17 main languages at the village and the staff of 39 interpreters was divided into two shifts. The manager and assistant manager alternated double shifts—from 0500-2200—and were on call following each shift. There were six interpreters for Spanish; five each for French and German, three each for Finnish, Italian and Korean; two each for Japanese, Mandarin, Portuguese and Serbo-Croatian; and one each for Czech, Hebrew, Hungarian, Romanian

and Swedish. The pool of interpreters also provided services in Cantonese, Flemish and Hungarian, when necessary.

A total of 2,932 interpretation requests were filled at the three athletes' villages. The UCLA Village Language Center handled the most (1,072), followed by USC (934) and UCSB (926). The heaviest day for requests was recorded on 24 July when a total of 154 requests were made—61 at UCLA, 50 at USC and 43 at UCSB.

20.07.5 Use of the Flying Squad

The Flying Squad provided both primary and backup interpretation assistance to the Organizing Committee and the Olympic Family. It consisted of a pool of 102 interpreters and covered 25 languages. It was supplemented by 50 more interpreters who were assigned to various venues and could be called upon as needed.

Unlike interpreters assigned to the villages and venues, the Flying Squad interpreters, for the most part, did not have fixed assignments. They floated and operated as trouble-shooters, being dispatched from the Language Service offices at the Main Press Center. The only exceptions were at the Olympic Arrival Center (OAC) at Los Angeles International Airport where the Flying Squad had primary responsibility for assisting members of the Olympic Family during in-processing, beginning 9 July, and at Opening and Closing Ceremonies where 63 interpreters covering 22 languages were either assigned to specific countries or groups of countries or were on-call for general language duty.

The Flying Squad-supervised and dispatched by two managers and two assistant managers—consisted of 15 Spanish interpreters, 13 French, 13 German, six Mandarin, four Arabic, four Italian, four Japanese, four Portuguese, three Russian, three Finnish, three Greek, three Hungarian, three Korean, three Punjabi/Hindi, three Romanian, three Serbo-Croatian, two Amharic, two Bulgarian, two Czech, two Danish, two Norwegian, two Polish, two Swedish and one Turkish.

A large percentage of the interpreters were multilingual and were trained to respond to situations in all areas where language services would be needed, such as the field of play, award ceremonies, doping control, medical assistance, security needs, the message center and as a backup to VIP

and Press Operations. Still, the Flying Squad was not staffed sufficiently in several languages and could have used more interpreters to meet the language requirements for Korean, Japanese, Serbo-Croatian, Italian and Portuguese. It also should have been staffed by a Dutch interpreter to meet the needs that arose in that language.

The responsibilities of the Flying Squad at the OAC were divided into three phases: the arrival of the chefs de mission from 9-14 July; delegation arrivals from 14-27 July; and post Opening Ceremonies from 28-30 July. After 30 July, Flying Squad assistance at the OAC was available by calling the Language Service office at the Main Press Center. Its staffing schedule was as follows:

- Phase I; operational hours were from 0600-2200 divided into two shifts, with coverage provided for late night arrivals; one coordinator and five interpreters staffed each shift.
- Phase II; operational hours divided into two shifts, 0800-1500 and 1430-2200; one coordinator and 12-15 interpreters worked a shift.
- Phase III; operational hours from 0800-1800; staffed by one multilingual coordinator. Further assistance was available by dispatch from the Main Press Center.

A lack of an arrival schedule for incoming chefs de mission created problems for the Flying Squad during Phase I. Though coverage in the working languages was adequate, the Flying Squad had to resort to phone-links to provide second language requirements. Also, adjustments were made in staffing and operational hours. The number of interpreters was reduced by half when the demand turned out to be lighter than anticipated and the office opened two hours later, at 0800 hours instead of 0600, because few flights arrived early in the morning.

The language services most often required during Phase I were French, Spanish and Arabic, and, to a lesser degree, Mandarin and Japanese. Many of the arriving chefs de mission and officials had a working knowledge of English or spoke one of the aforementioned languages.

At the Main Press Center, the Flying Squad consisted of a pool of 15-20 on-site interpreters per shift who responded to appropriate interpretation requests, covering the basic languages—English, French, German, Russian and Spanish—as well as Japanese, Korean and Mandarin. It also assisted in the distribution of equipment for simultaneous interpretation during press conferences and worked with foreign journalists in their dealings with the Organizing Committee.

The Flying Squad also responded to telephone requests for backup interpreters at the villages, venues and at the Olympic Arrival Center. Interpreters were contacted and dispatched, as required, to assist other operations during the absence of regularly assigned interpreters and for special and/or unanticipated needs. Although interpreters were dispatched as quickly as possible, Flying Squad managers requested 24-hour notice to ensure language coverage.

20.07.6

Use of the translation pool

The Monterey Institute of International Studies (MIS) team of 28 translators handled the volume of 1,117 pages of translation from 11 July through the Games. Eighty-two percent of the work was English into French, 11 percent was French into English, four percent was English into Spanish and one percent was Spanish into English. Translations of other languages into and from English comprised the remaining two percent.

The two main translation projects were the village newspaper, the "Villager", which was published every other day for a total of 12 issues and the "Olympic Record", which consisted of the results and short text and totaled 270 pages of translation, also English-French.

Other major requests came from the IOC (76 pages of speeches and articles), the three villages (161 pages) and from various venues (121 pages, 97 of which came from yachting in Long Beach).

The translators, two editors and four management staff persons shared the staffing at the translation pool office at the Main Press Center and filled all requests during the 0800-2200 operating hours from 11 July-29 July. From that date through the end of the

Games, the schedule of translators had to be revised to meet the heavy work load and deadline pressure brought on by the translation requirements of the "Villager" and "Olympic Record." Beginning 29 July and continuing through the Games, the "Villager" deadline was 1500 hours every other day and the "Olympic Record" required daily translations of approximately 18 pages—roughly one page per sport—with a translation and typing turn around time of 80 minutes per sport. Deadline pressure, which necessitated greater staffing later in the day, was the primary difference between the translation pool's pre-Games and Games operation.

20.08

Summary

The Language Services Department was successful in providing the necessary language services to the Olympic Family, journalists and participants.

The department recruited, trained and deployed thousands of persons in the venues, villages and support service areas of the Games and provided a high level of skill in both interpretation and translation.

Careful planning helped to recognize the major areas that would need language support and the likely languages to be used. The planned services thus met almost all of the requirements of the sites during the ordinary course of operations and were backed up by the Flying Squad when additional assistance was needed. The Flying Squad proved to be valuable in many instances when an immediate, flexible response was necessary—as at the Olympic Arrival Center.

The recruitment, screening, selection and training process was integral in assuring the quality of language services to be delivered during the Games. The LAOOC was fortunate to host the Games in an area where so many languages are spoken and the thousands of interested volunteers from the Los Angeles area who applied for language services positions made the concept of an all-volunteer language corps viable. This concept may not apply to other host cities, but must be considered in depth—many had felt that Los Angeles could not field so many language-competent people, especially on a volunteer basis and were proved wrong. The training programs for the venue language coordinators were successful and even more training for the individual interpreters would have been helpful.

While the services provided by language services were good overall, there were some shortcomings and some complaints directed toward the volunteer interpreters who worked at the venues and villages. Although fluent in the languages they worked, the volunteer interpreters had little or no experience using their skills in a professional environment as the one that existed for the Games. This, however, was anticipated because of the Organizing Committee's policy of using volunteers wherever possible.

Another problem in the development of language services was caused by waiting until only 15 months before the start of the Games to create a comprehensive language program. Until then, a part-time manager was responsible for language services—arranging for translations and periodic interpretations for Organizing Committee business—as well as being responsible for other functions in the Human Resources Department. Had a

comprehensive language plan been implemented a year or two earlier and sufficient staff hired, managers would have had more time to familiarize themselves with the Games and the Organizing Committee and therefore would have been more effective. Volunteer interpreters also would have had better training to prepare them for the nature of their responsibilities and a permanent staff would have had more time to assess the needs of the department and properly determine the language requirements. Additional time and study perhaps would have eliminated overstaffing in such languages as German and the Scandinavian languages and understaffing in Arabic and Turkish.

The efforts of the permanent staff did produce a smooth flow of work in the pre-Games period and LAOOC requirements for interpretation at important events and translation of a large volume of documents were met with increasing efficiency as the Games drew close. Management of the contracted translators in the developing stages of the department was fully sufficient until resources for an in-house translation staff were acquired in 1984.

It is recommended to future organizers of an event of this magnitude that they recognize the importance of accurate communications and the value of language services. Planning should begin early in the life of the Organizing Committee and be maintained at a high, efficient level throughout, and if fiscally possible, professional interpreters should be used at all Olympic venues and sites.

21

Materiel Acquisition and Distribution

21.01

Materiel acquisition

21.01.1 Conceptual plan for acquisition of assets and supplies

Materiel management was the vital link between planning/development and physical production of the Games. Without raw materials and effective management, the Olympic Games could not be held; the stadia and arenas would exist, the crowds would arrive to watch the athletes but the Olympic staff would not be able to do its job. There would be no javelins for the field events, no typewriters for reporters and no chairs for the staff.

In the early planning stages, several members of the Material Logistics staff traveled to Montreal (site of the 1976 Games) and Edmonton (site of the 1983 World University Games) to discuss the materiel management systems used at these sites. From this research and the previous materiel supply experience of the staff, the LAOOC decided that the materiel management system for the Games should not be modeled after any previous system but would be developed along new lines. A major factor influencing this decision was the non-availability of government facilities and personnel that were heavily used in earlier Games. This new materiel management system would be tested and revised during the 1983 pre-Olympic events.

The acquisition of materiel for the Games was planned around the concept of allowing those most familiar with the needs of specific departments and sports to make the materiel orders. This led to a fairly decentralized materiel planning and purchasing operation. The materiel management system was structured in such a way that those staff members with knowledge of specific materiel needs were placed in the communications flow from departments and venues to the purchasing section of Material Logistics. Prior to the development of venue management teams, primary department heads communicated the expected needs of the department to supply coordinators. As the venue management teams were established, the venue department heads communicated more specific ordering needs to the supply coordinators assigned to the particular venues.

Materiel needs of the administrative staff prior to the opening of the venues were handled on an as-needed basis. Materiel to be used directly in the production of the Games at the venues was compiled by requisition and subsequently ordered when materiel planning had received budget-approved requisitions for 80 percent of the planned quantity of materiel. This system allowed for compilation of materiel requests until cost-effective ordering could take place. This compilation period also allowed for a detailed evaluation of the requests to eliminate excessive or wasteful requisitions. A drawback to this system was that late and excessive/insufficient ordering resulted in problems for a few commodities at both the point of distribution and the destination venue.

By conceptual design, a majority of the activity of the Material Logistics Department would occur in a relatively short period of time just prior to and during the Games. This kind of commercial activity was possible because of the ability of commercial Los Angeles to meet most materiel needs quickly. With this ability, the LAOOC was also capable of reducing holding costs, in effect, allowing the vendors to store the items until needed by the LAOOC. This sharp activity curve was reflected in a Material Logistics staff that numbered fewer than 10 in July 1983, 20 in January 1984 and close to 800 during July 1984.

21.01.2 Staffing

The initial design for staffing of the Material Logistics Department included four main operations tied together by a common manager and a common computer software system. The four main operations included materiel planning, purchasing, distribution and supply operations.

The staff prior to January 1983 was minimal and performed the purchasing function primarily for materiel needed in the LAOOC administrative headquarters. With the increase of staff from two to five in January 1983 the emphasis shifted to the purchasing and storage of materiel for the 1983 pre-Olympic events. This period was also used to design, test and implement the materiel management system to be used during the Games.

Staffing for the next year was done on a temporary basis only. The management of the department felt this would be the most effective way to create a stable, permanent staff. By evaluating the potential staff member during his temporary employment, the LAOOC made no immediate long-term financial commitment and the employee's ability to be resourceful and to function in a high pressure situation with an absolute deadline could be tested.

During the first six months of 1984, department managers continued to evaluate the performance of temporary

employees with the idea of making the top candidates into venue supply coordinators. The decision to hire supply coordinators at many venues was made too late to train them effectively in the materiel management system. Nonetheless, those people placed in supply coordinator positions accomplished far more than was reasonably expected of them.

21.07.3 Pre-order estimates and solicitation of vendors

In previous Games, there was no centralized attempt to estimate quantities of materiel that would be needed for the Games. Each organizing committee had required a different set of materials directly related to the physical lay-out of the Olympic venues, the type of existing facilities and the size of the Games. An attempt to emulate a previous materiel control system was destined for failure. Given proper planning and a workable time frame, an LAOOC ordering system that could produce results quickly and on demand was established. The need to generate 'hard' estimations and run the risk of mistaken projections was eliminated.

Working with materiel lists given by materiel control staff at the 1976 Montreal Games and 1983 World University Games, the LAOOC Material Logistics staff compiled a new list of standard materiel that it anticipated would be used in 1984. The items on this list were coded with materiel identification numbers and placed in the Walker materiel management software system on the IBM System 38 computer system. A report listing all

these items was generated and distributed to the department heads and venue management personnel. A supply coordinator then met with them to determine their needs for these items, making additions to the Walker system if a particular item was needed and not listed on the report. The planned quantities were entered into the system and served as the determination point for ordering of materiel-when requisitions for 80 percent (an arbitrarily established percentage) of the planned quantity line items on the materiel list were written and approved, the items were ordered.

This planning process was slowed because the venue department managers, including the venue supply coordinators, were not hired until the end of spring 1984. The bulk of the planning had to be done by the primary department managers and then revised when venue management staffing was completed. Materiel planning for the 1983 pre-Olympic events relied heavily on the non-LAOOC competition staff at each of the sites since there was no LAOOC structure in place.

The solicitation of vendors was also a decentralized process. The staff making the request for specific materiel often would ask that the purchase be made through a specific vendor. The specialized or technical nature of many items made it much too time-consuming for the Purchasing Department to know the proper source of much of the materiel, placing the onus for vendor identification on the departments and venues.

Whenever possible, the LAOOC contracted with a vendor who complied with the affirmative action program. There was no complex formal bidding procedure but multiple bids were taken if more than one vendor could be identified. Official sponsors and suppliers were given first

opportunity to bid on requisitioned materiel. When a requisition was submitted to purchasing with a specific vendor identified and the requesting party did not wish any other vendors contacted, a sole bid justification form was also submitted. If the requesting party could show that its choice for vendor had submitted the lesser of two bids, then the vendor was used without further bidding.

The response to vendor solicitation was overwhelming; the idea of being a supplier to the Olympic Games appealed to almost every vendor contacted for materiel. There were almost 12,000 vendors in the Walker system by the close of the Games, a majority of them based in Southern California.

21.01.4 Purchasing procedures

Once a determination had been made that a particular item was needed, whether it was anticipated or not, the originating party completed a requisition form. This form detailed the specific item by cost, vendor and budgetary information. The completed requisition was the secondary source document (the first being the original materiel item list) for the materiel management system. Information from the requisition was used to update item, vendor, venue and warehouse materiel reports.

To complete the requisition, the requesting party had to do some initial research on vendor availability because of the relatively small size of the central purchasing staff. The purchasing staff would seek a vendor only if one was not identified on the requisition.

For the requisition to become valid, the information contained on the form had to be correct and complete, with appropriate authorizing signatures included. A requisition which requested materiel with an estimated total cost under \$250 did not require completion of the purchase order/purchasing process. With the approval of the department manager, a requisition for this amount could be processed using an open purchase order for the department. No requisition was submitted to purchasing and when the invoice was received from the vendor by accounts payable, it was approved and signed-off by the department manager.

Requisition forms which requested materiel with an estimated total cost of \$250-\$1,000 required the signature of the originator, the department head and the budget manager for the department. Requisitions which totaled between \$1,000-\$5,000 also required the signature of the vice president of Finance, in addition to the first three signatures. Requisitions for a total more than \$5,000 also required the signature of the executive vice

1

president of the LAOOC. This authorization and purchasing procedure remained in effect during the Games for those departments operating out of the administrative headquarters in Culver City. Personnel based at venues were not required to use the same authorizing process since each venue was operating in an autonomous atmosphere.

The completed, authorized requisition was returned to the supply coordinator who reviewed it for any missing information. Part of the review process was to identify a materiel item identification number (if none existed previously), identify a vendor number, establish a materiel/vendor relationship (what kind of materiel does this vendor supply) and identify the materiel/venue relationship (what and how much materiel is going to which venue) in the materiel management system. All of this information was entered into the computer system for management and inventory control purposes.

Once verified as accurate, the requisition was given a purchase order number from the purchase order log. The purchasing staff verified the availability of materiel with the vendor, terms of the purchase and the expected date and manner of delivery. A formal purchase order was completed, the information was entered into the materiel management computer system and the purchase order was sent to the vendor. At the same time, by computer, the Material Distribution Center was notified to expect delivery.

These purchasing procedures were carried out from January 1980 through January 1984 by the purchasing section of the Material Logistics Department. In February, the purchasing function was removed from the responsibilities of the Material Logistics Department and made a separate function in the Finance Department.

21.01.5 Results of the purchasing process

By the close of the Games on 12 July 1984, the materiel management system contained almost 12,000 vendors, a majority of whom conducted business in Southern California. Materiel planning processed approximately 35,000 requisitions with more than 8,000 different line items, and 7,200 purchase orders were

1 Materiel is stored in a large warehouse.

Materiel Acquisition and Distribution

2

2 Labels consist of a description of merchandise.

3 Support craft and competition canoes and rowing shells are carefully stored and later transported to Lake Casitas.

3

written and approved with a dollar value in excess of \$74,000,000. The 5: 1 ratio of requisitions to purchase orders was caused by the merging of several requisitions for a particular item to improve purchasing power and the ability to purchase more than one item from a vendor. Countless other orders for materiel were not included in these totals since they were for amounts less than \$250 and placed on open purchase orders or paid for with petty cash.

The goal of the Material Logistics Department was to place all orders for materiel prior to the opening of the venues. Ideally, all of the needed materiel would be at the Material Distribution Center, tagged and ready for delivery by 10 July 1984. While this goal was not reached (and there never was a reasonable expectation that the LAOOC would reach it), 88.4 percent of all orders were placed before the move-out period began. Only 2.3 percent of the ordering was done after the Games began. Even though these percentages indicate a high response to ordering deadlines, the LAOOC could have improved the percentages by developing the relationship between the venue supply coordinators and the venue staff earlier.

21.01.6 Timeline of the purchase date and delivery date of the goods ordered

Materiel planning for the Games had as its foundation the belief that the sooner orders were placed with the vendor the greater the likelihood that the materiel would be received in time for the Games. Given enough lead time, the Material Logistics and Purchasing Departments could make arrangements to have materiel delivered to the Material Distribution Center well before the opening of the venues but not so early that additional warehouse space had to be acquired.

This type of materiel planning was reflected in the relationship of the order date to the delivery date. While it took approximately a month from the date of order for an item to be delivered on average, the specific time for delivery was directly proportional to the month in which it was ordered. Materiel ordered in April took much longer to be delivered (intentionally so) than materiel ordered later in the year.

21.01.7 Venue purchasing procedures during the move-out period

For the Purchasing Department, the process of decentralizing the purchasing process began on 16 July 1984. Venue personnel requiring new materiel were then required to go through the venue purchasing loop rather than the central Purchasing Department. Blocks of purchase orders were distributed to the representative of each commissioner. In some cases these purchase orders went to the venue supply coordinators but in general they were kept by the venue directors. Personnel who required new materiel went to the person charged with the purchase orders to make their request. A purchase order was filled out with information pertaining to the item, cost, budget and vendor (the information which was usually placed on the requisition form). This procedure bypassed the requisition process since there was then no formal materiel planning and ordering procedure. The venue department manager and venue director's signatures were required as was the commissioner's. None of the materiel management relationship information was required on the purchase order

since the items ordered were not moved through the Material Distribution Center. Neither the Material Logistics Department nor the central Purchasing Department needed to be apprised of the new purchase.

Materiel costing less than \$500 and purchased by the venue did not even require a purchase order. At the same time the venue was given a block of purchase orders, it was given a number of pre-signed checks and a petty cash fund to handle small purchase needs.

The desk officer for a specific venue stationed at the Operations Center located within the LAOOC administrative headquarters in Culver City had to approve (by phone) materiel purchases of more than \$10,000. The approved purchase order was then processed in the same manner as any others generated during this period. The assigned vendor was then called and notified of the purchase order number. The vendor arranged delivery of the materiel directly with the venue management and not with Material Logistics.

Since time was the most valuable commodity during the move-out phase, these procedures allowed venue management flexibility in making purchasing decisions outside the primary department framework without sacrificing the required speed of purchase.

While alternative procedures were developed to accommodate the venues' need for speed, the standard procedures for purchasing remained intact for those primary departments functioning at the administrative headquarters in Culver City.

The bulk of purchasing thus shifted from the primary departments to the venues, from the department managers to the venue directors and from the central purchasing staff to the venue supply coordinators.

21.01.8 Venue purchasing procedures during the Games

From the perspective of the Purchasing Department the change from the move-out period to the Games period was a subtle one. The procedures established for the move-out period remained in place for the Games and, in fact, it was anticipated that they would be more effective. Venue personnel in transit from the administrative headquarters to their venues during the move-out period had been firmly established in their venue positions and were capable of better determining venue materiel needs. This made the venue supply coordinator the vital link in the ordering and acquisition of materiel for the venue.

With the opening of the Games, the priority for purchasing was to get the necessary materiel into the venue as quickly as possible. This meant that there was little or no reliance on the materiel distribution system—orders were placed directly with the vendor who was expected to deliver the materiel directly to the venue. Deliveries to the venues were managed through the supply coordinator and his staff. Valuable items were logged by the supply coordinator as to their delivery date and location within the venue. A minor percentage of the deliveries, usually pertaining to small items, were delivered directly to the venue departments, bypassing the supply coordinator and the materiel management system.

Purchasing by the primary departments at the administrative headquarters in Culver City was reduced to almost nothing. Departments with centralized management (i.e. Security and Food Service) continued purchasing materiel through established, pre-Games procedures but the vast bulk of the purchasing had been shifted to venue operations.

21.02 Materiel distribution

21.02.1 Conceptual plan for storage and distribution

The original plan for storage of materiel to be used in the Games was simply to acquire a large amount of storage space, receive shipments of materiel, place it in cargo containers according to venue and hold it until venue distribution. This concept would allow each venue's supplies to be kept separate from all the other venues, thus aiding in quick distribution. This plan was dropped since placing materiel into containers was ineffective from a space management point of view even if it raised the accountability of materiel for each venue. If the LAOOC continued to rent warehouse space as needed, the containers would take up far more room than physical storage of materiel on pallets within the warehouse, thus increasing the cost of storage and forcing the relocation of major quantities of materiel each time a new warehouse was needed. The system was redesigned to reduce the warehouse space needed by keeping all materiel together, unsorted, until final warehouse placement was established. Once the final warehouse space allocation was made (in January 1984) all materiel destined for one venue was sorted out, moved to another warehouse if necessary and placed in a special area within the warehouse. This change in the system required that the Material Logistics staff estimate the amount of storage space each venue would require. This plan could have resulted in problems if

inaccurate estimates were made but actually worked extremely well.

The original materiel distribution plan assumed that the time available between a venue being accessible to LAOOC personnel and when it had to be operational would be very short and would result in a frenzied distribution period from 11-27 July. The plan also assumed that heavy traffic on the Los Angeles freeway system and key thoroughfares would result in congestion and would lengthen the time of deliveries from the Material Distribution Center to the venues. The plan thus called for deliveries between 2300 and 0300 hours, the least congested traffic period.

Modifications to this plan were required because many Olympic venues were able to start their move-in operations much earlier than the projected 11 July date and because the anticipated heavy traffic did not materialize, thus allowing deliveries at virtually any time of the day. Although this eliminated the need for, or fear of, intense activity within certain limited hours during a 16-day period, it forced the Material Logistics staff to rework its distribution schedule and expend extra time looking through a venue's section within a warehouse for materiel required early.

With staffing of the storage and distribution operations utilizing hourly contracted labor, the management was highly flexible in its staffing requirements on a daily basis; on high demand days, it hired more staff and on low demand days it used only the minimum number required to remain operational. This arrangement resulted in major savings to the LAOOC on the salaries of unused or under-utilized materiel distribution staff.

21.02.2 Supply plans for the 1983 events

The framework for the materiel management system for the Games was established and tested using the 1983 pre-Olympic events. The limited size of each of the events as compared to the enormity of the Games allowed this testing with minimal risk. Each subsequent 1983 event allowed for further refinement of the system. The emphasis during the 1983 events focused on the materiel planning system and venue supply operations rather than on the storage and distribution systems.

In 1983, the size of the Material Logistics staff was quite small, ranging from five to nine people. A 1983 event supply coordinator was designated by the department to serve as the liaison among the Sports Department,

management at the site of the 1983 event and the Material Logistics Department. This position was equivalent to the venue supply coordinator's position during the Games and required that the staff member collect materiel planning information from the site management and the event management.

The system for acquisition of materiel was similar, though not identical, to that used for the Olympic Games. The event management staff working at the LAOOC was given materiel lists developed by the Material Logistics Department. This list, along with materiel needed but not listed, served as the basis for more substantial and complete materiel lists used for the Games. Once materiel needs were established, the event management staff was required to submit completed and approved requisition forms for the materiel to the Material Logistics Department. Vendors were generally suggested by the requesting party, with the same standards applying for selection of the vendor as those used during the Games. All of this information was placed in the Walker materiel management system for use in tracking purchasing, storage and distribution of this materiel.

In direct contrast to the purchasing system used for the Games, orders for 1983 events were done as the requisition came in and not when 80 percent of the materiel item lines had been requisitioned. This resulted in less cost-effective buying but the time frame for ordering was so short that the LAOOC could not wait until all the requisitions were completed. All events in 1983 were not held simultaneously so materiel planning had to be done on an event-by-event basis.

Some materiel that was ordered and used for the earliest 1983 events (water polo at Pepperdine University and cycling at California State University at Dominguez Hills) was reused at the later 1983 events (swimming/diving, gymnastics, rowing/canoing and archery). All materiel was brought back from the 1983 event sites and placed in storage until the next event or until the materiel was used during the Olympics. Although most of the sport-specific equipment was not reused until the Games, much of the general office materiel could be used at each of the 1983 events, thus reducing the cost at each subsequent event.

Materiel supplies for the events were stored in the Rowan Street (Dart) Warehouse until the event site was turned over to the LAOOC for the production of the event. The materiel was then taken out of the warehouse and trucked to the event site. The 1983 event supply coordinator was on site to make sure that all of the necessary materiel was delivered and additional supply needs were filled.

Materiel Acquisition and Distribution

4

5

4 Incoming materiel is directed to the Materiel Distribution Center.

5 Shipments of special cargo such as horses or yachts are specially planned in advance through the U.S. Customs Service and official custom house broker F.B. Vandergrift.

Most of the supply problems arose early in the ordering process largely because of the lack of formalized event management structure. Department personnel responsible for the identification of supply needs of the department at the event were not hired early enough to form a proper relationship with the event supply coordinator nor were they made aware of their responsibility to identify and quantify materiel needs for the event. Although identified as a big problem during the 1983 events, this issue resurfaced in many instances for the Games.

21.02.3 Storage space: Estimation and acquisition

With the evolution of the materiel storage to the point where space would be acquired only as needed and materiel would be palletized by venue rather than placed in containers, the

Warehouse available space (square footage)

Aisles and office space (20 percent)	45,000
Receiving	20,000
Villages	35,000
Supplies/Publications	14,000
Youth	4,000
Security Cages	2,000
Shipping	1,000
Sports:	
Rowing and Canoeing	15,000
Yachting	10,000
Gymnastics	5,000
Modern Pentathlon	4,000
Other sports (19 at 2,500 each)	48,000
Total Sports	82,000
Unassigned	12,000
	2 15,000
Space Available :	
Bell	120,000
Rowan	65,000
Zellerbach	30,000
Total space	215,000

need for estimation of storage space was reduced (but made more difficult) and the process of acquisition of storage space was simplified.

Although the LAOOC had 5,000 square feet of storage available during 1982, the first warehouse space acquired by the LAOOC was the Dart Warehouse in the City of Commerce in May 1983. This facility consisted of five 10,000 square foot sections. An agreement was reached with the facility managers that allowed the LAOOC to acquire additional sections as needed.

When LAOOC materiel storage needs exceeded the storage capacity of the Rowan Street/Dart warehouse, additional space was acquired at the General Services Administration Bell Warehousing Center. This acquisition became part of the warehouse space collectively known as the Materiel Distribution Center (MDC). Other warehouse space was acquired from the Zellerbach Paper Company and the Bethlehem Steel Company, both of which were warehousing and not production sites. Warehousing space in the administrative headquarters in Culver City (Marina Center) and in the uniform storage and distribution building near the administrative headquarters was used for special purpose storage.

Warehouse space acquisition

Warehouse	Square footage	Date
Rowan Street/Dart	65,000	May 1983
Marina Center	25,000	Aug 1983
Zellerbach	30,000	Oct. 1983
Bell	120,000	Jan 1984
Uniform Distribution Center	100,000	Feb 1984
Bell Annex	30,000	Jun 1984
Bethlehem	45,000	Jul 1984

A drawback to acquiring this space on an as-needed basis was that materiel management could not initially store materiel by venue. Rather than sort the materiel each time the LAOOC acquired more space, the materiel was stored by item or clusters of related items.

By March 1984 the Material Logistics staff had acquired warehouse space in four different locations; Rowan Street/Dart, Zellerbach, MDC/Bell, and the Uniform Distribution Center (UDC), in addition to the warehouse space at the Marina Center. Additional space at the Bethlehem Steel warehouse was added in July. The Material Logistics staff then began planning a massive redistribution of materiel so that all materiel specific to a venue would be in one warehouse. Based on information supplied by the venue supply coordinators and previous event/materiel management experience, the Material Logistics staff made approximate determinations of the square footage required by each of the venues. The warehouse supervisor could draw on actual experience with four Olympic-type events. The balance of the available space was divided among the remaining nineteen venues.

Minor adjustments had to be made in the planned allocations because of the unexpected need for major storage space for materiel from the Olympic Arts Festival and the Ceremonies Department.

21.02.4

Storage warehouse operations in the pre-Games period

Prior to the move into the venues, the operation at the Material Distribution Center focused primarily on the receipt and storage of materiel for use at the administrative headquarters of the LAOOC and the Olympic venues.

A shipment of incoming materiel was directed to the Material Distribution Center (the Bell, Rowan, Zellerbach and Bethlehem warehouses were collectively known as the MDC) where the driver presented a shipping document to the MDC receiving staff. The delivery was logged manually in and the shipment was unloaded.

The shipment remained on the receiving dock until it was verified through the Walker system. This remained standard procedure with only a few exceptions occurring when data entry fell behind prior to the opening of the Olympic villages. The receiving clerk located the correct purchase order by checking the Walker system via a terminal located in the receiving area. This process often required additional labor since the order had to be found by purchase order number and this number was rarely on the bill of lading. The clerk was required to search the system using the company name and the estimated date of arrival until the appropriate purchase order number was located, thereby identifying what venue was to eventually receive the materiel.

After the purchase order number was identified, the clerk printed out a receiving document. The quantity and condition of the shipment was recorded on the document and then sent to data entry personnel who keyed the purchase order number, quantity received and the condition of the shipment into the Walker system. The materiel identification number was also produced.

Overage (materiel in excess of quantity ordered) shipments were accepted but the overage quantity was not paid for. The vendor had to arrange for pick up, or, as in most cases, the cost of the pick up was higher than the cost of the extra merchandise and the materiel was simply left with the LAOOC.

Partial shipments were even more common at the MDC. The quantity received was entered on the receiving report and the materiel was accepted. It became the responsibility of the sports coordinator to note that the merchandise was short on a levels report ("on-hand quantity" was less than "purchased quantity") and either contact the vendor directly or contact the Purchasing Department. It was the responsibility of the data entry clerks to arbitrarily determine which venues would receive the allotment and which venues would still have to await shipment of the item. The rule of thumb was that materiel was allocated by venue order on the purchase order.

Damaged shipments were also noted on the receiving report. Any item that was seriously damaged was rejected and arrangements were made to

MDC staffing

Cumulative	64.00	26.84	119.00	77.04	167.00	118.74	233.00	239.64

secure a replacement. If only minor damage occurred and the effect of the damage could not be determined by MDC personnel, an expert on that type of materiel was called in to evaluate the damage. The decision to accept or reject materiel was made based on this evaluation. The director of Material Logistics was also given a contingency fund to quickly effect repurchasing without going through standard requisition procedures. This facilitated the acquisition of needed items which might otherwise be slowed by budget problems and extra paperwork.

Once the shipment had been accepted at the receiving dock and the delivery information entered into the Walker system, warehouse personnel labeled each item with location, materiel, quantity and unit of measure data. Materiel was then moved to the correct venue location within the warehouse to await eventual shipping to the specified venue during the move-out operations.

The staff received 25 shipments of materiel in one day at the peak of warehouse activity during this period.

21.02.5 Storage warehouse operations in the move-out period

Prior to 10 July 1984, operations at the MDC focused on receiving and storage tasks. After that date the emphasis at the MDC shifted to distribution of materiel to the appropriate venues. While there was still an on-going process for receipt and storage of materiel to be held until the Games period, most of the manpower at the MDC was put to work moving the stored materiel out of the MDC.

It was anticipated that the bulk of this shipping/ distribution process would occur in a very short period of time but many venue management staff set up operations at the venues prior to the move-out of the administrative headquarters period. This resulted in

the materiel management staff having to sort through a large quantity of venue materiel to find particular items that the venue management staff required early. To further complicate the process, the bulk of the materiel shipping occurred very close to the Games rather than as soon as access to the venue was obtained,

Whenever possible, shipments to venues were delayed until full truckloads were available, but this policy was rarely carried out because most venue materiel was urgently required.

A list of goods being sent to the venue was checked off as merchandise was loaded into trucks. This document then became the bill of lading. The venue supply coordinator supervised the loading process and made sure that the truck was locked and sealed prior to departure. Each seal placed on the locked truck had an Olympic logo and a serial number for security. The truck departed for the venue at the same time as the venue supply coordinator so that the coordinator would be at the venue upon its arrival. The commissioner for each of the sports received daily materiel reports which itemized the following day's shipments, their content and destination within the venue, thus allowing at least minimal advance planning for manpower and storage needs.

The process of materiel distribution was completed when the venue supply coordinator received the materiel at the venue. Trucks backed up to loading docks outside the areas that required the materiel and parked, thus becoming temporary storerooms. At other venues, vans or containers on flatbed trucks were driven into the venue and parked wherever space allowed. Since there was no mandatory requirement that all venues have loading ramps, any ramp available was used. Some trucks were equipped with hydraulic gates to provide easier access to the cargo.

When it was decided for cost Or space reasons that shipping containers would be taken off the flatbed trucks and placed on the ground, forklifts were borrowed from the MDC equipment pool to handle the move.

While the original plan called for the delivery of this materiel in the early morning hours, the lack of highway congestion allowed shipping at hours more convenient for the venue.

Deliveries to the administrative headquarters in Culver City proceeded as usual although at a reduced rate since the staff was now moving to its venue positions.

During the peak activity in this period, a maximum of 65 outbound shipments from the MDC were made in a single day. Approximately four million cubic feet of materiel were moved through the materiel management system. Vehicles used in this movement of materiel from the warehouse area to the final venue destination were as follows:

Description	Number
Five-ton trucks	48
Stakebed trucks	14
Automobiles	12
Passenger vans	15
Cargo vans	16
Forklifts	48
Electric carts	20
Tractor trucks	20
Trailers	210
Flatbed trailers	40

It should be noted that during the June-July 1984 time frame, materiel was simultaneously being received at the MDC while other materiel was being delivered to venues. While this appeared to complicate the efforts of the staff at the MDC, the savings in storage cost more than compensated. If all materiel requirements had been received prior to the venues opening, it is estimated that at least 100,000 additional square feet would have been needed to accommodate all the materiel.

Materiel Acquisition and Distribution

21.02.6 Venue equipment delivery and installation

Although major quantities of technical equipment were utilized in the production of the Games, the responsibility for their delivery did not rest primarily with the Material Logistics Department. Sponsors and suppliers, knowledgeable in the technical aspects of their own equipment, bypassed the Material Distribution Center and delivered directly to the venues. The venue supply coordinator assisted with space and ancillary requirements for the equipment at each venue. The venue technology manager was also on hand to take receipt of the equipment upon its arrival. Installation and testing of the equipment were done by the supplier and the venue technology staff.

For equipment that was delivered to and stored within the Material Distribution Center, standard procedures for receiving and venue delivery were followed. Special precautions were taken to ensure that valuable equipment was not released to the venues until adequate security had been established. While at the MDC, this equipment was kept in fenced, high-security areas. Communication between the venue supply coordinator and the venue technology manager as well as between them and the other venue departments had to be constant to avoid problems of placing equipment within the venue. In a few instances, departments within venues ordered equipment without notifying the venue supply coordinator, resulting in unexpected pick-up and delivery of shipments and loss of inventory control within the materiel management system.

21.02.7 Olympic cargo distribution

The Material Logistics Department was also charged with the responsibility for overall management and coordination of inbound Olympic cargo, materiel originating outside the United States from the IOC, an NOC, an International Federation or other Olympic body for utilization before and during the Games.

Olympic cargo arrived by air, sea and land. Customs clearances were obtained for the LAOOC by F.B.

Vandegrift Customs Brokers at Los Angeles International Airport (LAX), the Port of Los Angeles/Long Beach and other facilities designated by the United States Customs Service.

Vandegrift or Olympic cargo operations were notified (on most occasions) in advance by the IOC/NOC/

IF's cargo carrier (airline or freight shipline) of forthcoming shipments. After the cargo verification was completed by the cargo carrier and the documentation was released, Vandegrift cleared the cargo through U.S. Customs. LAOOC personnel at the Cargo Distribution Center Annex (located at LAX) then notified a contracted freight line to pick up the cleared cargo from the carrier and deliver it to the Cargo Distribution Center located four miles from LAX.

Olympic cargo at the Cargo Distribution Center (CDC) was broken down, numbered, tagged and segregated into a storage area according to final destination. The cargo remained at the CDC until arrangements could be made with a representative of the IOC/NOC/IF regarding delivery. Once the CDC warehouse supervisor finalized these arrangements the cargo was screened by LAOOC Security at the CDC, loaded onto a freight truck and sealed with an LAOOC truck seal. The seal number was written down on a log sheet and the truck was dispatched to its final destination.

Since some Olympic cargo arrived just prior to the Games or was used immediately upon arrival, delivery to and storage at the CDC was bypassed. Cargo was delivered directly to its final destination.

Once the NOC, IOC or IF received and signed a receipt for the cargo, it became the Olympic Family member's responsibility to arrange for its storage, local transportation and outbound movement. If requested, the Cargo Distribution Center and Vandegrift assisted in these functions.

The Cargo Distribution Center began operations on 10 July 1984 and closed on 15 August 1984. The staff at the CDC was small and shared many of its resources with the Material Distribution Center and the Uniform Distribution Center. The CDC received, stored and delivered cargo for 34 NOCs and handled 175 separate cargo movements involving 5,000 individual pieces with a combined weight of 500,000 pounds. The major delivery points included:

Site	Pieces	Weight in lbs.
USC Village and swim stadium	2,568	310,941
UCLA Village, gymnastics and tennis	973	42,642
Long Beach fencing, volleyball and yachting	743	55,047
Biltmore Hotel	349	17,934
Santa Anita Park equestrian	306	42,776
Lake Casitas canoeing and rowing	62	17,538
Dominguez Hills cycling	56	6,121
Prado Rec. Area shooting	17	2,157
UCSB Village	7	782

Special problem areas such as the importation of horses for the equestrian events and sailing vessels for the yachting events were worked out among the LAOOC, Vandegrift and the U.S. Customs Service long in advance of the arrival of these shipments. Special care for these problem cases and for Olympic cargo in general led to very few complaints about the condition of the cargo upon receipt by the IOC, NOC or IF.

21.02.8 Venue resupply procedures and results

The venue supply coordinator at each Olympic venue was responsible for the resupply flow at his site. Space was allocated for trailers at each site to store the bulk of the anticipated supply needs of the venue. Additional quantities of common materiel were kept at the MDC for distribution upon request by the supply coordinators.

Regional supply supervisors maintained regular communication with each of the supply coordinators in their regions to ascertain any additional supply requirements for the venues. Both the regional supervisors and the venue supply coordinators had petty cash funds for purchase of emergent materiel needs. Each of the venue departments also had general petty cash funds that could be used to procure needed materiel.

A majority of the purchases made at the venues during the Games period used these department-based procedures rather than general resupply procedures.

21.02.9 Storage warehouse operations in the move-back period

With the end of competition at each venue, the LAOOC was required to move out all of its equipment and supplies as quickly as possible. The role of the supply coordinator at each

venue was simple: place all moveable assets in trailers for return to the Material Distribution Center. This process was accomplished without benefit of comprehensive inventory sheets. The commissioner at each of the venues used varying amounts of the venue assets as incentive gifts for his staff, with the remaining materiel turned over to the supply coordinator. Suppliers and sponsors who had loaned or leased items to the LAOOC were permitted to pick up these items at the venues, saving the LAOOC the cost of transportation back to the vendor's location. LAOOC Security at the venue maintained strong control of the fence line until the assets had been placed in trucks or trailers and sealed. With some exceptions, they were successful in achieving this goal.

The sealed trucks returned to the Material Distribution Center and were unloaded, with no inventory taken of their contents as long as the seals had not been broken prior to arrival.

Since the venues closed at various times during the course of the Games, the traffic flow into the MDC was manageable. Materiel was brought into the warehouse, secured on pallets and left until all of the materiel was returned in the week after the Games ended. Full security was provided at the MDC to assure that no materiel would be stolen.

27.02.10 Final disposition of the assets after the Games period

Following the Games, assets no longer in use were sent back to the Material Distribution Center for storage until a strategy for their disposition was established.

A five-part strategy was developed to dispose of the assets while at the same time increasing the general revenue fund, rewarding staff for hard work, assisting organizations in the community and giving the public an opportunity to collect Olympic memorabilia. The five parts to this disposition plan were:

- Rewards to staff
- Donations to certain organizations
- Exercising repurchase agreements
- Negotiated transaction not under repurchase agreements
- Public sale and auction

Staff incentive gifts

Certain assets such as televisions, mopeds and videotape recorders were given by the central departments for exemplary service to some staff

members who were not venue specific and thus not eligible to participate in the venue incentive programs. Following approval by the Finance Department, these items were requisitioned by department heads through Material Logistics and delivered to the respective staff members.

Donations

Other items were donated to organizations which had supported the operations of the LAOOC during the Games and could put the items to good use. Among those organizations receiving materiel from the LAOOC were Los Angeles County, the Los Angeles Police Department, the Los Angeles County Sheriff's Department, the Orange County Sheriff's Department, the University of California, the Santa Barbara Foundation and the Los Angeles Unified School District. An example of the kind of materiel donated is listed below with approximate quantities:

Approximate description	Quantity
File cabinets	1,100
Storage cabinets	100
Steel shelving	50
Picnic tables	41
Patio chairs and tables	500
Fire extinguishers	100
Umbrellas and bases	40
Drafting tables	6
ironing boards	40
Fans	1,000
Desk lamps	1,000
Park benches	10
Medical supplies	various
Lockers	100
Coolers	150
Beds and mattresses	2,500
Blankets and pillows	2,500
Carpeting rolls	20
SuperTurf rolls	50
Laundry soap boxes	20
Laundry carts	6
Hand trucks	25

The LAOOC received innumerable requests for supplies and equipment from charitable organizations throughout Southern California and the rest of the United States. The requests far exceeded the available resources. Rather than establish arbitrary standards, the LAOOC decided not to make any donations to such organizations.

Repurchase options

Whenever possible, materiel which had been purchased with a "repurchase by vendor" clause was sold back to the vendors. The revenue from these sales went into the general fund.

Negotiated sales

Many items returned to the MDC were of value only to commercial buyers, rather than to the general public. The

MDC staff was therefore authorized to contact alternative purchasers of these items and solicit bids. Many commercial items were sold in this manner following the Games.

Public sale and auction

In view of the phenomenal interest in Olympic memorabilia following the Games, the LAOOC decided to conduct a combined retail sale and auction in order to provide the greatest possible access to the materiel by the general public. Auctioneers were interviewed and the joint venture of A.Z. Stein Co., Inc. and Fred Bush and Company, Auctioneers, was selected to manage both the sale and auction in conjunction with the LAOOC. It was decided to conduct the sale and auction as quickly as possible to catch the public while Olympic interest was still high.

In consultation with the auctioneers, the LAOOC decided that items that were attractive and limited in quantity (unable to support a multi-day sale) would be held back for the auction. Items which the LAOOC had in large supply were set out at the sale. Advertisements for the sale and auction were placed in the major circulation newspapers in Southern California for several weeks prior to the event. The LAOOC was fortunate to receive a great deal of media coverage both prior to and during the event which heightened public awareness of both the sale and the auction.

Both the sale and auction were conducted at the MDC. The sale was conducted outside the loading docks from 1000 to 1800 hours on 15-19 October 1984. Inspection of all the auction items took place at the same time. More than 15,000 people attended the retail sale during this five-day period. By the end of the week nearly everything that had been put out for sale had been purchased.

LAOOC sale items

Description	Sale price
Publications	\$ 1-5
T-shirts	3
Record albums	2
Seat cushions	5
Olympic pins	5
Jewelry boxes	10
Notebooks	3
Posters	1-5
Manual typewriters	20
Binoculars	15
Flags	20-30
Televisions	165-525
Belts, hats, scarfs	2-10
Uniform pieces	5-10

6

6 A bill of lading is checked as goods are loaded into trucks or unloaded into the warehouse.

The LAOOC auction was held from 20-21 October 1984. More than 700 registration paddles were sold and at times more than 1,000 people were in attendance at the auction. Everything from 62 pairs of white gloves to two helium-filled balloons were sold. All goods were lotted and tagged prior to the auction and a printed catalog was produced. Those interested in attending the auction were given the opportunity to preview the materiel during the retail sale.

More than \$850,000 was grossed in the five-day sale and two-day auction. The net proceeds of these seven days were earmarked for an exhibition commemorating the Games at the Los Angeles County Museum of Natural History in Exposition Park—a fitting site since it lies less than 200 yards from the Los Angeles Memorial Coliseum, the site of the Opening and Closing Ceremonies and the athletics competition.

Although a majority of the materiel assets of the LAOOC were liquidated in this fashion, still remaining were those materiel assets required by the LAOOC for its continuing operations. Once these items were no longer required by the LAOOC, they were sold or donated in similar fashion, with proceeds from this disposition going into the general fund.

21.03 Summary

The concept of materiel planning, acquisition and distribution for the 1984 Games relied upon the belief that venue management personnel knew what materiel was needed. The centralized department, rather than deciding what to order, tried to make the acquisition, storage and distribution procedures for this materiel as efficient as possible. Information

Materiel Acquisition and Distribution

obtained from the venue- or department-based managers was channeled directly into the materiel management system. The information form, not the materiel content, was standardized throughout the LAOOC to allow accurate tracking of the materiel from requisition through final disposition. A weakness of this system was the late hiring of the venue managers responsible for materiel decisions, resulting in late and sometimes inadequate materiel requisitions which eventually caused less effective mass purchasing and more vendor paperwork for the Material Logistics Department.

The purchasing aspect of the materiel management system was effective until it was removed from the Material Logistics Department in January 1984. Although this move was made to more closely ally this function with the general procedures and control of the Finance Department, it effectively removed the necessary relationship of purchasing to planning and distribution. Even so, the purchasing function achieved its goal of acquiring the majority of needed materiel long before the opening of the venues.

The storage of materiel after acquisition was equally effective once the decision was reached not to sort and store the materiel according to venue. The decision to acquire warehouse space only when it was needed proved to be a wise one, reducing costs and limiting the manpower required to staff unused space. The only drawback to this "as needed" plan was the need to store materiel en masse rather than by venue until the bulk of it had been acquired. A major reorganization of the materiel was then undertaken to move it into specific venue areas within the warehouses.

A problem that plagued the materiel management system was the heavy reliance placed on quick and accurate data input to the materiel management computer system. This was a problem because of the large quantity of information which had to be keyed in, the management level decisions placed in the hands of data entry clerks and the short (and ineffective) training period for the data entry staff. Although this problem was not resolved, the eventual lessening of the work flow as the Games approached and the on-the-job training of the data entry staff allowed the process to continue unimpeded.

With the shift from acquisition and storage to distribution, Material Logistics found itself with fewer problems than anticipated. There was a much longer period of time than had been anticipated in which to make deliveries to the venues because the LAOOC had been able to secure early access to them. Expected heavy traffic problems which would have forced the distribution cycle to take place very late at night never did occur, thus allowing the materiel movement to take place at hours convenient to the venue and Material Distribution Center staff.

Supply operations at the venues were handled efficiently by the venue supply coordinators and their staff. Materiel needed at the last minute was purchased through existing systems and venue-specific procedures. Resupply was handled by the supply coordinators and their regional supervisors. On-site inventories were maintained by the supply coordinators with technical installation and maintenance handled by the Technology staff and equipment suppliers.

Olympic cargo was also handled by Material Logistics using generally the same system of storage and distribution as that of the general Olympic materiel.

With the close of each of the Olympic venues, the assets of the venue were utilized to some extent as bonuses in an employee incentive program. Those assets which were not given away as gifts or auctioned on-site were placed in truck trailers and returned to the Material Distribution Center. This materiel was sorted into functional groups with the intention of making charitable contributions to deserving groups, selling them by direct sale to the public or conducting a general auction.

After a portion of the materiel had been given away, a five-day sale and two-day auction were successfully held to dispose of these remaining assets to the public. The proceeds from the sale and auction were placed in a special fund which established a permanent Olympic exhibit at the Los Angeles County Museum of Natural History.

As an on-going operation, the LAOOC continued to utilize various assets in the day-to-day conduct of its business. These assets were to be disposed in the same manner when no longer required.

With the disposal of these remaining assets, the materiel acquisition and distribution function of the LAOOC completed its responsibilities.

22

22.01 **Role of the Los Angeles Olympic Organizing Committee**

Business meetings of National Olympic Committees and International Sports Federations are often held in the host city of the Olympic Games in the years preceding the Games and during the Games period. These groups use the meetings in pre-Games years to inspect the preparations for the upcoming Games and to familiarize themselves with the host city and local organizing committee. During the Games period, groups such as the ANOC (Association of National Olympic Committees) and especially the International Sports Federations take advantage of the presence of their local administrators and officials at the Games and hold meetings in the host city (IF meetings are commonly known as congresses). These congresses provide a forum for revision of International Federation rules and regulations, discussion of policies and issues and election of new officers. The organizing committees of past Games had often assisted groups holding such meetings with planning, physical preparation, language support, as well as support during the meetings themselves. It was not uncommon for organizers to absorb the staging cost of congresses held in the host city during the Olympic period. Early in the planning for meetings and congresses to be held in Los Angeles in 1984, the Los Angeles Olympic Organizing Committee assumed a role of active involvement in the organizational stage. However, the LAOOC asked the other parties to assume responsibility for expenses incurred in the staging of their own business meeting(s). While welcome to hold its congress in Los Angeles, each IF was informed in 1983 that each would be responsible for any costs incurred in holding a congress. The LAOOC would, however, assist those federations desiring congresses in identifying and procuring all necessary resources. During the pre-Games period, however, the LAOOC took a more active role in the financing, planning and staging of major Olympic meetings in Los Angeles. The major example of this was at the January 1983 meetings of the Executive Board of the International Olympic Committee (IOC) with the National Olympic Committees (NOCs) in Los Angeles. The Los Angeles Olympic Organizing Committee assumed responsibility for all arrangements including transportation and the assignment of (but not payment for) rooms to the delegates.

22.02 **Meeting of the Executive Board of the international Olympic Committee with the National Olympic Committees**

The LAOOC hosted a major meeting of the National Olympic Committees and the IOC Executive Board at the Biltmore Hotel in Los Angeles from 12-21 January 1983. This was the only large-scale opportunity for the LAOOC Protocol Department to identify and plan for the specific tasks and duties it would be performing during the 1984 Olympic Games. Based on the experiences of this meeting, the LAOOC developed a more precise vision of protocol activities for the IOC and NOCs during the Games. Over the 10-day period, various LAOOC procedures and plans were implemented and tested to identify problems and obtain hands-on experience. This meeting also provided the opportunity for the LAOOC and the Biltmore Hotel staff to work together and become familiar with each other's operations in preparation for the Biltmore's role as Olympic Family headquarters during the Games.

The primary objective of the LAOOC for the January 1983 meetings was to demonstrate how well organized and well equipped the LAOOC was to conduct efficiently the Games of the XXIIIrd Olympiad. It was also important to ensure the comfort and personal well-being of those attending to promote a positive impression of the LAOOC and Los Angeles and demonstrate the LAOOC's ability to carry out the tasks ahead in preparation for the Games.

Another objective of this meeting was to identify and test an accreditation system to determine its feasibility and use for the Games. Systems and procedures were developed for interviewing, hiring and training personnel which would be instrumental for the massive task of hiring the necessary staff in 1984. Key individuals were identified during the meetings who later became the core of the LAOOC Host/Hostess Program for 1984.

Many LAOOC internal departments used the meeting as a testing ground or dress rehearsal for their 1984 plans. These included Security, Transportation, Olympic Family Services, Technology (telecommunications), Finance and Protocol. Critical areas were identified and tested on a smaller scale to determine which systems and procedures worked and which needed further development and improvement for 1984.

The Olympic village personnel interviewed all official delegates from the NOCs in order to determine their needs and desires as they related to village services. Each NOC was given the opportunity to tour each Olympic

village and then officially request which village it desired for its delegation in 1984.

Delegates to the NOC meeting were greeted at the Los Angeles International Airport by a team of LAOOC staff, including hosts/hostesses. Delegates were escorted to a special passport control line which was open only to official delegates. Special LAOOC luggage tags which facilitated baggage and customs handling had been sent to all delegates who were then accredited upon arrival at the Biltmore Hotel.

IOC/NOC Meetings Program

The purpose of the 1983 meeting of the Executive Board of the International Olympic Committee with the National Olympic Committees in Los Angeles was to discuss and resolve various issues and questions as they related to the preparations for the 1984 Olympic Games and future Games.

The Executive Board of the IOC met on three separate days and on a fourth day with the General Assembly of the Association of NOCs. The ANOC General Assembly met on two other days and was preceded by a meeting of the ANOC Council. Meetings were also held by the Association of African NOCs (ANOCA), Olympic Council of Asia (OCA), Commission of the Olympic Movement and the Press and Television commissions of the IOC. Visits to the venue sites were offered by the LAOOC for all delegates prior to the meetings of the ANOC General Assembly and IOC Executive Board. Five hundred sixty delegates (560) from 141 nations attended in all.

On 18 January 1984, a special presentation was held in which IOC President Juan Antonio Samaranch presented Jim Thorpe's 1912 Olympic gold medals for the decathlon and pentathlon events to Thorpe's children, thus restoring Thorpe's amateur status. The presentation was organized by the United States Olympic Committee.

Hosts/Hostesses

All hosts and hostesses for the IOC/NOC meetings were volunteers who were selected through a stringent interview process. Because they were essential to the success of the meetings, they were required to complete a thorough two-day training program prior to final selection. Many of the 149 hosts/hostesses were bilingual or multi-lingual and provided vital communication services for the delegates from each country. Hosts and hostesses were uniformed for easy identification by the delegates.

Program of the Meeting of the Executive Board of the International Olympic Committee (IOC) with the National Olympic Committees (NOCs) 14-21 January 1983 Biltmore Hotel Los Angeles, California

Wednesday, 12 January
Opening of the IOC Secretariat
Opening of the LAOOC Secretariat

Friday, 14 January
Meeting of the Association of African NOCs
Reception for Association of African NOCs, hosted by the LAOOC
Venue tour for the IOC Press Commission

Saturday, 15 January
Meeting of the Council of the Association of National Olympic Committees (ANOC)
Venue tour for the IOC Press Commission
Venue tour for the IOC Television Commission

Sunday, 16 January
Meeting of the IOC Press Sub-Commission
Meeting of the IOC Television Commission
Meeting of the IOC Working Group of Assistance to the NOCs
Premiere opening of the technology and venue model displays in the Regency Room at the Biltmore Hotel
A screening of the ABC Sports/LAOOC film "Sharing The Dream"
Venue tours (Northern, Southern and Central/Western) for the delegates

Monday, 17 January
Meeting of the IOC Press Commission
Meeting of the General Assembly of the ANOC
Press conference given by the International Amateur Athletic Foundation
Venue tours for the delegates and members of the Executive Board of the IOC

Tuesday, 18 January
Meeting of the Executive Board of the IOC
Meeting of the General Assembly of the ANOC
News briefing given by the IOC director
News conference given by the Organizing Committee of the XIV Olympic Winter Games-Sarajevo 1984
Program for guests of delegates at the Beverly Center and Universal Studios
Presentation of 19 12 Olympic medals to the family of Jim Thorpe
Reception following the Thorpe presentation hosted by the United States Olympic Committee
Sports demonstration of rhythmic gymnastics and synchronized swimming and reception and dinner following hosted by the LAOOC

Wednesday, 19 January
Meeting of the Executive Board of the IOC
Meeting of the IOC Commission for the Olympic Movement
Meeting of the General Assembly of the ANOC
Program for guests at Santa Anita Park
Reception and dinner for the delegation in the homes of Southern Californians
Reception and dinner for the accredited media at the home of the LAOOC news secretary

1

Thursday, 20 January

Meeting of the Executive Board of the IOC with the National Olympic Committees Program for guests at Disneyland
 News briefing(s) given by the IOC director
 Report of the LAOOC to the Executive Board of the IOC with the NOC
 Reception and dinner hosted by the IOC

Friday, 21 January

Meeting of the Executive Board of the IOC
 News briefing given by the IOC director
 News conference given by the president of the IOC
 Report of the LAOOC to the Executive Board of the IOC

Language Services

Interpretation for each of the major languages was provided by multi-lingual hosts/hostesses assigned to NOCs and by request through the LAOOC Secretariat. In addition, the LAOOC Secretariat provided translation services as needed. Simultaneous translation was provided in both French and English for all IOC meetings and German, Russian and Spanish were added for meetings of the ANOC General Assembly.

Social Functions

Various social functions were organized to inform and entertain the delegates. These included receptions, dinners, presentations and a sports demonstration of synchronized swimming and rhythmic gymnastics.

On 19 January, a unique program of in-home dinners was organized in order to give the NOC delegates the opportunity to spend an evening in a private home. The majority of the delegates chose to attend these dinners throughout the entire Los Angeles area and were delighted at the hospitality and warmth of their hosts.

A guest program was organized to provide activities for family members and friends of the delegates. Arrangements were made for tours of local amusement parks, shopping excursions, luncheons and an afternoon at Santa Anita Park, site of the 1984 equestrian competition.

Various venue tours were set up to give all delegates, including the media, an opportunity to visit all the sports sites as well as the three Olympic villages. The respective sport commissioner and/or sport manager were in attendance at each venue to describe the particular site and answer questions. Delegates were shown model rooms in each Olympic village and were given the opportunity to explore the facilities available at each.

Support Services

The LAOOC maintained a secretariat at the Biltmore who provided information and assistance for translation/interpretation services, additional hosts/hostesses and travel needs. A large area (Regency Room) was set up with books and displays which provided information and answers to questions for delegates. This area included a slide show on the Olympic villages, architectural models of the villages and sports venues and was staffed by members of various LAOOC departments, including Sports, Ticketing, Transportation and Health Services. Cultural, Customs and U.S. Postal Service representatives were also on hand. The Technology Department set up displays of the electronic messaging system (EMS) and the results systems.

Additional services were arranged for the convenience of the delegates. Banking, currency exchange, medical services, travel and transportation assistance were all specially provided at the Biltmore. A full program of services for news media was also arranged for the 246 accredited media who attended. The LAOOC helped to arrange accommodations, arranged site tours and provided news conference facilities (including simultaneous interpretation in English and French) and a media work room with information boxes, typing areas and telecommunications (telephones, telecopier and telex).

22.03 Congresses

22.03.1 Conceptual role of the LAOOC

The objective of the LAOOC was to assist the federations in conducting their own congresses by identifying and organizing resources, with the federations paying for the various services.

By identifying and organizing resources and facilities, the LAOOC helped make it possible for all of the congresses held in conjunction with the Games to be conducted as efficiently and economically as possible while still providing the high quality required for such important conferences.

Since the membership comes from many different nations, the congresses usually, but not always, require simultaneous interpretation into some combination of six different languages: English, French, Spanish, German, Russian and Arabic (e.g., English-French, English-French-Russian, etc.) Frequently, voting takes place to elect officers and/or pass legislation pertaining to the sport. As a result, the quality of interpretation is particularly

critical so that voting is based upon a proper understanding of the issue(s) under consideration. There were a few federations for whom the quality of interpretation was not critical—their sessions were information events where major issues were not resolved and the expense of professional, conference-level interpreters was neither required nor desired. In Los Angeles, 12 federation congresses required simultaneous interpretation and three required no interpretation assistance.

Unlike previous Olympic Games, the Organizing Committee for the Games of the XXIIIrd Olympiad did not assume ultimate responsibility for the planning, management and funding of federation congresses held in conjunction with the Games. The LAOOC did, however, develop a comprehensive “Plan for Congresses” for those International Sports Federations wishing to hold congresses in Los Angeles in conjunc-

tion with the 1984 Games. The LAOOC also identified and secured congress meeting sites (generally hotels) and interviewed and selected individuals and companies to provide interpretation services upon request. Interpretation services included individuals (free-lance), professional simultaneous conference interpreters and a company which provided the portable interpreter booths and necessary electronic equipment, headset receivers and delegate microphones.

The LAOOC assisted in identifying the best sources for all other services which might be required by the federations. A limited number of buses for those federations wishing transportation assistance were contracted at federation expense. Although the LAOOC’s objective was to assist the International Sports Federations in putting on their own congresses while itself assuming no financial responsibility, the LAOOC recognized that the quality of experiences for those attending the congresses would inevitably reflect on the LAOOC because the congresses would take place at the time of the Games of the XXIIIrd Olympiad and because the LAOOC was involved in their preparation.

Because arrangements for IF congresses held at the time of the last three Olympic Games were provided by the Organizing Committee, in most cases the IFs had not developed the necessary administrative personnel and procedures nor the ability to raise funds for these congresses.

In consideration of the financial status of the IFs and to develop the best possible relationship between the LAOOC and the IFs, every effort was made to assist the IFs in putting on the congresses in the most efficient and inexpensive way possible while preserving their quality.

The LAOOC assisted the federations in securing hotel accommodations for a limited number of congress delegates who were not officially accredited for the Olympic Games and therefore were not eligible for the hotel accommodations of accredited congress delegates.

In the planning stages, each IF requesting a congress was asked to identify a “congress coordinator” who acted as a liaison between the IF and the LAOOC on all congress matters and preparations. The LAOOC sports commissioner and congress director assisted the federation in identifying and recruiting a representative to serve as the volunteer congress coordinator who would assume the on-going responsibility for planning and managing the congress. This individual was contracted on behalf of the federation to arrange for all the necessary

services such as meals, transportation, office equipment and supplies, audio-visual equipment, entertainment and accreditation. The LAOOC Congresses Department provided training and orientation for the congress coordinator but all final arrangements were the responsibility of the federation rather than the LAOOC.

22.03.2 Congress assistance given by the LAOOC

From 1981-1983, the LAOOC corresponded frequently with the IF officials. A congress questionnaire was mailed to all federations in 1982. The returned questionnaires contained vital planning information on required resources, funding/budget data and space requirements. The largest part of the planning and organization of each congress, however, was "diplomatic" in nature. Cooperation and communications had to be established between the various federation officials and the various LAOOC departments involved (Sports, Accommodations, Transportation, Language Services).

Throughout the planning stages, the LAOOC Congresses Department encouraged, guided and directed federation officials and congress coordinators during all phases of planning to cooperate and share facilities and resources wherever feasible as a means of minimizing costs and providing the most efficient utilization of facilities and personnel. Continuous advice and support to federation officials and congress coordinators was provided particularly in the areas of:

- Review of past congresses, their organization and production
- Catering, coffee services and meal services
- Distribution of electronic interpretation headset receivers, and, more importantly, return of the instruments at the completion of the congress day
- Security matters
- Advice on table arrangements, table placards (country names) flags, banners, other aspects of Look
- Advice on number of volunteers needed for various functions
- List of consulates in California

The LAOOC also provided assistance with congress delegate registration and last-minute administrative needs on days of the congresses.

During the preparation for and conduct of the 1983 LAOOC-sponsored sport events held March-September 1983, the director of congresses met personally with representatives of every federation holding congresses in Los Angeles. These meetings and subsequent supplementary telephone conversations were the most critical factors in developing congress plans which would actually work and satisfy all parties.

The director of congresses and the IF officials together with the sport commissioner and/or sport manager personally visited the proposed sites for the congresses. These site visits proved absolutely essential since the IF officials were very interested in how the congresses would work and were particularly interested in the atmosphere and surroundings of the proposed sites. Issues of cost, interpretation, housing, transportation and accreditation for all delegates were major discussion items.

Congress coordinators developed working relationships with the congress hotel and the LAOOC Congresses Department. The responsibilities of these individuals included:

- Compiling and preparing lists of delegate names
- Providing airport arrival services for delegates as needed
- Coordinating with the LAOOC's Accommodations Department regarding housing for congress delegates during the pre-Games period
- Coordinating housing during the Games period for congress delegates not accredited for the Olympic Games by their federation or NOC
- Arranging accreditation
- Arranging for entertainment and visits to special attractions
- Arranging meals and coffee breaks with the congress hotels
- Planning the congress meeting room configuration and set-up of equipment, flags and placards
- Preparing and distributing documents, brochures, communiques, mailings, information about Los Angeles and congress operations and other written materials requested by the federations
- Preparing notepads, pens, and other materials for congress delegates upon arrival
- Securing personnel to record and transcribe the congress proceedings
- Working with the commissioner, the international and national sports federations and the LAOOC to identify, recruit and train other personnel needed for the congress

In the month prior to the Olympic Games, congress coordinators conducted pre-convention meetings

with hotel convention services representatives. In almost every case, a trial set-up (mock-up) of the head table and delegate tables was arranged. At that time, tablecloth colors and other room decorations were established, including flower, flag and banner placements. In some cases, banners were put on the wall behind the head table; in others they were hung in front of the head table which was elevated above the floor.

The LAOOC Congresses Department compiled and integrated the following information, requirements and requests from IFs for their congresses:

- Estimated attendance at general congress sessions
 - Estimated attendance at council/board meetings
 - Estimated attendance at committee meetings
 - Dates and hours per day of each of the above meetings
 - Congress meeting room needs
 - Council/Board meeting room needs
 - Committee meeting room needs
 - Secretariat space/facility needs
 - Meal/banquet/coffee break and entertainment requirements/requests
 - Press conference room requirements
 - Housing requirements/requests in congress hotels
 - Transportation needs to and from congresses
 - Number of congress delegates who would not be accredited during the Games; Congresses Department to ensure that IFs have procedures for accrediting them for the congresses
 - Linguistic needs/requests such as number of simultaneous or consecutive interpreters (i.e., number of languages) needed for each congress session and/or council/board/committee meeting determine use of volunteers versus paid professionals
 - Interpretation hardware; delegate headsets, interpreter headsets, microphones, booths, others as needed
- Interpretation services needed at each press conference, banquet/luncheon, entertainment event
- Multi-lingual typists for transcription of proceedings of congresses, board, council and committee meetings, preparation of bulletins, communiques and voting results; other special requests of IF officials

- Multi-lingual typewriters—i.e., typewriters adaptable for multi-language typing elements; supply of multi-language typing elements
- Translation/transcription services needed following meetings
- Number of rooms, desks, chairs
- Meeting room set-up required/requested for congresses board/council/committee meetings; choosing from schoolroom style, theatre style, horseshoe-shaped table, hollow square table, rectangle, or other pattern
- Meeting room equipment, electronics required/requested
- Head table size, number of chairs, elevated or not, one tier, two tier, or other
- Head table microphones; how many, where placed
- Podiums and podium microphones
- Delegate microphones/podium microphones; how many, where placed
- Flags/emblems used; country placards, other decorative items
- Ballot boxes, blackboards, flip charts, film or slide projectors
- Recording equipment; and which kind—reel-to-reel versus cassette
- Secretariat/office; space and equipment needs/requests
- Xerox/copy machine/paper and supplies

The LAOOC secured the necessary and appropriate IF congressional meeting sites, obtaining the meeting rooms without charge wherever possible. In addition, the Congresses Department identified and secured, where necessary and appropriate, services required for the congresses at the lowest possible cost. These services included:

- Congress site director/coordinator and staff; congress volunteer staff training services
- Accommodations; hotel space for IF delegates, both accredited and un-accredited, who could not be housed at the appropriate congress hotel
- Interpreters
- Interpreting equipment; headsets, interpreters' booths, interpreters' microphones and headsets, technicians to run the equipment and dispense and collect headsets
- Translators
- Secretariat (office equipment and personnel)
- Security matters
- Transportation was provided by LAOOC Transportation Department and paid for by the IFs
- Miscellaneous services including technology, administration and entertainment

Appropriate and necessary contracts or agreements for all the above services were determined and arranged for the IFs by the LAOOC.

4

4 NOC delegates dine at one of the many functions held in their honor during their stay in Los Angeles.

Conference Facilities

The LAOOC arranged for Congress meeting facilities at four primary sites around Southern California: the Los Angeles Airport Hilton and Towers, Los Angeles Marriott Hotel, Long Beach Hyatt Regency Hotel and the Westin Bonaventure Hotel in Los Angeles. Letters of understanding were completed in April 1983, with agreement reached that the hotels would not charge for rental of the meeting space as long as sufficient food and beverage services were ordered by the client federations. Six federations held their congresses at the Hyatt Regency Long Beach, two at the Los Angeles Airport Hilton and Towers and one at the Westin Bonaventure. Three of the other four congresses were held at sites close to the competition venues of the federation concerned and the IHF Congress was held in San Diego, California.

Language Services

International Simultaneous Translation Services Company (ISTS), based in Florida and Montreal, was selected for all simultaneous interpretation services. It had previously provided such services for the Games of the XXIst Olympiad (Montreal 1976), XIIIth Olympic Winter Games (Lake Placid 1980), the XIth Olympic Congress at Baden-Baden in 1981, the 1983 Summit of Industrialized Nations in Williamsburg, Virginia, and many other events. This was the only company with enough technicians and equipment to service the meetings which were spread over a vast area ranging from San Diego to Long Beach to downtown Los Angeles to Malibu.

ISTS prepared special contracts for the federations which the LAOOC distributed to the appropriate federation representatives and asked to have signed and returned. In signing the contracts, the federations assumed responsibility for any additional services required or equipment which might be lost at the congress, whose cost would be over and above the fees the federations had paid for the original equipment ordered. Most federations did order more equipment such as additional microphones and headsets just before or during their congresses.

Security

In spring 1983, the congress director and the director of security for the LAOOC met and decided that the congresses would be officially "outside the LAOOC security blanket." Security arrangements would be up to the individual federations. The LAOOC Security Department did, however, take the following steps:

- Met with LAOOC congress staff and congress coordinators at each congress hotel to discuss contingency plans. In the case of several hotels, security personnel were present outside the doors of each congress to ensure that only official delegates or observers to the congress entered.
- Maintained communication with hotel security personnel and alerted the hotel security and congress coordinators of newly developing needs for additional security

There were no security problems at any of the congresses that required assistance from the LAOOC Security Department.

Transportation

Invoices were sent to the two IFs which had requested bus transportation from the LAOOC and required a 25 percent deposit by 15 December 1983. Final payment was due 15 March 1984.

22.03.3

Organization of the congress staff

In early February 1983, the Congress Department was created within the Olympic Family Operations group. The purpose of this new department was to develop and present to the federations a plan for holding congresses in Los Angeles.

By November 1983, the Congress Department had developed the plan for congresses, assisting sport commissioners in identifying, recruiting and training volunteer congress coordinators for each federation and laying the groundwork for appropriate interpreters and interpretation equipment. The Congresses Department then became inactive until March 1984.

In March 1984, the Congresses Department was reactivated. By the end of May 1984, two additional full-time staff were hired: an administrative assistant and a manager of congress operations, both of whom served through the Games.

22.03.4

Recruitment and training

The LAOOC was not prepared to fund a significant expansion of its own staff, nor was it considered necessary to have many additional staff members to assist with the congresses. The director of congresses thus suggested to the federations that they, along with the LAOOC sport commissioners and the Congress Department, jointly identify and recruit individuals who would serve as congress coordinators to plan and operate the congresses. These individuals provided a limited amount of volunteer time in the year prior to the congresses and volunteered full time for a week or so at the time of the congress.

In June 1983, the sport commissioners, IF officials and Congresses Department jointly began interviewing and selecting candidates for the roles of congress coordinators. All except one were identified and selected by the end of September. The final IF selected its congress coordinator in April 1984.

The director of congresses and manager of Language Services spent three days at the United Nations meeting with the heads of each translation, interpretation, conference services and document flow divisions. This effort proved extremely useful in compiling a comprehensive list of all functions and services which might possibly be needed by the federations. More importantly, these meetings educated the LAOOC as to current highest level of standards for international conference operations, number of inches prescribed by the U.N. as most appropriate to allow for an individual delegate at a conference table, methods of balloting, protocol of which staff members should be present during the actual conducting of the congress and decision-making process regarding which officials and delegates at a conference should be interrupted with messages and by whom.

Congresses in the pre-Games period

In September 1983, the LAOOC unexpectedly assumed the role of host to the 1983 World Target Archery Championship, which had previously been scheduled for Mexico. The Federation Internationale de Tir a l'Arc (FITA) Congress was to be held in conjunction with the championships. The Congresses Department agreed to play a major role in organizing that congress, following the proposed plan for 1984. The archery congress was an ideal vehicle for the just-selected congress coordinators to practice their roles for the 1984 congresses.

All the issues ultimately encountered in the Olympic congresses manifested themselves during the archery congress, including: interpreter selection, interpreter travel and housing arrangements, congress table arrangement (a special horseshoe-shaped configuration was used with head table at the open end), country name placards, identification with IF president in advance, "document flow" (quantity, frequency and speed of documents needing to be photocopied), transcribing taped proceedings of the meeting, translating those proceedings from one language to another (French/English), need for multi-lingual typewriters and typists and extra costs resulting from congresses running late.

In order for the congress coordinators to assume responsibilities for ongoing planning and preparation for the congresses, a major orientation and conference was scheduled for 14 November 1983. This orientation included each congress coordinator (in some cases one or two additional volunteer personnel as assistants to them), sport commissioners, the chief interpreter-designate, the designate from the interpretation equipment company, representatives from Xerox, photo and sound (audio visual services), design (country name placard) and others.

This orientation session simulated as nearly as possible the atmosphere and circumstances of a 1984 congress. The International Ballroom at the Los Angeles Airport Hilton and Towers, one of the 1984 Congress sites, was utilized. A formal congress table arrangement was used and International Simultaneous Translation Services Company installed a three-interpreter booth and provided headsets, since some of the orientation was conducted in French, requiring the delegates to learn to use the electronic headset receivers.

22.03.5 Review of the congresses

Since so many officials of the International Sports Federations normally come together at the time of Olympic Games, it is natural for the federations to hold congresses in conjunction with the Games. However, holding congresses in conjunction with Olympic Games presents many logistical challenges because of the generally scarce resources available in a city during the Games (housing and transportation, to name two examples). In addition, the federation congress, which is generally a prestigious and important event, becomes at best an unnoticed secondary event in the community. Because of the overwhelming focus on the Olympic Games, normal considerations and services are frequently lacking or difficult to secure. Therefore, when the Organizing Committee is not planning to host and organize the

congresses as an integral part of its responsibilities, many federations are now choosing to hold congresses in conjunction with their world championships. Overall, the LAOOC approach to congresses was significant in two ways:

- Since the federations were required to pay for services, the federations were more selective in deciding what was important for them to have, what was important for them to accomplish, how much time they needed and what languages they needed.
- Because the distinction was drawn clearly between the resources available to delegates accredited to the Games and those available to congress delegates who were not accredited for the Games, federations had to make arrangements for unaccredited delegates who were not guaranteed accommodations, transportation, credentials and tickets accorded to the Games officials.

22.03.6 Summary of IF congresses FINA Congress: 25 July 1984 Pepperdine University Law School Malibu, California.

Facilities were outstanding in the new Law School Amphitheater. The congress was scheduled from 1000 to 1600 with approximately 160 delegates and observers expected. Congress actually began about 1020 and ended at 1640. The day preceding the congress, the bureau (approximately 12 members) met at Pepperdine in an upstairs meeting area in the Firestone Field House to make its recommendations on each issue that was to be presented to the congress. As a result, at the beginning of the congress, each delegate was handed a list of resolutions with a proposed recommendation by the bureau. This allowed the congress to progress by requiring only a yes or no vote on the recommendations with minimum discussion. Three interpreters provided service in English and French.

IHF Congress: 25-26 July 1984 Westgate Hotel San Diego, California

The handball federation decided to hold its congress in a city other than Los Angeles and with the help of the sport's commissioner selected the Westgate Hotel in San Diego. The IHF Congress was one of the two congresses which required the least involvement of LAOOC congress personnel. It was almost self-contained and was run by the United States Team Handball Federation. The LAOOC's only role was to provide

5

interpretation services which included nine interpreters providing service in English, French, German and Arabic and which were paid for by the federation. There were approximately 120 delegates each day.

FIVB Congress: 25-26 July 1984 Hyatt Regency Hotel Long Beach, California

The volleyball congress was one of the best prepared and executed congresses in Los Angeles. A special banner welcoming the congress was prepared by a local artist and especially attractive country name placards were prepared creating an excellent atmosphere and setting for the congress. FIVB had its entire hotel plan and agreement completed in writing by late fall 1983, and all delegates, including those not accredited for the Olympic Games, were able to stay in the hotel during the congress.

Nine interpreters provided service in English, French, Spanish and Arabic for approximately 130 delegates each day.

FIG Congress: 25-26 July 1984 Airport Hilton and Towers Los Angeles, California

The gymnastics federation conducted the longest series of meetings in conjunction with its congress. Numerous meetings of committees, the executive board, commissions, technical assemblies and the general assembly took place during this nine-day period. Receptions and social functions were sponsored almost every night by a different major company seeking to improve its business with the federation.

Twelve interpreters provided service in English, French, Spanish, German and Russian for approximately 250 delegates.

UIPMB Congress: 25-26 July 1984 Conference Center/Coto de Caza Coto de Caza, California

Along with the handball federation, the Union Internationale de Pentathlon Moderne et Biathlon was the least involved with the LAOOC Congresses Department. Because of the remote

6

5 NOC delegates view a venue model.

6 IOC and NOC members tour UCLA, one of the three athlete villages.

Meetings and Congresses

location and relative isolation of the Coto de Caza venue, events at Coto had to be arranged for and managed by those physically present there. As a result, the LAOOC's venue director and his assistant provided all the initial planning and the operational management during the congress.

IWF Congress: 27 July 1984 Airport Hilton and Towers Los Angeles, California

The secretary-general of the weightlifting federation personally handled all the detailed planning, site visits and prepayments for interpretation and bus services in the year prior to the congress. Two months before the congress, on his final visit to Los Angeles, he agreed to let the assistant venue manager serve as the congress coordinator to arrange for flowers, table arrangement, interpretation coordination and other matters best handled at the local level.

Only minor modifications in the room set-up were made since both FIG and IWF used the same room. The one bus ordered by IWF functioned successfully, running two shuttles between Loyola Marymount University (venue for weightlifting) and the Los Angeles Airport Hilton in the morning and two again in the evening. Delegates were all housed at Loyola Marymount.

Twelve interpreters provided service in English, French, Spanish, German and Russian for approximately 200 delegates.

FIAC Congress: 27 July 1984 Hyatt Regency Hotel, Long Beach, California

The federation conducted a short congress from 0900 to 1300 using the same room, interpreter booths and table configuration as the volleyball congress did the day before. Only the head table was slightly reorganized. FIAC was also able to use the bright, bold country name signs which FIVB had made.

Nine interpreters provided service in English, French, Italian and Arabic for approximately 150 delegates.

IAAF Congress: 31 July-1 August 1984 Westin Bonaventure Hotel Los Angeles, California

The original estimated attendance for the athletics congress was 280. Actual attendance the first day was more than 450. This was the largest congress ever held and was attributed to the many observers, press and local dignitaries who unexpectedly attended. Special guests who made opening day remarks included LAOOC President Peter V. Ueberroth, IOC President Juan

Antonio Samaranch and Los Angeles Mayor Tom Bradley. Second day attendance was closer to normal.

Fifteen interpreters provided service in English, French, German, Spanish, Russian and Arabic.

The federation had made a special, perforated tear-off card as part of the delegate's simple accreditation/registration card, one tear-off card for each day. A delegate had to submit that card, which had the delegate's name and identification number typed on it, in order to get a headset for simultaneous interpretation. The card was given back at the end of the day when the headset was returned.

The most critical and serious issue involved accommodation arrangements for delegates not accredited for the Games. Because the IAAF held the only major congress during the Games period, the housing of delegates who did not have access to the same hotels as the Games-accredited IAAF delegates was a serious matter. The LAOOC offered accommodations from rooms remaining in its inventory for the Olympic Family and these were used by some delegates. Others attending the Congress decided to stay at a downtown hotel close to the Congress site which became available late in the pre-Games period.

IYRU Congress: 5 August 1984 Hyatt Regency Hotel Long Beach, California

The International Yacht Racing Union held a small, brief congress with no interpretation required. Approximately 60 delegates attended.

The major issues were the method of coffee service and how to hang the IYRU banner. On the day of the congress, the hotel convention services representative was not in attendance and there was difficulty in fixing the banner, which ultimately could not be used.

ABA Congress: 10 August 1984 University Hilton Los Angeles, California

The Association Internationale de Boxe Amateur held a short one-day congress. Attendance was approximately 150.

The boxing federation set up an unusual arrangement for interpretation, with four interpreters hired to do consecutive, rather than simultaneous, interpretation into French, English and Spanish. This made for a slow and cumbersome congress, but it was the approach to interpretation which the president of the federation insisted on.

The AIBA congress generated the most public attention and controversy as a result of a Games dispute from the night before concerning the awarding

Example of Congress Scheduling: Congress of the International Amateur Athletic Federation (IAAF) 27 July—3 August 1984—Westin Bonaventure Hotel

of a medal to a contestant. Eventually, the executive board dealt with the problem at the end of the congress. The issue preoccupied the attention of many of the officials and the lobby outside the congress room was essentially a waiting room for media wanting to know what had been decided.

AIBA had live microphones positioned throughout the hall and delegates would frequently grab a microphone and speak loudly out of turn, causing additional disruption.

22.04 Summary

Without exception, the federation officials said the facilities and services were the best they had had in many

years. In spite of a few operational problems with the interpretation, the overall quality of the interpreters and equipment operations was far beyond that of previous federation congresses. However, at previous Olympics, federations had not had to pay for services and, although muted, mentions of how much it was costing were heard. Eventually, the issue of costs subsided as general appreciation of the success of the congresses increased.

It is recommended in the future that decisions regarding meeting schedules and facilities should be made at the earliest possible date to aid organizers and to help delegates who are not accredited for the Games and may not qualify for Olympic services such as accommodations, transportation, credentials and tickets.

23

News Relations and Press Operations

23.01 Areas of responsibility for News Relations and Press Operations

23.01.1 The conversivity of tasks

The task of dealing with the news media on the local, national and international levels was a difficult one. Thousands of media had interest in the Games during the 1979-1984 preparatory period, and more than 8,600 were actually accredited to report about the Games during the Olympic period. The responsibility of the LAOOC was to provide sufficient information and services to the media to allow them to function properly in their news-gathering and news-reporting roles. These responsibilities took shape at two different levels. In the planning and preparation phases, media had interest in interviewing members of the Organizing Committee, in receiving information about the structure of the LAOOC and its activities and in seeing the sites which would be used for the Games. At the same time, the LAOOC had to begin the detailed plan for accommodating the logistical and technical needs of the press, radio and television during the actual time of the Games. In order to be sure that both ongoing media relations and long-term planning received sufficient attention, these functions were split into different departments: News Relations and Press Operations.

The titles of the departments described their areas of responsibility. News Relations ("News" for short) dealt with the day-to-day requirements of the media, including:

- Interview requests
- News conferences
- News releases, photographs and support materials
- Policy and reaction statements
- Venue tours and media event advance

The News group began at the formation stage of the LAOOC and was limited to a news secretary and secretary through mid-1981. The staff was later expanded.

The 1984 staffing included an advance team staffer to accompany the senior management of the Organizing Committee at almost all public functions, since news media coverage of the Games and the LAOOC had reached a near-fever pitch.

Press Operations focused solely on the logistical preparations for hosting media at the Games. It was not responsible for giving on-the-record statements to the media or for receiving daily inquiries regarding the Organizing Committee's day-to-day affairs. Long-range planning and advance preparations could be given sole emphasis without the burden of

dealing with important news events on a daily basis. Press Operations worked principally in the areas of:

- Accreditation; forms, identity cards, processing and physical badging
- Accommodations; assignment of media to LAOOC-reserved housing
- Information Services; athlete biographical data base, Main Press Center interview procedures, sports information and notes, and video recording and viewing
- Main Press Center; MPC layout and construction, news agency liaison and planning, Organizing Committee administration and media support services
- Photographic Services; camera repair, film processing and transport, photo pool liaison and photographic position surveys
- Venue Press Operations; recruitment and training of venue press chiefs and staff, operating plans for the venues and seating charts

The Press Operations group was also responsible for liaison with the Press Commission of the International Olympic Committee and assisted in some areas of television support.

Because of the event-related nature of the department, Press Operations grew slowly after appointment of a director in 1981. The initial operating plan for Press Operations was completed in May 1981.

As the Games drew near, both News and Press Operations found it important to work closely together. Information needed to be shared and journalists who came in to meet with one group almost always asked questions about areas covered by the other. Some confusion resulted as journalists did not understand the split between the responsibilities of News Relations and Press Operations. On the whole, however, good communications between the two departments resulted in an effective working atmosphere internally and provided solid external support for the media.

23.01.2 Analysis and conclusions

- The division of responsibility between day-to-day work and long-range logistical planning proved wise. Each department was able to concentrate on its own function and neither area suffered as a result of a temporary crisis in the other.
- An unfortunate result of the division of responsibility was a division in office space. News and Press Operations were not located near each other, resulting in a lack of communication of basic materials such as news releases. Physically co-locating the groups from the start would have assisted in the sharing of information, although the thin staffing of both departments would have made it tempting for one group to borrow heavily from the other during emergencies. Problems of either News or Press Operations would have hindered the progress of the other—the entire reason for initial separation.

23.02 Dissemination of LAOOC information to the news media

23.02.1 News releases, publications and other written material

The primary method for communicating news material was in writing. Through news releases and publications, information was distributed to media around the world on a timely basis.

There was no set pattern for news releases or features; the LAOOC made announcements and released material whenever there was something important to say. This had the effect of making the releases more useful when

received but also led to some confusion (especially among foreign media) for those who had expected some regular timetable for the dissemination of Olympic information.

The News group focused on several themes during the preparatory period, but turned toward a reactive stance in the later stages. In 1980, the primary messages included descriptions and explanations of the symbols and themes for the Games and specific information about the financial, management and organizational policies of the LAOOC. In 1981, News emphasized the permanent construction undertaken and the increase in licensing and marketing and tried to broaden international awareness of the Games. In 1982, the venues had been finalized in most sports, and attention was focused on the Games sites. Pre-Olympic competitions, tickets and the torch relay highlighted 1983, with intensive reaction periods following each major announcement.

During 1984, the News staff was immersed in reaction to a flood tide of stories, all of which had, in the minds of the questioning media, some link with the Games. Construction, LAOOC staffing requirements, tickets and the torch relay led the headlines. Intense interest in the smallest details of Games planning required immense amounts of staff time to react, while some of the advance team had to be assigned to assist with the Olympic Torch Relay. As a result, the available staff had time only to respond to inquiries and did not participate in as many proactive media activities as had been hoped for.

During the Games period, nine releases were issued after the opening of the villages and Main Press Center (MPC) from 14-27 July, and nine additional releases were issued during the actual period of competition from 28 July-12 August. One-third of these items dealt with the availability of tickets for spectators.

Releases were sent to a mailing list which was inherited from the group which won the bid to stage the Games. It was updated periodically by adding the names of those national and international journalists who visited the Organizing Committee or who wrote for information. A special effort to reach the local media led to numerous conferences with local editors or news directors, who added multiple names from their publications or stations in order to make their coverage complete. At its peak, the mailing list comprised about 4,000 persons, although only a few items were distributed to the entire list: "Olympic Countdown" volumes (5 in all), "Stars in Motion," numbers 1-6, the monthly "Olympic Update" and major releases such as the announcement of the LAOOC's ticketing or Olympic Torch Relay programs. Most of the releases were sent to a smaller list of 1,000 names which focused primarily on local media and representatives of national and international news media with offices in Los Angeles.

Additional printed materials for media included an introductory press kit, consisting of a collection of releases describing the general activities of the LAOOC. Press kits covering general matters were introduced in 1981 and refined yearly through 1983, after which the general information book "Olympic Countdown: 200 Days To Go" replaced the press kit. Specialized information packages were introduced about the Olympic venue sites (1981), the torch relay (August 1983) and Olympic Arts Festival (January 1984).

The News group was responsible for compiling and maintaining a file of newspaper and magazine clippings related to LAOOC and Games coverage. A massive three-part clipping system covered national media reports, reports from international media and coverage of the torch relay. The clip files contained than 30,000 pages of national coverage alone and were indexed by date rather than subject matter. "News Summaries" were also prepared for use by the News staff and by other key executives within the LAOOC; these included photocopied highlights from reports in daily newspapers and weekly/monthly magazines, as well as transcriptions from radio and television programs. Copies of these summaries were also forwarded to the IOC offices in Lausanne, Switzerland.

23.02.2 Photography

Interest in photography of the Games increased dramatically in 1983 and 1984, especially in view of new technology which allowed greater use of color reproduction in newspapers. The News group provided sets of color slides picturing the major venues, living conditions inside the Olympic villages and the Look of the Games as presented during the LAOOC's LA83 events.

Initially, photographic availability was limited to black-and-white portraits of the chairman, president and executive vice president of the LAOOC, along with limited shots of the major venues. Sets of these photos were assembled in small photo kits and distributed on a request-only basis to news media desiring photographic back-up for their written material. A complete set of venue photographs was never made available; few requests were received for photographs for some of the smaller sites.

Requirements for color transparencies changed the shooting requirements and new sets of photographs had to be taken in 1983. Thousands of sets of ten slides each were made and were distributed upon request. Again, the most popular sites were provided, although most of the sites were available on request. A full venue set was not produced, although there was a substantial demand for one in the three months prior to the Games.

Major news events were photographed under the direction of the News group, working in agreement with local photographic firms. Event photographs were compiled into subject indexes and were available to media requesting specific photographic support of Games personalities or of major events. These operations were carried on separately from documentation efforts for the "Official Report of the Games of the XXIIIrd Olympiad."

Multi media shows utilizing transparencies were produced by News in 1981 and 1982, until the formation of a separate audiovisual function within the Public Relations Department.

Reproducible copies of the *Star in Motion* logo, *Sam the Olympic Eagle* mascot and the LAOOC's Olympic Pictograms were also available in black-and-white versions in all general press kits and on request. In cooperation with the Licensing Department and Press Operations, media were allowed to use these symbols without charge so long as their use was restricted to editorial coverage of the Games and not to promotion (or implied endorsement of the LAOOC) of an individual newspaper, magazine or radio/television network, program or station. No difficulties were encountered with these controls. Because of the especially heavy demand for color reproductions of the *Star in Motion*, color transparencies of the LAOOC's logo were made available on request, beginning in mid-1983.

23.02.3 News conferences

The LAOOC organized numerous news conferences about the Games dealing with important subjects of the moment. Conferences and media briefings were usually held for a specific announcement, rather than for general background, especially in the period 1980–1983. During the latter part of 1983 and into 1984, periodic briefings were held during specific times when increased information was needed by the media—such as in the month prior to the 2 June 1984 deadline for acceptance of individual invitations to compete in the Games by National Olympic Committees.

Briefings and conferences were held at sites all over the Los Angeles area, usually in hotels which had joined the LAOOC's Official Hotel program. Occasionally, gatherings were held outdoors or at sites which were appropriate for the subject matter of the briefing; the announcement of the program for the Olympic Arts Festival was held at the Los Angeles Museum of Contemporary Art. As time became very precious in 1984, briefings were held in the LAOOC's conference facilities in Westwood or in Culver City.

Technical considerations usually included raised platforms for television cameras, lighting balance for both television and still photographers and multiple-output audio patch units for the use of radio and television reporters.

23.02.4 Radio and television

Special audio and video releases for electronic media were not produced by the LAOOC, but the organizers made their top executives available for local radio and television reporters in periodic fashion, as well as in unusual situations which provided for unique coverage.

Local media were the primary focus for most of the radio and television effort, although national and international media did pick up certain segments for re-broadcast on their systems. President Peter Ueberroth appeared on a prominent local television station news program on a once-monthly basis for most of 1981 and 1982. National and foreign television crews also recorded hundreds of interviews with LAOOC personnel in the Organizing Committee offices, especially in the twelve months prior to the Games. Although Ueberroth was the primary subject in sessions up to July 1983, officials in specific areas were heavily sought after in the months just prior to the Games.

One of the unusual opportunities for television coverage of LAOOC officials was on 13 May 1984, when President Ueberroth and Executive Vice President Harry L. Usher viewed a news conference given by the National Olympic Committee of the USSR in Moscow and broadcast live in the United States. Media were invited to a Hollywood studio to speak with both men following the USSR NOC briefing which began at midnight Los Angeles time. Media questioning did not begin until almost 0200 in Los Angeles.

23.02.5 Tours

The immense interest by journalists in the unique setting of the Games was apparent early on, measured by the many requests for tours of the venues by journalists coming to Los Angeles. In concert with the Press Operations staff, tours of the major sites were conducted on a twice-weekly average from mid-1 982 through early 1984.

Although numerous tours were given in 1981 and early 1982, the majority of venue sites were not finalized until early 1982. The most requested sites included: the Los Angeles Memorial Coliseum (athletics), USC Village and swimming site, UCLA Village and Pauley Pavilion (gymnastics), The Forum (basketball), Velodrome (cycling) and Long Beach Convention and Exhibition Center (fencing and volleyball).

Tour dates and sizes were carefully coordinated with Protocol and with the venue owners. Because each of the most popular facilities was already existing and had continuing operations, venue owners were concerned about disruptions to their normal schedules

4

4 The LAOOC News Department stages a press conference in June 1983 to announce the mail order ticket system.

by continuing large tour groups from the LAOOC. This led to tour groupings, which would include both media and protocol tours arriving in separate vehicles (and with separate guides) at the same venues at the same times in order to cause as little interruption of normal venue activities as possible. Journalists requesting venue tours were generally required to telephone, telex or write the LAOOC at least one week in advance of their visit. The News group would attempt to gang the tours of visiting journalists together as much as possible in order to reduce the drain on staff time and to requisition properly a suitably sized vehicle.

Working in tandem with Press Operations and in cooperation with the U.S. State Department, the News group led a series of ten tours for journalists from South and Central America, Africa and Asia on a once-per-month basis in the last nine months of 1983 and in January of 1984. One day of each U.S. State Department tour schedule in Los Angeles was devoted to the LAOOC and its preparations for the Games. This program was well received by the journalists and led to return visits or trips by colleagues of those who had participated in the program.

News Relations and Press Operations

23.02.6 During the Games period

The News Department divided its staff during the period of the Games in order to reach the largest number of media effectively. Groups were concentrated at the Main Press Center as well as at the LAOOC's administrative headquarters in Culver City and at the major venue sites.

The news secretary, along with the special projects manager, was assigned to the LAOOC president during the Games. This proved invaluable, especially since the varying demands for appearances by President Ueberroth could be best sifted by

those who had already screened thousands of interview requests in the pre-Games period. Communicating with Ueberroth through News staff physically with him was close to ideal for both the News and Press Operations groups headquartered at the Main Press Center.

The News staff had an office at the Main Press Center, where it was anticipated that inquiries about Organizing Committee actions and requests for interviews and statements regarding various incidents occurring during the Games would be handled. Statistical information regarding the competitions themselves would be handled by the Information Services sector of Press Operations. In the News office, provision was made for two deputy news secretaries, one scheduler for interviews, one advance team member and two secretaries.

Although the News office was not staffed until approximately 21 July, it handled most inquiries without incident between 0800 and 2000 hours daily

thereafter. The office was not staffed after 2000 on most days and the responsibility for reply fell to the administrative staff of the Press Operations groups as to which was responsible for answering certain questions; this area was never clearly resolved and continued on a case-by-case basis throughout the Games.

A deputy news secretary, advance team member, scheduler and two secretaries continued operations at the LAOOC's Culver City administrative headquarters. Non-accredited media were able to get information and interview some LAOOC officials, while clipping and news summary services continued as in the pre-Games period. This group was also able to monitor developments as relayed to the LAOOC

Operations Center within the Culver City building. The smoothness with which the Games proceeded served to eliminate most of the need for the News office at Culver City and most of that staff transferred to the MPC.

News assistants were assigned to sites where the most media interest was expected: the UCLA and USC Villages, the Exposition Park area, including the Coliseum and Sports Arena, and the Long Beach Convention and Exhibition Center complex. Those assigned to the villages proved invaluable both in assisting the village administration on media matters and in cooperating with the Press Operations staff at those sites. News staffers led some of the daily village tours, assisted in the interview areas and helped to guide journalists in the best use of the limited village access available to them. Since almost all focus at the sports sites was on the competition alone, News staff helped to arrange and carry out the media services programs in cooperation with the Press Operations staff there.

23.02.7

Analysis and conclusions

The News group, as constituted, achieved its primary objectives in all areas. Media received accurate and detailed information in a timely manner when the Organizing Committee had something to say. A high level of service was delivered on journalist tours, and follow-through on interviews and requests for information/statements was unusually efficient, considering the limitations on staff.

It was clear, however, that News was understaffed; it was barely able to react effectively to the torrent of reactive pressure apparent in the final stages of the pre-Games period. Additional staff should have been hired in the late stages of 1982 and in early 1983 to become thoroughly competent in the details of the organizing effort. They would have

then been ready to handle not only the requirements of reactive news dissemination, but also to plan and carry out a detailed proactive program. Although it turned out that the Games did not need to be "sold," it would have helped the LAOOC's world wide image to have a more continuous and rhythmic flow of information to the mass media in at least the last 18 months prior to the Games. It is possible that some of the image problems suffered by Los Angeles, especially in the eyes of foreign media, could have been reduced or eliminated if a direct-reach program for media had been implemented. In view of the small staff, none was possible.

Mailing lists also reflected a reactive, rather than proactive, approach. Those who initiated contact were listed; major media which did not act overtly were not included. If targeted mailing rosters compiled in concert with some of the larger national sportswriter associations were not practical early on in the pre-Games period, merger with the accreditation information residing with Press Operations should have been attempted in the six months

prior to the Games. Neither was attempted; but considering the available staff time, neither was possible.

The concept of "news summaries," containing not only local clippings but also those of national and international media, was outstanding. It allowed the LAOOC's key executives to gauge the possible private and public relation to various programs-not only in the local area-but also across the country and around the world. These summaries were a tremendous educational and sensitizing tool.

23.03
Interview policies
and procedures

23.03.1
During the pre-Games period

Media coming to Los Angeles found a wide variety of subjects for their work in the members of the LAOOC staff. As the planning progressed in the pre-Games period, ever-increasing pressure was placed on staff time for media access and interviews.

In the early stages, media attention focused almost solely on the president of the LAOOC, Peter Ueberroth. As time went on, however, Ueberroth directed many of the inquiries to individual department heads or other staff. In the year prior to the Games, great media interest was focused on the staff management of sensitive areas such as security, transportation and villages.

The News staff utilized scheduling assistants as early as 1982, with one on staff in 1983 and two in 1984. Their function was to take all requests for interviews, whether originally directed to the individual himself or to the News Department, and find mutually

convenient times and places for the journalist and the staff member. The most important facet of this was to protect the time of the LAOOC's key executives. It is literally true that some of the key staff managers could have done nothing except give interviews in the six months prior to the Games. Heavy requests for interviews were often solved by scheduling group interview sessions.

In most cases, a News Department staff member accompanied the interviewer during the interview session. Presence of a News staffer provided two advantages for the LAOOC: wide-ranging interviewers frequently asked questions in areas unfamiliar to the subject-which the News staffer could often answer. The News staffer was also better educated in the area discussed between the journalist and staff member by simply sitting in. Although some journalists took exception to the company of a News Department staff member, most appreciated the additional information provided at many sessions.

23.03.2 During the Games

Interview procedures during the Games were necessarily more haphazard than when the LAOOC was contained in a central headquarters. Senior LAOOC officials not assigned to specific sports sites were generally scheduled through the News staff at the administrative headquarters in Culver City or at the Main Press Center. President Ueberoth was scheduled by the News staff traveling with him.

Sports Commissioners and others working at a specific venue were scheduled in cooperation with the News staffer assigned to that venue or village; if no News Department staff member was assigned, the venue press chief (from Press Operations) would take responsibility for staff interview scheduling.

In general, venue interview requirements were modest except for the commissioners and occasional needs for medical personnel to explain certain injuries which had occurred. Interview requests for central LAOOC management were numerous and were often met by media availabilities in news conferences at the Main Press Center.

23.04 Spokesperson function

23.04.1 Role of the news secretary and deputies

When the Organizing Committee issued statements to the media, they were issued solely by the News Department. This simple concept concentrated the efforts of the News group as the LAOOC's single news voice.

Media calling the LAOOC, regardless of department, were referred to the News Department. The responsibility of the News staff, then, was to respond efficiently to calls about all matters and to give accurate on-the-record statements for use by the media. For the most part, the News staff did an extraordinarily efficient job of following through on calls from the media, especially considering the size of the staff available to handle such matters. As noted earlier, however, this task would have been more easily carried out at a higher level of performance had the staffing been adequate.

The Press Operations group, despite its daily interaction with media from around the world, did not assume any spokesperson responsibilities. All LAOOC statements for the media were handled by the News Department.

23.04.2 Role of Press Operations during the Games

Although not involved with spokesperson functions during the pre-Games period, the Press Operations group was heavily involved with this function during the actual time of the competitions.

With no News staffers available at most of the venues, the venue press chiefs assigned by Press Operations became the spokespersons at each venue. In general, there was little need for their services, since the competitions went smoothly for the most part. In the odd situations which required comment at the sites, the venue press chiefs worked with the sports commissioners to release appropriate information, which was then communicated back to the Main Press Center for central dissemination to the media and reported to the Operations Center for LAOOC management use.

Centrally, the News office at the Main Press Center fielded most of the questions relating to LAOOC activities, as opposed to information derived from the competitions themselves. As the News office was not usually staffed from 2000-0800 hours, incoming calls were handled by the Press Operations administrative staff as available. Too often, answers were unavailable to the Press Operations staff and messages for return calls were taken.

In some areas, News turned to the Information Services sector of the Press Operations staff for assistance. All questions regarding attendance were handled by the Press Operations' Information Services group, and numerous other matters were also

Accreditation quotas in the 1978 Olympic Charter

International Agencies (including Agence France Press/FRA, Associated Press/USA, Reuters/GBR, Tass/URS and United Press International/USA. The European Pressphoto Union/FIN has also enjoyed International Agency status since 1960 since Reuters does not have a picture service.)	150
National Press Agencies	200
National Written Press	2,500
Photographers	400
Press Technical Personnel	250
Television and Film News Agencies	100
Radio/Television Commentators (For organizations holding broadcast rights only)	800
Radio/Television Support Staff (rights-holders only)	1,500
Radio/Television Technical Staff (rights-holders only)	1,900
Total	7,800

referred there-usually relieving an overloaded News group at the Main Press Center. Although closer planning could have provided a more workable procedure, the results were satisfactory to most of the media requiring assistance. In the main, junior News Department staff members looked for help from Information Services when more senior News personnel were not available, a by-product of thin staffing in News. In addition, a lack of coordinated staff time in development between News and Press Operations prevented the compilation and exchange of detailed "briefing books," which could have helped each group better grasp the knowledge held by the other. Requests coming into News, which then turned for assistance to volunteer Information Services personnel who had not been fully prepared to respond to such inquiries, usually resulted in difficulties. These matters were usually resolved after a senior Information Services staffer was found-but the time taken to locate them was wasteful, irritating and inefficient for both LAOOC departments and the journalists concerned.

23.05 Press Operations: Accreditation

23.05.1 Concept of the system

The goal of the press accreditation process was not only to provide information sufficient for the actual badge-making process but also to gather a wide variety of information about the needs for media facilities, housing, seating, transportation and other items. In this way, the single essential document which had to be completed-the application for accreditation-served as an all-in-one source of data from which a preliminary plan for press facilities could be refined.

In order to provide useful data and appropriate responses for the more than 9,000 forms which were returned to the LAOOC in the months prior to the Games, an automated system of data collection and reporting was necessary. The LAOOC's "press dossier" system responded to this need. As originally envisioned, all forms would be manually put into a computer data base; after input, the press dossier programming would keep track of each individual, financial commitments and obligations, facility needs and requests and provide management reporting tools for use by the Press Operations Department.

After the press dossier system received all possible data relative to media attending the Games, this information was then forwarded to independent systems which were responsible for accommodations and badge-printing. The accommodations systems—run by the Accommodations Department, not Press Operations—generated housing confirmations for journalists from information contained in the press dossier data base. With the press dossier data contained in the accommodations system, the Accommodations Department then collaborated with Finance to receive appropriate payments from journalists to pay off their housing balances.

Although changes in the names of the journalists who would actually attend the Games were expected to continue past the date of the Opening Ceremonies, the plan for badge-printing envisioned a cut-off date for new information to be internally set, after which changes (and new badges) would have to be made individually. The appropriate data from the press dossier system was then forwarded to the accreditation (badge-printing) system, which physically printed the individual identification data on the blank badge stock. These badges were then ready for use in the accreditation center of the Main Press Center where news media received their credentials.

The planned role of the press dossier system was to retain all pertinent information about Olympic journalists within the Press Operations Department while providing necessary data to other departments primarily responsible for some of the functions tracked by the press dossier program, such as: accommodations (reservation of housing), accreditation (printing of badges), finance (collection of money for housing and services), technology (ordering of EMS, paging, telecopier and telex equipment) and transportation (car rentals and parking). Although the concept was sound, difficulties outside the sphere of Press Operations prevented the press dossier system from fulfilling the functional role envisioned for it.

23.05.2 Distribution of the quotas

There is little doubt that many more journalists would like to cover the Games than can be accommodated. The tremendous growth in interest regarding major sports and sporting events led one International Federation president to remark that matches may have to be played twice in the future—once for the journalists and once again for the public. In order to keep the number of journalists attending the Games within manageable limits, the IOC limited the number of media allowed to attend to 7,800 and set up a program of national quotas, allocating the number of journalists, photographers and technical personnel who could be accredited to report on the Games. The responsibility for administration of this process was given to the IOC Press Commission.

While the ceiling of 7,800 media was recognized by the bid documents for the Games, the May 1978 *Los Angeles Responses to Questionnaires from International Olympic Committee and International Sports Federations* also stated that *“the OCOG may accredit such additional press personnel from the local news media as it deems appropriate.”* As the responses were incorporated by reference into the LAOOC’s agreement with the IOC, this provision was carried forward.

The Olympic Charter specifies that the Organizing Committee and the IOC shall jointly determine the quotas, noting especially the number of accreditations given at past Games, the national participation at past Games and the situation of the particular nation to which the reports will be going. Also

crucial in fixing quotas was the geographic distance of any particular nation from the city in which the Games would be held and the financial ability of journalists in individual countries to come to Los Angeles. In determining the number of accreditations to distribute, it was recognized that the LAOOC would deal independently with the international agencies, television and film news agencies and the radio/television broadcast organizations which purchased exclusive broadcasting rights for the Games. Thus, the number of accreditations available for distribution included 200 for national press agencies, 2,500 for national written press, 400 for photographers and 250 for press technicians. Since the decision about how many accreditations would be given to national press agencies was actually in the hands of the NOCs (which know the needs of their national agencies far better than a fledgling organizing committee), the 200 national press agency credentials were combined with the 2,500 national written press credentials for a national written media total of 2,700.

The LAOOC submitted its recommendations for quotas at the February 1982 meeting of the IOC Press Commission in Los Angeles. Distributions of written press accreditations to 149 NOCs totaling 2,520 and photographer’s credentials to 54 NOCs, the international and national photo pools and to the IOC totaling 390 were proposed. The press commission took these suggestions under advisement, and discussion was continued at the subsequent meeting of the press commission in Rome in May 1982. An increase to 3,000 national written press, including a limit of 100 local journalists, was proposed; the LAOOC rejected this position as too modest for local media. In June, the IOC circulated a letter asking for comment on its proposed quotas from the Rome meeting.

Quotas were finally fixed in March 1983, at the meeting of the IOC Press Sub-Commission on accreditation in New Delhi. The IOC and LAOOC agreed on the distribution of 2,648 out of the 2,700 national written press accreditations (the rest being held in reserve), as well as an extra 100 accreditations for specialized media covering a single sport only (and thus admitted only to that sport site) and 300 accreditations for the local area for the LAOOC to distribute. Distribution of 343 photographic accreditations was also agreed on, with a reserve of seven for NOCs and the remaining 50 reserved for the international agencies.

Accreditation of the 48 photo pool photographers would be in addition to the Olympic Charter limit of 400.

The specialized accreditations were for any of nine sports which would probably not receive heavy media attention in Los Angeles and in which there were large numbers of specialists

who would like to attend: archery, canoeing, equestrian, fencing, hockey, modern pentathlon, rowing, shooting and yachting. Many of these specialists would probably not have been otherwise accredited since many NOCs favor newspapers and magazines which have much larger circulations than specialized publications dealing with single sports. Distribution of these accreditations to NOCs did not take place until December 1983; the number of specialized accreditations was increased to 150 in view of the more than 200 requests received from the NOCs for specialized press in the nine sports listed.

The March 1983 determination of the quotas was timely since the press accreditation form, already in development, could be distributed in advance of the recommended nine months prior to the Games, giving the NOCs additional time to determine their own distribution plans and re-collect the completed forms from their journalists for return to the LAOOC. Although the total number of press rose from 7,800 to 8,200, including the specialized press, the Press Operations group was certain that small additions to press seating areas could be arranged. The LAOOC was also aware that although registrations for the Games would go right to the limits, it was likely that a significant number of media would not actually attend. Even a modest “no-show” rate of five percent would reduce media attendance from 8,200 to 7,790—below the original quota the LAOOC had agreed to support.

Quotas for technical personnel were more confusing. Many NOCs could not estimate their technician requirements until the number of press and photographic accreditations was known. Some NOCs tried to accommodate the requirements of their media for technicians inside their journalist or photographer quotas, while others applied for large technical quotas in hopes of turning these into journalist or photographer accreditations at a later date. Although NOCs submitted guesses of their press bodies’ technical staff requirements in June 1982, the determination of press technical quotas was not completed until October 1983. NOCs of 24 nations were allocated 184 technical staff accreditations, leaving 66 accreditations out of 250 technical staff total for use by the international agencies. As the requirements for technical staff grew, the LAOOC noted that many technicians had need only for access into the Main Press Center. Fearful of issuing additional technical

staff accreditations, which allowed access into all stadium press areas—but no seating privileges—the Press Operations Department developed a special credential for admittance into the Main Press Center only. This met the requirements of the agencies which needed staff in the Main Press Center and also helped to keep technicians out of the venue press areas where overcrowding was a concern. Only technicians with requirements for venue access needed to receive a full Olympic technical staff credential. Accreditation forms were sent in appropriate numbers to all NOCs and returns began pouring into the LAOOC close to the deadline of 1 February 1984, just less than six months prior to the Games. The IOC Press Sub-Commission allocated 28 additional press accreditations from the reserve in late November, so by 1 February, the LAOOC expected the NOCs to return 2,676 press accreditation forms, 343 photographer forms and 184 technician forms for a total of 3,203.

It was made repeatedly clear to the NOCs that non-return of forms by 1 February would result in cancellation of those accreditations represented by the forms. After the deadline passed, the IOC Press Sub-Commission and LAOOC met in Los Angeles in March 1984 and took up the re-allocation of accreditations not used by non-return of forms sent to NOCs. At that time, 2,641 forms had been received from NOCs for press, photographers and technicians combined with 44 more forms expected soon because of bank or postal strikes in various countries. Accreditations for the international agencies had reached the alarming total of 462, well over the quota of 266 (150 writers, 50 photographers and 66 technical staff) and with a re-allocation expected to be 140 (100 writers, 40 photographers as agreed by the Sub-Commission the previous November), the accreditation total for all written press had risen to 3,287 against a quota of 3,500 (International Agencies 150, national written press 2,700, photographers 400 and technicians 250). The Sub-Commission and LAOOC agreed to balance these returns against the quota of 3,500, leaving 213 accreditations still in reserve; these were split one-third (71) for the IOC, to use for late applicants and special situations, and two-thirds (142) for the LAOOC, in view of the insatiable interest shown by United States media. The LAOOC’s mandate was to work closely with the NOC of the USA (the United States Olympic Committee) to identify additional U.S. media deserving of accreditation. The actual re-allocation totaled 148, with 81 press, 59 photographers and eight technicians, reducing the IOC’s available accreditations to 63.

5 LAOOC staffers check payments of journalists during in-processing at the Main Press Center.

6 Journalists begin their accreditation procedure at the Main Press Center.

Accreditation of the international agencies proved to be confusing early on. Although the charter specifies that the Organizing Committee should work directly with the agencies on this, the LAOOC assumed that the IOC Press Commission would divide the quota of 150 writers, 50 photographers and 66 technicians among them. This proved incorrect and the LAOOC simply dealt individually with the needs of each agency; each received extremely liberal treatment in view of their worldwide reporting responsibilities. Additional accreditations were almost always granted upon demonstration of need within the overall coverage plan which the LAOOC had discussed with each agency.

23.05.3 Procedures for accreditation

Aware of differences in the efficiency, interest and sophistication of both NOCs and press worldwide, the accreditation procedures were designed to be as simple as possible. Once the quotas were determined, the LAOOC sent its press accreditation application forms to the NOCs in August 1983. Each form was ten pages in length and was accompanied by a 36-page instruction book which contained important information about services offered by the LAOOC and how to take advantage of them. The instruction book contained the full questions in both English and French, while the answer sheets listed only a space for the answer next to the question number, with a one- or two-word identifier to help tie the question numbers/answer spaces back to the full question in the instruction book. This was done so that those filling out the form would have to read the instruction book. Each set of answer sheets was numbered from 00001 to 12000, and each individual sheet had a page number as well as a set number on it. A sample set of filled-in answer sheets was provided in the back of the instruction book.

The accreditation application asked questions about personal biographical data (21 questions), the applicant's press body and coverage plan (15), accommodations requirements (9), transportation needs (2), telecommunications (14), photographic needs (11) and financial summary (4); a total of 76 questions.

Although some media complained about the length of the form, it was felt the sole opportunity to gather good data about the overall requirements of the media would be from the only document which everyone had to complete: the accreditation form. Forms which were not completely filled out were still accepted as it became clear that most media did not understand their own requirements as little as six months prior to the Games. Questions regarding personal and press body data, accommodations and transportation needs proved useful, while some of the press body data and all of the photographic and telecommunications questions provided little worthwhile data.

Rights-holding broadcast organizations were sent forms containing answer sheets for only the personal data and authorizing signatures; individuals within these groups did not need to specify their individual requirements, which were already being met on a group basis by their broadcast organization. Members of the international agencies were sent complete form sets.

A separate telecommunications handbook was sent along with these forms. The Los Angeles-area telephone utilities required that any orders for their facilities must be sent directly to them rather than through the LAOOC. Their order instructions and forms were also published in English and French, totaling 72 pages plus order forms.

After the announcement of the boycott by some nations in May 1984, the IOC and LAOOC worked together to reduce the quotas from countries which would not be participating and to increase the accreditations available to NOCs whose participation would be increased because of the boycott. The number of accreditations allowed to the non-participating NOCs was 50 percent of the number of journalists which they had actually registered. For example, the USSR NOC, which had a quota of 113, actually registered 35 persons and had its quota reduced to 18. A total of 96 journalist accreditations and 20 photographer accreditations were re-distributed to 34 NOCs; nine of the accreditations out of the IOC's general reserve were also distributed.

Further quota adjustments were not made; an occasional addition was made by telex in the last few days before the Games. After the opening of the Main Press Center, almost all decisions regarding accreditation were in the hands of the Organizing Committee. The IOC had little knowledge of the minute-by-minute requests for accreditation and left decisions largely to the LAOOC as to whether sufficient facilities existed to accommodate additional journalists.

The quota system was clearly successful in controlling the flow of media coming to the Games. The early agreement on the quotas allowed dispatch of the accreditation forms well ahead of the required time; this in turn allowed the IOC and LAOOC to take a firm stance on the return deadline for such forms. As a tool for management of the media coming to Los Angeles, the re-allocation by quota helped the NOCs and the Organizing Committee to work together on commonly understood limitations for attendance of national media in the busy days just prior to the Games.

NOCs receiving these forms sent them to media selected by the NOC. These forms were filled out, returned to the NOC for authorizing signatures and then returned by the NOC to the LAOOC by 1 February 1984. Two photographs (two-by-two inch) and any applicable financial deposits were also required along with the returned form; journalists could reserve accommodations (requiring a deposit) and pay for insurance and parking passes. Forms not returned by the NOC by 1 February 1984 were considered cancelled and the accreditations represented by them were eligible for re-allocation.

Thus, journalists had to fill out the accreditation form; obtain a bank draft or certified check in U.S. dollars for their accommodations, insurance and parking pre-payments; and enclose two photographs (two-by-two-inch), returning the completed form to their NOC to return to the LAOOC. Unless additional requirements arose, journalists had no further responsibility in the accreditation process until they arrived in Los Angeles.

23.05.4 Processing of the applications and distribution of the Olympic identity cards

With a return deadline of 1 February 1984, the LAOOC expected that accreditation forms would begin arriving in September 1983, with the bulk coming in December. Unfortunately, almost all forms were sent close to the deadline, and the Press Operations group faced a flood of forms in the last two weeks of January 1984. As of Friday, 3 February, a total of 2,131 forms had been received and 398 more had been identified as in transit after telex notification from the NOCs involved. This constituted approximately 79 percent of the 3,203 forms originally sent to NOCs—a good return. Forms which had been sent prior to the deadline but which had been slowed in the mails, or held up by national mail strikes, continued to arrive in succeeding weeks.

A severe problem was the lack of money sent with some of the forms. Foreign regulations or strikes sometimes prevented transmission of funds to the USA or transmissions in U.S. dollars. NOCs either held onto these forms until the payments were available or sent the forms ahead with the money to follow. In few cases was the LAOOC notified; checks later arrived without reference to whom that money was for, or wire transfers would be added to the LAOOC account without details about where they came from or for whom they were intended.

The forms were supposed to be sent to a special bank address where the bank drafts or checks were removed and deposited into a designated account, a photocopy was made and attached to the form, which was then sent on to the Press Operations group. As often as not, however, the forms were mailed directly to the LAOOC and not to the bank address. These forms were sent by Press Operations to the bank address where they were treated in the regular manner.

Once in the hands of Press Operations, forms were checked for completeness and pre-payments and the information was entered into the press dossier system. Olympic identity cards for category “E” accreditations were

prepared manually and sent to the NOCs as soon as possible. These cards included the name of the journalist, identification of that person as a journalist, date of birth and a picture—one of the two that had been sent in with the accreditation form. Each card had a six-digit number, eventually used to control the flow of accreditation in the Main Press Center accreditation center.

Since the Olympic identity card was a necessary prerequisite to receiving an accreditation badge, the LAOOC withheld ID cards for non-payment of accommodations or other fees. Telex messages were sent to all NOCs in late June listing those journalists who were delinquent with regard to pre-payments. Since time was running out, the NOCs were asked to acknowledge the non-payments and send their journalists to Los Angeles with sufficient funds to pay all costs on arrival. For pre-payments which had been sent but for which the LAOOC had no record, the NOCs were asked to supply the necessary data to track down the money. This helped to clear up some of the wire transfers that had come into the LAOOC's accounts but had never been identified as belonging to an individual journalist. However, the Press Operations group moved to the Main Press Center with many accounts still unresolved—these questions would have to be answered as the journalists physically came forward to get their accreditation cards.

Substitution procedures were necessary as some journalists were replaced by others for a variety of reasons. Simple, one-page substitute forms were sent by the LAOOC to NOCs shortly after the 1 February 1984 deadline for original submissions. Substitution forms required only personal information from the new applicant and the name and organization of the person being replaced. The form required the endorsing signature of the NOC to be valid.

Accreditation procedures for the 300 local accreditations held by the LAOOC proceeded much as with the NOCs. The LAOOC, acting as an NOC for local media in a three-county area in which the Games competition was scheduled to take place, sent a questionnaire in August 1983, with return due in September. Once returned, the LAOOC determined the distribution of its accreditations and sent out the full accreditation forms in November, with a 1 February 1984 return deadline. A second round of questionnaires to local media not previously showing interest was sent in November and returned in February 1984; a limited number of accreditations was granted to media returning these forms in March.

Main Press Center-only accreditations required a short one-page form which was sent out in May 1984 with a return deadline of 15 June. In general, only agencies with private offices in the Main Press Center were authorized for MPC-only accreditations.

23.05.5 Processing of the journalists at the time of the Games

The Main Press Center accreditation area was set up to move people through a multiple-step process as quickly as possible. According to the plan, a journalist would arrive with his or her Olympic identity card and passport (driver's license for U.S. citizens) in hand, proceed to pay off any remaining accommodations (or other) balances, receive a “paid in full” receipt and proceed to the accreditation counters.

At the counter, the journalist matched his Olympic identity card number against an actual accreditation badge of the same number, checked for correctness in spelling and, if correct, signed both the badge and an accreditation receipt and proceeded to have his picture taken. The photograph was then mounted on the badge, the badge was laminated and the journalist was handed his completed credential, to be worn around the neck, with a chain provided at the counter. A duplicate photograph (produced simultaneously with the original on the badge) was attached to the receipt and kept for record purposes.

7 A journalist matches his Olympic Identity Card number against his accreditation badge to make sure it is the same.

8 A photographer has his photograph taken for his credential.

9

9 An aerial view of the Main Press Center adjacent to the Harbor Freeway in downtown Los Angeles.

The 8,396-square-foot accreditation facility included an information desk directly inside the accreditation area in the Main Press Center. The accreditation area had its own entrance and was the only portion of the Main Press Center which could be entered without an accreditation badge (thus keeping non-accredited personnel out of the MPC itself), although access control personnel asked to see an Olympic ID card. Those wishing to enter without Olympic ID cards were immediately sent to the problem-solving staff. An information booth staffed by four persons helped direct media to the proper lines for either housing payment or accreditation. The accommodations and finance groups occupied an area including a private office for two people, a vault and a processing station with five counter stations, each for two persons. Each station was equipped with a terminal connected to the accommodations reservations system. The accreditation badging booths consisted of eight tables, each with a team of persons to check identification, take photographs and laminate badges. Each booth was marked by a series of personal identification numbers matching those on the Olympic identification cards—journalists simply had to find the booth handling their Olympic ID card number in order to receive their badge. Two booths were set up for processing Main Press Center-only accreditation badges, which was a completely manual process, using preprinted badge stock and typewriters for adding name and agency identification to the badges themselves. Offices were additionally set up for the Press

Operations accreditation staff, and a data processing room contained equipment for generating new badges and holding badge stock.

For more than 80 percent of the media accredited—almost 7,000 persons—this procedure worked very well, and most journalists who had filled out their forms properly and on time, and had made the required pre-payments, were processed in 3.5 to ten minutes, including their stop at the accommodations reservations desk. Booths were set up to handle NOC-accredited media (ID cards beginning with 01), host broadcaster (ABC) personnel (ID cards beginning with 02), personnel from the European Broadcasting Union (03) and other electronic media (04). All media holding cards beginning with 01 or 04 were directed to the accommodations counters, while those with cards beginning with 02 or 03 went directly to the accreditation booths since their accommodations were all pre-paid by their broadcast organization. This served to eliminate much of the line at the accommodations counters since the host broadcaster and EBU together accounted for 41.4 percent of all media accredited for the Games. The anticipated peak load of 200 persons per hour was never reached, and after the first three days of accreditation the staff performed at a more efficient rate than could have been anticipated. However, for those who had not completed the formalities, a much longer process was involved.

Noting that there would be difficulties in any processing station for up to 10,000 people, four problem offices were set up to handle individual queries, late substitutions and the like. Each was equipped with a terminal linked to the press dossier system and was enclosed to provide privacy.

Journalists not in possession of an Olympic ID card were handled by problems officers trained to locate missing records, process substitutions or even initiate a new accreditation if warranted. A lounge area was arranged with chairs, television and an Electronic Messaging System (EMS) terminal. Four problem-solvers were available to handle problem cases which were expected at a top rate of eight per hour, averaging 30 minutes each (a maximum capacity of four percent or about 350 cases over the pre-Games period of 14–28 July). The actual rate was far greater. Almost 1,500 individual problems were processed during this two-week period, a rate of almost 17 percent—more than four times the expected capacity.

Most of the problems involved very late applications or substitutions by broadcasters and NOCs and a backlog of applications received from the host broadcaster after 1 June 1984. Many of these late applications were not entered into the press dossier system (and thus not transferred to the accreditation system for printing of badges) until after the move to the Main Press Center, and without pre-printed badges to work with, the accreditation staff had to print credentials individually for the journalists at the time they came in. With 800 new applications from the host broadcaster arriving from 1–13 July, 565 more accreditations were processed during the main accreditation period of 14–28 July: 164 were from NOCs (including specialists) and 331 were from broadcasters (including 200 from the host broadcaster). This very late crush of forms was not expected, and staffing was insufficient to permit timely entry of the forms into the press dossier and accreditation systems. Loaned input staff from the host broadcaster helped ease the problem, but the difficulties were compounded by the sluggish response of the LAOOC's computer systems, apparently overloaded by similar applications in other sectors. Printing of individual badges became a slow, tedious march in frustration, with some applicants having to wait four hours or more to have their badges made. The delays lessened after a massive badge-print was arranged a few days prior to the Games, but those who had been forced to wait did not receive the efficient treatment that the organizers had planned.

The MPC accreditation center was scheduled to remain open from 0800 hours on 14 July through the end of the Games. Although few accreditations were processed after 2200 hours each day, the overnight shift became vital to input newly received forms, count the accreditations processed that day and resolve problems found earlier in the day. After the accreditation flow slowed, hours were cut back to 0800–2200 hours by 1 August.

Group	Quota allowed	Actual attendance

TV/Newsfilm agencies	100	87
Other (16 press/ 19 photo/ 11 tech)	0	46
Totals	4,050	3,837

Reporting of accreditations processed was haphazard and incomplete. The uncompleted sections of the press dossier program included the management reporting sections; there was no reliable method of knowing how many accreditations had been processed and how many more persons were expected.

Accreditation for all media personnel, both written and electronic, took place at the Main Press Center with the exception of a short period from 4–10 July at the International Broadcast Center. Accreditation for early-arriving broadcast personnel was handled there as a courtesy; only pre-printed badges could be processed as no equipment for making new badges was available. Only 381 persons were badged during this period.

23.05.6 Results of the accreditation process

Exactly 8,700 media received accreditation for the Games, with another 450 persons receiving Main Press Center-only accreditation. Even though this was greater than the expected 8,250 media for the Games, the extra accreditations did not cause a problem because of their distribution pattern. In addition, the procedures and processing of accreditations worked smoothly in the planning and early operational phases and proved satisfactory for more than 80 percent of those covering the Games at the time of accreditation itself. Although the problems experienced were painful, they were limited to a relatively small number of media, and problems, other than waiting for badges to be printed, turned out to be less than two percent.

After the determination of the quotas for accreditation, the LAOOC focused on the control of the number of journalists, photographers and press agency technicians who would attend. It was felt that most of the electronic media would restrict themselves to their pre-arranged commentary areas and their technical staff would, for the most part, not be present in the stadium press areas, but rather in the IBC. With a quota total of 4,050 expected and planned for, the LAOOC—in cooperation with the IOC—was successful in holding down the number of press accreditations.

By category, the LAOOC accredited 2,821 journalists, 567 photographers, 357 technicians and 92 persons from non-rights-holding television firms, whose access was extremely limited.

Even though the number of photographers was greater than anticipated, the photographic shooting positions in the stadiums accommodated their needs. The major achievement was in holding down the number of writers from an expected 3,300 to 2,821.

Accreditation for electronic media soared well beyond the quota of 4,200 to 4,863, including the Official Film. Commentators (generally anyone who needed permanent access to commentary positions) totaled 1,452 against a quota of 800, while technical staff was 2,888 against a quota of 3,400. The LAOOC, in cooperation with the broadcasters, reformed the "ES" credential from a support staff person to a supervisor and handed out 494 such administrator cards. Electronic media also required 29 still photographers to be accredited.

Main Press Center-only accreditations totaled 450, with 402 going to press agencies and 48 to electronic media. The international agencies and photo pools used 63 MPC-only cards, while international press required 99, local media needed two, and United States national press, 188. Television/Newsfilm agencies required 29 MPC-only accreditations and 21 were distributed to various others.

While the overall accreditation operation served its purpose and successfully badged 9,150 persons, several points can be made about the experiences gained:

- Categories of accreditation must be changed from the present format. Current categories do not recognize the place of editors or supervisory staff among press or broadcast media. A distinction no longer exists between national written press and national press agencies: both are accredited by the NOCs; the LAOOC simply eliminated the "EA" badge category for national press agencies and no complaints were heard. Further, the international agencies have no need for a separate category ("EI") badge since their access is no different from that of national press; all written press fully accredited for the Games should have the same accreditation category.

□ The unusual cases regarding NOC press attaches must be solved. These individuals, often full-time staff members of an NOC, service the news media of their country in the Main Press Center and in the press stands while living in the village with the team. In the past, various attempts have been made to combine the athlete's access privileges with those of the media for these liaison officers. In Los Angeles, NOC press attaches living in the village were given additional access codes to let them into press stands, while press attaches living outside the village were given special access codes to permit it. This was barely satisfactory; it is recommended that double accreditation (that is, the issuance of two different badges) of both athlete and journalist be issued upon certification by the NOC of the identity of their national press attache at an Olympic Games.

□ Quota distribution to the NOCs alone is no longer workable. The place of specialized journalists as an integral part of the media covering the Games was underlined by the creation of the 150 specialized accreditations. Such journalists have looked to their International Federations for support, and the pressure brought by the IFs helped to create this category. In the future, each IF with a sport on the program should be given a quota of accreditations to distribute to journalists who specialize in covering their sport. The interest of the NOCs is clearly in providing accreditation to those news media who will reach the widest possible audience—usually daily newspapers and national magazines rather than specialized journals, which generally have smaller circulations.

□ The use of quotas for broadcast media seems to make little sense in view of the negotiated agreements between the organizers and broadcasters for exclusive rights. The organizing committee, in reality, is bound to provide as many accreditations as the broadcaster reasonably needs. Any quota for broadcaster accreditations can only be fixed on a broadcaster-by-broadcaster basis, with reference to the previous Olympic accreditation requirements of broadcasters of that nation at prior Games.

□ The organizing committee as well as the IOC should have small quotas of accreditations to be distributed as they see fit, inside the overall limits of accreditation.

□ Early determination of the quotas was very helpful, and distribution of the accreditation forms as early as one year prior to the Games was very beneficial to the NOCs, which then had six months to prepare the forms and return them to the LAOOC. The official timetable envisioning forms distributed nine months prior to the Games and returned six months prior is not realistic.

□ Accreditation forms should be shorter than that used by the LAOOC. The essential data regarding personal and press agency data, accommodations and transportation requirements seemed meaningful

enough, but many media had little idea about their real interests or plans one year prior to the Games. It may be reasonable to separate the registration function of accreditation and the ordering of services into separate questionnaires, requiring registration prior to the ordering of accommodations, telecommunications or transportation facilities,

□ Handling of the accreditation forms and information was very confusing because so many groups had an interest in the data: Press Operations for identification of the needs of its clients, Accommodations for the reservation of rooms, Accreditation for the data required to print badges, Finance for record-keeping of money and so on. A more cellular group designed to handle the needs of the media, organized under the control of the Press Operations group and with participation by identified members of each of the required support functions, would have helped to resolve difficulties faster than was experienced in Los Angeles. Processing of the accreditation forms and all of the attendant support requirements did not get much attention from the supporting groups until it was almost too late.

□ Processing of the applications and the construction and maintenance of the well-designed press dossier system was poor. Data processing needs of Press Operations competed for attention with those of other departments close to the time of the Games, when all of the preliminary work should have been completed. A stand-alone system for data processing (or at least a stand-alone backup) for all accreditation centers is essential to ensure that the long waits for central processing time do not occur as happened when new accreditation forms were processed at the Main Press Center. The major accreditation problem at the MPC was the long wait for the printing of individual badges—caused by an inability to receive sufficient processing capacity from the central computer system. Despite continuing advances in technology in time-sharing and multiple-user systems, it is strongly recommended that at least a backup system for badge production which is completely self-contained be available at the site of the press accreditation center.

□ Accreditation of the electronic media at the Main Press Center was of negligible value to the LAOOC. The cost savings from not installing data lines and processing equipment at the International Broadcast Center would have been more than offset by the operational flexibility of dealing with broadcasters separately from the press and decreasing the load on the Main Press Center accreditation area.

Note that the total of 8,893 is 2.17% greater than the accreditation total of 8,700; this is due to made badges to replace lost accreditation cards, improper sub-letter identifications, improper access codes, faulty laminating and the like.

23.06 Press Operations: Housing

23.06.1 Conceptual plan for housing of the press

The LAOOC undertook the task of finding suitable housing for the media in its original responses to the IOC in 1978. With more than 8,000 persons expected, the task was an onerous one, especially in view of the scramble for hotel reservations in the period from 1980–1983.

Knowing that the Main Press Center would be located at the Los Angeles Convention Center in downtown Los Angeles and that the International Broadcast Center would be located in Hollywood, the LAOOC was cognizant of the need for downtown Los Angeles and Hollywood area rooms in its initial hotel acquisition period in 1982.

The overall goal was to house as many written press in the downtown area as possible while placing broadcast personnel in Hollywood. Failing this, it was assumed that broadcast media could be placed in the downtown area while written press could be housed near the Los Angeles International Airport—especially those interested in covering basketball, cycling or any of the venues in Long Beach.

It was emphasized that accommodations for press should be available at a variety of prices, noting that media from different nations had various restrictions imposed by their own affluence, currency exchange rates, government restrictions and the like. For this reason alone, it was necessary to contract for some low-priced student residence housing to accommodate journalists from countries with known problems regarding money. In all cases, journalist necessities such as air-conditioning, laundry, restaurant and bar services, international telephone access, color televisions and areas for work space were evaluated before making any selections.

Once the housing sites were determined, specific hotels could be assigned to the various groups. Broadcast organizations had their housing needs considered after signing exclusive-rights contracts with the LAOOC. The five international agencies received similar preferential treatment among written media, following the protocol suggested in the Olympic Charter. Other written media had an opportunity to reserve housing on a first-come, first-served basis upon return of their accreditation forms, including the required pre-payment. This policy was undertaken in the hope of faster return of the accreditation forms from National Olympic Committees. It was anticipated that more desirable hotels in the downtown Los Angeles area would be primary choice for most journalists and would be assigned first, with those returning forms later placed in the airport area. Once payments were received, journalists were assigned to a specific hotel and were mailed a confirmation of the receipt of their deposit and their assignment. Shortly before the Games, a second confirmation was sent

finalizing the hotel, length of stay, room rate with final payment due at the time of accreditation. Journalists were required to bring these slips with them to Los Angeles for presentation at the Main Press Center accreditation area, where they would then pay off any balances due and receive receipts certifying their full payment, allowing the journalists to receive their accreditation cards.

23.06.2 Determination of the housing units designated for press

While the LAOOC agreed to find and reserve suitable housing for the news media, it had a similar responsibility for members of the International Olympic Committee, National Olympic Committees, International Federations, sponsors, staff and technical personnel. Thus, even after suitable accommodations had been reserved in desirable areas, much discussion remained as to which group would be placed in any particular hotel.

When the LAOOC began acquiring rooms as part of its "official hotel" program in 1982, it was felt that the needs of the press would best be served by moderately-priced units located primarily in the downtown area. Since most media worked on a restricted budget for an event as long as the Games, and in view of the growing strength of the United States dollar against foreign currencies, it was felt that most media would not be able to afford top-scale hotel prices. As part of the agreement with hotels pledging rooms during the Games period, hoteliers reserved 80 percent of their rooms for the LAOOC, and the Organizing Committee agreed to pay for these rooms for a minimum of 17 nights (27 July–12 August) at the hotel's "rack rate" in effect during the first six months of 1984. These "rack rates" are the hotel's published, regular prices for walk-in customers. By tying the hotel to its "rack rates," the LAOOC avoided the possibility of massive "Olympic surcharges" being added to the charges incurred by its guests. Since many local hotels appeared ready to charge double or triple their normal rates for the Games period, the LAOOC agreement with its official hotels provided reasonable protection against overcharging. All hotels in the city of Los Angeles were subject to the city's bed tax.

Finding moderately-priced accommodations in the downtown area proved to be difficult. Eventually, it became clear that a substantial number of journalists would have to be accommodated in the airport area: many of the moderately-priced downtown hotels did not want to deal with the LAOOC (holding out for higher rents from other visitors) and remaining properties were either priced too high or were judged inappropriate.

News Relations and Press Operations

The student residences at Occidental College in Eagle Rock provided low-priced accommodations but without the services found in major hotels. Occidental's major advantage was its proximity to the downtown area, with fewer than 30 minutes needed to reach the Main Press Center by bus.

Hotels in the airport area were priced appropriately but were further away from the downtown area and the MPC. Despite their geographic undesirability, there was little choice but to use them, since suitable hotels did not exist any closer to the Main Press Center in sufficient quantity to house the remaining written media expected.

Hotel confirmations began as early as 14 January 1984, after roughly 35 percent of the press accreditation forms had been received. However, efforts continued through May to try to identify additional suitable hotel properties in the downtown area in the hope of transferring some of those already assigned to airport-area accommodations. As properties were identified, reassignments were generally made in line with the order in which forms had been received earlier. Even small numbers of rooms in desirable hotels were taken in efforts to move as many journalists into the downtown area as possible.

Tremendous interest was taken by journalists wishing to know the names of the hotels selected so they could specify a particular place to stay. With the tremendous fluctuation in the roster of hotels to be used for press, the LAOOC did not publish its list of press hotels until February 1984, in the information book "Facilities for Journalists, Volume 1." As stated in the application for accreditation, the LAOOC determined the hotel assignments of journalists applying for LAOOC-reserved housing, thus lessening the need for journalists to know the precise roster of hotels reserved for press use. The information provided from the accreditation form specified the journalist's preferences for cost, location and the reservation of a single or double room, guiding the Press Operations group in making specific assignments as each form was considered in order of receipt.

A small number of media was expected to ask for accommodations in areas close to a particular venue. These requests were handled on an individual basis, and the LAOOC was able to place most of these journalists in reasonably close locations without having to pre-book specific blocks of rooms near individual venues. The LAOOC's agreement with the IOC in March 1983 creating 100 (later expanded to 150) accreditations for journalists covering a single sport, specifically exempted the LAOOC from having to locate housing for these specialized journalists. While this left those journalists to their own devices, it eliminated a time-consuming and inefficient search by the Press Operations group for very small numbers of rooms in a wide variety of locations. The journalists involved were better able to negotiate for one or two rooms near a particular site on their own and almost all did so with little difficulty.

The final distribution of properties showed that a total of 1,627 rooms were reserved by the LAOOC and used by journalists in the downtown (59 percent) and airport areas (41 percent). Another 474 beds out of an available total of 507 (93.5 percent) were occupied at Occidental College. Finally, 24 rooms were reserved for journalists requesting accommodations near particular venue sites: 13 rooms in Long Beach (fencing, volleyball and yachting), seven rooms in Arcadia (equestrian) and two rooms each in Oxnard (canoeing and rowing) and Malibu (water polo). The detailed distribution was as follows:

Press housing roster

Hotels	Rooms	Rate
Downtown area: (965 rooms)		
Ambassador Hotel	10	\$136
Hotel Figueroa	102	102
Holiday Inn/Convention Center	123	89

Total:	1627	

Student residences	Beds	Rate
Occidental College	507	\$ 35 *

* (A single room with two beds cost \$70)

23.06.3 Procedures for the filing of deposits, assignment and confirmation of assignments

The LAOOC assured the availability of rooms for its preferred guests by mid-1982 through its official hotel program, but also had the burden of millions of dollars of hotel liability for all of the rooms reserved through it. In order to alleviate some of that liability prior to the Games as well as to provide a strong incentive for use of rooms reserved, it was determined that a substantial deposit would be required.

Since the best opportunity to gather information about the housing needs of the media would come at the time of accreditation—the only procedure which was mandatory for every person coming to cover the Games—information sufficient to specify preferred cost and location had to be included in the application for accreditation.

The press hotel list had not been finalized at the time of preparation of the form in mid-1983, and since final rates would not be available until the publication of hotel "rack rates" in December, rate classes had to be established to categorize journalist interest in hotel prices and quality. The classes developed included: first class (\$140 per room per night, single or double occupancy); superior class (\$120); moderate (\$85) and student residence (\$35 per bed night, two beds in a room). The prices listed were the maximum rates anticipated in each class.

The LAOOC initially wanted journalists to make a full pre-payment of 17 nights at their preferred rate, liquidating the LAOOC's financial responsibility for all rooms assigned. At the request of the IOC, however, the LAOOC agreed to accept deposits for a seven-night stay, with the remainder payable at the time of arrival in Los Angeles, prior to receiving accreditation. This meant that journalists desiring to stay in first class accommodations had to enclose a deposit of \$980 U.S. with their accreditation application; those

desiring superior class owed \$840; moderate price, \$595; and student residence, \$245 for double occupancy or \$490 for single occupancy. All media were free to make their own arrangements, of course, and had no obligation to the LAOOC if they did so.

Journalists requesting housing assistance were asked to specify the area in which they wished to stay, whether near the Main Press Center, International Broadcast Center or elsewhere, their arrival and departure dates and whether they wished to stay in a room with one or two beds. Those requesting two-bedded rooms were asked for the name of a roommate so that the two applications could be linked during the room assignment process. If no roommate was listed after a request for a double-bedded room, it was assumed that the journalist would pay the full rate for the room, and that the other bed might be used by an accompanying family member, or by the journalist for extra work space. If the journalist wanted the LAOOC to select a roommate for him (ensuring that the journalist would then pay only half of the total room cost), he had that option. If two journalists planned to share the same room, only one was required to pay the room deposit.

Assignments were made after receipt of a properly filled-out accreditation form, accompanied by the appropriate amount of deposit money. Applications sent without money were not processed for housing until funds arrived at the LAOOC, although some exceptional cases were processed if national currency laws or bank strikes had made transactions impossible, and, if the LAOOC had been promptly notified with confirmations from the NOCs or the banks involved.

The assignment strategy focused on the different classes of hotels and the characteristics of the reserved hotels in each class. Although everyone wanted to stay in the downtown area, some properties of more marginal quality were deemed unsuitable for some groups and were accepted for assignment to press only because of their central location. This was important since the principal factor in assignment was the location desired, rather than the price class selected.

If a journalist paying a deposit for the \$140 per room per night class was faced with a decision between a less attractive hotel in the downtown area and a more comfortable property in the airport region, the Press Operations

group suspected that the downtown location would be more acceptable—given a certain standard of quality. These decisions were made on an individual basis, reflecting subjective judgments made to best assist the journalists involved. While the guideline posited above proved to be generally correct, it was not always so. As the forms were received by the Press Operations group, some surprising patterns began to emerge. Although heavy interest in student residence housing had been anticipated from smaller nations and those with weak currencies against the U.S. dollar, relatively few persons selected such housing as their primary choice. The most popular category was the moderately priced hotel, located in downtown and requiring a deposit of \$595. In mid-April, with most of the accreditation forms that the LAOOC would receive in, requests for hotel rooms totalled 1,741. Requests for single rooms numbered 1,060 (61 percent) and for double rooms, 681 (39 percent). The detailed breakdown:

Press accommodations request summary

Category	Single rooms	Double rooms	Total rooms
First Class/\$140	252 (73%)	95 (27%)	347 (20%)
Superior Class/\$120	317 (55%)	262 (45%)	579 (33%)
Moderate Price/\$85	491 (60%)	324 (40%)	815 (47%)
Totals	1,060 (61%)	681 (39%)	1,741 (100%)

Requests for student residence beds numbered 237.

Since the LAOOC's press room inventory never rose above 1,627, some late-applying journalists were assigned to Occidental. Those who found this unacceptable requested refunds and looked independently for their accommodations. This eventually proved possible as the housing market in the Los Angeles area during the Games had more than sufficient capacity to absorb small groups of individuals.

Refund policy rewarded early notification by media who did not want LAOOC-reserved housing. The amount of refund available decreased as the time of the Games neared, with 100 percent of a deposit refundable for notifications to the LAOOC made prior to 1 March 1984. Notification of

withdrawal from LAOOC housing made between 1–31 March permitted a 75 percent refund, and 50 percent was refunded for notifications made between 1–30 April. No refunds were made for withdrawal notifications sent on or after 1 May 1984.

Confirmations were sent beginning in January, 1984. Individual letters were sent initially, until the flood of accreditation forms arrived late in January and the Accommodations Department was prepared to send automated confirmations directly to all media. These confirmations noted the arrival and departure dates, assigned hotel, funds received and the total hotel cost at the rate anticipated. As accreditation forms were processed by the Press Operations housing staff, the Accommodations Department was provided with information necessary to complete the confirmations: name, address, arrival and departure date, location, rate category and deposit amount. The Accommodations group then processed and produced the confirmations, which were checked by Press Operations before mailing. This

procedure continued through most of May, when a second confirmation noting the final assignment, confirmed room rate and actual balance due (as calculated from the arrival and departure dates and the deposit received) was supposed to be sent out.

However, due to massive problems in tracking funds in the press dossier system, the second confirmation was never sent. Since approximately 10 percent of the press were never sent an original confirmation, these journalists had no information about their hotel assignment, balance due or even that the LAOOC had received their money. Further, none of the registered journalists received a final balance due statement prior to their arrival in Los Angeles, although most figured out their approximate balance by subtracting their deposit received from the anticipated total room cost stated on the only confirmation they had. Most of these situations were resolved by hundreds of individual telephone calls and telex messages from journalists to the Press Operations Department. All responses noted assignment, confirmed rate, arrival and departure dates and balance due.

As journalists paid for their accommodations based on the number of nights

10

between their arrival and departure dates, many were anxious to change these dates to avoid paying for unused accommodations. These notifications also came over the telephone and by telex and reached dizzying frequency by mid-June. Each change required a recalculation of the balance due, as well as notification by the Press Operations housing staff to the Accommodations Department, which had the direct liaison with the hotels involved. The Press Operations staff did not book, cancel or change dates for any journalists with the hotels directly; all booking information was handled by the Accommodations Department.

Journalists who had requested housing but who had not made the required deposits were in danger of not being accredited and no Olympic identity card was sent. A telex message to all NOCs with delinquent journalists was sent on 22 June 1984 noting the name of the individual concerned, the affiliated press body and the amount due. NOCs were asked to inform the individuals concerned and instruct them to bring full payment for their housing balances to Los Angeles. In the case of payments already sent but not recorded by the LAOOC, those believed delinquent were asked to supply verifying details of their deposits. Some unidentified payments were claimed following these messages and a number of NOCs fully informed those listed as delinquent, leading to proper payment of the full balance due, without incident, after arrival.

10 LAOOC President Peter V. Ueberroth (left) introduces Romania's famous Olympic gymnast, Nadia Comaneci, during a news conference at the Main Press Center.

News Relations and Press Operations

With confirmations at the 90 percent level and time running out prior to the Games, the Press Operations group telexed lists of all press bodies accredited in each country to the NOC concerned on 4 July 1984 noting the name of each press body, the hotel which its media had been assigned and the number of rooms reserved. The NOC was then asked to disseminate this information to the press it had accredited, and to call or telex the LAOOC regarding questions. These messages were well received; some journalists finally learned of their hotel assignment via these lists. The NOCs were also instructed to tell all media coming to Los Angeles that balances due for accommodations would be payable upon arrival and prior to accreditation.

23.06.4 Processing for housing upon arrival

With the move to the Main Press Center on 5 July, the Press Operations housing staff found limited communications available since most of the telephones had not been installed and the new telephone numbers were not readily available to those seeking information. This was corrected after contact with the telephone company involved, but placed a substantial hardship on those trying to determine balances due, change dates or confirm room assignments.

At the time of accreditation, journalists came to the accreditation center of the MPC, showed their Olympic identity card and proceeded to the accommodations reservations desk. This area included five counters, each staffed with two clerks, to assist journalists in confirming their rooms and paying their balances. A vault space, counting area and a separate office for the shift supervisors from the Accommodations and Finance Departments were arranged around the front service counter area. Each person who had reserved a room was listed on individual reservation sheets listing their name, country, room assignment, deposit received and balance due.

Once the balance was paid, the journalist was handed a receipt verifying the payment in full and allowing the processing of the Olympic accreditation badge. Problems of lost deposits and disagreements on balances were handled by the shift supervisors, aided by transaction and balance reports from the press dossier system. Unfortunately, the reports used were days or weeks old, and new reports could not be run due to the lack of available central processing time. The shift supervisors did the best they could. Journalists who had no need of LAOOC housing were issued a receipt showing no balance due and continued on through the accreditation process.

Media were advised in the "Facilities for Journalists" series that payment for accommodations costs would be accepted in U.S. dollars only in the form of cash, bank drafts, cashier's or traveler's cheques. However, at the time of the Games, the Finance Department was prepared to take cash in major Western European currencies, bank drafts, cashier's and traveler's checks denominated in major Western European currencies and American Express, Mastercard and Visa credit cards.

Further, media without reservations were able to obtain hotel or student residence accommodations from the LAOOC at the time of accreditation. Although space existed only in some airport area hotels and at Occidental among the properties selected for press, the LAOOC was in the business of selling off its remaining hotel spaces in order to lower its liability for the thousands of rooms it had reserved. Almost all media requiring housing and, choosing to take LAOOC-reserved accommodations, stayed in the airport area or at Occidental, since these sites were tied to the Main Press Center by the press transport system. Media with their own automobiles usually found accommodations elsewhere, since many rooms were available throughout Los Angeles in view of the less-than-expected demand for Olympic-period accommodations.

Absent from most of the interaction with the journalists was the Press Operations housing staff. Though they had set up the assignments and helped process the confirmations, the procedures for actual room assignment and any changes were the responsibility of the Accommodations Department alone. This caused some frustration for the journalists who had been used to dealing with the housing specialists in Press Operations.

Refunds for those who had overpaid were processed after the close of the Games and were made after an audit had been conducted on all press accounts.

23.06.5 Results of the press housing process

As the statistical summaries above demonstrate, 1,651 hotel rooms and 474 student residence beds were utilized for approximately 2,769 journalists during the Games, while another 392 journalists declined to

utilize LAOOC-reserved housing. More than 600 others were ineligible for housing assistance, including local journalists, observers and specialized media. Some important points can be gained from the experiences in Los Angeles:

□ It must be noted that Los Angeles did not have a central press "village" or other specially-built housing for the media. Had such a facility existed, challenges not faced by the LAOOC would have arisen and the difficulties experienced would not have existed for the most part. The essential requirements for press housing include air-conditioning in hot climates, electricity in the room, desk/work space, international telephone access and color television, as well as the availability of extended hours food and beverage services and laundry and lockbox services.

The following observations and recommendations must be evaluated against Los Angeles' use of multiple commercial hotel sites and student residences for the housing of the journalists.

- Hotel selection strategies used by the Press Operations group did not meet the eventual requirements of the press with enough precision. Journalists showed that they desired first-class accommodations close to their central work place and were willing to pay for it, in far greater numbers than had been anticipated. While the media do not expect to pay a premium above those rates charged to others for these accommodations, many are willing to pay the going fare for top-of-the-line housing and the services that accompany it. Of the rooms ordered, 53 percent were for rooms costing \$120 per room per night. While this should not prevent the offer of moderate and low-priced housing required by some media, it must be noted that top-grade housing must be made available to journalists in greater numbers than may have been previously envisioned.
- While almost all media assigned to the airport area found it unsatisfactory, it should be noted that complaints ceased noticeably after the LAOOC's press transportation system proved dependable and efficient. Journalists who had felt that their housing location away from the MPC would result in endless bus travel time found that the trip from their hotel to the MPC usually took one hour or less on shuttle loops that were easy to use and were frequent in the morning and late evening hours—the journalists' heaviest use time. While the performance of the transport system did not eliminate the difficulties of living near the airport, it did relieve the concerns over endless delays in transport between the hotel and MPC. Good transport was not an excuse for the selection of housing removed from the immediate area of the MPC, but proved a necessary and welcome salve.
- From the beginning, media requested that the organizers reserve rooms for them at fixed rates in order to protect against housing shortages and possible price-gouging. While the LAOOC performed these tasks, the Organizing Committee was unfairly faulted for passing on prices which turned out to be higher than some discounted rates at the time of the Games from hoteliers who had overestimated the general demand and failed to fill their rooms during the time of the Games. Journalists must share the blame, and the cost, of having organizers assume multi-million dollar hotel room liabilities well in advance of the Games when competition for hotel reservations are at their peak. Both at Montreal in 1976 and Los Angeles in 1984, hotels were not filled to capacity during the time of the Games, despite dire pre-Games predictions of housing shortages. Journalists must either make their own arrangements, accept the reservation system of the organizer and utilize the accommodations offered or withdraw their reservation in accordance with the published refund procedures and schedule.
- To their credit, almost all of the LAOOC press hotels cooperated fully with the Press Operations housing staff and provided extra services to accommodate the special needs of the journalists, especially regarding late hours for food and bar services, recreational activities and use of the switchboard. The Press Operations housing staff met with each of the press hotels approximately three months prior to the Games to sensitize hotel management to the special requests which they could expect, a practice which proved valuable and should be continued.
- Confirmations should be sent out only once, indicating the confirmed room rates and the balance due. This document should also be brought to the housing payment center at the time of arrival by the journalist. Changes in the arrival and departure dates, to the extent that they affect payment due, should be required in writing, and changes from it should not be allowed less than one month prior to the opening of the journalist housing payment center. A second confirmation reflecting the changes and new balance due should be issued as soon as possible, either by mail or telex.

□ Journalists uniformly appreciated the existence of a specially-assigned housing staff for press, especially since the journalists were not housed together in a central apartment complex or village of their own. Working within the Press Operations group, the staff gave special attention to the particular needs of the press and their individual and national sensitivities. If continued in the future, this group must have the operational responsibility for assignment and control of those rooms which are allocated for press, both in the pre-Games receipt-of-deposit/assignment/confirmation period and during the time of the Games. Financial controls should have been instituted from the start by the department responsible, rather than in the last 60 days, or worse, at the time of the Games. Individual attention to the unique reporting and filing requirements of the worldwide press will result in better working conditions and, very possibly, more complete coverage of the Games. It is recommended that the press housing personnel be engaged as early as deposit monies begin arriving.

23.07 Press Operations: Information Services

23.07.1 Conceptual service plan

The goal of the Information Services division of Press Operations was to provide media with detailed information about the facilities arranged for them prior to the Games, and with background notes, athlete and official quotes and pertinent statistics during the Games. As information services on this scale had not been attempted in prior Games, the undertaking proved to be massive, especially considering the large number of sports and the wide scope of information available for publication.

Information Services was organized to provide data through publications, individual information sheets containing notes, quotes and statistics, electronic inquiry through the Electronic Messaging System (EMS), live interviews at the Main Press Center and video replay services through the Main Press Center's video recording and viewing centers. Although the actual preparations started only about six months prior to the Games, each of these areas was properly planned and supported by the time the Main Press Center opened on 14 July 1984.

23.07.2 Distribution of operational information prior to the Games

Since the News Department of the LAOOC had responsibility for the dissemination of general information about the work of the Organizing Committee, Press Operations had no role in the compilation and writing of news releases, the staging of news conferences and arranging for interviews. This left the Press Operations group free to concentrate on instruction of the journalists about the working conditions they would face during the Games. Many questions regarding accommodations, accreditation and transport were posed in the preparatory period from 1981–1983; although the publication of a brief brochure regarding basic procedures would have been useful, these questions were handled on an individual basis.

The Press Operations group also contributed articles to various publications which reached large numbers of journalists. The magazine of the Association Internationale de la Presse Sportive (AIPS), *"International Sport,"* carried numerous items and articles about media services for the Games, helping to prepare journalists for the procedures ahead. Appearances before meetings of journalists' societies carried out the same function.

As policies became firm in 1983, as much information as was available was included in the instruction book for the press application for accreditation for the Games. This book was separated from the answer sheets so that media would retain it and refer to it for information and policies regarding accreditation, housing, insurance and transportation. These instruction books and the accompanying forms were sent to the NOCs, which distributed them to the media in August 1983.

Great interest in the specifics of press operations, including accreditation access levels, data on the hotels reserved for press, services in the Main Press Center, photographic services, telecommunications regulations, transport schedules, venue seating and sub-center areas, began intensifying approximately one year prior to the Games. The LAOOC's response was to prepare a comprehensive document, giving as much information as possible in a single package. Originally scheduled for publication in October 1983, the draft of "Facilities for Journalists, Volume 1" was not completed until December. It was eventually mailed out in February 1984 and distributed by the NOCs to their journalists immediately following the Olympic Winter Games in Sarajevo. Six thousand (6,000) copies were printed and mailed to the international agencies, National Olympic Committees (for national written press) and rights-holding broadcasting organizations. The 104-page document was well-received and additional copies were sent out to numerous NOCs on request.

14

Follow-up to the initial "Facilities for Journalists" volume required detailed site maps of the sports venues, showing the location of press seating and working areas in each. It was hoped that precise, detailed information distributed prior to the Games would serve to educate the journalists coming to Los Angeles, making their surroundings familiar more quickly and providing a better idea of what to expect from the host city as well as from the Organizing Committee.

"Facilities for Journalists, Volume 2" was completed in May 1984 and printed in a quantity of 6,000. It was also mailed to international agencies, NOCs and television broadcasters in larger quantities to take care of growing demands which had exhausted the supply of Volume 1. The quantity again proved barely sufficient as copies of Volume 2 became scarce close to the opening of the Main Press Center (14 July), when the "Media Guide for the Games" became available. The contents of Volume 2 served to complement, rather than update, Volume 1. Maps of competition sites, showing press seating and sub-center areas, photographic shooting positions and interview rooms were published. Area maps showing press hotel locations and airport arrival procedures were

illustrated, along with an hour-by-hour (rather than sport-by-sport) Games schedule. The book contained 128 pages.

With these two volumes, the Press Operations group carefully explained the projected conditions and services which would be available for the media in Los Angeles. Although published slightly later than planned, they had a positive impact on the level of understanding brought by most journalists to the Games and better enabled the LAOOC to meet their needs, since media members were at least exposed to the services available.

23.07.3 Distribution of operational information at the Games

The main vehicle for disseminating operating information regarding press services for the Games was the "Media Guide for the Games." Totalling 176 pages, it provided an all-in-one guide for media regarding the location and nature of services available at the Games. The 12,000 Guides were distributed beginning with the opening of the Main Press Center; by the time the MPC closed, only a few hundred of these guides remained.

Designed to answer almost any question about media services, the guide contained information on:

- Accreditation, including accreditation category codes, access privileges for each code and the on-arrival procedures for obtaining Olympic press credentials
- Accommodations, noting payment procedures, geographic distribution of hotels and student residence sites, with maps and United States hotel procedures and protocols
- Transportation, outlining the general nature of the LAOOC's Media Transport System, pick-up points at the Main Press Center and references to the separate brochure containing media transport schedules; information on non-LAOOC transport was also provided
- Main Press Center (MPC), noting the services available and their location, a directory of news media with private offices in the MPC and a Main Press Center telephone directory
- Photographic services, detailing shooting regulations, available camera repair, film processing and transport services, pool photography procedures and venue lighting balances and color temperatures
- International Broadcast Center (IBC), explaining the basic facilities available to rights-holding radio and television broadcasters and the layout of the IBC

- Results and information services, including detailed instructions on the use of the Electronic Messaging System (EMS), results distribution procedures and video viewing availability
- Venue press services, detailing seating regulations and noting the available facilities for seating, sub-centers, interview rooms and photo positions by use of statistical summaries and site maps, similar to those in *“Facilities for Journalists, Volume 2”*
- Information about the 88th Session of the International Olympic Committee, International Federation congresses in Los Angeles, NOC press attaches for the Games, notes about the Olympic Arts Festival, representative pictograms and the full schedule of the Games

This publication was also valuable as the standard reference source for LAOOC staff requiring information regarding available press services.

Additional information regarding press services was generally not needed during the Games, except for situations regarding ticketing and sign-up procedures for the marathon course coverage buses. These matters were handled by separate sheets distributed at the Main Press Center and at the appropriate venues. Bulletins were also posted on EMS.

At the beginning of the Olympic Arts Festival, Press Operations compiled and published an 84-page *“Information for Journalists”* handbook, containing brief outlines of the Festival’s performers and performances as well as information about press services offered during the event. These guides were distributed at the time of OAF accreditation and proved helpful to media in attendance. Total print run was 1,000 copies.

23.07.4 News conferences and interviews arranged for media during the time of the Games

The LAOOC endeavored to provide a constant stream of subjects for the media, especially in the pre-Games period, to best expose the popular athletes and present different facets of the host city as well as the work of the Organizing Committee. Key to these efforts were the news conferences held in the main interview room of the Main Press Center.

Seating for 630 persons was available, with simultaneous interpretation into English, French, German and Spanish. Russian had been scheduled, but was eliminated after the announcement of the USSR boycott and subsequent reduction in the number of journalists attending from the Soviet Union. Interpreters were housed in specially-obtained booths and journalists used portable headsets loaned in exchange for accreditation badges at the beginning of every interview session. Microphones were provided for the speakers, who were on a platform which was raised two feet off the ground and seated up to 12 persons at

any one time. Six floor microphones were available for media to ask questions; microphones were either stationary or hand-carried by LAOOC staff, at the choice of the interviewees. Raised platforms were provided for up to 20 television cameras, levelled at two, three and four feet high. Multiple-output audio patch boxes were available, with 96 outputs available to tape the original speaker’s voice only. Two video projectors, each with nine by 12-foot screens were also installed in the room for viewing video presentations and events of the day on television during periods without scheduled news conferences.

In order to give many of the media an opportunity to learn more about the Games and the preparations, the LAOOC scheduled ten news conferences on various subjects for the week prior to the Games. However, after very modest interest was shown in some of the early conferences, the number was reduced and conferences were eventually held on the Torch Relay (attendance: 30), Look of the Games (20), Health Services (50), Security (60) and Transportation (25). Greater interest was shown for news conferences featuring notable athletes: a delegation from the People’s Republic of China drew 475 people on 24 July at 0930 hours, and Edwin Moses, undefeated in six years in the 400-meter intermediate hurdles, drew 500 people the same afternoon. On 26 July, Nadia Comaneci, now a coach of the Romanian gymnastics team and former gold medalist in Montreal and Moscow, drew 550 people at 0900 hours. The largest crowd came on 1 August, two days before the opening of the athletics competition, when Carl Lewis—favored to duplicate Jesse Owens’ 1936 feat of winning four gold medals in the sprints, long jump and relay—answered questions from 1030–1130 hours for 600 people. Lewis also drew 350 persons on 12 August, after he had won four gold medals. In all, 25 briefings drew 100 persons or more out of the 69 conferences held; 7,525 media attended the briefings for a per-session average of 109.

The main interview room was in operation for 25 days, beginning eight days prior to the Games and ending on 13 August, the day after Closing Ceremonies, with a news conference given by Juan Antonio Samaranch, President of the International Olympic Committee. English was the primary language for 64 of the conferences, with Italian primary in two, and Chinese, Romanian and Spanish each primary in one. The United States Olympic Committee used the main interview room frequently to introduce its athletes to the media and hosted

33 of the 69 conferences given (48 percent). The LAOOC hosted 19 (27.5 percent), the IOC, six (eight percent), other National Olympic Committees, five (seven percent), International Federations, three (four percent) and others, three (four percent). In all, the room was used for 79 hours of news conferences.

Other NOCs used smaller conference rooms to introduce their teams to the news media. The Canadian NOC held 11 news conferences in meeting rooms holding 90 persons, and similar use was made by the NOC of Great Britain. The annual convention of the Association of Track and Field Statisticians (ATFS) was held in the Main Press Center. The press corps following the President of the United States watched the Opening Ceremonies on television from a second floor conference room. Room 212B (capacity: 90) hosted six meetings; 14 meetings and conferences took place in room 211 (capacity: 90); five interview sessions were held in room 205 (capacity: six) and two meetings were held in 30-seat room 201. The Director’s Room of the Los Angeles Convention Center was available to the LAOOC and was used for television interviews and as a pre-conference holding area.

The LAOOC publicized the scheduled meetings and news conferences through all available means: schedules were posted daily on EMS and bulletin boards in the MPC lobby, announced via public address in English and French four times daily and broadcast on both the giant readerboard in the MPC lobby and on the MPC’s closed-circuit television system via a character generator on channel 14. Updates were posted on EMS, the readerboards and on the television menu.

A strong effort was made to fill the schedule in the days prior to the Games, noting media interest in the popular athletes and subjects of the Games and in view of the restrictions on access to the Olympic Villages. Once the Games began, however, the LAOOC did not attempt to set any schedule for briefings since most of the journalists were busy at the sports venues. Where there was interest, the organizers pieced together conferences on particular subjects, or, more often, simply made LAOOC officials or a particular athlete available to the media on a particular day.

23.07.5 Supplement to the entry data: Athlete biographical material for use on EMS

Journalists reporting the Games often required information on particular athletes, their previous performances in major competitions and details of Olympic and world records set by those athletes. No comprehensive data existed about the performances of athletes in Olympic sports, so the LAOOC was left to provide the data itself, if at all,

The existence of the Electronic Messaging System (EMS) provided an opportunity for journalists to gain

access to this data directly, requiring a simple, easy-to-understand format which could be used by media from all over the world with minimal problems of language or computer literacy. Although compilations were begun as early as two years prior to the Games, the work accelerated quickly after the hiring of a chief researcher in December 1983, barely eight months prior to the Games.

The documentation effort focused on the career achievements of athletes in major world and regional championships, records set, progressive histories of best marks in particular events and summaries of past championship competitions. Some data was extremely difficult to come by, since certain sports kept very poor records of their past championship events, while others were well-documented, such as athletics, basketball, gymnastics and swimming. In each case, data gathered usually included the complete results of world and world junior championships from 1972–1983, and for athletics, swimming and weightlifting, complete world record lists and 1983 and all-time best mark lists.

The documentation effort divided the sports into four categories. The best information was available for sports in which rankings were based on time, distance or weight measurements—athletics, swimming and weightlifting. The compilations focused on:

- Progressive Olympic and world record lists
- All-time lists of best marks in each event and 1983 and 1984 yearly best marks lists
- Results of Olympic Games, 1896–1980, including the top eight places
- Results of world championships and/or world cups, 1972–1983, including the top eight places
- Results of regional championships (African Games, Asian Games, European championships and cups and Pan-American Games), including the top three placers
- Results of world junior championships, including the top three placers
- Construction of career records of competitors who had placed in one or more of the above categories

Compilations included yearly progression in each event, placing in all major championship events listed and records set.

News Relations and Press Operations

The second group of sports had both individual and team rankings, including canoeing, cycling, equestrian sports, fencing, gymnastics, modern pentathlon, rowing and yachting. Olympic Games and world and area championship results were compiled, along with the career records of individual competitors. Career records of team placings were compiled as for individuals, but under the name of the country involved. Thus, the name "Romania" in gymnastics listed team performances of the Romanian squad in past Games and world and European championships.

The third category was for sports with only individual rankings: archery, boxing, judo, shooting, swimming (diving and synchronized only), tennis and wrestling. The documentation included Olympic, world and area championship results and career records of competitors who had placed in one or more of the championships listed.

Team competitions formed the final category, comprising baseball, football, handball, hockey, swimming (water polo) and volleyball. Along with Olympic, world and area championship summaries, and team career records, Olympic records were compiled in the various sports in both individual and team categories. These proved very useful during the latter stages of team competitions as records were eclipsed.

In all, 2,400 biographies, including individual and team performers, were compiled. The depth of information made available in most sports depended solely on the availability of information regarding the various championship events. Not surprisingly, the most complete compilations were in those sports in which both the International Federations and the specialized media are eager to record the detailed results of their major competitions. Biographies of individual competitors in athletics totaled 475, while 499 swimmers were profiled (along with 115 divers). The next highest total was 171 for rowing, followed by 155 gymnasts (40 rhythmic), 144 weightlifters and 133 canoers and kayakers. The data was manually compiled on worksheets following the format of the EMS screens which would be used for presenting the data. The data-gathering period continued through May, and the compilations were not completed until mid-July. Input began in April and continued through the time of the Games as additional information, new biographies and updated material were added.

Personal data on the athletes, including height, weight, birthdate, sport and events, was taken from the sport registration forms. As a function of the

LAOOC's results system, this athlete "summary" also noted in which events the particular athlete was entered and gave his or her complete Games results to that point. Where athlete biographical data was also available, an EMS action key linked the two information screens together, placing the current Games data with the biographical information about past performances. Both biographical and registration data existed for approximately 1,400 athletes, a figure lowered considerably because of the boycott by Eastern European NOCs which eliminated athletes who had registered previous success in international championship events.

Although the primary interest of the media was in athlete biographies, additional information served to make the system useful for a wide variety of support personnel as well. Information was included on the background of the Games and of the preparations of the LAOOC, Games schedules for media events, sports events, and both athlete and media transport, information about the International Olympic Committee and the 88th Session of the IOC, the International Federations, Olympic participation and growth and a profile of Los Angeles-area weather.

In all, the athlete information database totalled slightly less than 75 million bytes. This information was requested more than 120,000 times on EMS, proving to be a popular feature. The "Olympic information" section was 25 million bytes in storage and was called up 150,000 times.

23.07.6 Supplement to results: Notes and quotes from the Main Press Center, venues and villages

In an effort to supplement the statistical results of the events as well as to offer to the journalists some of the colorful background information about the Games, a small-scale news service was devised to publish interesting notes and gather brief quotes from participating athletes, coaches and officials. Information was forwarded from each venue or village to the Main Press Center, where it was copied and distributed within the Main Press Center and entered on EMS, so that journalists at other venues could share the data. Additional information not covered from the venues would be developed from the Main Press Center.

In the two weeks prior to the Games, most of the information sheets were developed by the editorial services group in the Main Press Center and detailed arriving teams, summaries of news conferences held and registration totals. Data from each of the villages was also distributed on a daily basis. Village reports were originally typed at the village press sub-centers and sent by telecopier to the editorial services office, where it was copied for general distribution in the MPC and re-keyed into EMS, where it was available to anyone who had interest.

16 A news agency uses all its allotted space in the Main Press Center.

17 Sonotubes decorate the outside of the MPC.

Once the Games began, notes and quotes material poured into the editorial services office at the MPC; venue reporters were producing an average of more than 75 pages per day. The heavy load overwhelmed the capacity of the keypunchers who were entering the data into EMS and slowed the appearance of the material on the EMS. Delays were also experienced in the transmission of the notes and quotes material from the venues themselves. Nevertheless, journalists received an enormous amount of supplementary information about the competitions and general data about the Games. The page count totaled 1,518 in all:

Notes and quotes produced during the Games

Archery	19
Athletics	137
Baseball	26
Basketball	88
Boxing	70
Canoeing	14
Cycling	12
Equestrian	50
Fencing	105
Football	126
Gymnastics	36
Handball	68
Hockey	53
Judo	27
Modern Pentathlon	7
Rowing	36
Shooting	9
Swimming	56
Tennis	8
Volleyball	62
Water Polo	135
Weightlifting	37
Wrestling	27
Yachting	26
UCLA Village	67
UCSB Village	25
USC Village	50
Main Press Center	142
Total	1,518

This page total was considerably in excess of the pre-Games projection of 876, but the additional output did not

appear to hamper production schedules or cause load problems in Main Press Center photocopying and distribution schedules.

23.07.7 Video viewing

The LAOOC arranged to have all of the closed-circuit television signals from the host broadcaster available at the Main Press Center to accommodate media who wished to cover multiple venues at the same time. Since television monitors at the venues were not linked to show video from other venues, journalists at a particular venue could not watch action from any other, thus missing any opportunity to view important events not present before them.

In order to assist such journalists, and make available the Games competition sessions in an easily-retrievable format, a video taping and viewing program was arranged at the Main Press Center. In concept, a journalist could return from a venue and ask to see any of the competitions in the Games which had already taken place and be able to immediately replay any event, with the ability to watch replays in slow motion or stop action.

The video viewing program allowed exactly that capability and was a popular feature on the first floor of the Main Press Center. The video viewing room had 40 video cassette players and 40 television monitors (13-inch) for viewing, with clerks available to assist with machine operations and use of the tape library. Heavy use was made of the video viewing room after controversial incidents such as the fall by Mary Decker (USA) during the 3,000-meter final on 10 August. The detailed usage summary:

Video viewing use summary

<u>Date</u>	<u>Viewer total</u>	<u>U. S. viewers</u>	<u>Int'l viewers</u>
29 July	19	11	8
30 July	36	17	19
31 July	27	13	14
1 Aug	45	26	19
2 Aug	44	22	22
3 Aug	37	16	21
4 Aug	45	24	21
5 Aug	56	28	28
6 Aug	65	33	32
7 Aug	56	25	31
8 Aug	51	26	25
9 Aug	64	22	42
10 Aug	93	37	56
11 Aug	108	50	58
12 Aug	71	34	37
Totals	817	384	433

18

18 A video viewing room for journalists at the Main Press Center.

Tape recording was done in a separate room upstairs in the Main Press Center, where all of the signals produced by the host broadcaster, ABC, were fed. Sixteen stations were set up to tape each of the 15 signals provided as well as ABC's domestic television coverage of the Games. Four copies of each tape were made for distribution to the video viewing tape library on the MPC's first floor and to the three villages. Since multi-channel feed was costly to bring in from the International Broadcast Center, it was economical to produce multiple tapes from a central facility—the Main Press Center—which had already contracted for transmission of the world signals to it.

Each tape was logged carefully using the digital tape counter in each machine. These indexes were copied and placed with each tape so that users could quickly move to the portion that they wished to see. Almost 2,000 tapes were used for recording the competitions. All programs were complete, with the exception of archery, preliminary football at Annapolis and Harvard, portions of the modern pentathlon, shooting and yachting, which were covered by summary rather than live.

23.07.8 Analysis of the Information Services sector

For the Press Operations group, the Information Services sector represented an opportunity to bring more information than ever before to the journalists who could, in turn, write more complete reports about the Games. In the main, this effort succeeded. Clearly, journalists received more information other than results, than ever before, through the vehicle of notes and quotes. They had access to a data base of larger proportions than could have been expected in the athlete biographical sections of EMS, not to mention the wide background data that was available in the additional information portions of EMS.

Video tapes of events already conducted during the Games were readily available for the first time for media, and journalists found this feature useful in cases of controversy. News conferences had a substantial impact in the days prior to the Games by providing story opportunities and live appearances by athletes who would be difficult to reach otherwise in the Olympic villages.

Certain lessons should be learned by the experiences in information provision, both in the pre-Games planning period and during actual operations:

- The planning of Information Services should have started far earlier than it did. The hiring of a full-time manager for this project should have taken place 18 months prior to the Games, rather than six. Deputy management became necessary later for the MPC interview room operations, video viewing and editorial services.
- General information for the media regarding accreditation, housing and transportation procedures should have been distributed in brochure form two years prior to the Games to all National Olympic Committees, which could then have distributed it to journalists in their countries. This would have familiarized those interested in the procedural aspects of accreditation and housing especially, which were areas of major concern in Los Angeles.
- The concept of detailed press service information, including site maps, proved worthwhile in the "Facilities for Journalists" series. Many journalists found their work easier in Los Angeles because they had a general idea of the conditions to be expected. Better timing for distribution would have been one year prior to the Games for Volume 1, and six months prior to the Games for Volume 2.

- "The Media Guide for the Games" was also successful. It has been difficult to determine whether the information contained was ever used, but a competent guide for news media certainly helped avid readers, as well as the staff working at the time of the event. It would have helped to have delivery of the guide approximately two weeks prior to the opening of the Main Press Center rather than at the time of opening itself.
- In the planning of news conferences, special care must be taken to urge the NOCs to bring their top athletes into news briefings with the media. Contacts by the LAOOC began in 1981 for this purpose and proved to be very beneficial as many of the athlete news conferences were very well attended. The Press Operations staff was surprised by the lack of interest in the activities of the Organizing Committee, such as design, health services and transportation. The time in organizing these events might have been better spent in recruiting additional athletes to come to the MPC interview rooms.
- The availability of a one-on-one interview room for the Organizing Committee president or other top Olympic dignitaries is worthwhile. Refreshments should be available and lighting for television might be considered.
- Athlete biographical data was well received as presented on EMS. However, the researching effort should have started fully two years prior to the Games rather than eight months if the project were to have been completed. The most difficult task is the gathering of data; the compilations and editing took much less time once the data was in order.
- The general information section of EMS was well used and appreciated but journalists also asked about general information brochures about the organizers and the general non-press preparations in Los Angeles which they could take with them. This information could have been contained in an additional section of the facilities guide for news media or in an updated version of a general information brochure published previously by the organizers.
- The program of notes and quotes was very well received by the media, but further training should have taken place between the Information Services group and the venue reporters and statisticians. For many of the venue reporters, the importance of the transmission of notes and quotes material to the MPC was lost in comparison to the immediate distribution of the material at the venue site. This transmission responsibility should either be entrusted to another person or additional instruction must be given to the venue reporters.
- Video viewing was very much appreciated by the media and proved to be a workable concept which should be continued.

23.08 Press Operations: Main Press Center

23.08.1 Conceptual plan for central press services

Use of a central center for press services is a requirement for multi-sport events such as the Olympic Games. Because support facilities for media cannot be efficiently duplicated at all sites, it makes sense to place major emphasis on a single, central location. A wide variety of services can be provided there, with smaller-scale facilities tailored to the immediate filing needs of the media placed at the surrounding sites in sub-centers.

This was the basic plan for the LAOOC, which recognized the necessity of a Main Press Center (MPC) early in its bid process for the Games. Development of the MPC concept characterized it as a small city for journalists, photographers and technical personnel, where all of their professional as well as many of their personal needs could be met.

Clearly, facilities for composing and transmitting stories were important as were photographic equipment and film processing support. Private working areas for major agencies were necessary and expected as was a complete information service, including electronic inquiry, interview rooms, results on paper and television monitors showing the various events. The latter were necessary so that media could cover more than one event at a time.

On the personal side, additional conveniences were welcome, since less time could be expended on them, leaving more time for actual coverage. Banking facilities, customs and courier services, food facilities, information booths, photocopying and travel services were only some of the suggested service possibilities. The actual services were determined only after examination of the space available and the cost implications of providing such services.

23.08.2 Site selection and relations

The obvious choice for the MPC site was in the downtown Los Angeles area. Venue sites for athletics, boxing and swimming, as well as one of the two major villages were located there, as were major hotels and freeways. In addition, facilities used to handling major temporary installations for conventions and trade shows were readily available. The central location of the Los Angeles Convention Center (LACC), with almost 334,000 square feet (31,030 square meters) of usable exhibit space, between the Coliseum/Sports Arena/USC sites and the downtown hotel areas, made it a natural choice.

The strength of the Convention Center was its experience in handling conventions, exhibits, meetings and trade shows on a regular basis. The facility, opened in 1971, needed no permanent modifications for Games use and had often been asked to provide for massive electrical requirements, temporary partitioning and extensive plumbing. The LACC and LAOOC announced the conclusion of a license agreement for use of the facility on 11 August 1981. The agreement included use of the main building, which included Yorty Hall (210,685 sq. ft./19,580 sq.m, capacity: 23,000) Petree Hall (23,852 sq. ft./2,216 sq. m) and 20 meeting rooms totaling 38,551 sq. ft./3,582 sq. m, plus an extensive lobby area with food services available through a pub, restaurant and five snack bars. The new North Hall was also part of the license, and the 105,300 sq. ft./9,786 sq. m building, while not used by Press Operations, proved to be very convenient for the press transportation and Awards Ceremonies groups. The LAOOC's term of occupancy was from 5 July to 18 August 1984.

Additional facilities included in the lease were 3,600 parking spaces, 2,700 of which were under and around the main building, with an additional 900 spaces across the street in a separate parking structure also controlled by the LACC. The city reserved the right to provide all utilities within the LACC, including compressed air, electricity, gas and water, as well as all cleaning services, since these activities were a revenue-generating source. Similarly, the agreement included provisions for food service, requiring normal concession service from 0800 to 1800 hours each day from 5-14 July and 13-18 August and services from 0800 to 0200 hours each day from 15 July-12 August. It was expected that the LAOOC would either contract for or provide all other equipment and services required for its tenancy.

A license addendum was negotiated in early 1984, but finally signed on 29 June, only six days before the LAOOC began its term of occupancy. Included was rental of an additional 7,712 sq. ft./716 sq. m of warehouse space for use in photocopying results and a modification of the parking license, allowing the sale of parking permits to media.

22

- 19 Journalists use the Main Press Center information station.
- 20 A photo technician sets up a darkroom.
- 21 Journalists work on Electronic Messaging System terminals inside the MPC.
- 22 Journalists composing reports in one of the MPC's work areas.

News Relations and Press Operations

Relations with the LACC were excellent. The LAOOC dealt primarily with three people: the general manager, an account supervisor and the building superintendant. The LACC, through the building superintendant, arranged for all electrical fixtures and power (120 - and 220-volt), plumbing, public address facilities and some furniture, including six and eight-foot long folding tables and padded side chairs. The LAOOC took exclusive occupancy on 5 July, opened the MPC for business on 14 July and closed on 14 August. Clean-up and move-out was completed by 17 August, a day ahead of the LAOOC's occupancy termination date.

23.08.3 Administrative requirements and operations

Planning of the Main Press Center began in mid-1981, shortly after the signing of the license agreement. Planning focused primarily on the main floor of Yorty Hall and the partitioning of common areas and provision of space for major press agencies and sponsor services, such as camera repair and film processing. As the main floor plan was completed in concept in March 1983, attention turned to the administrative requirements of the LAOOC.

Since the Convention Center retained its existing office area during the LAOOC's license term, no relocation of its staff was necessary. The obvious requirement for the LAOOC was staff space for the Press Operations directorate, Information Services group and News Department. Further refinement showed that the MPC would become a hub for several other departments, to take advantage of the availability of information there as well as the central location. Language Services, Publications, including both the "Olympic Record" and "Villager," and Television Operations all had their primary operating bases at the MPC. Support functions for all MPC groups included first aid, security and technology, all of which required dedicated spaces.

Because the first floor was filled with media service areas, all of the administrative offices were on the second floor. The prime series of four large (1,080-1, 188 sq. ft. each) offices overlooking the main floor were assigned to the main functional areas of the MPC: News, Press Operations (two) and Television Operations and were subdivided by drape partitions into smaller working spaces. Internal offices were assigned to the Technology Department (including message center, telephone switchboards, and telephone company

representatives), Publications ("Olympic Record" and "Villager"), Security and Language Services (interpretation and translation; altogether, 1.5 offices). First Aid was assigned to a first floor area which was specifically designed for this function during trade shows.

These administrative offices were the first to be installed upon arrival of the LAOOC on 5 July, although ideally, these offices should have already been operational on that date. Although mostly ready by 8 July, last-minute contact with the Press Operations group became impossible because of move-out of the group from the LAOOC's administrative headquarters and incomplete move-in at the MPC. Intra-venue contact was maintained by portable radios, which proved to be the best method for immediate communications within the building. Telephones were also liberally placed and were usually call-restricted to either the MPC itself or to the Olympic sites and the Southern California area. A few telephones retained their national or international access.

23.08.4 Agency requirements and operations

The major press agencies required individual working areas in order to properly coordinate the coverage efforts of their staffs and the preparation and transmission of reports to their points of distribution. With agency staffs running as large as 200 and as small as four persons, a flexible plan was devised to meet their needs.

Requests for private working space were received beginning in 1981. In response, each agency requesting space was asked to quantify its space needs and provide data on the number of accreditations that agency felt it would receive from its NOC. Early determination of agency needs for a wide variety of services including accommodations, darkrooms, medical insurance, local staff, parking, telecommunications (EMS, pagers, radio, telecopiers and telex), television and vehicle rentals was planned through an agency facilities questionnaire, similar in style to the journalist accreditation form for the Games. Scheduled to be sent in March 1983, with a return date in August, a delay in finalizing prices caused distribution of the questionnaire to be delayed until

August, slightly ahead of the accreditation form. With the return of the agency facilities questionnaire not required until 1 February 1984 (same as the journalist accreditation form), it functioned merely as a bulk order form for services offered by the Organizing Committee and caused substantial confusion with the journalist accreditation form, which also requested information (and payment) for accommodations, insurance and parking.

By June 1983, agency requests filled available office space and assignments began. Design characteristics of the office spaces required a flat, non-static floor, with good access to electricity and plumbing (for those requiring darkrooms) and sufficient security to keep others out. Offices were designed in modules of 384 sq. ft./35.7 sq. m, measuring 16 feet wide and 24 feet deep. Spaces were made available in sizes as small as a half module (12x16/192 sq. ft.), while the largest were thousands of square feet.

It was determined early that agencies desiring private office spaces should be treated at least as well as individual journalists coming to the Games without the requirement of special facilities. Since MPC work space, chairs, electricity up to 500 watts per outlet, tables and typewriters were made available to individual journalists without charge, the same was true for agency offices. No charge was made for floor space, chairs (up to one per 50 sq. ft.), tables (up to one per 200 sq. ft.), typewriters, and electrical outlets contained in the office space utilizing 120-volt ac with a 500-watt load capacity. Offices were equipped with ashtrays and wastebaskets as well. Agencies had to pay for any other equipment and furniture which was brought into their space. This included the hardwall partitioning which surrounded the offices, office doors, and special electrical, furniture and plumbing needs.

Provision of the electrical and plumbing services was turned over to the Convention Center, which already offered these services as a part of its normal trade show assistance program. Construction and furniture requirements were submitted to Greyhound Exposition Services (GES), already a leading show decorator in the Convention Center and contracted by the LAOOC to provide these services to the LAOOC and private office holders in the MPC at negotiated rates. An agency furnishings questionnaire, covering major items such as partitioning and doors, additional furniture and electrical and plumbing needs was sent out in December 1983, with a return date of 15 March 1984. Upon receipt, the forms were checked for

completeness, balanced for orders against payments and forwarded to either the LACC or GES, depending upon the items ordered. Agency representatives were invited to meet with the LAOOC Press Operations group whenever they were in Los Angeles. These meetings proved to be valuable and answered many questions, especially among those agencies with darkrooms.

Agencies continued to change their office requirements even up to July 1984, despite a late-order (post 1 June) surcharge of 50 percent on all furnishing orders and 25 percent on all electrical and plumbing orders. Some agencies dropped out for various reasons and others filed late requests for private space. All agency requests for private space except one were accommodated, which finally included 71 agencies from 21 countries.

Agency partitioning construction was begun on 5 July and was completed in time for furniture to be delivered on 9 July. Darkroom installation was slower, but was completed in time for the needs of the agencies.

Each of these darkrooms was constructed to the specifications of the agencies, since the LAOOC offered no generalized design in view of the varying requirements of the users. Dark-room construction required the building of small lightproof rooms for developing film and printing negatives, with water and drain lines installed for custom-built sinks. Some agencies working with color photography also ordered hot-water heaters. Most of the agency offices were not occupied until the week prior to the Games, although agencies with darkrooms usually had a representative present from 14 July on.

GES and the LACC handled last-minute orders at a special desk in an office located on the main floor of Yorty Hall, which was open through 27 July. GES also coordinated the movement of freight in and out of the MPC through its contracts with the local unions. The volume of freight handled by GES (move-in and move-out) exceeded expectations considerably, but posed no problems with an ending volume of approximately 750,000 pounds. Since almost all agencies ended their operations on 12 August, the same day as Closing Ceremonies, tear-out of agency offices began immediately on 13 August. By 15 August, all offices were closed and the floor was returned to pre-LAOOC occupancy condition by 17 August.

Eight agencies took advantage of an LAOOC offer to find local staff to assist them during the Games. Recruited from local colleges, most of these staffers functioned as clerks, drivers and messengers. Agencies paid rates not lower than the United States minimum wage, but usually \$5-7 U.S. per hour. In all, 36 persons were hired: 21 by two of the international agencies (15 by one). Seventy-six others were hired by the European Broadcasting Union to work as drivers at the International Broadcast Center for a local staff recruitment total of 112.

Other groups requiring office space included the IOC Press Commission and IOC Press Office, press offices of several National Olympic Committees and an office for the Association Internationale de la Presse Sportive (AIPS). These were accommodated on the second floor, close to the LAOOC's own MPC administrative offices. The IOC Press Commission/Press Office room was arranged in a 1,176 sq. ft. space and equipped with an EMS terminal and printer and closed-circuit television set. An adjoining space for the press officers of eight NOCs was arranged in a similar-size room with each space equipped with typewriters and Olympic-venue and village-only telephones. Non-exclusive EMS terminals and printers were installed in a common area. The AIPS was also housed in a 1,176 sq. ft. room, which it divided in half. The press office of the

United States Olympic Committee was arranged in a 448 sq. ft. lounge area on the second floor and furniture and other requirements were installed by the USOC. All of the groups concerned found these arrangements to be satisfactory.

23.08.5 Common area requirements and operations

The goal of the MPC was to provide everything a journalist would need to cover the Games without ever having to leave. Access to the competitions, information and results, telecommunications and writing areas had to be provided in sufficient quantity so that all media could work in a relaxed but efficient atmosphere.

The MPC met all of these working requirements. The immediate feature of the main floor upon entry to Yorty Hall was the information station, which had individual racks for printed results, plus notes and quotes for each sport. Sports were marked with pictograms, and additional pictograms were used for information from the IOC, Main Press Center and the three villages. Each bin was tagged daily as new results came in and all bins were changed each day. Information sheets were color-coded to allow easy identification and separation of results, start lists and supplementary information. Inside the diamond-shaped results area, Electronic Messaging System (EMS) terminals were available for press use. Twenty-four terminals and eight printers were placed in this area, to provide information on athletes, background information and cumulative and past results during the Games. For additional convenience, 16 EMS terminals and two printers were located in the lobby area, adjacent to the MPC entrance.

Working areas were located behind the main floor results diamond and equipped with padded chairs, tables and manual typewriters in 19 different keyboards. Two work areas separated by the main aisle were provided within the hall. The first area contained only English-language typewriters for the 288 working places formed by 72 folding tables that were 30 inches wide by eight feet in length, with four places at each. The second work area contained 81 tables set for a total of 324 places, which featured mostly international keyboards in addition to English. Signs at the sides of the working area walls indicated the various typewriter keyboard languages. The 612 working places proved wholly sufficient and crowding was never experienced; the largest number of working media in the combined areas at any one time was estimated at just over 420 persons.

Telecommunications of all kinds were located adjacent to the working areas. Ninety-six international-access telephones on folding tables divided by table-top partitions for sound insulation were provided; calls had to be made via credit card or reversed charge. After it became apparent that

24

24 Assembly of the 72,000 journalists' gift packages requires a cooperative effort by LAOOC staff and volunteers.

some journalists did not have credit cards and that their country's telephone company did not take collect calls, Pacific Bell, the local telephone utility responsible for the MPC, set up a cash service allowing media to call and pay immediately after. Twenty-four coin-operated telephones were also available in a separate bay, but appeared to be lightly used. There were numerous unexpected orders for private telephones within the MPC from press agencies which did not have private offices. An area was set up near the charge-a-call telephone banks to accommodate these journalists, again with folding tables and table-top sound insulation booths provided free of charge. Of the 26 agencies ordering such telephones, 13 were from the USA, nine from Europe, two from Asia and one each from Africa and Oceania. Two agencies (one each from Brazil and the Philippines) ordered telex and teletype equipment for their stations without any previous notification to the Organizing Committee. Flexibility in the telecommunications area allowed accommodation of their needs.

Additional telecommunications equipment included 40 Xerox telecopiers compatible with CCITT groups I, II and III, all accompanied by charge-a-call telephones. Others telecopied stories mostly to countries which do not use the Latin alphabet, such as China, Israel, Japan and Arab nations. However, the requirements could have been met with ten machines or fewer since this area was rarely used. Telex requirements were much greater and Western Union International was required to increase its outgoing lines from 60 to 90 midway through the Games. Unexpectedly, journalists did not file their stories from the sites (where telex service was available), preferring instead to come to the MPC to compose their reports and send telex messages from the MPC's telecommunications center-causing severe backlogs. In addition to the main telex area, a small area for journalists to punch their own tapes was offered, with 16 off-line teletype machines. These proved very popular, especially when the backlog of to-be-re-punched material made it more efficient for media to punch their own tapes which could then be sent immediately without re-keying. The daily total of messages sent from the MPC reached the 300 mark on 25 July and averaged just over 500 per day during the 16 days of the Games.

Television monitors showing the direct feed from each venue where the host broadcaster was producing a live broadcast were provided in an area furnished by Sanyo. In all, 32 television monitors (25-inch) were set up, allowing approximately 180 journalists to watch the competitions at any one time.

Brother provided a repair station for its manual typewriters and provided assistance to those with typewriter problems. The services provided by Canon in camera repair and by Fuji in film processing are more fully discussed in the section on photographic services.

23.08.6

Other programs and services

A variety of services designed to make the journalists feel at home in the Main Press Center were arranged by the LAOOC in order to create a more relaxed (and therefore better) working atmosphere for the media. Although minor by themselves, the combined impact of these service groups was a substantial assistance to the media in both personal and work-related areas.

Banking

First Interstate Bank constructed a small branch location inside the MPC accreditation area. Services were provided at seven teller stations from 0800-1530 hours and from 1630-2400 hours daily, to handle currency exchange, processing of letters of credit and wire transfers, opening of new accounts, cashing and sales of traveler's cheques and other items. Traffic was not as great as expected and hours from 0900-1800 hours

would have sufficed. Busiest hours were usually from 0900-1100 hours daily and the busiest days from 6-12 August. The most frequent transactions were the cashing of traveller's cheques and processing of cash advances, mostly from Mastercard and Visa accounts. Cash advances totaled \$58,000, currency exchange \$25,000, 43 new accounts were opened for agencies and MPC vendors and roughly 20 wire transfers were processed.

Binocular rental

Binoculars were available for daily rental beginning on 28 July from 0800-1700 hours. Daily rental was \$4 and required an additional deposit or credit card to protect against loss. The top daily rental was 47 pairs on 28 July for the Opening Ceremonies while the average daily rental was two.

Checkroom

Metal shelving was arranged in a secured area and staffed 24 hours per day to allow journalists to drop off materials for short periods. Checked bags were tagged with a photocopy of the journalist's accreditation badge and attached to the parcel. When the parcel was claimed, the accreditation badge was compared against the badge attached to the item. The same area served as a distribution point for press gifts and parking passes reserved by press.

Courier and customs services

DHL provided international courier services from 0800 to 2000 hours daily. Business was concentrated between 1600 and 1830 hours daily, with the heaviest concentration in the last week of the Games. By weeks, DHL moved 12 shipments between 16-22 July (nine domestic and three international), 108 between 23-29 July (52 and 56), 194 from 30 July-5 August (69 and 125) and 250 from 6-12 August (134 and 116), for a total of 564 (264 and 300) over the period the MPC was open. F.B. Vandegrift performed freight forwarding, customs clearance and delivery/pick-up functions for international shipments and anticipated that its heaviest service would come just prior to and after the Games. This proved correct, as Vandegrift handled 29 import transactions totaling 13 tons and 25 export transactions totaling 16 tons. During the Games, Vandegrift also handled 81 small package shipments, usually consisting of exposed film. Their booth was staffed from 0800 to 2000 hours daily.

News Relations and Press Operations

Food services

The Convention Center had an existing concessionaire already in place at the time of signing the licensing agreement. The concessionaire was required to provide service from 0800 to 1800 hours daily from 5–14 July and 13–18 August and from 0800–0200 hours during the period of 15 July–12 August, at prices equal to those charged during the four months prior to the LAOOC's occupancy. Food service facilities included a combination bar and restaurant seating 220 persons, a cafeteria seating 411, plus two snack bars in the lobby level hallways and four more in Yorty Hall. The actual service began with only one of the snack bars in the pre-Games period but eventually included a buffet lunch service in the bar/restaurant. During the Games, the cafeteria was open from 0700–1100 hours, but closed after two days of light attendance, leaving only the concession stands open in the mornings. The bar/restaurant opened at 1100 and remained available until 0200. An agreement reached on 31 July kept the larger snack bars open around the clock and provided soft drinks to journalists at no charge at a self-service machine in Yorty Hall. In the 14 days of service from 31 July–13 August, 66 1 tanks of drinks were used totaling approximately 56,200 individual drinks. The LAOOC also agreed to pay for a free dessert item with each lunch or dinner purchased in the bar/restaurant and 2,376 were consumed. Agencies with private offices could order special "room service" inside the main working area and some took advantage of this.

Information

Bulletin boards were posted in the lobby area and were used for all types of journalist communications, most essentially the posting of news conference schedules. Information booths were staffed around the clock and were designed to answer general questions about the MPC and about press services and the Games. However, it became a primary point for the distribution of informational materials including the LAOOC's "Media Guide", "Media

Transportation Handbook", NOC team handbooks and the "Olympic Record". Alongside was the Greater Los Angeles Visitors and Convention Bureau, which distributed information about Los Angeles, made restaurant and tour reservations and provided souvenir posters to media. Sign-ups for hospitality and village tours began at these information stations but were soon moved after the congestion became too great. Better instruction and direction would have been worthwhile, as would a strict procedure for the updating of information so that the staff members would have been better informed.

Newsstand

The LAOOC made arrangements by contract to have newspapers of foreign nations brought into the MPC on a daily basis. A local vendor was contracted to provide sales personnel and racks and to sell candy, snacks and sundries in addition. Newspapers from 28 nations were available in addition to USA newspapers; a wide variety of magazines in several languages were also available. Not surprisingly, the best-selling periodicals included the Los Angeles Times among American newspapers and the French all-sports daily *L'Equipe* among foreign press. The newsstand was open on a 24-hour basis.

Photocopying

Xerox provided courtesy photocopying for journalists on two machines: one large-volume unit and one smaller machine. A total of 213,200 copies were made for journalists, including 193,838 on the large-volume machine. Xerox staffed this area daily from 0800–2400 hours.

Postal Service

The United States Postal Service (USPS) set up a full-service branch in the MPC with daily hours of 0800 to 1800 hours, although hours were extended if lines had formed near closing time. Five counters were available, with four processing regular mail and special cancellations and one working with an international message transmission service. The busiest periods were the three days prior to the Games and the last three days of the Games. The souvenir Olympic coin sets and philatelic packages available at the postal station were sold out by the end of the Games.

Stationery sales

A local stationery supply retailer was contracted to provide small office items for sale to the journalists. It operated from 0900–1800 hours daily and sold a wide variety of items, the most popular being batteries, pens, mailing tubes and writing tablets.

Telecommunications

Motorola and Pacific Bell had a booth to provide pager rental and to answer inquiries about telephone services. Since the technology center on the second floor had most of the responsibility for incoming telephone lines, nearly all telephone-related questions ended up there. As a convenience for journalists, Pacific Bell arranged to issue telephone credit cards for short terms, since international telephone credit cards were not accepted in the USA. In all, Pacific Bell issued 387 of its calling cards. Pager rental, issuance and return was brisk in the downstairs booth. In all, Pacific Bell and Motorola rented 719 pagers to the news media (including television), including 281 Optrx alphanumeric display pagers, 397 BPR-2000 digital-only display pagers and 41 Envoy tone-only units. Press totals included 101 Optrx, 192 BPR-2000 and 28 Envoy units for a total of 321.

Transportation

Budget Rent-A-Car made automobile rentals available on the agency facilities questionnaire sent out in August, 1983. Compact, full size and luxury cars were available, as well as station wagons, at preferential rates. Twenty-nine cars were ordered by 12 agencies via the agency questionnaire: three agencies ordered four compact cars, ten asked for 19 full-size cars, one asked for three station wagons and one requested three vans. All of these cars were picked up at the Los Angeles International Airport lot. At the MPC, Budget staffed a booth in the lobby from 0700 to 2100 hours from Sunday through Friday and from 0700–1800 hours on Saturdays. Cars were rented at preferential rates to media possessing valid driver's licenses in their countries of origin, passports and either a cash deposit or valid credit card. Orders were relayed to the main dispatch desk in Los Angeles and renters were picked up by Budget and driven to their rental vehicles. This transportation desk was adjacent to a separate LAOOC transport information counter which assisted journalists with their use of the press transport system, transport in the general Los Angeles area and sign-ups for entertainment and village tours offered by the LAOOC.

Travelers services

American Express provided a financial and travel services booth, which arranged sale and cashing of traveler's cheques, ground transport, sightseeing in Los Angeles and services for its cardholders. Its hours of operation were from 0900 to 1730 hours daily, and it served 50–75 customers daily. The busiest days were on 27 July and 13 August and the most popular transactions included the sale and cashing of traveler's cheques and cashing of personal checks for cardholders.

United Airlines provided air travel reservations and ticketing services from 0900–1730 hours daily from 23 July to 13 August. An automated dialing service was available to assist customers during closed hours. The most popular services were confirmation of flight times and changes in reservations. The LAOOC provided a travel-liaison officer for journalists to assist with lost luggage and other travel-related concerns from 0800–1800 hours daily.

23.08.7 Press entertainment, gifts and hospitality

One of the most vexing questions confronting the Press Operations group was the proper level of entertainment, gifts and hospitality to be provided for the media. Journalists were coming to Los Angeles to report on the Games, and a heavy schedule of activities could take away from the main focus of their stay. In addition, costs for such activities could run very high. Conversely, the LAOOC desired to play the role of hosts properly, and to extend a genuine welcome to all media who traveled to Los Angeles. A middle ground, involving activities mostly in the pre-Games period, emerged.

Of all the welcoming ideas presented, a loosely-structured gathering of news media for an evening of food, music and conversation was deemed the most appropriate. It was held away from the MPC in order to provide a different atmosphere, with transportation provided by the LAOOC. The date was fixed for 27 July 1984, the evening preceding Opening Ceremonies, in order to make the event available to all media and to relieve pressure for press attendance at the Pre-Opening Gala musical event (part of the Olympic Arts Festival) at the Hollywood Bowl.

Invitations were issued at the time of receipt of the press gift package. The MPC readerboard also noted the event duration and transportation schedule. Scheduled for 1800–2200 hours, the Plaza Pool Deck of the Westin Bonaventure Hotel provided an appropriate site in an attractive outdoor setting. Wine and cheese stations, beef, turkey and submarine sandwich stations, along with hot dog and chili bars provided ample food, while rollerskate-equipped hostesses served beer. Soft drinks and mineral

water were also available. Entertainment included bands in various locations, including country and western, jazz, mariachi, reggae and a salute to American composers. A small elevated stage for break dancers was set up in the middle of the plaza and proved to be very popular.

The evening proved successful. The lack of a formal program provided more than 3,000 media with an opportunity to relax with their friends and talk with colleagues in an unhurried atmosphere; the LAOOC achieved its goal of presenting a warm welcome to the media. The guests appreciated the gift of a signature-series LAOOC poster, provided in a quantity of 5,000. The planning and execution of this event was coordinated by a media protocol supervisor with one part-time assistant who worked on the party for approximately two months prior to the event.

The continuing press hospitality requirements during the Games were not settled until the end of June 1984. Although the LAOOC had interest in a hospitality area in the Main Press Center itself, the wide-scale construction and move-in activities in preparing the MPC for use and the anticipated expenditure for continuing hospitality costs there determined that another close-by site be found. The Holiday Inn/Convention Center, already selected as a press hotel, had an adequate room for serving buffet meals and, willing to make an attractive offer on price, was an ideal choice.

From 14–20 July, the Press Hospitality Suite served light snacks from 1200–2100 hours, with a bar available for cocktails on a cash basis only. From 21–28 July, a complimentary cold buffet was available from 1200–1600 hours, with snack and cocktail service from 1600–1800 hours and 2200–2400 hours, and a complimentary hot buffet dinner available from 1800–2200. From 29 July–13 August, snacks and cocktails were available from 1200–2100 hours, and a complimentary cold buffet dinner was available from 2100–0200 hours. In all cases, soft drinks and coffee were available free, but all alcoholic beverages were only available for cash at a small bar installed inside the room. Journalists with full "E" accreditations were admitted, but Main Press Center-only badgeholders were not. This program was well received and the hours of operation proved proper: 19,913 meals

were served, including 3,867 cold (lunch) and 2,283 hot (dinner) buffet meals in the period from 21–28 July and 6,763 cold buffet dinners from 29 July–13 August, a Games-period average of 422.7 meals per five-hour seating from 2100–0200 hours daily. Seating was adequate with space for almost 100 persons in the 1,595 sq. ft. room. A selection of daily newspapers and leading magazines, both USA and international, was available at no charge, as were two arcade-style video games.

Entertainment was available to media in many forms in the pre-Games period. Tours were offered free of charge to numerous Southern California attractions, including Disneyland, Knott's Berry Farm/Movieland Wax Museum, Long Beach's Queen Mary and Spruce Goose attractions, Los Angeles County Museum of Art, Magic Mountain, Museum of Natural History and Universal Studios. The Los Angeles Dodgers professional baseball club also extended an invitation to interested media to attend several of its home games. Media also had facilities available at a local athletic club as well as golf and tennis clubs in the area. Out of all these options, however, actual interest was light; sufficient interest to fill a bus was confined to Disneyland and Universal Studios tours for the three days prior to the Games.

Large, arcade-style video games were available to journalists at no charge in the MPC. Six games were placed in the south hallway near the snack bar. Little interest was shown in these and users tended to be LAOOC staff rather than media. Scoring competitions between staff members in the after-hours periods proved to be as fierce as any on the Olympic playing fields.

Motion pictures were shown nightly in the MPC's main interview rooms from 14–26 July at 2000 hours. These attracted very little interest, with top attendance numbering seven for "*The Godfather*."

A press gift program was planned beginning in late 1982. Experimental gifts during the 1983 events included briefcases, writing-pad folders, wallets and even complimentary arrows during the XXXIInd World Target Archery Championships in October 1983. Journalists seemed to appreciate gifts which helped them report on the Games as well as being souvenirs of their visit to Los Angeles. Sponsors of the LAOOC were surveyed for their interest in providing such items and the majority of items eventually used in the press gift package were donated by sponsors. The press package contained a nylon carry bag, solar-powered calculator, baseball-style cap, clipboard/lapboard, commemorative bottle of Coca-Cola, commemorative medallion, pen with neckchain, two reporter's notebooks and an Olympic preview issue of "*Sports Illustrated*." These gifts were received very late and partially

assembled at the LAOOC's administrative headquarters and finally at the MPC itself, requiring more than 1,000 man-hours of effort. Distribution took place after journalists were accredited at the MPC, with several thousand shipped to the International Broadcast Center for distribution to technical staff who had been accredited at the IBC from 4–10 July or for technicians who were accredited to the IBC only. In all, some 12,000 gift bags were assembled; some did not include every available item as supplies had been exhausted through incomplete shipments or mishandling.

23.08.8 Staff management, orientation and training

Staff requirements in the Main Press Center were large; in addition to the facility being gigantic, the staff occupied the building for 45 days with 32 operational days. This required several staff turnovers, not to mention the three shifts necessary because the MPC was open on a 24-hour basis. This meant that nine complete personnel teams had to be assembled: three shifts per day in three teams working roughly ten days each.

In all, 2,018 positions were identified for the Main Press Center. Of these, 1,164 were from 29 different contractors and sponsors, including the Los Angeles Convention Center staff (229). LACC food concessionaire (133) and maintenance staff (36) and LAOOC sponsors like American Express (travel services: 40), Canon (camera repair: 98), First Interstate Bank (69) and Fuji (film processing: 142). LAOOC suppliers such as Brother Industries (typewriter repair: 71), MCI Communications (telex service: 50), Monterey Institute (interpreters: 42) and the photographic motorcycle messenger service (60) required large numbers of people to perform their tasks.

LAOOC staff, including both salaried and volunteers, totalled 854. Press Operations had the greatest number, 521, while Telecommunications required 113 and Technology, 100. Of the 854 total, paid staff totalled 167 and 687 were volunteers. The breakdown:

Group	Total
Accommodations	
Management	1
Hotel Liaisons	9
Reservation Staff	9
Finance	
Management	6
Accountants	8
Cashiers	33

News Relations and Press Operations

The LAOOC staff was divided into three work shifts: 14–21 July, 24 July–3 August and 4–15 August with work hours from 0800-1630 hours, 1600-0030 hours and 0000-0830 hours. Of the staff recruited by Press Operations, 421 were volunteers, 75 were paid on a short-term basis during the time of the Games and 25 were from the LAOOC's permanent Press Operations staff. Management staff were specially recruited, usually from experienced sports information professionals at colleges and universities around the country. Remaining staff were recruited from Citizen's Advisory Commission members, public relations and sports information professionals in the local area and college students in communications, journalism and public relations.

Staff training was held at a one-day orientation session on 9 June 1984 at the Main Press Center. The department managers were introduced and a brief overview of what to expect was given along with general information provided by the Games Staffing Department regarding rules and regulations. Some of the individual departments within the MPC also held additional training sessions, usually during evenings or on weekends. Formal staff training occurred on-the-job, with attendant confusion in the first few days. Staff morale was high, however, due to the interest shown by the media in what they were doing and, after a few days, staff performed at a generally high level.

Staff were fed in the same manner as at all other sites with pre-prepared sandwiches and soft drinks which were set up in a 1,595 sq. ft. room at the Holiday Inn/Convention Center, approximately 100 meters from the

MPC. The room had a capacity of 96 persons, which was fully adequate, and contained a microwave oven, refrigerated food-storage cabinets and a much-appreciated large-screen television for viewing events. Ordering from a central food distribution facility was done daily.

Staff rewards and gifts were distributed at the end of the Games. An all-MPC staff party was held on the evening of 15 August after the MPC had closed. A buffet dinner, including a congratulatory cake, and dancing was held from 1800 to 2300. Staff gifts were handed out during the party. Upon arrival, all staff were given a certificate of appreciation, a gift voucher and, if female, an LAOOC *Star*

in Motion pendant and a rose. The gift voucher entitled staff members to a package including a commemorative Coca-Cola bottle, Games signature series poster, final results book, LAOOC-licensed "TV Viewer's Guide" and a special staff medallion. A few special gifts, including television sets, were given to MPC staff members who had distinguished themselves by outstanding performances during the time of their shift.

23.08.9 Reflections on the MPC experience

The Main Press Center served as the central point of activity for journalists in Los Angeles, providing both personal and professional services for 32 days, plus a ten-day set-up and three-day tear down period for a total occupancy of 45 days. Journalists were uniformly pleased with the

25

28 Photo journalists line the floor of the Los Angeles Memorial Coliseum to record the athletics competition.

27

facilities offered and the performance of the staff was satisfactory. A wide range of services was successfully offered to the media and, when problems arose, the staff—both paid and volunteer—could not have been more eager to help solve them. The experience left these impressions for the future:

- The ideal site choice for a Main Press Center facility is inside the main stadium, close to housing reserved for the press. As the needs of the media have outstripped the size of some main stadiums as a whole, an area close to the stadium and within walking distance of press housing units is the best. The LAOOC's choice

of the Los Angeles Convention Center was good in view of the closeness of the Coliseum (two miles) and downtown hotels, and remained so, despite the distance to press housing near the airport, because of the outstanding service of the LAOOC's media transport system.

- The use of a facility experienced in handling exhibitions and trade shows was very beneficial. Problems regarding provision of power, water or other custom requirements for the agencies or the LAOOC never surfaced and were less in scale than for some trade shows. The similar use of an existing contractor for the temporary building and decorating of the MPC was wise. Greyhound handled construction, decorating, labor and materiel questions with expertise and speed that would have been

hard, if not impossible, for the LAOOC to duplicate. The LAOOC's agreement with the LACC and Greyhound provided for careful cost checks and approvals before proceeding with any orders.

- The LAOOC's occupancy of the MPC was for much too short a time. With only nine days to set up before opening, the Press Operations group had almost no time to establish a proper working environment, complete training or attend to hundreds of details which would have made the transition easier and the opening days of the MPC much more efficient. It is recommended that while opening of the MPC should occur simultaneously with the

opening of the villages, exclusive possession of the MPC property should be taken as much as one month prior to opening. At a minimum, the administrative requirements of the MPC (and Press Operations) management must be fully operational at least two weeks prior to opening, including EMS (if available), financial support, photocopying, radio and telephone systems, telex and telecopier units and mail arrangements.

- The agency facilities questionnaire was a disaster given its confusion with the journalist's application for accreditation. Although proper in concept, it may best be used in the future as a questionnaire only without the ability to order. This would have provided the LAOOC with solid information about the requirements of each agency more

29

29 Photographers have deck-level positions at the Olympic Swim Stadium.

than one year prior to the Games. It is also recommended that the organizers employ one person whose sole responsibility is to look after the arrangements of the agencies requiring private office spaces. This task fell to the MPC manager and proved to be an inefficient use of time in the late stages.

- The many individual meetings between agencies reserving offices at the MPC and the Press Operations Department were most useful. There is no substitute for actually seeing the MPC facility and planning from an actual visit. Individual meetings are far more effective than group sessions where agencies rarely get to discuss their own specialized arrangements.
- Common area requirements were met fully but the organizer must be aware of changes occurring without any notice. This was the case in ordering of private MPC telephones without office space by a variety of agencies. However, the problem was stopped and handled efficiently. Less efficient was solving the problem of telex service, which wasn't fully resolved until after six of the 16 days of the Games had passed; a casual poll of the journalists one day prior to the

Opening Ceremonies regarding their filing preferences might have been prudent. It is clear that in predicting the use of facilities, organizers must be cognizant of the time zones around the world, in conjunction with the distance and time of the venues from the MPC, to project a likely split in communications facilities between the venues and MPC. In Los Angeles, more facilities were at the venues than were used, and the MPC telex service had fewer facilities than proved necessary. Telecopier requirements were completely overstated everywhere.

- Most of the support services proved useful. Journalists were pleased with the wide variety of services available and were able to spend more time working as a result. Care must be taken, however, with regard to these facilities; they must be provided properly to be successful. Food service was not a high priority of the Press Operations group since an existing concessionaire was in place and had served thousands of customers at prior LACC events. Yet, journalists asked why international dishes were not featured as had been arranged at prior Games, or why the bar and restaurant were not open later in view of the late return of many journalists from the competition sites and the limited restaurant service available near the MPC around midnight. More complete planning would have averted these concerns, since assumptions of competent performance should not be made in any area of planning for the Games.

- Despite the advances in technology with EMS and a four-foot by 18-foot scoreboard in the MPC lobby area, the most widely attended information sources were simply bulletin boards posted in the lobby. Their use is strongly encouraged as a central part of, rather than as an adjunct to, services providing announcements and information for journalists.
- Press entertainment programs had a positive effect on the media, especially the pre-Opening Ceremonies party at the Westin Bonaventure Hotel. The lack of a formal program gave the journalists a chance to relax in the company of their hosts, and an opportunity to be cherished by organizers desiring to make their guests feel welcome in a strange city. Tours and trips should have been focused more on the area's best-known attractions, since a wide variety of events diffused journalist interest into very, very small groups.
- Journalist gift programs must require receipt of the materials from donors well ahead of time. The strenuous effort to pack bags in time for distribution was not necessary and took away from other MPC preparations. Rather than a sign-in procedure for journalists taking gifts, it would have been better to physically punch a hole in the accreditation badge of each person who received a gift package, eliminating any doubt about the receipt of these items. Delivery of gift bags in bulk to broadcast organizations proved unfortunate, since no control was exerted over their distributions. Items provided in insufficient quantities for distribution in all gift packages should either be returned or distributed at an information table on a first-come, first-served basis.
- Staff personnel acquitted themselves well during their period of the work with the LAOOC. However, preparations for their work by the Press Operations Department were sadly inadequate. A more structured program of training, perhaps only one day in length (perhaps more for supervisors), should have been instituted so that staff did not begin their training at the same time as they had to work with the journalists. Strict procedures for the dissemination of information to staff about the Press Operations group and the MPC should have been arranged well in advance of their term in the MPC and changes should have been made under procedural guidelines that would have given them authority and recognizability.

23.09 Press Operations: Photographic services

23.09.1 Conceptual plan of services

Careful attention was given to the requirements of the photographers accredited to cover the Games of the XXIIIrd Olympiad. Unlike reporters and broadcasters, who may comment or write after watching replays and analyses of events, the photographer has only a single moment in which to record an image. It is necessary, therefore, to make available sufficient space for shooting in all areas, backed up with proper facilities for equipment repair, film processing and transport. The Press Operations group was told many times of the improper actions of photographers at past events, whether Olympic Games, world championships of various sports or even smaller events at major sites. In each case, little information was available to photographers prior to the events regarding shooting positions, lighting conditions or the availability of close-by processing. Faced with the choice between severe restrictions on photographers which would generally not contribute to the production of outstanding pictures or a strong program of education regarding photographic protocol at the Games, the LAOOC chose the latter.

Photographers were consulted with regard to the selection of photographic shooting positions and to the auxiliary services necessary for successful processing and dissemination of Olympic photography. Photographers were provided with detailed information about the lighting conditions and positions expected in Los Angeles, the program for film transport and processing and the expected protocol between the competition management and officials and the photographic media. With this introduction, photographers came to Los Angeles prepared to use the available facilities, knowing what to expect and what was expected of them. The result was a generally successful photographic operation, leaving the photographers unfettered to do their work within certain specified limits.

23.09.2 Nature of pool and non-pool photography at the Games

Because of the large number of photographers who are accredited at any Olympic Games, it is impossible to guarantee infield positions at athletics or courtside positions in basketball or volleyball for all photographers who might wish to attend. While positions open to all accredited photographers must be arranged at each site, the number who are admitted into athlete or field of play areas must be limited in order to prevent crowding or disruption of the athletes or officials involved with the competition. Therefore, it is necessary to form groups of a few photographers who

will shoot from these prime positions and make their pictures available to the many media who have interest in them. This task is left to the International and National Olympic Photographic Pools (IOPP and NOPP).

Consisting of 24 photographers each, plus necessary technical staff, the International and National pools service different sets of clients at the Games. The IOPP, a cooperative among the Associated Press, European Pressphoto Union and United Press International, provides its photographs to its thousands of combined subscribers worldwide via the normal distribution channels of each of its three member agencies. The NOPP, usually a newspaper, news service or newsphoto agency selected by the organizers, is responsible for photographing a similarly wide range of events as is the IOPP and making its photographs available at a central location for selection and purchase by media accredited to the Games. Purchase prices must reflect labor costs and processing materials necessary to produce the images ordered, rather than fees generally charged by commercial photographic houses for images used in advertising or public relations work. Thus, a journalist whose periodical had not received a photographic accreditation to the Games would have the opportunity to acquire photographs for publication from the NOPP's display area at the central press center a similar facility.

The pools work directly with the organizing committee to arrange accreditation, film transport and identification of pool photographers to allow their use of primary positions at competition sites. IOPP and NOPP photographs made available to IOPP members or prepared for display and sale to accredited media are also provided separately for the archives and use of the IOC and for the organizing committee of the Games.

Pool privileges are also made available to a very limited number of other photographers. One photographer each from the IOC and from the organizing committee is ordinarily given pool privileges and, for 1984, each International Federation was given an opportunity to nominate a photographer for its needs. Pool privileges for such IF photographers were limited to the venue(s) used for the particular sport involved.

23.09.3 Operation of the IOPP and NOPP

Since the composition of the IOPP cooperative was well known as early as 1982, the LAOOC's attention was focused on the selection of an entity or group to serve as the National Olympic Photograph Pool. The LAOOC's interest was to properly service those

photographers coming to the Games as well as to provide itself with a complete and useful archive of images for use in post-Games reports at no cost to itself. For a group seeking to become the NOPP, the advantage consisted mostly of the large number of photographic credentials available (24) to the NOPP, a total larger than could be granted by any National Olympic Committee. After approximately one year of discussions with a wide variety of photographic entities, the LAOOC accepted the offer of the *Los Angeles Times* Photographic Department to provide NOPP services. An agreement was concluded in December 1982, in which the *The Times* agreed to provide:

- Twenty-four competent photographers for photographic coverage of the 21 competition and two demonstration sports in the Games, in both black-and-white and in color
- Procedures for taking individual requests for coverage from accredited journalists
- Processing of its film and the display prints and slides at *The Times'* photo laboratory in downtown Los Angeles rather than at the Main Press Center
- A viewing area and order/sales office at the Main Press Center
- Processing of duplicate black-and-white and color prints and duplicate color slides at *The Times'* laboratory, for sale at the MPC
- Telephotographic services, including two lines and machines compatible with modulus 352 transmission pattern, using a drum with speeds of 30, 60 or 120 revolutions per minute, with journalists responsible for their own line charges
- Sets of photographs taken and displayed for the IOC and LAOOC, complete with any indices compiled by *The Times*

The LAOOC, in turn, agreed to provide:

- Twenty-four accreditations for NOPP photographers and additional accreditations as necessary for *The Times* technical personnel
- Four journalist access passes into each of the Olympic villages
- Priority processing for NOPP film
- Priority parking for NOPP photographers

The NOPP requirements eventually totaled 24 photographers, three editors and 14 technicians, for a total staff of 41. The NOPP order/sales office in the MPC was open from 0800 to 2400 hours, with the busiest hours from 1000 to 1600 hours daily. In all, 1,421 black-and-white prints were displayed and 838 color transparencies were available at the NOPP office, with 397 black-and-white prints and 894 transparencies eventually sold. Film was usually processed and pictures edited and readied for display within three hours after film delivery to *The Times* offices. For each picture selected, six prints were made, including copies for the IOC, LAOOC, IOPP, the NOPP office and two copies for internal use by *The Times*. Orders for black-and-white prints were filled within three hours, with each print costing \$25. Twelve duplicates of each

color transparency were made, including copies for the IOC, LAOOC, IOPP, NOPP office, two copies for use by *The Times*, with the remaining six copies available at the NOPP office for immediate delivery to anyone who requested that image. Thus, delivery of transparencies was usually immediate, although thousands of eventually unused duplicates were included in the 21,000 duplicate transparencies processed by *The Times*. In rare instances when the available stock of certain transparencies was depleted, additional duplicates were always available within five hours of the time an order had been placed. Sale price of transparencies was \$30 each, with cash, personal and traveler's cheques accepted. Requests were received for certain images even one week after the event had taken place. Color prints were available at \$40 each, but no interest was shown in these; additional color transparencies could have been sold had *The Times* been prepared for the great interest shown in them.

The NOPP also had its own motorcycle messenger corps, consisting of eight retired police officers, and utilized a helicopter transport from Lake Casitas, site of the rowing and canoeing competitions, and from Fairbanks Ranch for the second day of the three-day event in equestrian. Parking for the NOPP usually consisted of four passes per venue, including one for a photographer, one for a messenger and two for administration.

The International Olympic Photographic Pool was coordinated by the Associated Press. A separate IOPP lab was constructed in the MPC, adjacent to the Associated Press' own photo lab, and the 24 photographers and additional technical personnel operated out of that area. Although only 18 photographers and 12 technical personnel were accredited as IOPP staff, the actual totals were larger since photographers and technical personnel from the accredited staffs of the members of the cooperative (AP, EPU and UPI) also worked with the IOPP. Eight persons were also given Main Press Center-only accreditations.

An agreement with the IOPP and its members was also executed by the LAOOC in April 1984. As with the NOPP agreement, the LAOOC agreed to provide accreditations and special identification passes for pool photographers, priority parking and processing for the IOPP and raw space in the Main Press Center for use by the IOPP in erecting and operating its own laboratory during the Games. The IOPP agreed to participate with the NOPP in a full exchange of images program and to provide the IOC and LAOOC with copies of those IOPP images selected for use by the IOPP or its members.

News Relations and Press Operations

Summary of National Photo Pool activity (at the Main Press Center only)

Date	Black & white photographs displayed	Black & white photographs sold by NOPP	Color transparencies displayed	Color transparencies sold by NOPP
28 July	48	1	38	7
29 July	104	2	57	14
30 July	71	8	53	23

Totals	1,421	397	838	894

(1) Charges included \$25 for black-and-white prints, \$30 for duplicates of color transparencies and \$40 for color prints.
(2) NOPP office hours from 0800-2400 daily; the busiest hours were from 1000-1600 daily.

IOPP operational requirements included arrangements for 15 messengers (including ten access/drop-off passes) and parking for one car at each venue, with two passes required for some of the larger venues.

23.09.4 Identification of photographers and the use of bibs

Given the split in access between pool and non-pool photographers and the additional burden of eliminating unaccredited photographers from reserved positions in the venues, it was important to devise a simple but effective system of identification of photographers in the venues.

The possibility of using the accreditation card as a determining factor was logical but required too much effort, since photographers often move about quickly, eliminating the ability of a photo marshal to stop them and check badges. Armbands were also considered but posed the same identification problem as accreditation cards in some areas because of their small physical size. Vests or bibs had been used for pool photographers in the past but rarely for non-pool photographers. They offered the considerable advantages of larger size, easier visibility and the possibility for coordination with the LAOOC's color scheme in and around the field of play. In addition, by requiring that these bibs/vests be worn at all times, photographers would be uniformed to a degree. Some competition officials complained after the 1983 events that the unkempt appearance of some

photographers, dressed comfortably in order to carry heavy and sometimes unwieldy equipment, detracted from the venue decor in the field of play area. The use of bibs/vests was at least a partial solution to these concerns.

The Press Operations group decided in mid-1982 that bibs would be the most appropriate way to identify pool photographers as distinct from non-pool photographers. The 1983 events utilized a bib system for field of play access and the photographers were most cooperative. The LAOOC's official camera sponsor, Canon, agreed to produce these bibs, the design of which was finalized in August 1983. At the suggestion of members of the IOC Press Commission, it was decided to assign bibs to all photographers and to individually number each bib. By this method, an easy identification system was created in addition to the accreditation badge in case of disciplinary problems. An offending photographer whose small accreditation badge was unreadable except at point-blank range could be easily identified from more than 50 yards away via the bib number. Bib designs included a number on both front and back, with the words "Accredited Photographer" or "Pool Photographer" on one side and "Games of the XXIIIrd Olympiad" on the other. The front and back designs were purposely made different in order to foil unscrupulous individuals who might try to "manufacture" their own bibs by splitting one in half and wearing only that half to a venue site. Pool bibs were chrome yellow in color, with vermilion trim. Pool bibs were numbered from 10 to 109 (100 total) to prevent anyone from wearing a bib numbered 1 while accredited photographer bibs were produced in an original quantity of 500, with a re-order of 100 placed during the Games.

It had been anticipated that bibs would be handed out at the time of accreditation along with press gift packages. In view of the overwhelming amount of activity taking place in the accreditation area, however, the bib dissemination responsibilities were switched to the Press Operations offices on the second level of the Main Press Center and were directed by the manager of photographic services. This added the advantage of personal contact between the photographers and someone they could turn to in time of need turned out to be beneficial to both sides.

Pool bibs were distributed to the International and National Pools (24 each), to the IOC's photographer (one), to the member of the IOC Press Commission responsible for photography (one), to the LAOOC's official photographers (two) and to the LAOOC's documentary group (four). It was agreed during the Games to provide one pool bib to a still photographer from the host broadcaster, bringing the pool bib distribution total to 57. Federation photographers who had pool privileges in the venues of their sport were given a non-pool bib imprinted with the pictogram of their sport, signifying their special status for that sport alone.

23.09.5 Photographers' positions in the venues

It was essential that the LAOOC provide proper positions for photographers with sufficient access and working room to produce good pictures. While photographers had been assigned to areas in the press seating sections or other difficult-to-work-in locations at previous Games, the Press Operations group was determined to bring the photographers close to the action while not disturbing the competition itself.

Planning for photographic positions began in November 1982, 20 months prior to the Games. A survey was made over a four-day period at 16 venues, with detailed discussions regarding four other sites. With a firm grasp of photographic requirements more than one and a-half years prior to the Games, the Press Operations group was able to speak forcefully on their behalf during the planning stages for each venue and in meetings with the technical delegates of the International Federation concerned and to reserve areas which had not been available to photographers in some prior Games.

In general, most sports required a field-of-play level shooting opportunity and a second, smaller position at an

elevated level to give an overall perspective of the playing area. Differences in regional photographic tastes had to be accommodated and the number of positions necessary depended not only upon the popularity of the sport but also on the event schedule of the Games. Requirements in Los Angeles fluctuated depending on potential conflicts with other, perhaps more important, events.

In order to acquaint photographers with their working areas, venue diagrams illustrating not only press interview zones, seating and working areas but also the photographic shooting positions were published in "Facilities for Journalists, Volume 2" in May 1984. Although it would have been preferable to distribute such a volume in January or February of 1984, the diagrams had a positive effect on the preparations of photographers coming to the Games. Information on venue lighting and color temperature conditions to assist photographers in film and lens selections were also published in both "Facilities for Journalists, Volume 1" (distributed in March 1984) and Volume 2.

The major concerns in the photographic working areas included positions for athletics, basketball, boxing, canoeing/rowing, gymnastics, shooting, swimming, weightlifting and yachting. Most of the other sports had sufficient positions to handle the photographers who attended, with space reserved on the field of play or just outside it, and an elevated position of some type, usually in a reserved section of the spectator seating areas. It was emphasized as well that photographers would be able to work from unoccupied seats in the spectator sections, as long as they were not disturbing spectators and would leave if a spectator holding a ticket for the seat being used by a photographer arrived. This required a close liaison with the leader of the stadium seating attendants, security guards and/or ushers, but was extremely effective in alleviating overcrowding in popular photo positions.

At the Los Angeles Memorial Coliseum, site of athletics, it was decided that due to the narrowness of the areas outside the running track, no moat would be built for the use of photographers. An early survey noted that a 42-inch depth (with a five-foot width) would have been sufficient, but no moat was planned. Instead, use was made of existing grassy areas along the home straight and on each of the curves. In addition, a four-row-deep section of spectator seating was reserved directly opposite the finish line. During most sessions of athletics, more than 150 photographers crowded into the Coliseum, with almost 100 concentrating in the area looking down the home straight toward the approaching runners. Already crowded by the placement of the awards platform nearby, photographers were squeezed into an uncomfortable but workable area where four rows of equipment and

people were eventually set up. Remote cameras were situated on the ground, usually supported by short-legged tripods not higher than one foot off the grass surface. A first row of photographers was either seated on the ground or kneeling, while a second row sat on a two-foot high bench and used either hand-held cameras or cameras mounted on monopods. The use of monopods was enforced as some photographers took unfair measures in the early sessions to mount large tripods taking up two and three positions. The back row of photographers was standing and some did use tripods since no other photographers were in back of them. An early difficulty with the placement of two television cameras on risers in front of the photographers was eliminated after discussions with the host broadcaster resulted in the cameras being moved behind the photographers. Messengers and other auxiliary non-shooting personnel were required to stand back near the television cameras, behind the photographers. Technical delegates of the IAAF were concerned about the preservation of the protocol of the awards ceremony and required a physical restraint at the side of the awards area to prevent photographers from rushing the platform. This decreased the shooting area further but did preserve the appearance and dignity of the awards procedures. Although far from perfect, this main shooting position for athletics proved workable. Other positions in the Coliseum were fully satisfactory for photographic use. Of note was a specially-built elevated platform erected for the use of still photographers and unilateral world broadcaster cameras on the concourse level of the Coliseum, looking down the home straight. It was heavily used and its location behind the spectator seating areas made it unobtrusive.

At The Forum, site of basketball, there was considerable discussion over the use of photographic seating positions on the playing floor court ends. Eventually, it was agreed that four positions would be available on each side of the basket at each end of the court for a total of 16. Reserved seating for photographers was arranged with eight seats in the first row on each side of the basket on both ends of the court available for a total of 32 and a total floor level seating capacity of 48. For the men's gold medal game, an increase in the on-the-floor positions to 22 was arranged without difficulty and ten more positions could have been made available without

substantial additional strain on the court area. The venue press chiefs responded to the great interest in the on-the-playing-floor positions by instituting a sign-up procedure for the on-the-floor positions not taken up by the IOPP or NOPP. Sign-ups established a priority order for replacing photographers who left any of these positions. Photographers cooperated with this system and often gave on-the-floor positions up after a few minutes to allow a colleague to shoot from the same area.

At boxing, ringside positions were available only to the pools. Non-pool photographers had positions arranged at the back of the press seating areas, located on the floor-level bleachers. Although some doubt had been voiced as to whether these positions would allow a view over the top ring rope, they proved to be adequate. A secondary set of positions was established on the concourse level, looking down into the ring from areas not being used by handicapped spectators.

Positions for canoeing and rowing were made difficult by the use of an existing lake which provided few areas for photographers to stand while following the races. The host broadcaster agreed to allow three photographers and a photo marshal on each of the three stationary houseboats it was using on the course and additional positions were arranged for head-on views as well as a position opposite the finish line on the shore. Photographers did not make much use of the houseboats, since they had to remain there during the entire competition period and were, therefore, unable to photograph awards ceremonies. Most of the photographic interest was limited to the shore area, directly across from the finish line and near the awards platform. There was sufficient space to accommodate everyone and photography proceeded smoothly at this site.

Gymnastics was going to be one of the most-photographed sports in the Games. In preparation, the LAOOC set up reserved walkway areas along the sides of the competition podium and also at the end, on the lower lip of the press seating platform. On the peak day, 160 photographers crowded into the area without substantial difficulty. Their ability to get coverage of the various apparatuses from three sides of the podium proved to be fully sufficient.

The shooting venue suffered from a common problem in the construction of the range houses. Although the targets were outdoors, the shooting area was roofed, affording some relief from the heat for the competitors but completely hindering photographers' ability to photograph the shooters. Photographers did their best in these areas and asked some of the competitors to pose after completion of their rounds. This caused no problems and other opportunities for taking pictures were available in the skeet and trap events, which were held completely outdoors.

Summary of venue lighting conditions

Sport	Venue	Balance	Footcandles	Light type	Color temperature
Indoor venues:					
Basketball	The Forum	Daylight	80-125	Metal-Halide	5400-5800 K
Boxing	L.A. Sports Arena	Tungsten	80-125	Incandescent	2830-2930 K
Fencing	L.B. Terrace Theater	Tungsten	64-80	Incandescent	3100-3200 K
Gymnastics	Pauley Pavilion	Tungsten	80-125	Incandescent	2910-3330 K
Handball	CSU Fullerton	Daylight	64-125	Metal-Halide	6150-7200 K
Judo	CSU Los Angeles	Daylight	160-250	Metal-Halide	5320-5600 K
Volleyball	Long Beach Arena	Daylight	160-200	Metal-Halide	3900-4800 K
Weightlifting	Gersten Pavilion	Tungsten	160-250	Incandescent	3090-3530 K
Wrestling	Anaheim Convention Center	Daylight	125-250	Metal-Halide	5750-6300 K
Outdoor venues:					
Athletics	L.A. Memorial Coliseum	Daylight	N/A	Metal-Halide	5600 K
Baseball	Dodger Stadium	Daylight	N/A	Metal-Halide	4000 K
Football	Rose Bowl	Daylight	N/A	Metal-Halide	4000 K
Water Polo	Pepperdine University	Daylight	N/A	Metal-Halide	4000 K

Swimming had been one of the most vexing venues for photographers in past Games. Although shooting positions close to the deck are required, Olympic photographers, with the exception of pool photographers, had never enjoyed positions on the deck level. Trial deck positions for photographers during the 1983 events proved successful, although FINA objected to the aesthetic appearance of the photographers, who were not clothed all in white as were all FINA deck officials. A compromise was reached when a restricting fence was planned, with an opening of approximately 18 to 24 inches beginning at the four-foot level, allowing photographers to shoot through the glassless opening. With 50 yards of cleared area all along the poolside, photographers had an opportunity for coverage not available at prior Games. However, late changes in the spectator seating plan at the venue caused the addition of staircase exits for fire safety purposes. Since these were placed within the photo runway area, the available space was reduced by almost 60 percent. This caused intolerable crowding in the first afternoon session, which was corrected after consultation with the local fire officials the next day. Adequate room was available for an average of nearly 140 photographers present for the afternoon sessions.

At weightlifting, photographers had traditionally been placed at the sides of the lifting platform and had no access to positions in front of the lifters, eliminating any possibility of photographing the lifters against a backdrop of the scoreboard, a dramatic image. Because of the layout of the platform area, photo positions at the side of the platform were limited to five on each side for a total of ten.

Additional positions were available, however, in front of the lifters and against the scoreboard backdrop. The difficulty came, however, in the blocked line of vision between the photographers and the platform because of the position of the International Federation officials. This difficulty was never actually resolved, though, because these officials were not always present and the photographers' vision was only occasionally obstructed. An auxiliary photographic position was set for ten persons at the back of the venue, on either side of the main television camera platform, and this helped to a minor degree. It would have been better to have built the photo seats with a slight elevation to eliminate the problem of trying to look through those people seated directly in front of the photographers.

Yachting required the use of photographer boats, which were small enough to work relatively close to the competitors and marks without causing problems of disruption or wake. Eight boats carrying four persons each had been planned (total: 32) but the greater-than-anticipated interest in photographic coverage led to the addition of two more boats, which were assigned to the two courses in which there was the greatest interest that day. Thus, the actual total was 40, with all boats following the competitors from approximately 50 yards away. With the immense interest in this sport, photo

positions on these boats were assigned on a first-come, first-served basis, with overflow media assigned to the press boats which were stationed 100 yards away from the competitors. The idea of placing small barges at some of the major marks was considered very late but dropped because of lack of time to build and anchor the devices properly.

For the Opening Ceremonies, all photographers were admitted and assigned, via tickets, to specific shooting positions in the Coliseum. Photographers were required to report to the Coliseum area and be escorted to their positions at 1300 hours for the ceremonies beginning at 1630 hours. Each group was escorted by LAOOC photo marshals to its area and set up calmly and without incident long before the beginning of spectator entry. The calm and precision with which this was accomplished gave the photographers confidence that the LAOOC had properly prepared for their needs.

Equally important in gaining the confidence and respect of the photographers was the all-photographers meeting held in the main interview room of the Main Press Center on 26 July 1984, two days prior to the Opening Ceremonies. The IOC Press Commission member responsible for photography and the LAOOC's manager of photographic services were present to explain the basic guidelines for photographic coverage of the Games and in particular for coverage of the Opening Ceremonies and other events which would require ticketing. With 475 persons in attendance, this meeting provided a valuable forum for the organizers to set the tone for the days to follow.

Lighting of the venues varied depending upon the existing installations and the additions made by television. The LAOOC's list of venue lighting specifics published in "Facilities for Journalists," Volumes 1 and 2, helped to prepare photographers for conditions in Los Angeles and Fuji delivered an additional, more detailed listing, with color-correcting factors, a few days into the Games. Lighting conditions were generally about 125 footcandles (1345 lux) and the LAOOC contracted to have all interview rooms set at that level, with tungsten balance. Interview room lighting usually required four to six lights each, with two power circuits of 100 volts a. c., each with a 30-ampere capacity.

23.09.6 Camera repair

The LAOOC concluded an agreement for camera repair services in May 1980 as part of a sponsorship agreement with Canon, U.S.A., maker of 35 mm camera equipment. Canon agreed to provide camera repair services for accredited photographers to the Games, including a camera loan program and repair facilities at the Main Press Center and at other venues as deemed necessary.

Canon set up its main service bureau at the Main Press Center in a 4,801 sq. ft. (446.25 sq. m) area, with space for calibration, cleaning and repairs, a photographer's lounge and its equipment loaner program. Canon personnel provided repairs for all brands of photographic equipment, subject to the availability of parts. Equipment which required extensive repair was held in the workshop area and photographers were free to use the equipment loaner program. Canon camera bodies, with and without motor drives, and a wide variety of lenses were available to accredited photographers on a first-come, first-served basis. Canon's main service bureau was open from 0900-1800 hours from 14-24 July and from 0600-2400 hours during the period 25 July-12 August.

Auxiliary service centers providing repair services only were located in the sub-centers at athletics/boxing, fencing/volleyball, gymnastics/UCLA Village and at the swimming/USC Village site. Hours of operation were generally 0900-1800 hours during days of competition at those sites only. Use of these stations was very light.

23.09.7 Film processing

The task of film development and related services for accredited photographers was undertaken by Fuji Photo Film Co., U.S.A., under a sponsorship agreement signed with the LAOOC in November 1981. Fuji also agreed to donate a limited amount of

News Relations and Press Operations

its film to the LAOOC for its own use while the LAOOC agreed to provide the raw space necessary for the construction of the film processing lab within the Main Press Center.

Fuji's laboratory of 15,962 sq. ft. (1,483.5 sq.m) was believed to be the largest in Olympic history and offered film processing, film sales, film viewing and private darkroom services to the accredited photographers at the Games. In all, Fuji processed 43,260 rolls of film during the Games and made 5,837 color prints in the 8 x 10-inch size.

Available processing services included 120 or 135 size black-and-white film, with one-stop push processing available for most film and two-stop push processing available for Fuji Neopan 400 and Kodak Tri-X-Pan film only. Color negative film processing was available for the 135 size only, using the CN-16/C-41 process with no push processing available. Color reversal film could be handled in either the 120 or 135 size, using the CR-56/E-6 process only, with one-stop pushing available for most film and two-stop pushing available for Fujichrome RSP (daylight) and RBP (tungsten) reversal film and Kodak E-6 compatible reversal film. Duplicating film compatible with the E-6 process was handled in the 135 size only, in lengths up to five feet/160 cm. Full-frame, glossy-finish color prints in the 8 x 10-inch format were available from 135-size original negatives only and were produced with border with an image coverage of 16.2 cm by 24.4 cm and with a 3.6 cm white space at the bottom for captions. Prints cost \$3.50 U.S. each, payable at the time of pickup.

Most of the photographers requested processing for color reversal (transparency) film, as 33,022 rolls were processed (5,292 from 14–27 July and 27,730 from 28 July–13 August) versus 6,067 rolls of color negative (print) film (1,312 and 4,755), 4,171 of black-and-white (1,055 and 3,116) and 5,837 color prints (770 and 5,067). Push processing for color reversal and black-and-white film was popular; 69.4 percent of all reversal film was push processed and 65.6 percent of all black-and-white film was pushed. Although a priority processing system had been set up for film taken by the IOPP and NOPP to ensure processing within two or three hours, Fuji managed to process all color negative and color reversal film turned into its lab within that period, with black-and-white film usually available within one hour. It had been expected that most processing would require a three to five hour turnaround period. All film was returned uncut in plastic sleeves.

Photographers were required to place their film inside specially-made Fuji envelopes for processing. These envelopes were manufactured in different colors marked for highest (AAA), secondary (AA) and lesser priority (A). Highest priority was assigned to the IOPP and NOPP, the IOC's photographer, the LAOOC's documentary and staff photographers and federation photographers. Secondary priority was assigned to the international agencies (AFP, AP, EPU, Tass and UPI), with all other media in the remaining category. Duplicating film had the lowest priority. Processing envelopes had space for each photographer to note his name, organization and the type of film enclosed with any processing instructions. Each envelope was identified by a six-digit number and a bar code matching that number, which was read by Fuji's computerized film log system, which tracked the progress of all work turned into the Fuji MPC lab. A claim tag system forming an audit trail of the film envelope as it progressed from the venues to the lab and back into the hands of the photographer was established for use by the photographer, LAOOC venue sub-center, LAOOC Main Press Center film drop depot and Fuji. Photographers were required to produce their claim tags in order to claim any processed film. The computerized tracking system worked well and very few rolls of film were reported missing, although about 60 rolls of processed film were never picked up.

Fuji further assisted photographic media with its film sales counter, at which were sold 12,681 rolls of film, in addition to the 10,000 rolls of Fujichrome tungsten film which were given away to accredited photographers.

Auxiliary services available to the photographic media included 25 light tables and six projection areas for editing of processed film and individual darkrooms for do-it-yourself processing and printing. Twenty-one darkrooms were available for two-hour increments free of charge on a first-come, first-served basis. Fifteen darkrooms had facilities for developing black-and-white film and making black-and-white prints, including sink, film dryer, enlarger (with easel, 50 mm and 75 mm lenses and timer), print processing trays and print dryer. Six darkrooms had facilities for making black-and-white prints only, including sink, enlarger, print processing trays and print dryer in four, with two larger darkrooms equipped with two enlargers and one automatic print processor each plus a sink, print processing tray set and print dryer. Chemistry was provided in liquid form at no charge, including a D-76 type film developer, D-72 type print developer and Kodak Rapid Fixer fixing solution. Film development tanks and other enlarger accessories were available for use at no charge at the darkroom rental counter. Printing paper was not supplied but was sold in

three contrast grades in 20-sheet packages at the Fuji sales counter, or photographers were free to bring in their own brands.

Fuji SD690 enlargers were provided for use by agencies which had arranged for their own darkrooms. A total of 36 such enlargers, equipped with 25 x 30 cm easel, 50 mm and 75 mm lenses and timer, were made available, with 32 used by various organizations. Four of the enlargers were used by the LAOOC at the remote film processing trailer at Lake Casitas.

The Fuji MPC lab was open from 14 July to 14 August, and accepted film for processing up to 1900 hours on 13 August. From 14–22 July, the lab was open 0900–1900 hours daily and open 0900–2100 hours daily from 23–27 July, 0700–0200 daily from 28 July–12 August, 0700–1900 hours daily on 13 August and 0800–1000 hours on 14 August for pick-up of developed film and prints only.

The LAOOC provided a small laboratory at Lake Casitas for the use of photographers covering the rowing and canoeing competitions. This lab was located in a trailer behind the grandstands. Used occasionally by most photographers, but heavily by one wire service, the trailer was installed to meet the needs of those media who did not have time to send their film to Los Angeles for development at the MPC, then wait for development before printing and transmission. The lab at Lake Casitas was self-service and was equipped with four sinks, film developing tanks and timers, four enlarging stations courtesy of Fuji (each with easel, lenses and timer), stabilization processor (courtesy of the Associated Press) and a small light table. Photographic chemistry was provided in liquid form at no charge.

The LAOOC carefully tested the sensitivity of the high-speed film available against the X-ray equipment used to scan the bags of those entering the Olympic Villages and found that no fogging occurred, even after repeated uses. The tests were conducted with the cooperation and guidance of both the IOPP and NOPP representatives in Los Angeles in April 1984.

23.09.8 Transportation of film

The vital link between the photographic positions in the venues and the Fuji laboratory in the Main Press Center was an organized system of speedy transportation for film. Without such a link, the speed of the Fuji development process could only have served to help save lost opportunities because of slow delivery to the processing area.

After considering several alternatives such as messengers on the press bus system and some conventional messenger services using automobiles, the LAOOC decided to examine the possibilities of using motorcycle-mounted messengers as a faster way to deliver exposed film picked up from a single point at each of the venues. In this way, the messenger would only have to report to a single place, pick up the film and ride back, with the ability to sift through traffic more quickly because of the motorcycle's smaller size.

An agreement was reached with a motorcycle messenger group in early 1984, providing for 40 riders and additional auxiliary staff, as necessary, available from 23 July–12 August 1984, using motorcycles provided by the LAOOC. The Organizing Committee also agreed to provide fuel, early access to the motorcycles for testing and training purposes, appropriate accreditation for the riders and auxiliary staff, as necessary, office space at the Main Press Center, reserved parking at the MPC and uniforms for the riders.

A schedule was worked out, sending riders to venues at designated times during each day of competition for a maximum of 35 riders, with five held in reserve. Larger venues had scheduled pick-ups every one to two hours, while less popular sports had pick-ups scheduled once or twice per competition session. This proved satisfactory for all groups except the IOPP and its members, AP, EPU and UPI. Noting their special needs and transmission times for certain key events, it was arranged for the IOPP/members to have three "wild card" pick-ups per day, at the venues and times of their choice. After the daily meeting of the IOPP team leaders each afternoon, they informed the LAOOC of their desired additional pick-up venues and times and the information was passed on to the motorcycle messenger service dispatcher. The venue press chiefs at those venues were notified as well through the Electronic Messaging System of the additional pick-ups so that they could plan accordingly. These measures proved successful in meeting the needs of the IOPP and its members.

At each venue, it was important that the film be properly collected, counted and ready for the motorcycle pick-ups at the designated times. In order to keep the messenger on the road rather than at the venue, each venue press chief assigned intra-venue messengers to visit each photographic position at designated intervals to collect photographers' film. Film had to be sealed in Fuji or agency envelopes and marked with at least the name of the photographer involved. All film was returned to the venue press sub-center and combined into specially marked

nylon bags used for film transport. Fuji envelope claim tags for the sub-center were removed and the shipment was handed to the motorcycle messenger on arrival for return to the MPC. Although the internal messengers were uniformed and became familiar to many of the photographers after a short period, it would have been helpful to place some additional identification on them, such as a photo-type bib/ vest, noting their responsibility for film pick-up. The venue press chief at any venue had the authority to hold a motorcycle messenger until another round of internal pick-ups had been made and this occasionally resulted in a late return to the MPC. Generally, however, the pick-up and return of film was quite rapid.

Upon return to the MPC, the motorcycle messenger delivered the film bag to the LAOOC's film drop point in Yorty Hall. LAOOC staff members sorted the film delivered into two groups: those sent in Fuji envelopes and ready for delivery to the Fuji lab for processing and those sent in the envelopes of particular news agencies. The film sent in Fuji envelopes was delivered to the Fuji lab immediately, while film in agency envelopes was sorted by agency and delivered to those agencies for their own handling. This program proved to be dependable and fast and left the handling of film in the trained hands of the LAOOC, rather than with the motorcycle messenger or the Fuji lab, especially for those rolls delivered in agency envelopes.

The motorcycle messenger office in the MPC served as a dispatch office, meeting place, payroll office and rest area. The room was equipped with EMS and telephone equipment and radio communications proved unnecessary. Fewer than five United States newspapers and magazines used their own messenger services, working with access passes to pick-up film at designated points. No foreign agencies used their own messengers, although the NOPP employed eight off-duty police officers for this purpose and had great success.

23.09.9 Use of photographers for record purposes by the LAOOC

The LAOOC faced thorny problems in trying to fulfill its own photographic needs for the Games. While a wealth of images of the competition and ceremonies of the Games would be available from the IOPP and NOPP, photographic records of the administrative and other behind-the-scenes areas had to be covered as well. In addition, the LAOOC had its own requirements for coverage of items in full view of all photographers, but in which there was little interest on the part of most photographers, such as the competition equipment and technology devices on the field of play and the uniforms worn by the LAOOC's staff on the field and in the stadium. While the LAOOC had arranged for a staff photographer since mid-1983, the amount of coverage possible by a single individual was obviously limited.

Moreover, many of the LAOOC's sponsors and suppliers had demanded photographic and press accreditations, required to record images necessary for use by those organizations. Although the LAOOC referred all such matters to the NOC of the United States, it was clear that such accreditation requests would almost certainly not be granted.

In late 1983, the LAOOC contracted with Long Photography, Inc., a Los Angeles-based photographic firm which was well known in sports photography circles. Under the agreement, Long provided two photographers to act as a documentary group and photograph the activities of the LAOOC from 25 June to 17 August 1984. These photographers worked on a scheduled basis under daily assignment by the LAOOC to record all relevant activities of the LAOOC, including venue construction, village operations and areas which not only were uncovered by the accredited photographic media for the Games, but were also inaccessible to such media, for example, drug-testing stations. They were accredited during the Games as LAOOC staff members. In addition, Long formed another group of seven photographers to act as a service bureau for requests from non-accredited or insufficiently-accredited news media and LAOOC sponsors and suppliers for coverage of the Games and to provide additional photography for the LAOOC for use in its own publications and in the *"Official Report of the Games of the XXIIIrd Olympiad."* The offering of services to sponsors and suppliers was in accordance with a pre-established rate card of Long, ensuring that clients of the Long group would not be subject to price changes close to the time of the Games. The LAOOC protected itself against crowding in the major venues through this service group by including a contractual requirement that no more than one of these seven photographers be present in any one venue at any one time. The LAOOC agreed to provide logistical support including accreditation, communications equipment, office space at the MPC, parking and priority processing for the Long group.

Long also agreed to provide lighting equipment and installation for all of the LAOOC's formal interview rooms at the venues.

Assignments for the documentary group were completed in mid-June and shooting began on schedule on 25 June.

Unusual photographic opportunities and talents led the LAOOC to accredit two additional photographers close to the time of the Games. The Organizing Committee agreed to allow one photographer into only the Coliseum for the Opening Ceremonies, athletics competition and Closing Ceremonies, shooting solely from a single elevated position during each event. Shooting from the west end during the Opening Ceremonies and from the top of the peristyle during Athletics, this photographer took a remarkable set of photographs which was made available to the LAOOC for its own use at no charge. A second photographer was accredited to photograph only the design and Look elements of the Games, again producing remarkable results. In all, the LAOOC accredited nine photographers with "EP" badges and two additional documentary photographers as staff in addition to its already existing two-man staff photo team.

23.09.10 Analysis of photographic services

The Organizing Committee provided a high standard of photographic services for accredited photographers. Working photo positions generally provided a clear view of the competition and were amply spacious to accommodate almost everyone who wanted to work at any particular site. In addition, all photographers were able to shoot the Opening Ceremonies, despite the lack of photographers' pit or moat as is now common in stadiums constructed today. Camera equipment support in the loan and repair areas was fully sufficient. Fuji's efficient film processing and host of additional services set a new standard in Olympic photographic service levels. Film transport was usually dependable and was sufficiently flexible to allow the return of film marked for use by the LAOOC's film processing sponsor or by an individual agency at the Main Press Center. The organizers also settled their own photographic needs by cooperative agreement with the International and National Olympic Photo Pools and alleviated unnecessary anguish over documentary and sponsor service problems by contracting with a leading sports photography firm and placing rigid requirements on that firm in order to control its activities.

Planners of future Games may find it worthwhile to consider some of the difficulties encountered and solutions offered in Los Angeles:

- Photographers are the most challenging segment of the written media. They require a better view than the highest-paying spectator, more personal working room than their journalist colleagues, better lighting than their television brothers and special assistance in the collection, delivery, processing and transmission of their film and pictures. They are well-known for their sometimes uncooperative attitude, unkempt appearance and

for a competitive nature which borders on paranoia vis-a-vis their fellow professionals. Yet, when given the opportunity, they can capture images which cannot be described in words but convey our experiences with perfect clarity. It is the task of the organizers to provide these opportunities by educating the photographic media through provision of detailed information well in advance so that both sides are well prepared for cooperation during the time of the Games. This was the view of the LAOOC and the minimal difficulties which arose during the Games can be directly attributed to this perception of the needs of the photographers at an early stage.

- It is crucial to understand the limits of the photographic positions in the stadiums and to allow for photographic accreditation accordingly. The greatest pressure put on for accreditation was by photographers, with each additional credential placing more strain on the prime positions at athletics, gymnastics and swimming.
- A meeting of all photographers just prior to the start of the Games such as was held in Los Angeles is very beneficial. Many of the rumors and misunderstood fine points regarding the photographic services at the Games can be explained and illustrated. Such a meeting is an excellent opportunity for the organizers to build confidence in themselves among the photographers by clearly explaining the relevant procedures and responding to the questions and requirements of the attendees. Photographer discipline is much easier to impose after the guidelines have been clearly enunciated within 48 hours of the start of the Games.
- Understanding of the pool and non-pool concept is very important. The pools can provide a rich source of photographic images for use by the organizers, especially from the NOPP, which is selected by the organizing committee. It is also important to note what the pools cannot or will not do, especially in the behind-the-scenes areas. Complete coverage for the organizer will depend on a combination of pool photography and the recruitment of a quality photographic team to record with precision the activities surrounding the on-the-field events of the Games.

- Although the LAOOC managed to provide adequate photographic positions in the Coliseum, it is highly recommended that a moat or photographer's pit be made available in the main stadium. Had the Coliseum been slightly different in configuration outside the running track, the LAOOC would have built a pit approximately five feet wide and 42 inches deep along the home straight and a similar dugout at the beginning of the first turn, looking down the final straightaway. That position proved to be the most difficult in the entire Games for the photographers, the photo marshals and for the International Federation concerned. The elevated platform available for shots down the home straight proved worthwhile.
- Careful liaison and planning with sponsors providing equipment support and film processing will result in fully satisfactory performances in most cases. The LAOOC worked very closely with both Canon and Fuji and was fully rewarded with excellent performances by both in their areas of service.
- Transportation of film is always difficult, even under the best circumstances. It would have been worthwhile to give the intra-venue messengers who picked up film from photographers some sort of identification, such as a photographer's bib marked to identify that person for film pick-ups. Otherwise, many photographers are too busy shooting to notice another one of the many staff people from the Organizing Committee in their area, even when the photographers are well aware of the film pick-up schedule.

23.10 **Press Operations: Transportation**

23.10.1 **Conceptual plan of service**

With competition sites spread across the vast Southern California area, transportation was one of the toughest challenges awaiting the LAOOC. Commuting between sites was difficult enough during non-Olympic periods for those familiar with the local area but figured to be even more troublesome for foreign media who were not familiar with the local system of freeways, ramps and streets. Knowing that parking would be severely limited at most sites, the LAOOC wanted to provide a transport system for the journalists which would meet their requirements and keep them from renting cars and requiring parking spaces. Such a plan would reduce traffic generated by media-related

vehicles and alleviate the confusion of foreign media learning to negotiate the Los Angeles area freeway and street system.

Development of the transport system moved along slowly until September 1983. Many types of programs were suggested, including bus systems, large parking areas well removed from the venues with special shuttles, subsidized taxi fares and others. It was ultimately determined that the system which would provide the greatest service to the largest number of people would be a simple bus system, moving media from their accommodations to their central work places and then to the necessary venues and villages. This system was offered free of charge to all media.

Although some media would certainly rent cars, their number could be reduced with a dependable bus system. Parking requirements were similarly reduced, anticipating that car rentals by journalists would go down.

23.10.2 **Bus system**

Once buses were decided upon as the main vehicle of transport, the system parameters had to be outlined. The basic idea was to eliminate almost all need for journalists to use private cars for their work at the Games. Thus, the journalists had to be transported between their accommodations and the Main Press Center as well as to the venue sites. Because the MPC would serve well as the central dispatching point, the system took basic shape with transport from hotels to the MPC, then from the MPC to the various venue sites. The service required reflected the number of media expected at each site, as determined by the number of seats in the press areas at the venues as well as the timing of the competition sessions. It made little sense to service venues during long between-session breaks or when closed. Conversely, large venues needed frequent service over long periods to bring the many media requiring transport there.

Most media needed to arrive somewhat prior to the start of any session and leave well after, with time to file their reports at the venue sub-center. It was determined that some photographers would like to arrive approximately two hours prior to the start of a session, while most media could probably finish their reports roughly two hours after a session was completed. These were the outside parameters of the system, which also took into account that some media would leave an event midway through and require transport elsewhere and that many would leave the venue immediately after completion of a session.

The eventual system schedule featured continuous, shuttle-type service to the larger venues and occasional service to the smaller ones. The composite below shows the longest hours recorded during all days at a particular site; for example, transport from the MPC to the baseball venue at Dodger Stadium ran 1330–2200 hours on four days, 1030–1900 hours on three days and 0730–1600 hours on one day, thus the earliest/latest times were 0730–2200 hours, which was not offered on any single day.

Another route was added to modify route (4) on 5 August in order to assist media covering the cycling Team Time Trial at the Artesia Freeway.

Media service from their accommodations to the MPC was emphasized in the morning and late evening (post-competition) hours, when media were coming to the MPC and then leaving it for the day. Transportation was offered only to the LAOOC's press hotels and student residences. Media staying at accommodations arranged without LAOOC assistance had to meet the buses where they were scheduled. Service ran from 14 July to 14 August, with hotels blocked into groups for maximum efficiency and the least amount of confusion for the journalists. Los Angeles International Airport-area hotels were grouped into two service routes of three hotels each. Service was provided from 0600–2400 hours on an hourly basis from 14–19 July and on 14 August. Service from 20–28 July was run from 0530–2400 hours, with hourly service beginning at 0600 hours, and half-hourly service from 0530–0930 hours and 1830–2330 hours. Service from 29 July–13 August was run on a 24-hour basis, with additional service on the half-hour between 0530–0830 hours and 1830–0130 hours. The travel times ranged from 34–63 minutes, depending on which stop one boarded. No service was offered on 15 August, since almost everyone was leaving and these hotels featured free or low-cost shuttle service directly to the airport.

Service in the downtown Los Angeles area was similar. Three groups of two, three and four hotels were established. Two of the routes had service every two hours from 14–19 July and 14–15 August, from roughly 0600–2400 hours, with service every hour from 0600–2400 hours during the period 20–28 July. Service was hourly on these routes around the clock from 29 July–13 August. Since many journalists could simply walk to these hotels, it was felt that more frequent service was not necessary. In contrast, the downtown foursome of the Mayflower Hotel, Los Angeles Hilton Hotel, Figueroa Hotel and Holiday Inn/Convention Center had 693 rooms reserved for print media and 320 for Canadian television personnel, requiring very frequent service in order to move everyone in a timely fashion. The route was run from 0600–2400 hours from 14–19 July and on 14–15 August, with service every 30 minutes. From 20–28 July, service was provided every 15 minutes from 0600–2400, while from 29 July–13 August, service was offered every 15 minutes 24 hours per day. Travel times at all downtown hotels to the MPC ranged from two to 14 minutes, depending on which stop one boarded.

Service to the student residences at Occidental college was arranged on an hourly basis from 14–19 July and on 14–15 August with half-hourly additions between 0530–0930 hours and 1830–2330 hours from 20–28 July. From 29 July–13 August, 24-hour service was offered on an hourly basis, with half-hour additions between 0530–0830 hours and 1830–0130 hours. Travel times ranged between 26–30 minutes.

Service from the Los Angeles International Airport (LAX) to the MPC (and the MPC accreditation center) was judged important since journalists would get their first impression of Los Angeles (and the Organizing Committee) at LAX. A questionnaire was sent to National Olympic Committees by mail and telex in June 1984, asking when they would be arriving, including flight number and time, if available. This information helped to pinpoint the proper arrival pattern and buses were sent to greet arriving journalists at LAX from 14–28 July only. Media arriving after that period had to make their own arrangements to get to the MPC. Media not living in downtown hotels were also provided with transport to LAX from their hotels from 12–15 August simply by reservation at the transportation information desk at the MPC. A total of 905 media chose to use the free shuttle to LAX.

A shuttle bus between the MPC and International Broadcast Center was run for electronic media coming from the IBC and needing venue transportation and for journalists who also worked with broadcast organizations. This service ran every 60 minutes from 0630–2330 hours from 14–26 July and on 14 August, with additional even-hour service from 0700–0900 hours. During the period of 27 July–13 August, the service ran hourly on the same schedule with increased even-hour service from 0600–0900 hours and 1800–2400 hours.

All media with category "E" accreditation badges were eligible to ride the system; badges were checked upon boarding. Schedules were printed in a special handbook for media and updated schedules were available on EMS. Although the buses ran as scheduled, additional buses were available if the ridership demand warranted it. This back-up system ensured that sufficient service would be available for the most popular events and that crowding would not be a problem, key factors in building journalist confidence in the system.

In addition to this basic venue service, it became obvious that media wishing to travel among the southern venues would be wasting hours by having to come back to the MPC to change routes. A small venue-to-venue system was developed, operating only on those days when events took place at those venues, making venue-to-venue service necessary.

Media transport schedule summary

Site/Sport	Schedule	Travel Times (Duration and Earliest-Latest)	Sport/Site	Schedule	Travel times (duration and earliest-latest)
Archery: from MPC from El Dorado Park	8-11 August only Departures 3 times daily Departures 3 times daily	50-60 minutes 0700-1330 1345-1930	Gymnastics/Tennis/UCLA Village: from MPC to UCLA to MPC	14-20 July / 13-14 August Departures every 120 minutes 21-28 July / 12 August: Departures every 60 minutes 29 July-11 August: Departures every 30 minutes	40-45 minutes 0800-1930 0800-1930 0630-2200

News Relations and Press Operations

The buses used were non-air-conditioned school buses, which proved satisfactory given the generally mild weather experienced during the period. Media expressing a desire for air-conditioned buses stated that it was necessary only on rides of more than one hour. The school buses usually carried 52 adults, but the expected capacity was lowered to 40 in view of the bulky equipment carried by many media.

A total of 250 school buses carried news media, with 191 assigned to the MPC for primary and back-up duties, 45 to the IBC and 14 to the LAX area and later to the venue-to-venue service in the southern venue area. In all, it is estimated that 196,580 passenger trips were made, with capacity reached only near the end of the Games, with 110,000 trips between the MPC and the venue sites. The bus system proved so efficient and reliable that many journalists who had rented cars and paid for parking preferred to take the buses and left their cars at their hotels or at the MPC. At Games end, almost 7,000 persons (about 80 percent of the media accredited) were using the buses regularly.

Journalists also had riding privileges at no cost on the regularly scheduled buses of the Southern California Rapid Transit District (SCRTD). These privileges did not extend to the SCRTD's specially arranged Olympic bus routes, which carried spectators from remote lots to the event sites.

23.10.3

Car rental and usage

Even though the LAOOC strongly preferred to have media ride the transport system set up for their use, it was clear that some media would require their own private vehicles. Some needed to move equipment from a remote Los Angeles location to the Main Press Center, while others, such as photographers, had heavy equipment for use in the venues.

The LAOOC worked with its official rental car agency, Budget Rent-A-Car, to make automobile rentals available at reasonable rates. On the agency facilities questionnaire distributed in August 1983, rentals were available in compact, full-size and luxury models, as well as station wagons and vans at weekly and monthly rates. Twenty-nine cars were rented by 12 agencies through the agency facilities form:

- Three agencies rented four compact cars
- Ten agencies rented 19 full-size cars
- One agency rented three station wagons
- One agency rented three vans

All of these cars were picked up at Budget's Los Angeles International Airport lot and were returned there.

At the Main Press Center, Budget staffed a booth in the lobby from 0700 to 2100 hours each day except Saturday which was staffed from 0700-1800 hours. Cars were available for rent, at preferential rates, to media possessing valid driver's licenses in their countries of origin, passports and either a cash deposit or valid credit card. Orders were relayed to Budget's main dispatch desk in Los Angeles and renters were picked up by Budget outside the MPC and driven to their rental vehicle.

While the LAOOC did not provide any journalist or press agency with vehicles on a complimentary basis, a taxi stand was set up in the bus terminal area of the MPC for interested media.

The Press Operations Department had a small fleet of its own during the Games consisting of 40 motorcycles, four sedans, 13 station wagons and two flatbed trucks. The motorcycles were used for film transport and messenger services, with the wagons assigned to venue press chiefs and their assistants for various events, including information services coverage of the marathons, cycling road races and equestrian three-day endurance event at Fairbanks Ranch. Some assistant venue press chiefs were given vehicles because of the long drive between their accommodations at Occidental College and their venue, where they were on duty for more than 12 hours daily. The two flatbed trucks were used for the marathons, and the sedans filled administrative and utility needs at the Main Press Center.

23.10.4

Parking

While the LAOOC was designing a media transport system that would eliminate the need for automobiles, it was clear that some media would require automobiles for their own use and would have to park those vehicles. In addition to making rental cars available through its agency facilities questionnaire, parking cards were made available through the agency facilities questionnaire and the journalist's application for accreditation.

It was recognized early that many more media would want to park their cars than there would be space available. It was also clear that in some venues, there was no available space for media to park since other groups had clear priorities; for example, National Olympic Committee vehicles in the villages. Given a probable shortage in supply and because the LAOOC had to pay for all the parking it used in many of the venues, it was decided to charge media for parking which was applied for through the agency facilities and journalist accreditation questionnaires. The costs themselves were derived from the cost of acquiring appropriate parking spaces and the cost of

Press parking allocations

managing and operating a priority parking system during the Games. In the interests of administration, only all-sessions parking was available for the various sports offered, although a sport day-pass had been considered. The administrative burden of making passes for almost every sport available on a daily basis was rejected as too cumbersome and intricate. Only at the Main Press Center was this plan used, where journalists could buy a pass for a single day or buy a pass good for all 32 days the MPC was open.

Parking was offered at all sites except for the Exposition Park area (athletics and boxing), UCLA Village area (gymnastics/tennis/UCLA Village) and the USC Village area (swimming/USC Village). In all three locations, the number of spaces available indicated clearly that no spaces would be available for journalists, and thus, none were ever offered. Many press agencies indicated that their real need was for pick-up and drop-off only and they had no desire to park their car on a permanent basis at any venue. Their requirement for access was met with the "access pass" which allowed card-holders into or near the LAOOC's bus turnarounds at the venues. A person was required to stay in the vehicle at all times and all vehicles with access passes were subject to being asked to move by the transport officers at the sites. Nevertheless, many of the messenger needs for the Games were met with these passes.

Parking fees had to be returned with the application for accreditation or agency facilities questionnaire. Money from unfilled parking orders was transferred to reduce the amount owed for accommodations, if any, or refunded if the journalist or press agency showed a zero balance for other services rendered.

Not surprisingly, parking requests were heavier than supply and priorities were set for distribution in June 1984. First priority went to those identified as photographic media, which included most of the foreign requests. The heavy equipment carried by photographic media made their requests for reserved parking more compelling. Second priority went to specialized media whose accreditation did not let them into the MPC or ride the media transport system. They were forced into using cars unless their accommodations were close by. Third priority went to general media from foreign nations and fourth priority to United States media. Last priority went to non-exclusive television news film crews, whose category "EF" accreditations allowed them only into the venues of athletics, gymnastics, swimming (where no parking was available) and hockey. All parking requests received from rights-holding broadcasters were ignored since rights-holders had their own parking program. Parking passes were arranged at no charge for photographic organizations which had signed agreements with, or were shooting for, the LAOOC, including the International and National Olympic Photo Pools and the documentary and other service groups of Long Photography.

Some additional passes were made available in the month prior to the Games and all legitimate requests were met in some locations. Problems with the lack of Press Operations access to data processing time led to a distribution of parking passes based on an incomplete set of requests. During the pre-Games period while the MPC was open, many journalists complained properly that they had paid for parking yet been denied for no reason when passes at that location were plentiful. These questions were resolved on a one-on-one basis and an audit produced a proper request list just after the Games began. Some passes were also sold at the MPC on a request basis, especially for the canoeing and rowing venue at Lake Casitas.

After accreditation, pass purchasers were issued their cards after accreditation at the distribution desk in the Main Press Center. No maps were issued, but most of the users had little difficulty finding the proper parking locations once they neared the venue site.

The results of the parking pass sales program were good. Most media understood that parking cost the organizers money and that this cost was subject to liquidation through charges made to the end users. The prices set, while not oppressive, did discourage those who might have asked for passes if there had been no cost. However, it may be worth speculation whether as many passes would have been asked for if so much attention had not been given to the parking program, including notice in the agency facilities questionnaire, journalist application for accreditation and the information books "Facilities for Journalists," Volumes 1 and 2.

At the Main Press Center, 1,724 day parking passes were sold at \$10 each, while 525 season passes were sold at \$300 each for the 32-day period from 14 July-15 August.

23.10.5 Analysis of press transportation

The media transport system worked much better than any journalist would have believed and exceeded the LAOOC's expectations for efficiency and service. The careful study given to the exact needs of the media, combined with the back-up capabilities for handling passenger overload, created a system which was dependable, on time and pleasant to ride on. While a school bus-based system is not the answer for every media event, it worked for Los Angeles.

Although the system worked very well, more information could have been made available earlier if staffing had begun sooner. Journalists who rented cars remarked later that they might not have done so if detailed information had been available about the bus system, even six months prior to the Games.

While the bus system ran almost perfectly from the user's standpoint, other areas of press transport services worked almost as well. Some of the important points to be learned include:

- Many options were considered for journalists. Because buses worked well at Los Angeles is no reason to think they will be the answer later. If equipment becomes bulkier, buses become less and less attractive. However, if the currently observed miniaturization of technology continues, buses could become the best answer. It is important to separate journalists from photographers and all written media from broadcasters (especially rights-holders) in making these considerations.
- Air-conditioned buses were not needed due to the generally warm but dry climate in Los Angeles. Passengers would have been uniformly uncomfortable if the humidity had been higher than in Los Angeles (a semi-arid region) and air-conditioning might have been worthwhile for trips beyond 60 minutes in duration.

- Car rental availability was welcomed in Los Angeles and most media arranged for their vehicles without difficulty. The organizers must carefully follow through the initial transaction to be sure that an order placed becomes a car delivered, since the journalists will blame the organizers to whom the order was given rather than the rental car company from which the vehicle was (not) delivered.
- Parking orders must be carefully scrutinized for priorities. Distribution must be based on a full list of requests and may demand a full-time clerk to check the completeness of any compiled list. Nothing is more infuriating to media than to have paid for parking and then be told that no request is shown for them.
- Media can be required to pay for parking where there is a full transport system provided already, and there are out-of-pocket costs to the organizer to provide for such parking. If transport is provided, there seems to be little reason why the organizer must pay for journalist parking, although free parking may be a hedge against transport system failure, at least for that segment which has its own vehicles.
- Where parking passes are provided, maps of the venues showing the appropriate parking area should be provided or many large-sized signs must be erected at the sites to direct pass-holders. Although those holding parking cards in Los Angeles seemed to find their way eventually, many commented that some sort of simple map would have helped in lieu of signs which sometimes did not exist. Simple maps could be combined in the media guide in concert with the site plans used to show press seating and working areas inside the various arenas and stadiums.
- Every press operations group must obtain for itself a small fleet of vehicles for occasional uses. The four sedans and 13 station wagons used by the LAOOC's Press Operations group were of great value and were constantly on the road.

23.11 Press Operations: Venue press operations

23.11.1 Concept and goals

Coverage of the competitions at the Olympic venues is the heart of the work of most journalists who come to cover the Games. Journalists not only need to view the competitions but must also have adequate facilities and space to compose their reports and send them either to the Main Press Center or to their home offices. The organizer's task is to properly prepare for the working needs of the media so that sufficient facilities are available as needed, but without the unnecessary costs or waste of ordering excessive facilities which are later unused.

The most basic requirement is for press seating. A clear, unobstructed view is necessary, preferably close enough to allow reporters to observe the smallest details of the competition. Seats with working tables are needed for those who order private telephones or use portable typewriters or video-display terminals to compose their stories on-site. Easy ingress and egress is necessary to allow journalists to leave their seats for interview sessions or to file stories in the press sub-center and then return. Interview areas are needed to gather information from the athletes, whether in informal post-competition meeting areas or in formal news conference settings following medal ceremonies. Working space away from the seating area is needed for journalists to compose their reports away from unfavorable weather and within reach of telephone and telex facilities, especially after a competition session is completed.

Each of these requirements must be met in the proper proportion at the sites, with the amount of facilities differing in relation to the popularity of the event and the size of the press corps expected. Since the category "E" accreditation badge allows free access into all stadiums for news media, the facilities provided at each site must take into account potentially wide swings in press interest between two sessions within the same day, with no possibility for changes in physical equipment or layout.

Organizing committee staff must be helpful, knowledgeable and thoroughly trained. Their ability to assist the media will depend mostly on their preparation for their position, including expertise regarding the site involved, the sport being played and the needs of the news media in attendance.

The goal of the LAOOC was to provide a satisfactory working atmosphere which would allow journalists to do their jobs in a relaxed environment, free from unnecessary distractions. Staff needed to be attuned to the needs of the media and facilities had to be flexible enough to meet overload requirements without wasting large amounts of equipment or space. Through careful planning, the required facilities were determined, equipment was ordered, staff was selected and the senior venue managers for press operations were trained. These site managers then took responsibility for the venue press operations, arranging the physical facilities and implementing the policies centrally developed by the Press Operations Department.

News Relations and Press Operations

23.11.2 Determination of the equipment and service level

The Press Operations group decided early that each venue's press facilities would fully meet the on-site working needs of the media but would leave out the wide variety of auxiliary services available at the Main Press Center. While sufficient facilities for working journalists were necessary at every competition site, personal conveniences such as banking, newsstands and travel services were better left to a central location dedicated to the needs of the media.

Thus, the initial task in development of venue press facilities was the determination of the requirements for seating, interview and sub-center space and technical support. These physical elements formed the outline of the venue service level and dictated the service requirements for the venue press staff at each site. In order to maintain a relatively consistent service level at each venue, the central Press Operations Department took complete responsibility for formulating the equipment and spacial requirements. The resulting service levels and requirements were then passed on to the venue press staff as selected by Press Operations. This cellular approach to the determination of requirements and training of staff was designed to produce a uniformly high standard of performance at each site, formed by a single department with common goals and training programs for each venue.

The press seating requirements were initially considered in May 1981. The number of seats required, with and without tables, was determined through close study of the facilities provided at past Games as well as in view of factors particular to Los Angeles. Seating plans and quantities were examined from Munich, Montreal and Moscow, noting especially the 1976 experience. The Montreal organizers not only provided a detailed summary of the seats provided, but also the number of seats occupied at all individual sessions. Since the 1976 Games were held on the same continent as Los Angeles and since the distribution of press accreditations in Montreal favored North American nations, the Montreal results were likely predictors of the needs in Los Angeles. This applied especially to the less heavily-covered sports where the seating capacities and attendance in Montreal were used as a basis for setting Los Angeles requirements. Seating quantities for the most popular sports, such as athletics, basketball, boxing, gymnastics and swimming required examination of the Moscow capacities as the perceived requirements in view of the growing number of media present at the Games.

Additional factors considered included the distance and travel times from the likely housing sites and the Main Press Center in downtown Los Angeles and the popularity of certain sports among United States media, who eventually received almost one-quarter of all press accreditations distributed. Actual seat counts were not set until the physical locations were determined in early 1984, since the seating plans of each venue usually required use or disuse of whole rows or sections, rather than just certain seats necessary to make up the requested allocation.

The division of seats with and without working tables was made based on an estimate of the number of media who would order private telephones at the stadiums or would need to write their reports during competition. The precedent of past Games was examined, and, as in the past, about half of the press places at any venue were specified for use without tables. Although press service in the USA usually requires a higher percentage of tabled seats, the multiple seats rendered unusable by the installation of tables and the high cost and long lead time needed for installation required a reduction in the percentage of tabled seats provided at the Games.

Seat locations were hotly debated. Although all sides agreed that journalists require a clear and unobstructed view of the competition, differing opinions were expressed as to the quality of seats to be assigned.

Functionally, press seats should provide a good view of the competition but also be close to the interview areas, mixed zone and sub-center. Moreover, press stands which are not equipped with television monitors for viewing the host broadcaster signal from that site should be located closer to the floor than might otherwise be necessary. The overriding concern must be whether the media can report accurately on the events from their vantage point. In general, media were placed in favorable locations at the sites, were able to properly observe the competition and had easy ingress and egress between their seating areas and the other facilities arranged for them at the venues.

Interview areas were very important and split into two groups: mixed zones and formal news conference areas. Mixed zones were so named because of their functional design which allowed athletes and journalists to mix freely in a designated area close by the field of play, but removed from spectator access to allow uninterrupted contact. The placement of the mixed zone was the determining factor in its success: if placed in an area where the athletes were required to pass as they exited the field of play, the zone was a guaranteed success.

37

38

39

40

37 Journalists have opportunities for informal, one-on-one interviews with the athletes at the venues.

38 Journalists follow the athletics competition from the press seating area at the Los Angeles Memorial Coliseum.

39 Journalists at work at one of the press sub-centers.

40 Press sub-centers such as this one (shown during construction) allowed journalists to file their stories from each competition site, without having to return to the Main Press Center.

Otherwise, many athletes may take routes which would not expose them to the media or which might have been shorter in distance from athlete transport or other services. In well-placed mixed zones, athletes were never required to speak to the media but had the option of doing so. At larger stadiums, short barriers, three to four feet in height, were usually erected to separate athletes and journalists, with interviews taking place over the fence.

Formal interview areas presented athletes in the classic speaker-audience format. A raised platform for the speaker(s) was provided, with microphones for athletes, a moderator and interpreters. The journalists were seated in the audience, with floor microphones provided for sound reinforcement. A multiple-output audio patch box was usually provided for taping the interviews if desired and a raised platform at the back of the room was available for television cameras. Lighting was arranged, as was a backdrop, for each interview room with levels set for 125 footcandles, tungsten balance and a color temperature of approximately 3200 degrees Kelvin.

Working areas made up the venue press sub-centers, which resembled scaled-down versions of the common work areas at the Main Press Center. Racks for information and results, telephones, telecopiers and telex machines, as well as working areas containing tables, chairs, typewriters and access to electricity were always provided. Additional features depended upon the size of the space allowed, but included venue press operations staff office space, beverage service, camera repair and television monitors. These sub-centers provided a method for journalists to write and file from the venue itself without having to go back to the Main Press Center. Given the distances between some venues and the MPC in Los Angeles, these facilities sometimes made the difference in meeting deadlines.

The requirements for equipping the press seats, sizing the mixed zones, the number of seats in interview areas and the various elements of the sub-centers became clearer after the venues were selected and the

popularity of the sports on the 1984 program among journalists could be evaluated. Placing the press seating areas was complicated by the need for electrical power. Since many journalists from the international agencies, as well as Canada and the United States, used video-display terminals to file their reports, outlets were needed in the press stands. Since table lamps and television monitors were added to press seating areas in certain venues, this requirement became more pronounced. Outlets were provided for roughly half of the table seats only, each providing 110-volt power with a load capacity of 5 amperes. Press seats in indoor arenas often required table lamps because of darkened conditions in the venue during competition, with lighting focused only on the field of play. This was the case at The Forum for basketball, the Los Angeles Memorial Sports Arena for boxing and the Terrace Theater at the Long Beach Convention Center for fencing. Television monitors were eventually provided at athletics and swimming, with the choice of the receiver dictated in part by the power consumption requirements. Electronic Messaging System (EMS) terminals required additional power as well as placement so journalists in other rows would not have their vision blocked. Aisles in the press seating area had to be wide enough to allow a results distribution clerk to circulate through the area and pass out information and results sheets in a timely fashion.

Mixed zones needed little equipment other than barriers or fencing but depended upon good staff control of athletes and media for successful results. Formal interview areas were sized in proportion to the number of press seats available and were usually about 20-30 percent of the press seat total, depending upon the popularity of the sport, probable media attendance and the travel time and distance from the MPC. Although the formal interview areas were scheduled for use only after a medal ceremony, athletes were often brought in after preliminary rounds and impromptu news conferences with leading officials were also held: medical officials involved with the decision to allow marathoner Gabriela Andersen-Schiess to finish held a news conference at the Coliseum on the day following the race. A unique formal interview problem was presented at athletics, a sport at which past Games and the 1983 world championships suffered from having only one interview room when two or three events ended at the same time. The Press Operations group responded by planning three interview rooms, seating 150, 75 and 75. The multiple rooms proved useful as journalists

waiting for a particular athlete did not have to wait for another interview session to finish; numerous instances of multiple interview room use occurred. Several interview areas were equipped with typewriters for preparing summary quotes by the venue press operations staff and all news conferences were tape-recorded and stored for reference at the respective venue press sub-center.

Sub-centers varied in size and sophistication depending upon the sport involved. Careful review was made of the combination of event scheduling, probable media attendance in view of national interest and world wide deadline times and the travel time from the venue to the MPC. Those venues which were located more than one hour in travel time away from the MPC were designed for heavier use than if those were situated closer. In general, sub-center work areas were designed for about 20-25 percent of the press seats available and were equipped with chairs, tables, typewriters and electrical outlets. Additional space was dedicated to telecommunications, including telephones, telecopiers and telex machines. Telephones for media use allowed collect calls and credit card billing to prevent line charges from being assigned to the LAOOC. Table-top telephone booths provided three-sided sound attenuation and at least some conversational privacy. The number of charge-a-call telephones provided varied from five to ten percent of the press seating area and was finally arrived at after careful review of the facilities provided and used at Munich, Montreal and Moscow; the time differences from Los Angeles to Europe and Japan and the continental composition of the media coming to the Games. A few coin-operated telephones were provided where feasible for the convenience of media calling within the local area.

Sub-center telex and telecopier facilities were provided based on the anticipated demand for their use, as drawn from the event schedules, probable filing times of media and telecommunications preferences of continental media groups. Both telex and telecopier requirements were scaled off the number of charge-a-call telephones provided, which had been scaled originally from the number of seats provided in the press stands and in the venue sub-center working area.

Telex machines were provided at a rate of roughly half the number of charge-a-call telephones, while telecopiers were provided at about 25 percent of the number of charge-a-call telephones. These telecopiers, all compatible with CCITT groups I, II and III, were for use not only by journalists sending reports to their agencies but also by the venue press operations staff reporters and statisticians for transmitting their notes and quotes material to the Information Services office of the Main Press Center. Each telecopier was accompanied by a charge-a-call telephone so that line charges would be paid by journalists; these telephones could also be used as regular charge-a-call phones by journalists if the sub-center was insufficiently equipped with charge-a-call units designated for journalist use. Off-line telex equipment for preparing tapes was usually available in the larger sub-centers.

Sub-center areas were arranged so that journalists entering would find the information and results racks immediately in front of them, with the working area and telecommunications areas next. Beverage service was usually placed away from the entry point to prevent crowding. Electronic Messaging Service (EMS) terminals were placed close to the results area but far enough away to prevent crowding the racks themselves or the entrance to the sub-center. Television monitors were generally placed so that journalists using the work area could observe the competition in that venue or the events taking place at other sites if available. Television sets were also placed near sub-center staff areas such as offices and the telecommunications areas to help prevent boredom. Venue press staff offices were usually arranged for the venue press chief, with additional offices usually provided, if space was available, for the reporters and statisticians to prepare their notes and quotes reports. Electronic typewriters were assigned for this purpose, although many venue press chiefs asked for more automated systems which had been deemed too costly to provide in large quantities.

Other areas in the sub-center included a film transport desk to which all film gathered by internal messengers was brought and sorted and where the film transport bag was prepared for the LAOOC's motorcycle messenger service. Agencies with their own messengers could notify the LAOOC's photographic services division at the Main Press Center one day ahead of their desired pick-up locations and times and the message would be relayed to the venues. Film in envelopes bearing that agency's name was held separately from that taken by the LAOOC's motorcycle transport service and released to the agency's own messenger on arrival.

Special intravenue access controls were usually managed from the sub-center. At some venues and all villages, special access cards were required to enter restricted areas. Armbands were dispensed to allow access to the athlete areas for canoeing/rowing (maximum of 20 persons, with no access to the interior of the boathouses or the dock area itself) and yachting (40 persons in the athletes' area at first, later increased to 80). A plan for similarly restricted access to the stables area at equestrian was disallowed. After crowding occurred on the swimming pool deck during training, up to 25 journalists at a time were issued temporary passes.

Press lounge areas were infrequently provided because of a lack of space in some venues and a perceived lack of interest at others. Generally, shade structures near the sub-centers were erected at outdoor venues where space permitted. This was the case at cycling, equestrian, modern pentathlon and shooting. Press beverage service was usually located there, along with a television set, round tables and chairs.

Venue food service for press was limited. The first suggestion had been to use hawkers in the press stands for food and to provide free beverages.

Since the LAOOC decided to use no hawkers at all, the plan for food availability was changed to provide press-only or Olympic Family-only lines at concession stands near press seating areas. This was done with varying success at a number of venues; only at the Coliseum was a special press food service area provided. Soft drinks and fresh water were provided

at the sub-center and at some venue seating areas at no charge. The overriding interest of journalists in venue food service was to be able to eat quickly during the course of a long day so that a minimum amount of time would be wasted waiting in lines. A parallel requirement for nearby restrooms was noted, but public facilities at the venues were always sufficient.

Press operations did not plan any presence at training sites which were not also competition sites. Journalists were generally allowed at training sites and could observe athlete training from an area adjacent to the training floor itself. Practice sessions of teams could be closed to the media upon request of team coach, manager or trainer. In some sports, the International Federation concerned requested restricted media access to athlete training.

23.11.3 Development of venue press management

Although the physical environment and equipping of the venue press areas was determined by the central Press Operations Department of the LAOOC, it remained the individual manager's responsibility to implement the policies promulgated by the central department and put the venue press services plan into action. The Press Operations group recognized at an early stage that the real success or failure of the venue press operations plan would be determined by the performance of the venue press chiefs.

Selection of the venue press chiefs began in 1982 and focused on the media background and experience of potential candidates. Desirable qualities included a strong interest in sports, media services experience and previous exposure to large-scale international, national or Olympic-type events. It became clear that the most readily acceptable candidates were current or former sports information directors for universities and colleges and publicity directors for professional sports clubs. These individuals not only were expert in various sports, many of which were also on the Olympic program, but also serviced the sports news media on a daily basis as the core of their professional lives. Sports information professionals were better attuned to the peculiar requirements of sportswriters and broadcasters than most former newspaper, radio or television personnel, who generally were familiar with one, but usually not all, sections of the media, and they had more direct experience with sports than many public relations professionals.

A program of national selection to bring the finest sports information professionals from across the United States to Los Angeles for the period of the Games was dropped after it became clear that the success of the venue press chief program would depend upon the close working relationship developed by members of each venue team. The LAOOC's commissioner program placed capable business managers from the local area in charge of each sport, with a mandate to build a management team to operate that sport during the Games. As the press operations person on the commissioner's management team, the venue press chief had to live locally in order to build the necessary contacts and trust within that management team in the weeks and months preceding the Games. The venue press chiefs were then selected from among sports information and leading sports public relations professionals in the Southern California area. In all, 29 venue press chiefs (VPCs) were selected to manage the 23 sports, three villages and IOC Session operations; six of the VPCs were from the permanent staff of the Press Operations Department.

Each VPC was responsible for recruiting at least some of his staff, attending training sessions given by the Press Operations Department, managing the physical set-up of all venue press areas, providing venue press staff training and implementing the press services program centrally designed by the Press Operations Department. All VPCs were required to be available for full-time work with the LAOOC for a minimum of four weeks and were paid at a weekly rate during that period.

The training program consisted of meetings every other week from 7 December 1983 through 13 June 1984, with a final session at the Main Press Center on 11 July. All topics related to press operations were covered, including accreditation, role of the commissioner, food service, health services and doping control, information services and interviews, language services, photographic policies and procedures, press seating and ticketing, security, staffing procedures, staff training, sub-center construction, television operations, transportation and venue supply procedures. A heavy emphasis was placed on technology training, including EMS, photocopying, results production and distribution systems and telecommunications systems (telecopiers, telephones and telex). Near the end of the training period, detailed operating plans were distributed, describing the centrally designed press services program for each venue in minute detail. These operating plans were compiled by the four-person venue press planner team of the permanent Press Operations staff.

Attendance was excellent at almost all sessions. Some of the VPCs with local assistants brought their leading assistant venue press chiefs (AVPCs) to the sessions as well. The Press Operations Department was able to instruct capable professionals with varied backgrounds and experiences in a specific set of policies over a long enough period to ensure compliance and, more importantly, understanding. Equally crucial was the development of an esprit de corps among the VPCs which became important as they began training their staff and relating the policies and principles which had been discussed during their own training. As members of the press operations management team, they saw more clearly the need for standardization in press services from one site to the next and were able to better instruct their staff members during the pre-Games training period.

The AVPCs were selected by both the central press operations staff and by the VPCs. Where the Press Operations group had been unable to use national sports information talent because of the need for local VPC presence in the pre-Games period, the same requirement did not apply to AVPCs, who were to be present only during the time of the Games. Over 80 sports information professionals were recruited from across the United States to come to Los Angeles and work during the Games; their experience and familiarity with sports news media proved valuable in conjunction with the contacts made within the venue management team by the VPCs.

23.11.4 Formation of the venue press operations teams

Rather than determining the positions required for press service in each venue separately, the Press Operations group developed a standardized set of positions with the number of persons, by position, adapted to fit the needs of each sport and venue. Recruiting followed and the teams were assembled in time for training at the venue sites shortly before the beginning of the Games.

Positions were divided into the five basic areas of press operations services: electronic media, formal interview, mixed zone, photographic and sub-center, all under the supervision of the venue press chief. The

electronic media group included one assistant venue press chief (AVPC) and one or more electronic media monitors, whose task was to marshal and protect broadcast personnel from unnecessary interference with the public or Olympic Family and to keep broadcasters within designated areas. Interview coordinators worked with the host broadcaster to assist in the logistical operations of brief after-event interviews with athletes as they left the field of play. The AVPC for electronic media was later eliminated because of the appointment of venue television coordinators by the TV Operations group. Formal interview crews consisted of an AVPC for formal interviews and staff moderators, note takers, technicians and ushers. The AVPC had overall responsibility for the appearance, equipping and operations of the venue interview areas, while the formal interview moderators were stationed at or near the speaker's table to direct the interviews, to select questioners and to provide sufficient breaks for consecutive interpretation. Formal interview note takers were responsible for producing the summary quotes from all news conferences held at venues, which were distributed on the site and later telecopied back to the Main Press Center for distribution there and entry into the EMS. Formal interview technicians checked lighting and sound reinforcement, made tape recordings of all news conferences held at the venues and assisted journalists and electronic media with the use of the multiple-output audio patch boxes. Their jobs were often combined with those of formal interview ushers, who made sure order was kept during all interviews and who served as circulation monitors for the microphones placed in the audience. Interpreters for the news conferences were provided by the LAOOC's Language Services Department.

Mixed zone staff included an AVPC whose responsibility was primarily to see that athletes did go through the zone and to enforce the athletes' right not to speak with the media if they did not wish to do so. The latter task was shared with mixed zone marshals in the larger venues. Quote service interviewers were needed to compile summary quotes from athletes in preliminary rounds when formal interviews were not required.

Photographic services were directed by an AVPC and backed up by photo marshals who worked with the electronic media monitors to keep unnecessary personnel away from the still photographic positions and to keep photographers within those positions.

Sub-centers were run by another AVPC in conjunction with sub-center stewards who were available to answer questions and keep the sub-center areas clean and properly equipped.

Three other staff positions reported directly to the venue press chief. The reporter/statisticians were required to compile the notes section of the notes and quotes material, which was often typed in the sub-centers. At athletics and swimming, race-in-review comments were compiled and distributed to give journalists short descriptions of the races to assist those who were not present, or were involved in the interview area or mixed zone and were unable to see the particular event. Reporter/statisticians were also responsible for gathering information regarding all athlete injuries at the site and following the course of any protests. Venue press messengers were available for various requirements and usually collected photographic film from photographers for eventual transport by the LAOOC's motorcycle messenger service. In the press stands themselves, press stewards assisted the journalists with directions to interview areas, mixed zones and photo positions, took requests for athlete interviews after preliminary rounds and helped to find seating during crowded event sessions.

Results copying clerks and distribution personnel were provided by the technology staff and related suppliers.

From the 16 positions set up to handle the widest variety of press operations needs, staffing was arranged for each venue according to its size and the number of media anticipated on a one- or two-shift basis. The average time committed by staff members in these positions was for approximately seven hours per day for 12 days, an 84-hour total.

Recruiting was initiated in several areas in September 1983. Most of the venue press chiefs had already been identified and a lengthy list of sports information professionals desiring AVPC positions had already been compiled. The Press Operations group

took the responsibility for the remaining recruitment of a total of 100 AVPCs (including those already listed) and 546 staff members. Members of the Citizens Advisory Commission on Press/Public Relations and Publications were solicited by letter as candidates for both AVPC and staff positions according to their experience. AVPC candidates were also sought from other sports information professionals in the United States, journalism advisors or teachers at local colleges and universities and outstanding public relations professionals with sports publicity experience. Staff candidates were recruited from high school and college journalism classes and school newspaper as well as Citizens Advisory Commission members and area sports information professionals, teachers and public relations personnel who were insufficiently experienced in sports press service to perform as AVPCs.

Staff identification reached nearly 75 percent by mid-February 1984, 92 percent by mid-April and 98.1 percent by mid-May. In all, 670 persons filled 686 positions; six were members of the full-time Press Operations staff, 27 were paid during their time at the Games (mostly venue press chiefs) and 637 were volunteers:

Press Operations staff by site

<i>Sport(s)</i>	<i>Volunteers</i>
Archery/Modern Pentathlon	19
Athletics	67
Baseball	11
Basketball	67
Boxing	32
Canoeing/Rowing	40
Cycling	21
Equestrian	24
Fencing	24
Football / Rose Bowl	19
Football/Stanford	9
Football/Harvard	9
Football/Annapolis	10
Gymnastics/Tennis	57
Handball	18
Hockey	30
Judo	11
Shooting	9

Volleyball	30
Weightlifting	19
Wrestling	17
Yachting	13
UCLA Village	18
UCSB Village	9
USC Village	18
Medical Press Office	4
Total	670

Single shifts were sufficient for most venues, but two shifts per day were necessary at boxing, gymnastics/tennis, handball, hockey, swimming, water polo, volleyball and the UCLA and USC Villages. A triple shift arrangement was necessary at basketball because of the three doubleheaders played daily during the early rounds of competition.

23.11.5 Physical move-in and staff training

Venue press chiefs took control of venue press areas shortly after the LAOOC took exclusive possession of the sites. In accordance with a preset move-in schedule, construction of all areas began and supplies were brought to the various departmental areas.

Although detailed architectural plans and supply lists were available, venue press chiefs were free to improvise as necessary to provide an adequate environment for the media. In most cases, the plans were followed, although supplies were occasionally late in arriving. Each venue press chief had authority to spend small amounts for supplies and other items without receiving central Press Operations' approval.

Each VPC used the Electronic Messaging System (EMS) to send status reports to the Main Press Center. A venue press operations manager was assigned to review all reports on EMS and dispense advice and instructions as necessary. This became critical at some sites because equipment provision decisions required higher authority levels than existed at any site. For example, provision of additional telephones or EMS terminals required approval by the vice president of the Press Operations Department prior to approval by the vice president of the Technology Department. The venue status reports were formatted with specific questions asked each time a report was filed to ensure adequate review of the preparations, including construction of the press seating and photographic areas, sub-centers, interview areas and the like. Requirements for additional staff were noted, especially if there had been absences or resignations late in the pre-Games period.

A recurring problem at the most popular sites was media visitation during the construction and set-up period. With the VPC setting up the

News Relations and Press Operations

venue press operations for staff training and then opening just one or two days prior to the beginning of the competitions, he had little time available for giving site tours or setting up interviews with LAOOC commissioners or other senior venue staff. Each case was handled individually, since all venue managers looked to the press operations group to handle any media who came to the site after the LAOOC took possession.

Training of staff took place just days prior to the beginning of competitions or sometimes on the job itself. The best-prepared site managers held full staff training sessions for all departments several weeks before the Games and needed only refresher courses in the actual Games environment to be ready for competition. Ideally, VPCs met with their AVPCs for detailed training in advance of staff training sessions and left substantial amounts of the final preparation of staff to the AVPCs. But each VPC modified his training program to suit the staff involved and cooperated with the overall staff training program of the site management.

23.11.6

Venue operations and communications

With dependable transport and adequate signs, media had little difficulty in finding the competition sites and the press operations areas reserved for their use. Press seating, interview, mixed zone and sub-center areas were all prepared in time for media use and the daily venue status reports sent via EMS every evening detailed the daily media attendance figures, anticipated problems with media or staff and reviewed all functional areas. These reports gave the senior press operations management at the Main Press Center specific information in a disciplined format about all venues and any anticipated problems.

The most difficult problem in venue operations was the requirement restricting entry to some events because more media were expected than could be seated in the available press seating area. Although it was clear that this would be necessary for the Opening Ceremonies, the general absence of ticketing gave most media the impression that none would be instituted for other events. When ticketing was required for the men's

basketball final, both sessions of boxing finals and the Closing Ceremonies, media were notified via bulletin boards in the Main Press Center and at the venue sub-center concerned, EMS press bulletin board announcements, printed notices at the MPC and venues, public address announcements at the MPC and even individual mentions by the venue press staff to journalists attending event sessions at the site concerned. Despite these precautions, some media never noticed or took the time to find out the procedures for acquiring tickets for these events.

In accord with the press commission of the IOC, the LAOOC held ticketed events to a minimum because of the difficult distribution procedures involved and the probable sufficiency of the LAOOC's press seating sections to meet the capacity requirements for all but the above-mentioned events. The sufficiency of press seating capacities was judged from documentation gathered through the journalist's application for accreditation. When events required ticketing, the press commission representatives met with the LAOOC Press Operations group to determine the allocation of press seats by group according to the press seating capacities and permanent seating assignments at the sites. In general, permanent seats were assigned:

- For the international agencies; Agence France Presse, Associated Press, Reuters, Tass and United Press International according to their needs
- For press agencies ordering a private telephone in the press seats
- For specialist writers in that sport

Press seating capacities for preliminary events could often be increased for final events without the addition of additional physical seats or space at the venues. Since the tabled seats installed by the LAOOC for Games use had been calculated for capacity purposes at 24 inches across, it was possible to increase the capacity by reducing the working width of a tabled seat to 18 inches by simply renumbering or restriping the seats. Such width reductions usually did not impair a journalist's ability to work. This dense pack (18 inches per seat) approach was used for both the basketball and boxing ticketing schemes to maximize the number of journalists who could be present.

Each venue press chief compiled a chart showing the placement of the permanently assigned places among the press seats (usually using a loose pack or 24 inches per seat arrangement), and a copy was forwarded to the Main Press Center. The number of remaining places was calculated and tickets were filled out

for assigned seating for all available press seats. Distribution of the tickets was by group, with the LAOOC representing and responsible for ticket distribution to local media, non-rights holding television newsfilm broadcasters in accreditation category "EF" and observer tickets for non-reporting commentators from exclusive-rights holding broadcast organizations. The IOC Press Commission took responsibility for distribution of tickets to all other media represented by National Olympic Committees. The number of tickets made available to each national press group depended on the requirements submitted by the national press attache of that country, the participation of that country's team in the event itself, or the preliminaries of that sport and the general interest of news media from any particular nation in the specific sport concerned. While the press commission determined the number of tickets to be distributed to the international agencies and individual countries, the LAOOC similarly determined the actual press entities which would receive tickets from the local area and among category "EF" newsfilm broadcaster observers. Tickets for observers (i.e., commentators not working from permanently reserved broadcast positions) from exclusive-rights-holding broadcasters were turned over to the International Broadcast Center for distribution by the broadcasters among themselves.

The actual distribution of the tickets to national press attaches and journalists was carefully made in order to provide tickets coinciding with the permanently reserved seats to those who had been assigned those places. In some cases, the name of the agency concerned was actually written on the ticket so that national press attaches would be sure to deliver the proper ticket to the proper agency or journalist.

In order to avoid ticketing in some cases, the Press Operations group obtained spectator tickets which were unclaimed by Olympic Family members in advance of the events or were returned at a very late date by National Olympic Committees and others. These spectator tickets were then forwarded to the venue press chiefs at

the sites concerned, with instructions that no ticketing would be instituted and that these tickets could be distributed to journalists arriving after the press seating area had been filled. Distributions were made in this fashion for the final two nights of judo (30 tickets each night), the men's volleyball final (30) and the equestrian competition on 12 August (20). Even though the men's basketball final and both sessions of boxing finals were ticketed for press, some additional tickets were available at the last minute for all three sessions: 50 for basketball and approximately 25 for each of the two sessions of boxing. After ticket distributions had been made at the Main Press Center, remaining tickets for restricted-entry events were sent to the venue press chiefs as well, again to admit additional journalists who did not know that tickets were required. Ticketing proved successful at basketball and boxing as the number of press present was restricted to the limit for which facilities were available. There were few journalists who could not get tickets if they really wanted to obtain them, although some were turned away at the venue itself, having failed to even attempt to procure tickets.

The distribution of tickets was as follows for these events:

Press ticket distributions

Basketball—ESP vs. USA men's final—10 August (314 seats with table and 190 without: 504 total)

International agencies	10
ESP national press	30
USA national press	150
Press of other NOCs in the Olympic Basketball Tournament	110
Other national press	93
Local media	40
TV newsfilm observers	20
Rights-holding TV broadcast observers	30
LAOOC staff positions	21
Total	504

Boxing—final sessions—11 August (162 seats with table and 228 without: 390 total)

International agencies	11
USA national press	150
Other national press	145
Local media	40
TV Newsfilm observers	20
Rights-holding TV broadcast observers	20
LAOOC staff positions	4
Total	390

The USA participated in the men's basketball final and placed boxing finalists in ten of the 12 weight classes to command the large number of tickets granted. Among non-USA media at basketball, eight seats were reserved by the ordering of private telephones, leaving 195 seats for allocation to national press by the Press Commission. At boxing, private telephones were ordered by non-USA press agencies taking up 16 seats on an assigned basis, with 129 available for distribution to non-USA national press.

Press ticketing for the Opening Ceremonies has been customary at Olympic Games, so journalists were fully prepared to follow procedures required to obtain tickets. The Coliseum press section held seats for 1,884 journalists using a dense pack approach, with 1,104 tabled seats at a width of 18 inches each and 780 spectator-type seats. The LAOOC and Press Commission worked on a plan which measured the number of accreditations actually granted to each country against the number of news agencies represented by those accreditations. In concept, each nation should have as an absolute minimum the number of Opening Ceremonies tickets that would allow at least one representative of each agency accredited from that nation to attend. Even though the actual intranational distribution plan would be determined by the national press attache and the journalists of each nation, this conceptual distribution plan proved to be a proper basis from which to determine the allocation of places to each national press group. The allocation:

Press ticket distribution

Opening Ceremonies-28 July (1,104 seats with tables and 780 without: 1,884 total)

International agencies	26
National press not including USA	1,193
USA national press	330
IOC Press Commission	8
LAOOC to distribute	336
To local media	96
To TV Newsfilm observers	20
To rights-holding TV broadcast observers	150
For LAOOC staff positions	10
Returned to IOC for photographers	18
Miscellaneous	33
Total	1,884

Additional tickets for photographers were prepared separately for positions reserved on the Coliseum floor, press box roof and in reserved seating sections on the east and south sides. In all, 396 photographer places were available, including the one row of 18 places returned to the IOC for distribution from the unused tickets in the LAOOC allocation. Tickets were marked and distributed beginning on 26 July at the Main Press Center.

On 27 July, a package of 582 additional spectator tickets was made available for journalists and distributed by the LAOOC's Press Operations group. The result was that almost any journalist who wished to attend the Opening Ceremonies was able to do so, even though the restrictive entry-by-ticket-only system had been implemented.

Concern over crowding in the Coliseum press area was the reason that the Press Operations group was required to impose ticketing procedures on the Closing Ceremonies. The ticketing requirement was announced only on 10 August and gave many journalists little opportunity to seek out their national press attaches since competition was still going on at many sites. However, tickets were distributed along the same lines as for the Opening Ceremonies beginning 11 August. Because of the re-configuration of the Coliseum for athletics, the press seating area held 1,864 places, using the dense pack seating approach. Confusion was

caused among journalists who wished to view only the finish of the marathon and did not know whether a ticket was required for their entry, since they would be exiting prior to the beginning of the Closing Ceremonies proper. Tickets were required for all entrants to the Coliseum on 12 August and since a substantial number of journalists interested only in the marathon were not selected by their NOCs to receive tickets, a strong protest followed. Fortunately, a package of additional spectator tickets was made available to Press Operations and approximately 150 were distributed to journalists. Almost 50 tickets were sent to the Coliseum sub-center to admit journalists arriving without tickets to cover the marathon finish at 1800 hours on 12 August, 45 minutes after the race began. The Coliseum press operations staff managed to admit all media who had interest in covering the marathon and/or the Closing Ceremonies.

The issue of providing television monitors in the press seating areas raged for almost three years. Although some maintained that monitors were essential for coverage, most journalists agreed that monitors were needed only for athletics, with many events taking place at once. The LAOOC rejected the high costs of cabling in the Coliseum for these monitors but eventually found the solution in low-power broadcasting within the Coliseum itself. By perching a transmitter on the rim of the stadium, excellent reception of the three host broadcaster signals (one track and two field) was available and no cabling cost was required. The 13-inch sets provided were bulky, however, and the scheduled provision of one set for every two tabled seats was reduced to one for every three, for a total of 235. The monitors were not heavily used because the sunlight reflected off the screens and made the picture unviewable, and because an excellent image was produced on the Coliseum's giant video scoreboard. At the swimming venue, the placement of the press seating area was slightly past the finish line and provided no direct view of the touch. Lacking a video board, the

LAOOC ordered 100 television sets placed in the swimming press seats, again using low-power broadcasting to avoid cabling costs. Only 65 sets were eventually installed since each set, like the EMS terminals, blocked the sight line from the seat it occupied, rendering the seat unusable for journalists. TV monitors were not provided at any other venues and no complaints were received.

Venue food service was generally adequate, although some press-only concession stands ran out of food on occasion, and press-only lines in other venues were never designated. In outdoor venues, it was important to have beverage or water service close by to prevent dehydration of those watching hour after hour of competition. At swimming, water stations were set up directly underneath the press stands.

Venue interview procedures also worked well. Although not well informed until after competition had begun, most coaches and athletes cooperated with the press operations group in passing through mixed zones and attending news conferences. The mixed zones were surprisingly heavily used in all venues where they were available, including team sports like basketball and handball. It is no understatement that mixed zones with 50 lateral feet of meeting space for athletes and journalists (separated by a three- to four-foot barrier) could have been favorably used at all venues and were missed where not provided, as at volleyball. Large mixed zones such as at athletics (more than 250 lateral feet of mixing space) and swimming (80 feet) were highly successful. The small 10-foot opening at basketball was always cramped and crowded. News conferences generally functioned well, although better cooperation would have been received if the venue press chief had been able to address team representatives prior to the beginning of competition to preview post-event procedures. A detailed agreement regarding post-event procedures was worked out with awards ceremonies, health services and press operations, noting the priority of each in the different post-event situations involving drug testing, medal ceremonies and news conferences:

News Relations and Press Operations

- An athlete is met first by a team, including an interpreter, doping control escort and press operations marshal, immediately following an event, and is tagged for doping control purposes (meaning each athlete has 60 minutes to report to doping control).
- A medal winner will first complete a one to two minute "flash interview," if requested, with the host broadcaster at the field level, then be taken to the ceremonies staging area to prepare for awards ceremonies if necessary.
- During this staging time, a press operations quote services interviewer can get some quick comments for reproduction and distribution.
- The athlete participates in the medal ceremony and then leaves the field.
- Doping control escorts meet the athlete at the field exit and take him to the news conference if 30 minutes or less have passed since the athlete was tagged for doping control. The athlete can give an interview until ten minutes are left in the one hour doping control reporting period. If less than 30 minutes remain, the athlete reports directly to doping control and will come to the news conference as soon as possible thereafter.

Notes:
(1) 200 passes each were allowed into the UCLA and USC Villages; working facilities were located with Gymnastics and Swimming sub-centers, respectively.
(2) 40 passes were available for entry into the UCSB Village; working facilities located on-site.
(3) 500 accreditations were available for the IOC Session; all information was distributed at the Biltmore Hotel in downtown Los Angeles.
(4) Gymnastics Facilities for rhythmic included 194 seats with table and 144 without; total of 338.
(5) Handball Final matches at The Forum had 2 14 tabled seats available for news media.
(6) Volleyball sub-center was combined with Fencing.

 UCLA-Open 31 days. 3,045 entries. Daily average: 98.
 USC-Open 29 days. 2,894 entries. Daily average: 100.

Other press operations problems differed from venue to venue. Some VPCs reported problems with access control or security in allowing media into areas where venue management had agreed to allow access but no instructions were ever given. Use of EMS varied widely and at venues where use was low, terminals were removed to allow greater seating. Venue close-down eliminated power and telephones at several sites within minutes after the competition ended and while media were still working. At basketball, the decorative banners and streamers hung from the ceiling blocked the scoreboard, requiring lowering of the board so journalists and commentators could see it. At boxing, the planned interview room for 77 persons was satisfactory for the preliminaries, but had to be expanded via temporary construction for 200 persons for the semifinal and final sessions. At cycling at Mission Viejo, insufficient telephones were provided for media; the imaginative venue press chiefs arranged for media to file reports from telephones in nearby private homes. At equestrian, difficulties with provision of telex operators caused confusion while little or no need for telex services surfaced at other venues. At handball, journalists from one nation demanded locker room access to the team from their country, although no locker rooms in any venue were open to anyone other than competitors. At modern pentathlon, overzealous journalists greeted a gold-medal winning countryman by leaping past barriers and security guards to almost crush him after the conclusion of the event. More journalists than expected came to shooting during the first day of competition and the resulting lack of facilities and hot weather made everyone uncomfortable. Yachting journalists found they had insufficient access to athletes and protested, leading to an increase in athlete area passes from 40 to 80. In addition, the sub-center was built 25 percent smaller than ordered and resulted in crowding, eventually leading to during the Games construction of an addition to recover half the lost area. In each case, the venue press chief worked with these problems and usually found an appropriate solution. Assistance from the Main Press Center was available but limited as the senior management of press operations was already busy with the problems of the MPC. It would have helped tremendously to have full-time staff members whose sole responsibilities were to coordinate the requests of venue press chiefs and to review carefully the venue status reports.

23.11.7 Village operations

Access to the Olympic villages was limited as had always been the case. Security was understandably tight, yet the media sought an opportunity to meet with athletes and to get a flavor of village life to share with listeners, readers and viewers back home.

The Olympic Charter focused on the need for limited press access to the villages and established a maximum of 300 passes into a single village at any one time. The LAOOC and IOC agreed to allow a maximum of 200 persons at one time into each of the two main villages (a total of 400) and an additional 40 persons into the village for rowing and canoeing athletes at UCSB. For a journalist to enter a village, he had to exchange his accreditation card for a village press card. A reverse exchange was made when a journalist left the village.

Each village was divided into three areas: administrative areas for the LAOOC, common areas for all village residents including dining areas, recreation and training areas, and housing units. The desired access for press focused on the common areas, leaving administrative areas for the LAOOC staff and the housing units for the privacy of the athletes. Common areas usually included a dining area, a discotheque or theater, shops, video-game area and other entertainment and relaxation areas. Training sites within the villages included a training track and additional facilities, depending on the village.

Access to these areas was severely restricted for press. At UCLA, a small area at one end of the training track was set up, with six tents (ten feet square) for interviews and an LAOOC office with EMS and intra-village telephones for calling NOC offices and setting up interviews. Press were also able to move along the grandstands of the track and could observe portions of the recreation area from a penned-in area at the top of the stands. At USC, journalists were allowed only into a small pen outside of the press entry area, also equipped with six tents (ten feet square) for interviews and additional umbrella-shaded tables. The penned area overlooked the village park and was close to the recreation area (contained in a classroom building) and the area for welcoming ceremonies. However, the pen offered no clear opportunity to contact any athletes and little or no view of village life. The training track was open as well at USC, but was entered through a different entry point and was not well known to the journalists. All village press areas were open from 0900—2100 hours daily, except for 28 July and 12 August, the days of Opening and Closing Ceremonies during which the USC Village only was closed to all visitors.

In order to give a better glimpse of the village, tours were set up for journalists. Each tour required sign-ups 24 hours in advance at the Main Press Center and was limited to a maximum of 25 journalists. Tours were scheduled once each day from 14–19 July, twice per day from 20–27 July and once per day from 29 July–11 August. These tours allowed media to walk through various parts of the villages, including the dining, health and recreation areas. A sample room was shown on the UCLA Village tour. These were well received by the media in the pre-Games period but were lightly attended during the Games.

Welcoming ceremonies were initially off-limits to media, but a decision on 16 July opened them to media with the consent of the NOC(s) involved.

The limit of 200 passes into the villages was never reached, despite some dire pre-Games predictions about crowding. After heavy initial interest in the villages, journalists became disenchanted with their limited access to athlete areas outside the residence halls and the difficult contact procedures with National Olympic Committees. Most journalists made contact with athletes at the competition sites during the Games period.

Press entry at UCSB was light, and averaged 15–20 persons per day, with the limit of 40 press into the village at one time never reached. The interview area was located adjacent to the recreation area and was good for athlete contact.

Sub-centers with filing facilities were located outside the villages themselves. At UCLA, the gymnastics/tennis sub-center was used, while at USC, the swimming sub-center was available. This was planned so that media would not remain inside the villages all day but would stay for interviews and then file their reports outside, allowing additional media to enter. Journalists were not in favor of this plan, but it did produce a continual turnover of media coming into the village. The interview rooms of these sub-centers were also available but were lightly used. One NOC did give an informal briefing at the UCLA interview room every day and one formal news conference was held. The idea of having an interview room near the

village, but outside the controlled area, proved wise, since journalists were not required to go through the time-consuming formalities of trading their accreditation badges for village passes to attend these events.

23.11.8 IOC Session and Olympic Arts Festival

The Press Operations Department took on additional responsibilities for support of the press operations sections of the 88th Session of the International Olympic Committee and the Olympic Arts Festival. In each case, close liaison was necessary with the entities responsible for the overall program: the IOC and the Olympic Arts Festival staff.

For the IOC Session, a press conference room was arranged in the Biltmore Bowl of the Biltmore Hotel, site of the session. Seating for 500 with necessary sound reinforcement was available. A press office and working area was set up in the Regency Room of the Biltmore, with necessary accreditation, EMS and telecommunications equipment. The LAOOC also assisted with the compilation of accreditation information and the preparation of the session accreditation badges.

Unfortunately, the IOC determined after the set-up had been completed that the IOC's own press office staff would operate the office and working areas and excused the LAOOC staff, who were subsequently re-assigned to duties at the Main Press Center and the venues. Later, LAOOC assistance was needed for session news briefings and staff were loaned as needed from the Main Press Center.

Olympic Arts Festival (OAF) press operations were divided between interview rooms with small working areas at the sites for dance (Pasadena Holiday Inn), theater (UCLA's Royce Hall) and a main center for accreditation, information, news briefings and ticket distribution at the Westin Bonaventure Hotel in downtown Los Angeles. Press operations staff members provided assistance in the compilation of the accreditation lists, equipment for all three press centers and manifests for ticket distribution. As the festival continued, OAF information staff requirements grew larger, and the press operations staff withdrew to focus on preparations for the Main Press Center. All press and public information requirements were left, as requested, in the hands of the OAF staff, which fulfilled these responsibilities throughout the remainder of the festival period.

News Relations and Press Operations

23.11.9 Reflections on the venue operations

In general, the venue press operations teams succeeded in delivering a professional environment for journalists to view the competitions and then to work on their reports. The venue press chiefs worked well with their staff and the media found a willingness-to-help attitude which solved many of the problems encountered individually. In future Games, the following should be noted:

- Athlete access must be increased in sports where competitors have extensive post-event responsibilities. Sports such as canoeing, equestrian, rowing and yachting caused unnecessary frustration for the media because of heavy restrictions on access to boathouses and stables. A controlled approach to journalist access into these areas, with marshals having the authority to give media access to athletes who wish to talk, could help immensely.
- Interview procedures should always consider the popularity of the mixed zones in Los Angeles. Almost without exception, journalists found that both mixed zone and news conference opportunities complemented rather than duplicated each other. News conferences will operate more smoothly if coaches and competitors are briefed by a press operations person regarding procedures at a pre-competition team meeting.
- Seating for news media must be arranged with a view toward not only the field of play but also the mixed zones, news conference and working areas. In the venues where facilities for journalists were spread throughout the building, many became confused and caused continual problems for access control personnel.
- Restrictions on press seating via ticketing are to be avoided if at all possible. The issuance of tickets is a frustrating and lengthy process for both journalist and organizer alike. When ticketing is required, information and procedures about distribution and pick-up should be publicized as widely as possible at least five days prior to the event. Distribution itself should begin not less than 48 hours prior to the event itself.
- The role of television monitors for press must be considered in light of need. Although many demanded monitors for all sports, the truth was that only in athletics was the television monitor issue an important one. Seats in swimming that did not provide a finish line view justified the use of monitors after careful consideration. The use of available technologies such as low-power transmissions gave the organizers a way to provide a requested service at a moderate cost. If possible, the provision of a channel which carries interview room news conferences at the venue concerned is fully worthwhile and will allow journalists in the press seating area to continue watching competition at that site instead of crowding into the interview room.
- Sub-centers should be opened well in advance of the beginning of competition, especially for those sports which have a large number of specialist writers, such as equestrian and yachting. With the construction of facilities and training of staff taking place concurrently, venue press chiefs and staff had little ability to assist media at these sites in the pre-competition days in Los Angeles.
- Telecommunications equipment needs must be carefully considered in light of evolving technologies. Telephone requirements at some of the smaller sites were underestimated; because of the early morning start at the cycling individual road races, European writers were able to file stories under deadline. Telex equipment at the venues was overstated since most of the final events took place after European deadlines and journalists returned to the Main Press Center to file. Telecopiers were lightly used and technology may pass these machines by, since most North American writers use small video-display terminals which require data transmissions through telephones via acoustically coupled modems. As this kind of equipment proliferates, the requirement for provision of additional power outlets will closely follow.
- Venue food service was generally adequate, as most media expected only free beverage service. However, special care must be taken that beverages are available at nearby locations and away from the public. Water must be available at outdoor stadiums where dehydration may be a factor. The availability of press-only concession lines or stands is sound, but they must either be placed away from public spectator stands and well-policed or placed in a restricted area. The same conditions apply even more stringently if food at press lounges or snack bars is provided on a complimentary basis. The LAOOC never faced the latter questions in view of costs and space.
- Venue staff communications must be carefully thought out. Hand-held walkie-talkies were by far the best but were in very limited supply. Telephones were helpful but hardly portable enough and were usually busy with outsiders asking questions. Equipment must be provided not only for incoming calls and requests but also for intravenue communications among venue press chiefs and venue press staff, especially AVPCs.
- Any centrally controlled operation must be able to deliver centrally located assistance to the outlying sites. The LAOOC's Press Operations Department management was unable to deliver consistently effective assistance to the sites because of the heavy requirements on it at the Main Press Center. A team of managers to deliver assistance to the venues from the MPC is necessary for back-up and guidance during all hours of venue operations.
- Venues with shared responsibility for design, equipment and operations must be carefully thought out as to the role of each group involved. The assistance given to both the IOC Session and Olympic Arts Festival events would have been better utilized if all sides had understood the role of the other. Without such agreement, the group ultimately responsible for the event—the IOC for its Session and the OAF staff for the Arts Festival—should be left to organize and execute its operations.

24

24.01 Concept of the programs

Coins and stamps commemorating the Olympic Games have become traditional in most nations hosting the Games since 1952. Coin programs honoring the Munich, Montreal and Moscow Games provided major sources of revenue to the organizing committees of those Games.

Stamp programs are also traditional. Although stamps are not generally viewed as having as great a revenue-producing or fund raising potential as coins, many nations have issued stamps during Olympic years commemorating the Games or their participation in them.

As far back as 1977, LAOOC senior management saw an Olympic coin program as an important fund raising possibility and assigned the head of its Government Relations Department to investigate and report on the possibilities of the LAOOC working with the Congress and the U.S. Department of the Treasury to bring about an Olympic coin program. The LAOOC also investigated the possibility of issuing a series of Olympic commemorative stamps with the U.S. Postal Service.

The President's Commission on Olympic Sports, which issued its final report in January 1977, listed both commemorative coins and stamps as potentially vast sources of revenue for amateur sports in general and for both the U.S. Olympic Committee and any potential Los Angeles Olympic organizing committee in particular. At that time, the Los Angeles group bidding for the Games was the Southern California Committee for the Olympic Games.

The Commission report noted that "a coin program would be well received by the American public in that it would produce significant revenue for amateur sports." Based on revenue figures from the Eisenhower silver dollar program, the Bicentennial coin program and the Canadian Olympic coin program, the Commission estimated that an appropriately developed U.S. gold and/or silver coin program would generate between \$1 billion and \$1.2 billion in group sales, with a net profit of \$500-600 million for amateur sports. The Commission further noted that consideration might be given to a U.S. Postal Service stamp program which would commemorate the Olympics every four years on first day covers. In

Canada, sales of philatelic stamps brought \$6.3 million in revenue to the Organizing Committee of the Olympic Games (COJO). In the United States, each cancellation of a first day cover (with the cover provided by the organization) usually meant that the Postal Service had sold a stamp without having to handle an extra piece of mail; after the first 100, there was a five-cent charge for each cancellation, providing additional revenue to the Postal Service.

Olympic commemorative coins were first struck by Finland for the 1952 Games held in Helsinki. Since 1964, each host nation for the Games (1964: Japan; 1968: Mexico City; 1972: Federal Republic of Germany; 1976: Canada; and 1980: U.S.S.R.) has minted and sold Olympic commemorative coins with much success. The 1972 Munich program had a net profit of approximately \$228.56 million (1972 dollars), the 1976 Montreal program about \$101.33 million (1976 dollars) and the Moscow program about \$85.15 million (1980 dollars).

Olympic philately has a strong tradition, with a great many stamps having been issued by many nations depicting or commemorating the Olympics. International Olympic Committee President Juan Antonio Samaranch allowed his own outstanding collection of Olympic philately to be exhibited during the Los Angeles Games.

24.02 Commemorative coin program

24.02.7 History of programs in the United States

Commemorative coins in the United States are rarely issued. Only 59 had ever been struck prior to 1982. Fifty of those were in silver (48 half-dollars, one quarter-dollar and one one-dollar piece) and nine in gold (six one-dollar, two quarter-eagles, \$2.50, and one fifty-dollar gold piece, the highest face value of any U.S. coin).

In 1982, the U.S. Mint issued a 90 percent silver half-dollar commemorating the 250th anniversary of the birth of George Washington, the first president of the United States. This was the first U.S. commemorative coin struck since 1954.

Following is a brief summary of the first and last (up to 1982) commemorative coins issued in silver and gold:

- Prior to 1982, there were 50 silver coins struck, including the first issued in 1892 and the most recent in 1954. The first was a half-dollar commemorating the Columbian Exposition in Chicago and celebrating the 400th anniversary of Columbus' discovery of America. There were 950,000 of these half-dollars minted. The one in 1954 was the last year of issue of the Washington-Carver dollar that ran from 1951-1954. In its last year, a total of 146,036 Washington-Carver dollars were struck.

- The first gold commemorative coin—two gold dollars celebrating the 100th anniversary of the Louisiana Purchase—was struck in 1903 for the Louisiana Purchase Exposition held in St. Louis one year later. One gold dollar featured Thomas Jefferson on its face, the President of the United States at the time of the Louisiana Purchase, and the other, William McKinley, who was a recently assassinated president. There were 17,500 coins minted of each. The last gold commemorative was struck in 1926 for the Philadelphia Sesquicentennial (150 years). These coins were quarter-eagles and there were a total of 46,019 struck. The last gold coins struck in the U.S. were issued in 1933 in denominations of \$10 and \$20.

24.02.2 Concept of the program

From its inception, the Organizing Committee believed that an Olympic coin program would be worthwhile. Senior management, however, was well aware that the United States Treasury Department historically opposed the issuing of commemorative coins for a number of reasons. Among them were:

- Coins were not items to be hoarded by people. Rather, as the "coin of the realm," they should be used as a medium of exchange and legal tender for all debts and purchases.

- The Treasury Department regarded the issuance of as many as 30 coins, using different designs, both confusing and conducive to counterfeiting.
- Issuance of coins such as Olympic commemoratives would set a dangerous precedent, especially if they were profitable, because many groups and organizations would make requests to mint coins to honor their particular observances.
- The government would loathe to do something it hadn't done in more than 50 years, that is, issue a gold coin.
- Minting of a gold coin would be directly contrary to the U.S. government's policy to diminish the value of gold and eliminate gold's special status in the international monetary system.

Having recognized that modern sales techniques and wide use of media had helped Munich, Montreal and Moscow market their coins, the LAOOC decided, despite the expected opposition from both the executive and legislative branches of the U.S. government, the worldwide sales of coins should be accomplished through the private sector, rather than through the Treasury Department or any other government agency.

To that end, the Organizing Committee solicited numerous private marketing companies experienced in marketing past coin and medal programs to make proposals. The LAOOC reached an agreement with Lazard Freres of Paris, Occidental Petroleum (USA) and the Franklin Mint (USA), which became known as the Coin Group and

1 Prospective buyers inspect the Olympic Coins at the Exposition Park booth.

advanced \$5 million and guaranteed \$50 million more to the organizers. The Group also took on the responsibility for helping move the Olympic coin bill through Congress and for ultimately purchasing the coins from the U.S. Treasury Department for cash. The LAOOC, according to the Group's proposal, would keep \$1 million regardless of the bill's fate and would be able to use the interest on the \$5 million.

Although the LAOOC was spearheading the coin proposal in the U.S. Congress, the Organizing Committee was not the only proposed beneficiary of the program. The LAOOC agreed to split the revenues it would receive from the sales of commemorative coins with the United States Olympic Committee on an equal basis, to assist the USOC with its fund raising efforts and to ensure that money from the sales of coins would go directly to the athletes for their development and training, in addition to the organization and staging of the Games in Los Angeles.

In the past, each National Olympic Committee received a fee equal to three percent of the gross sales of coins in their country in return for the right to market coins bearing the Olympic symbols in that country. In its agreement with the LAOOC to receive 50 percent of the coin revenues, the USOC agreed to clear the rights to use the Olympic symbols in each country and would pay the 3 percent fee to each NOC out of its share of the coin proceeds. In this way, the commemorative coin sales in the USA helped to finance the training and development of Olympic teams around the world.

24.02.3 Original legislation and marketing proposal

The original legislation in the U.S. Senate, co-authored by the chairman of the Senate Banking Committee and the ranking minority member of that committee called for 29 gold and silver coins to be minted by the Treasury Department. A Washington lobbying organization was retained by the Group to aid in pushing the bill through to final passage in both the Senate and the House of Representatives. Both the LAOOC president and executive vice president/general manager testified before the committee on the essential aid that would be provided to the LAOOC by the coin program.

The bill was amended to a lesser total of 25 coins, and, after further consideration and the passage of time, 17 coins, and easily passed the Senate in December 1981; as a result, the Group cut its guaranteed return to the Organizing Committee from \$50 million to \$30 million.

House legislation was initially authored by a Southern California representative and ultimately by the chairman of the House Banking Committee, which sent the bill to the full House on a 32-7 vote.

The committee version of the bill authorized the Treasury Department to mint up to 42 million legal tender coins in denominations of \$1, \$10, \$50 and \$100 in 17 different designs.

Further, it provided for the marketing of the coins by private firms selected through a competitive bid process overseen by the Treasury Department. A minimum of \$30 million was guaranteed, with proceeds being split among the private marketers, the LAOOC and the U.S. Olympic Committee.

Once the bill reached the House floor on 20 May 1981, however, the chairman of the Subcommittee on Coinage and Consumer Affairs opened debate on the bill, which the lobbyists had assumed would not happen.

The basic argument against the bill was that U.S. legal tender should not be put into the hands of private entrepreneurs and that too small a percentage of the money would eventually be directed toward aid for athletes. Furthermore, the Group was attacked, one member as being a foreign agent, another for having been fined by the government and the third as one having undesirable and unethical business dealings with socialist bloc nations.

A substitute motion calling for a 1983 issue of a single 90 percent silver coin with a one dollar face value, a 1984 issue of the same type of coin, also with a dollar face value, and a single 1984 issue 90 percent gold coin with a \$10 face value was made in May 1982.

The Mint would be authorized to strike up to 50 million silver and two million gold coins, the designs of which would be determined by the Secretary of the

Treasury. The silver would be sold at a retail price of \$32 and the gold at \$352. In a vote that surprised backers of the original bill, this motion won easily, 302-84, thus ending the Group and its proposal.

The Senate, noting the mounting time pressures to get any program going, approved S. 1230, as amended by the House, on 1 July 1982 and sent the bill to the president for his signature. President Ronald Reagan signed the bill into law on 22 July 1982 (Public Law 97-220).

24.02.4 Outcome of consideration by the Congress

The legislation actually removed the Organizing Committee from any specific role in the financing of the coin program. All manufacturing and marketing of the coins became the responsibility of the Department of the Treasury. A surcharge of \$10 for each silver and \$50 for each gold coin sold was split between the LAOOC and the U.S. Olympic Committee, the funds paid by the Treasury at the end of each month. The LAOOC pledge that no tax funds would be used to stage the Olympics was upheld in regard to the coin program, as the Secretary of the Treasury was responsible for insuring that there would be no net cost to the United States government.

2

2 The three Olympic coins.

Numismatic and Philatelic Programs

24.02.5 Authorization and striking of the Olympic commemorative coin

The program started very slowly, one reason being that the selection of the designs for the coins went through months of disagreement. After three designs produced by the U.S. Mint staff had been approved by the Treasury Secretary, independent coin and design experts told of their dislike for the designs at a Congressional hearing. Finally, a silver coin design by Robert Graham of California was approved as was a design for the gold coin by John Mercanti, an engraver for the U.S. Mint. The design for the other silver dollar was produced by the chief sculptor of the U.S. Mint.

24.02.6 Design and composition of the coins

The 1983 silver dollar was designed by Elizabeth Jones and featured a discus thrower on the obverse side and the American eagle on the reverse. Its weight was .86 troy ounces (26.73 grams) and its composition was .900 silver and .100 copper. It had a diameter of 1.5 inches (38.10 millimeters) and a reeded edge. It was proof minted at San Francisco (4,575,603) and the uncirculated minting was done at Philadelphia (920,485), San Francisco (550,000) and Denver (550,000).

The 1984 silver dollar was designed by Robert Graham and featured the Los Angeles Memorial Coliseum on the obverse and the American Eagle on the reverse. Its weight was .86 troy ounces (26.73 grams) and its composition was .900 silver and .100 copper. It had a 1.5-inch diameter and a reeded edge. It was proof minted at San Francisco (4,000,000) and the uncirculated issue was minted at Philadelphia, San Francisco (550,000) and Denver (550,000).

The 1984 Olympic Gold Eagle, worth \$10 face value, was designed by John Mercanti from a concept by James Peed, and featured Olympic torch bearers on the obverse and the American Eagle on the reverse. Its weight was .538 troy ounces (16.718 grams) and its composition was .900 gold (21.6 karat) and .100 copper. Its diameter was 1.06 inches (27.00 millimeters) and it had a reeded edge. It was proof minted at West Point, New York (1,360,000), Philadelphia (150,000), San Francisco (150,000) and Denver (150,000) and the uncirculated issue was minted at West Point (190,000).

24.02.7 Marketing of the coins

Selection of the marketer, as was the case with the designers, became a long and complicated affair, despite severe time restrictions. The Treasurer of the United States managed the coin program and established a program requiring dozens of potential marketers to submit detailed proposals for marketing the coins in the United States. D'Arcy-MacManus and Masius, a New York advertising agency, was selected. The agency's media advertising plan was approved, but the agency had difficulties setting up retail sales outlets. Four wholesale dealers were established to service the retail coin trade but were very slow in beginning that operation, probably because of the low profit possibilities with coins versus cash investments. Coin dealers generally are accustomed to high unit profits but Treasury Department policy required an initial cash purchase by wholesale dealers of 30,000 coins.

With U.S. marketing at least sporadically underway, the treasurer turned her attention to foreign marketing, again soliciting dozens of proposals, with the criteria being a marketing plan, qualifications and satisfactory financial stability. Lazard Freres, a member of the original marketing triumvirate, was selected as the foreign marketer and estimated that its overseas efforts would result in about 25 percent of the total coin sales.

D'Arcy-MacManus and Masius, however, continued to encounter delays in getting its program authorized after it took over in November 1982 and could not implement its recommendations until April 1983, by which date the program had earned \$24 million. The Treasury followed up later in the year by appointing a special task force charged with increasing coin sales. That group, assisted by a top marketing executive from a major private corporation, did so. It streamlined the program by establishing more retail outlets, financing a \$15 million series of television commercials and establishing a retail coin center in Exposition Park during the Games.

The Treasury never made arrangements with a major U.S. retail chain to handle the sales of the coins or to help by mailing information to their retail customers as had been done by arrangement of the Montreal organizers in 1976.

Still, sales increased with surcharge income to the LAOOC and the USOC growing monthly, from \$1.7 million in March 1983 to almost \$4 million by July 1983.

Sales continued to increase as enthusiasm for the Olympics, helped immeasurably by the tremendous public response to the Olympic torch relay, gripped the United States.

3

D'Arcy-MacManus and Masius reported that sales in the eastern United States had been relatively slow until the torch relay and the Games themselves. The sales program was extended through the holiday season in December 1984, until 18 January 1985.

3 First day covers of stamps and postal stationery issued in advance of the Games.

After sales ended, the coin dies were destroyed and silver and gold inventories were melted down.

**24.02.8
Results of the coin program**

Coin revenue to the LAOOC stood at \$31 million by 30 November 1984 with an anticipated additional revenue of \$5 million by the time the sales program ends. An equal amount was received by the United States Olympic Committee, helping to further their programs for Olympic sports in the USA. While the revenue which accrued to the Organizing Committee certainly was no small amount, reservations among those involved with the original proposals still believe that even greater revenue could have been realized had that proposal been passed by the U.S. Congress.

**24.03
Commemorative stamp program**

**24.03.1
History of United States commemorative stamps**

The first commemorative stamps issued in the United States came in 16 denominations, ranging from 1-cent to \$5, commemorating the 1893 Columbian Exposition in Chicago and marking the 400th anniversary of Columbus' discovery of America.

Since that time, literally thousands of U.S. commemorative stamps have been issued. But Olympic philately did not begin until 1932, when the Olympic Winter Games were held in Lake Placid, New York. A 2-cent stamp was issued to commemorate those Games and were first sold at the Lake Placid post office on 25 January 1932. Later that year, a 3-cent and 5-cent stamp set was issued on the occasion of the Games of the Xth Olympiad in Los Angeles and first sold at the Los Angeles post office on 15 June 1932.

The Olympic Winter Games were next held in the United States in 1960 at Squaw Valley, California. For those Games, a 4-cent stamp was issued and first appeared on 18 February 1960 at Tahoe City, California. In 1972, four stamps, including one airmail stamp, were issued to commemorate the Olympic Games in Munich and the Olympic Winter Games in Sapporo. Four postage stamps were issued in 1976 in celebration of the Olympic Games in Montreal and the Olympic Winter Games in Innsbruck. Five pieces of postal stationery were issued in honor of the 1980 Olympic and Winter Games at various times in 1979. A block of four 15-cent stamps and a single 10-cent stamp were first sold in Los Angeles on 5 September 1979 to commemorate the 1980 Olympic Games in Moscow. On 1 November 1979, a 31-cent airmail stamp honoring the Games was placed on sale at Colorado Springs, Colorado, headquarters city for the United States Olympic Committee. Another block of four 15-cent stamps in honor of the XIIIth Olympic Winter Games was issued at Lake Placid on 1 February 1980.

24.03.2 Concept and development of the program

Since the United States had traditionally issued commemorative stamps for a wide variety of observances and anniversaries, the LAOOC found the U.S. Postal Service very cooperative. In return, the U.S. Postal Service became an official licensee entitled to use the *Star in Motion* and other Olympic logos in promoting its involvement with and interest in the Games of the XXIIIrd Olympiad.

The LAOOC and the Postal Service reached an agreement in 1983 which provided for the issuance of 24 commemorative Olympic stamps depicting all the athletic events as well as issuance of other related stationery items such as postal cards and aerograms.

The initial series had its first day of cancellation on 8 April 1983 at Heritage Hall on the campus of the University of Southern California, which served as one of the Olympic villages for the Games. The set consisted of a block of four 40-cent international air mail stamps featuring the men's shot put, the men's still rings, women's swimming and weightlifting.

Other series issued included:

- A block of four 40-cent international airmail stamps featuring hurdling, women's basketball, football and women's gymnastics, issued at San Antonio, Texas, on 17 June 1983.
- A block of four 13-cent stamps depicting women's archery, the discus throw, women's high jump and boxing, issued at South Bend, Indiana, on 28 July 1983.
- A block of four 35-cent international airmail stamps depicting pole vaulting, cycling, women's fencing and women's volleyball, issued at Colorado Springs, Colorado, on 4 November 1983.
- A 28-cent international airmail postal card featuring speedskating, issued at Milwaukee, Wisconsin, on 29 December 1983.
- A block of four 20-cent stamps depicting figure skating, downhill skiing, cross-country skiing and ice hockey, issued on 6 January 1984.
- A 13-cent stamp depicting the Olympic Torch Relay, issued on 30 April 1984.
- A block of four 20-cent stamps featuring men's diving, the long jump, wrestling and kayaking, issued on 4 May 1984.

An aerogram depicting equestrian, water polo, tennis, hockey, baseball, team handball, luge, rowing and judo was issued on 14 October 1983. Also available from the Postal Service were Olympic cancellations from 33 postal stations which served Olympic venues during the Games, as well as maximum cards, which were pictorial postal cards on which a stamp could be affixed and then canceled on the picture side. The 25 different maximum cards available were ideal for collectors since the picture, stamp and cancellation were all related to a specific theme of the Games.

No revenues were received by the LAOOC from the United States Postal Service (USPS), as they merely continued to sell stamps at their regular face value. However, the LAOOC, in partnership with the International Olympic Committee and USOC, entered into an agreement with the Franklin Mint to sell First Day Covers honoring the stamps issued by the USPS on a world-wide basis. The income realized from this program was split among the three parties.

As a part of the Olympic Arts Festival, an Olympic Philatelic Exhibition was held from 25 July–12 August at the Pasadena Center Conference Building. The "Olympilex '84" exhibit proved popular and was attended by 3,500 patrons. The event was co-produced with the LAOOC by the Federated Philatelic Clubs of Southern California.

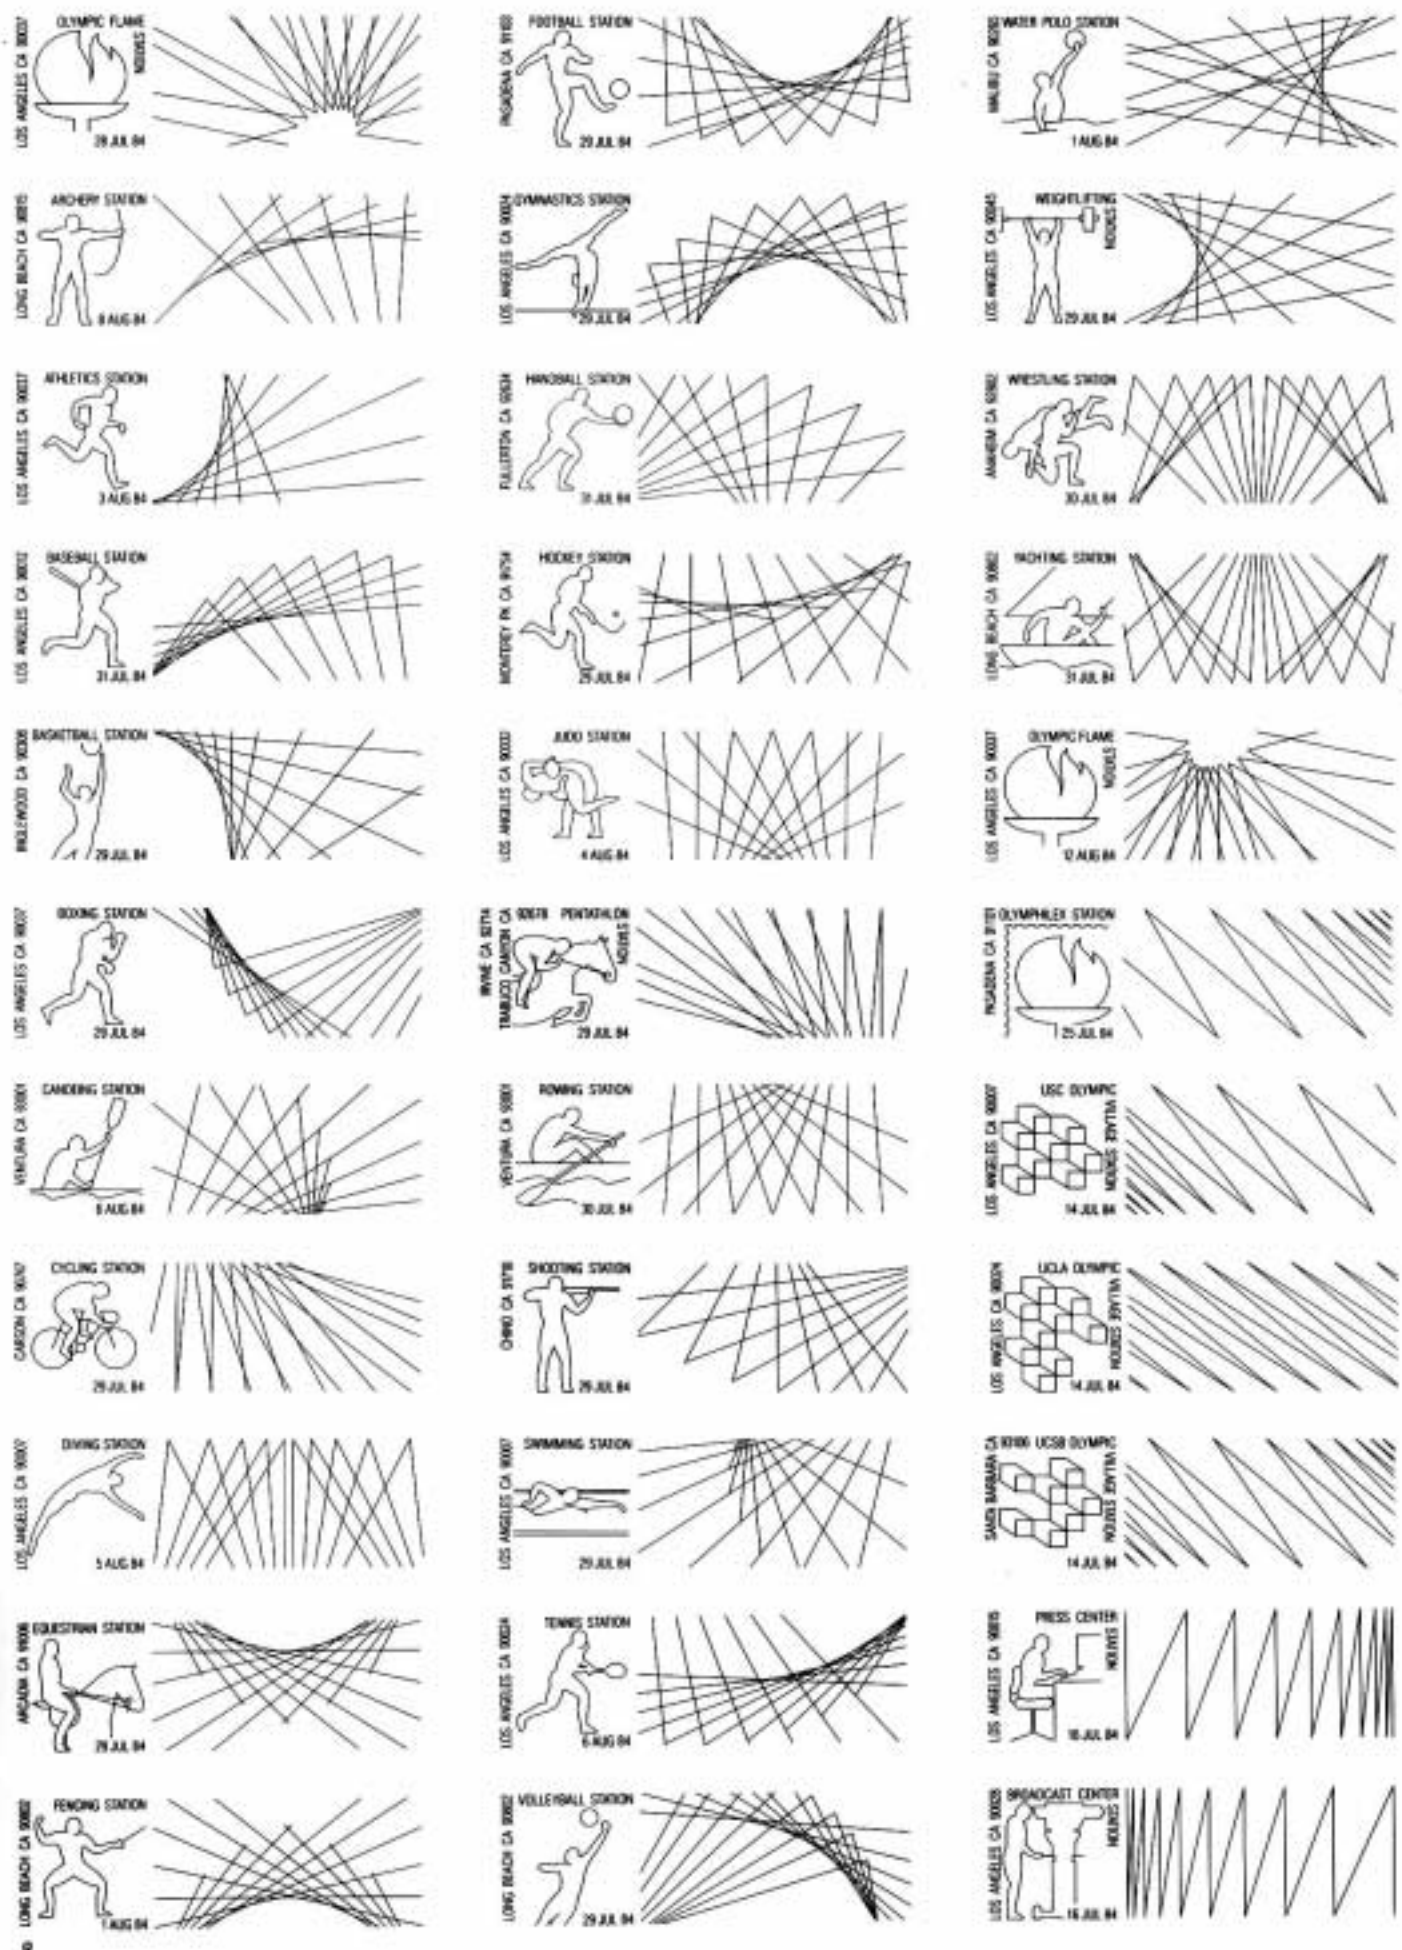

24.04 Special programs

24.04.1 Joint efforts with the Sarajevo Organizing Committee

Although there had been little involvement between organizers of Olympic Games and Olympic Winter Games in the past, given the disparate nature of the two events, the LAOOC and the organizing committee for the XIVth Olympic Winter Games in Sarajevo, Yugoslavia, communicated closely on a variety of matters in areas of mutual interest and benefit. Therefore, both organizing committees explored the possibility of producing a tangible item to serve as a lasting remainder of the close cooperation and friendship that existed between both the organizers and the peoples of Los Angeles and Sarajevo. To that end, it was decided to produce a limited edition medallion featuring a dove of peace and emblems of the two Games. Five thousand were minted by Josten's, the official supplier of awards for the Olympic Games, and distributed to all LAOOC staff members, to the Sarajevo organizers and, on a limited basis, to IOC members and other dignitaries. A smaller commemorative medallion featuring the same symbols was distributed to every LAOOC ticket buyer. There were 300,000 of those made.

24.04.2 Other collectibles: Medals and pins

Recognizing the intense interest in collecting and trading pins, not only by spectators but also by athletes, coaches, officials, journalists and nearly everyone else involved with the Olympic Games, the LAOOC licensed Ooh La La, Inc., to produce cloisonne jewelry. Ooh La La produced three different series of pins, totaling 101 different designs, including the *Star in Motion* in various sizes, *Sam the Olympic Eagle* as a participant in every sport and Olympic sports pictograms.

9 Special cancellations honoring each site were offered by the United States Postal Service.

Numismatic and Philatelic Programs

The LAOOC also had licensees that produced such items as commemorative plates, men's and women's jewelry, bus tokens, belts and belt buckles, glass objects, costume jewelry and handcrafted native American jewelry.

The Organizing Committee even issued pins for its staff to mark special occasions, including pins to honor and identify Olympic patrons, the Olympic Spirit Team, LAOOC volunteers (Team '84), *Sam the Olympic Eagle* as Santa Claus for Christmas 1982, and special volunteer pins honoring those who had worked more than 250 hours. Special thanks to LAOOC staff and volunteers were extended with a special flat enamel pin commissioned by IOC President Juan Antonio Samaranch and bearing the word "Gracias" and the initials "J.A.S." LAOOC senior management likewise showed its appreciation to the staff and volunteers after the Games with a special pin saying "Thanks" with the signatures "Peter, Paul, Harry" inscribed on it.

Various departments of the Organizing Committee also issued their own pins to commemorate their specific roles in the Games. The Press Operations Department even issued the first-ever pins for the media with mascot *Sam the Olympic Eagle* posed on three different style pins as a print journalist, as a radio/TV broadcaster and as a photographer.

24.05 Summary

Because commemorative coins and stamps had become major sources of revenue to recent Games organizers, the LAOOC sought such programs for the Games of the XXIIIrd Olympiad and succeeded despite resistance from the United States government, which had not produced commemorative coins in large quantities since the 1930s. The Organizing Committee coordinated its efforts with the U.S. Congress and the U.S. Treasury Department to establish an Olympic coin program and with the U.S. Postal Service to issue a series of commemorative Olympic stamps.

The coin program faced numerous delays from its inception. Although the United States Senate had approved a bill for 17 coins of varying designs that the LAOOC assumed would easily pass the U.S. House of Representatives, other interests arose and a substitute bill was passed. The latter halted the financing and marketing of Olympic coins by the LAOOC and its three private contract firms, giving those responsibilities to the appropriate government agencies. Ultimately, the Olympic coin program consisted of three coins, a 1983 silver dollar, a 1984 silver dollar and a 1984 gold eagle, worth \$10.

Revenue that accrued to the Organizing Committee through 30 November 1984 amounted to \$31 million. Another \$5 million was expected before the program ceased.

The LAOOC negotiated with the U.S. Postal Service for a series of Olympic commemorative stamps and eventually named the Postal Service as an official licensee of the Games. Series or single stamps or cards were issued by the Postal Service on ten different occasions during 1983 and 1984 to commemorate different facets of the Olympic Games. Also available from the Postal Service were Olympic cancellations from 33 postal stations serving Olympic venues during the Games, as well as maximum cards, which were pictorial postal cards.

The LAOOC also recognized the intense public interest in pins and other such collectibles and named various official licensees to manufacture and sell such items. Special pins were also issued by the LAOOC to mark special occasions, and at the close of the Games, two special pins thanking the LAOOC staff and volunteers were commissioned by the IOC President and by LAOOC senior management.

25.01 Concept of the Festival

25.01.1 Historical concept

The union of art and athletics in the Olympic movement began in 1906 when Baron Pierre de Coubertin, founder of the modern Olympic Games, organized a conference in Paris to study the extent to which art and literature could be incorporated into the celebration of the modern Olympiad. Coubertin believed that the Olympic ideal should celebrate the complete individual, not just athletic ability.

The Stockholm Games of 1912 were the first to fulfill this association, awarding medals in five competitions; architecture, sculpture, painting, music and literature.

During the next ten Olympiads, the arts competitions suffered not only from their own problems, but also in comparison to the athletic competitions. There were difficulties in mustering large orchestras to play new works, troubles with transporting exhibits and, foremost, difficulties in attracting first-class competitors—prospective artists who already enjoyed prominence in their fields, preferred to judge rather than be judged. Additionally, few prizes were awarded because judges often felt that the entries did not merit Olympic-class recognition.

Therefore, at the conclusion of the 1948 London Games, the International Olympic Committee (IOC) eliminated the competitive concept of the arts program. Beginning with the Helsinki Games of 1952, the Olympic cultural programs assumed the character of an exhibition or festival.

This decision to create an Olympic arts festival resulted in the addition of a rule to the Olympic charter which directed the organizing committee for each Olympic Games to arrange exhibitions and demonstrations of art, which the Charter defined as “architecture, literature, music, painting, sculpture, photography and sports philately.” The Charter allowed “*theatrical, ballet, opera performances or symphony concerts*” and specified that the arts component of the Games “*shall be on an equal standard. . .as the sports events.*”

Each organizing committee has had the option of choosing the type of arts festival it would present and the length of time it would encompass. Montreal in 1976 and Moscow in 1980 preferred to present only native artists. Mexico City in 1968 and Munich in 1972 had international festivals. The 1972 Festival lasted six weeks; 1976 lasted four weeks and 1980 lasted five. The 1968 program ran for a one-year time period.

25.01.2 Concept for 1984

For the Games of the XXIIIrd Olympiad, the Los Angeles Olympic Organizing Committee (LAOOC) honored the Charter mandate by creating a ten-week festival, most of which would precede the Games rather than compete with them. The first seven weeks, from 1 June to 20 July, featured programs that were international in flavor, thus reflecting the character of the Games and the host city of Los Angeles where more than 80 languages and cultures coexist. The final three weeks, from 20 July to 12 August, showcased the unique cultural richness of Los Angeles and the United States.

A significant parallel can be drawn between the organization of the Olympic Arts Festival and the Olympic Games. Both drew on the resources of the city of Los Angeles. The OAF reached out to the city’s arts community to enlist the support of its museums and galleries, its theatre and dance companies, its cultural and community centers. These organizations became co-producers of the Festival and were instrumental in its planning and implementation. Financial assistance from the Times Mirror Company, the official corporate sponsor of the cultural program, provided the Festival with sufficient resources and freedom to enable the organizers to be bold in their artistic selections.

The goals of the 1984 Olympic Arts Festival were:

- To be the year’s major international arts festival
- To serve as an elegant prelude and joyful accompaniment to the 1984 Olympic Games
- To celebrate the international brotherhood of the artist as the Games celebrate the international brotherhood of the athlete
- To showcase cultural diversity and excellence
- To present artists and works that have been seen infrequently by Los Angeles audiences

- To make a lasting contribution to Los Angeles and its artistic and cultural growth
- To provide a cross-cultural forum for world artists and audiences
- To create an atmosphere of festival and celebration throughout the greater Los Angeles area

The 1984 Olympic Arts Festival was a single, grand-scale celebration. Its program represented the traditions of world culture in a diversity of mediums. It challenged traditional artistic boundaries and united emerging young talent with more established artists—the essence of the Olympic Movement.

25.01.3 Cultural Affairs Department

Within the Los Angeles Olympic Organizing Committee, the Cultural Affairs Department, later called simply the Olympic Arts Festival, was designed to serve as the executive producer for all Festival events. The department was responsible for all artistic and managerial decisions relating to the Festival production. These included:

- Developing and implementing a comprehensive artist selection policy
- Selecting and managing the co-producing partners
- Overseeing the final selection of the performing arts companies, as well as selecting the artists commissioned for projects commemorating the 1984 Olympic Games
- Developing and implementing a comprehensive Festival marketing program
- Overseeing ticket sales and distribution
- Developing and overseeing a press and public relations program as it related to the Festival
- Coordinating Festival logistics from point of entry to exit of all visiting artists
- Ensuring the smooth technical production of all events

In order to avoid establishing a large staff of curators and impresarios for a one-time event of this scope and magnitude, the OAF entered into various agreements with existing Los Angeles arts organizations that had proven expertise and abilities in line-production. These organizations came

6

to be known as the Festival co-producers. The OAF executive personnel based within the LAOOC, together with the co-producers and their staff and short-term Festival employees hired in May and June 1984, planned and implemented all aspects of the Festival. The OAF executive production staff was headed by the LAOOC vice president for Cultural Affairs/Director of the Olympic Arts Festival and two associate directors.

The Cultural Affairs Department avoided duplication of resources as well as increased staff numbers by incorporating and utilizing existing support services and personnel from other LAOOC departments. Accommodations, Architecture and Construction, Finance, Government Relations, Language Services, Material Logistics, Public Relations, Press Operations, Security, Transportation, Ticketing, and the Legal Department were among those LAOOC departments that either assigned one of their personnel exclusively to the Festival project or lent occasional expertise in specific areas of need.

Although this organizational design ultimately proved successful, it was not without some trial and error, as the support service personnel were in the difficult position of reporting to two departments with differing goals and objectives.

The co-producers

In early 1982, the Festival organizers entered into consulting agreements in the performing arts with three primary co-producing organizations: the Center Theatre Group/Mark Taper Forum in theatre, the Dance Gallery of the Bella Lewitzky Dance Company in dance, and radio station KUSC-FM in chamber music. Acting under the supervision and direction of the Festival director and in concert with the Festival staff, the co-producers' contractual responsibilities were:

- To advise on the selection of the performing arts companies to be included in the Festival

- To serve as the primary liaison with the selected companies
- To assist with the negotiations on the performance agreements with these companies
- To prepare the master schedule of the performances
- To serve as the primary liaison with the performance venues
- To assist with the negotiations for the lease agreements
- To assist in developing the implementation plan and resource assessment for the performing arts component of the Festival

The co-producing partners incurred neither financial risk nor legal responsibilities for performance contracts with invited companies. The OAF was signatory and had all the legal, financial and performance obligations as defined in the agreements. Ultimately, the OAF was the executive producer/presenter and the co-producer was the artistic advisor and source of production personnel and was paid a consulting fee for these services.

Several observations should be made regarding the nature of the relationship between the OAF and its co-producers in the performing arts. Accurate and effective communication was imperative to the success of the Festival and this objective was not always met by the OAF and the respective co-producers. While the success of the 1984 Olympic Arts Festival cannot be questioned, the co-producing model should be analyzed closely to determine if the overall operations would be better served with a more centralized staff.

Festival staffing

In collaboration with OAF co-producers, the LAOOC Human Resources and Finance Departments developed a corollary to the LAOOC Games Staffing plan which better met the needs of OAF. It was called Festival Staffing.

This hiring process was used for the 600 Festival staff beginning after 1 May 1984 and included technical crews, front-of-house personnel, drivers, press assistants and venue finance personnel.

The LAOOC Finance Department established a separate company designation for Festival staffing in its payroll system. The venue finance managers used established forms and procedures and audited the process at all venues.

The co-producers were responsible for identifying positions (with OAF approval), recruiting applicants and interviewing and hiring. The prospective employees did not sign the LAOOC staff Terms and Conditions letter, but rather a special terms and conditions letter for the OAF and the necessary tax forms.

The primary variance between Games Staffing and Festival Staffing was with regard to security. It was recognized that OAF venues did not require a high level of security control, and as a result, OAF used a simple non-accreditation identification system with no need for security clearance. The only exception was for finance personnel who were cleared prior to hiring.

The Olympic Arts Festival was the result of efforts given by numerous artists and organizations that make up the arts community of Los Angeles. The success of this collaboration was apparent to all who took part in the Festival. Legacies to the city of Los Angeles were both visible and non-visible. Among the less tangible gifts was a new spirit of cooperation among the leading arts organizations within the city and a new sense of what is possible within a community of artists who have already begun to test the outer limits of convention.

7

25.02 Development of the Festival program

25.02.1 Artist selection

The basic premise in the selection of companies participating in the 1984 Olympic Arts Festival was one of excellence: to honor the true Olympians in the field of performing and visual arts. It also was important to the organizers that the program be multi-national, multi-cultural and multi-lingual and show diversity in medium and approach.

In the context of the Olympic Games—the foremost international sporting event—the cultural component could not live up to the mandate of “equal standard” if it were a festival of local or national character. It was decided that the Festival must be an international celebration of arts from around the

world. Therefore, those countries which had previously hosted an Olympic Games were invited to send performing arts companies and exhibitions. To increase continental representation, South America and Africa were added to the invitation list. To commemorate its first appearance in an Olympiad since the Los Angeles Games of 1932, the People’s Republic of China was invited to send a representative. Finally, looking to the future and the 1988 Games in Seoul, Korea, the Republic of Korea sent its national dance company.

In that international Olympic context, as the host city and country of the 1984 Olympic Games, it was appropriate to present many of the artistic treasures of the United States, as well as provide a program to share Los Angeles’ cultural resources.

The Olympic Arts Festival celebrated artistic excellence in both the performing and visual arts. Within each of those mediums, there was a forum for the contemporary, avant-garde artist as well as the more classical, traditional artist. The Festival selection list united emerging young talent with more established representatives of their fields and presented new works, new artists, new companies and new exhibitions that previously had not been seen in Los Angeles.

8

8

8 Dance and theatre receive heavy emphasis in the Olympic Arts Festival, showcasing performing companies from both the United States and abroad.

The ultimate responsibility for artistic decision making rested with the OAF director. However, mounting an arts festival of this scope resembles a jigsaw puzzle whose pieces are continually changing shape. It requires more than one person to select and place the pieces in their proper positions. The co-producers of the Festival were central to the process of artistic selection, serving as the key artistic advisors to the Festival director.

Four years went into the organization and implementation of the program. This period of time was roughly divided into four phases:

- Evaluation of past Olympic cultural programs and formulation of Festival philosophy, character and general format: August 1980 through March 1981
- Program building and analysis: March 1981 through September 1982
- Logistical planning and contract negotiations: September 1982 through May 1984
- Implementation: May through August 1984

It was the goal of the organizers not to vary from their original program concept once the logistical planning and contract negotiations were underway. Although they were prepared to deal with any realistic obstacles, the Festival was produced with very little deviation from the originally conceived plans.

Contract negotiations

Two standardized contracts were used by the OAF in finalizing the performing arts companies and exhibitions presented: a performance agreement and a cultural services agreement.

The performance agreement outlined the type, location and number of performances to be given by the performing company. It also stated financial arrangements and responsibilities for artistic fee, accommodations, per diem, transportation and freight. These points were negotiable and differed from company to company. The Olympic Arts Festival personnel were accountable for providing adequate technical, rehearsal and performance facilities and supplying a stage crew.

The performance agreement was used for all of the dance companies, most of the theatre companies and the chamber music ensembles.

The cultural services agreement, more simply known as a grant, was the contractual instrument signed with the

museums, the Music Center Opera Association for the Royal Opera of Covent Garden, the Los Angeles theatre groups, the California Institute of the Arts for the production of the Contemporary Music Festival, the Los Angeles Dance Alliance for the California Dance Festival and the Los Angeles Philharmonic Orchestra Association.

The OAF gave each organization a grant of money to cover all or part of the anticipated expenses. These groups, using the funds supplied by the LAOOC, then entered personal agreements with the various artists to be presented and paid all direct artistic and production expenses.

There were two levels of financial and technical responsibility within the cultural services contract. On one level, the OAF provided sufficient funds to cover all anticipated expenses and was the primary, if not sole operator of the ticketing function, and received all the box office revenues. This model was used by the California Institute of the Arts, the Los Angeles Philharmonic Orchestra Association and the Los Angeles Area Dance Alliance. On the second level, as entered with the Los Angeles-based theatres and the Music Center Opera Association, the co-producer received a smaller grant of money but presented its Festival productions in its own facility or base of operation. In this model the LAOOC received no share of the ticket revenue, but provided ticketing services to enhance the sense of a comprehensive and unified festival and to assist the organization in marketing efforts.

Dance

The Dance Gallery, under the artistic direction of Bella Lewitzky, served as the co-producer of the dance events. Under its agreement with the LAOOC, the Dance Gallery served as the principal artistic advisor to the Festival director, and made the initial selection of dance companies to be invited to participate. Once the companies received the formal letter of invitation from the LAOOC, it was the responsibility of the Dance Gallery to negotiate the performance agreement within the parameters set by the OAF management.

Companies and artists involved in the California Dance Festival auditioned for a place on the program. Selections were made by a co-producing committee of the Los Angeles Area Dance Alliance and the Dance Gallery.

The dance contracts were the least difficult of the performing arts contracts to negotiate. Dance companies are accustomed to the logistics of touring and of having to use different facilities and crews. In addition, they have standard fees and are familiar with touring contracts.

When an agreement was reached and contracts signed between the OAF and company representatives, the Dance Gallery assumed the role of primary artistic liaison, gathering and disseminating information for housing, transportation and furnishing technical support for rehearsals and performances. Finally, the Dance Gallery staff served as the manager for the visiting companies while they were in Los Angeles and as the line-producer/technical director at the dance venues.

Theatre

The Center Theatre Group/Mark Taper Forum served as the co-producer for the international and national theatre events in the Festival. The contractual responsibilities of the Center Theatre Group were much like those of the Dance Gallery, except that there were many more complex contracts negotiated for theatre. Only one contract in dance required personal attention and lengthy negotiation by the Festival director. Many of the theatre performance agreements necessitated the director's involvement, plus numerous trips to personally visit the companies.

Theatre companies do not normally tour, therefore the presentation of their productions are inherently more difficult. Additionally, many productions were presented in a language other than English, and it was imperative to make early decisions on whether the work would reach a predominantly English-speaking audience. Finally, many of the companies needed secondary subsidizing by their home governments, thus requiring additional negotiations by the OAF with governmental authorities from several nations.

Once the contracts were negotiated, the co-producers returned to the process and served as the liaison to the theatre companies.

The 16 United States theatre companies were selected by a different format. Any major regional theatre interested in participating in the Festival was required to submit a

9

proposal outlining its production and a tentative operating budget. The OAF staff and the theatre co-producer examined all proposals and made selections based on how each company would complement the international slate of companies and fit within the framework of the total program.

For Los Angeles representation, 30 proposals were reviewed by a selection committee of four prominent Los Angeles theatre producers and a local theatre critic. Nine companies were chosen to participate and were included within the group of national organizations. They operated under a cultural services agreement awarding a grant of money to cover a portion of their production expenses, using their own facilities and receiving all ticket revenues.

Music and Opera

There were multiple co-producers for the musical events of the Olympic Arts Festival: KUSC-FM for chamber music; California Institute of the Arts for contemporary music; Festival Music, Inc., for jazz; the Music Center Opera

Association for the Royal Opera of Covent Garden and the Los Angeles Philharmonic for the performances at the Hollywood Bowl.

The Chamber Music Festival was presented under the same co-producing model as were dance and theatre and used the same performance agreement for each of the seven ensembles.

There was virtually no recruitment of performers within the chamber music program. All but two of the groups presented were winners of major international chamber music competitions. Two established ensembles were invited to represent the United States and the Southern California area.

Although the OAF "presented" the other musical events—Contemporary Music Festival, Royal Opera of Covent Garden, Hollywood Bowl events—they were also produced under a cultural services agreement with the various co-producers.

Visual Arts; exhibitions

In selecting the visual arts exhibitions for the Olympic Arts Festival, there was no one overriding criterion for selection other than meeting the general goals established for the overall artistic standard.

9 *Les Ballets Africains in performance at the Pasadena Civic Auditorium.*

10

10 LAOOC Olympic Arts Festival Director Robert J. Fitzpatrick (left) and Los Angeles Mayor Tom Bradley (right) inspect the LAOOC poster series.

Southern California museums in those cities and communities where athletic venue sites were located were approached as early as 1981 to ascertain their interest in participating in the Festival. Over the next 12 months, museum directors met with the Festival staff and presented proposals for special Olympic exhibitions.

The character of the exhibition proposals were as diverse as the museums themselves, ranging from exhibitions on the history of the 1932 Olympic Games to Southern California's contribution to the ceramic arts.

If the proposal was deemed to be in keeping with the spirit of the Festival and met the OAF's standard of excellence, it was included in the program and a cultural services agreement was entered into between the OAF and the museum. The museum was responsible for securing additional funds, if necessary, either from additional sponsors or by charging admission fees.

In several instances, the OAF staff developed an exhibition idea which was then offered to an appropriate museum with an option to mount the display in its institution. In these cases, the Festival served as a broker for many important artistic projects, such as the exhibitions of ancient Greek artifacts and French impressionist paintings.

The exhibitions were scheduled to open at staggered times throughout the Festival's ten weeks, with an eye to ensuring that a maximum number of exhibits be open during the two weeks of the Games.

Visual arts; commissions

The Festival had a series of ambitious art projects commissioned for the 1984 Olympic Games which included photography, sculpture, fine arts posters and murals. In general, the

commissioning programs shared common guidelines. They were for a cross section of American artists representing a broad spectrum of styles and treatments. Emerging artists and the well-established were included in the final selection and attention was given to providing representatives of the cultural diversity among the arts in the United States.

The initial project was the Olympic Fine Arts Poster series. A selection panel comprised of the OAF director, associate director and experts from the Los Angeles Museum of Contemporary Art and the Los Angeles County Museum of Arts invited 16 artists to participate in the program. Knapp Communications served as the commercial publishers of the series.

The second Festival project commissioned was a major piece of sculpture for Exposition Park, the site of the Los Angeles Memorial Coliseum. This sculpture was planned as a permanent testament to the 1984 Olympic Games. When reviewing the work of various artists under consideration for the project, the selection committee looked for an artist who could work within the architectural context of the Coliseum, creating a work of appropriate scale and impact. When a finalist was selected, the artist was invited to create a maquette for final consideration before entering a commissioning agreement. This maquette and the proposed site plan were presented for review to the LAOOC president, executive vice president/general manager and the Olympic Arts Festival director for approval. Once approved, it was necessary to secure site approval from the owner of the land, the Museum of Science and Industry, and from the Los Angeles Coliseum Commission.

Subsequently, ten murals were commissioned to enhance the freeways in the downtown corridor approaching the Los Angeles Memorial Coliseum. The OAF was assisted in the program by Brockman Gallery Productions, which served as a co-producer. The artists were invited to participate in the program in recognition of their contributions to public art in Los Angeles as evidenced by the murals they had created throughout greater Southern California.

Finally, the OAF commissioned ten photographers to document the Games from an artistic, rather than photo-journalistic perspective. Co-producers for this project were the Los Angeles Center for Photographic

Studies and the Museum of Contemporary Art. Sixty photographers were invited to send portfolios and a proposal for the project and from this group ten were commissioned.

Festivals and film

In a city that is best known for Hollywood and the movies, the art of film making could not be ignored. Neither could multi-cultural festivals because of Los Angeles' varied mix of nationalities.

The structuring of the festivals and film portion of the Arts Festival was much the same as the visual arts exhibitions. The OAF organizing personnel approached the Los Angeles arts organizations that had ongoing projects in film or festivals. Each was asked to submit a proposal for a Festival project that would enhance its own program while adding special Olympic character.

The American Film Institute mounted a film festival exploring the new artistic frontiers of video, while the Los Angeles Film Exposition presented a series featuring the best international films of 1984, and the Academy of Motion Picture Arts and Sciences celebrated the art of animation.

An arts festival in Los Angeles would not be complete without a public celebration of the city's cultural and artistic diversity allowing for participation by Los Angeles' community of artists. The programs were co-produced by the Craft and Folk Art Museum (Festival of Masks), Plaza de la Raza (Folklife Festival), Huntington Library (Japanese Festival), and TOPSail '84 (a festival of tall ships).

The Olympic Arts Festival embraced all the arts. It demanded that audiences broaden their definitions of art and sharpen their powers of perception and discretion. Although the presentations were diverse, they were united by one common attribute: the pursuit and realization of excellence.

25.02.2

Venue acquisition

A total of 48 venues encompassing theatres, museums, an outdoor amphitheatre, a sound stage, several parks and a swimming pool, were sites for the 72 performing arts productions and the more than 30 visual arts exhibitions that were part of the 1984 Olympic Arts Festival.

Twenty-four of the total venues utilized were sites for theatre and dance productions, 11 of which fell within the technical and operational jurisdiction of the Olympic Arts Festival management. The use of the remaining 13 were incorporated into cultural services contracts negotiated with the LOS Angeles area theatres, Music Center Opera Association, the Los Angeles Philharmonic Association, California Institute for the Arts and the Los Angeles Dance Alliance and were the responsibility of those sponsoring organizations.

■ Principal performing arts sites

Olympic Arts Festival

The Festival organizers were looking to accomplish three things in acquiring performance and exhibition venues:

- To centralize the Festival as much as possible
- To create a sense of physical identity for the Festival
- To provide each company with a location suitable for its technical production requirements

Dance

Following the prescribed guidelines, venue acquisition for the dance portion of the Festival was a straightforward procedure. The requirements for an adequate facility in which to stage the dance performances included a wide and deep proscenium stage and a large audience capacity.

After studying the general technical requirements of each company, OAF personnel, along with the dance co-producer, investigated all theatre complexes in the area.

The site that came closest to meeting the prescribed needs and was available at the time of the Festival was the 3,000-seat Pasadena Civic Auditorium.

Negotiations with the Pasadena Civic Auditorium followed a standardized procedure since the auditorium was accustomed to frequent rental agreements. Cost of the rental was the main issue. Once that was resolved, the lease agreement was signed. It stated the length of time the building would be used, the rental cost and the areas of responsibility for each party.

Within the Pasadena lease agreement, the auditorium was responsible for premise upkeep and supplying an event supervisor—someone with thorough knowledge of the facility—who would be paid by the OAF. The OAF agreed to use the Pasadena box office staff and ushers, and, in accordance with union rules, to use union crew members backstage. The auditorium had a long-standing contract with a food and beverage concessionaire and the OAF agreed to work with it and to give the house management a percentage of the revenue. The OAF obtained complete control of all souvenir concessions, including using OAF staff and products. Additionally, television rights sales were reserved for the OAF alone and the OAF agreed to pay for excess utility usage.

Not all the companies presented were well-suited to performing in a large house; therefore the Festival organizers acquired the BOO-seat Japan America Theatre as a second theatre for dance. The Japan America Theatre lease was a standard contract, similar to the one negotiated with the Pasadena Civic Auditorium. The major exceptions were that the OAF augmented the box office staff and brought in additional technical backstage crew.

Theatre

Venue acquisition and artist selection were in progress simultaneously, creating difficulties in both areas. The OAF organizing personnel were handicapped in looking for adequate facilities without full knowledge of the productions to be staged. On the other hand, companies were hesitant to sign contracts without knowledge of the availability of suitable theatres.

In the most complex example, after inspecting the highly specific technical requirements of Le Theatre du Soleil which necessitated a stage area of 120 feet by 60 feet and 50 feet high, it was determined that a theatre of those proportions did not exist in Los Angeles. A sound stage was the only solution—Television Center, Studio 9. It was a large empty area that was infinitely flexible and could be constructed to fit any setting. The OAF theatre technical director and crew duplicated Le Theatre du Soleil's studio in Paris while at the same time allowing for later remodification for the two productions that followed.

The lease agreement for Studio 9 was straightforward. The OAF supplied everything from construction needs to front-of-house and backstage crews.

The four theatres at the University of California, Los Angeles (UCLA) were centrally located and prestigious, and many theatre-goers were acquainted with the location. In addition, the physical location and layout made it possible to produce a mini-theatre festival at UCLA.

Although the positive aspects of UCLA were strong, there were several problems encountered. Renovation was in progress in the main theatre—the Royce Hall Auditorium—at the time of the negotiations and there were no solid assurances of a completion date. Therefore, tickets were sold to the performances in this theatre without an accurate seat count or knowledge of row configurations. Also, as a result of the construction, it was not possible to test the acoustics and their appropriateness for theatre productions prior to taking occupancy.

The completed contract resembled that of the Pasadena contract, but had many more complex points. One of the important issues was backstage jurisdiction. The sites were property of the university, but the OAF was technically responsible to the companies and their productions. In the end, UCLA assigned an event supervisor to work hand-in-hand with OAF staff and also supplied the front-of-house staff. Backstage personnel were hired by the OAF technical director with UCLA reserving the right to review all employees.

Visual arts

Venue acquisition in the visual arts was a problem that directly affected the character of the exhibitions. Since it was not possible to rent a museum, the types of exhibitions were constricted by the wishes of the museums, even though OAF provided financial assistance.

The OAF contacted the museums in the Southern California area and asked if they were interested in hosting an Olympic exhibition. Generally, the museum was either willing to mount an exhibition with financial and brokering help from the OAF or already had a project in mind and asked for approval

and financial assistance for it. Some noted museums—the J. Paul Getty (Malibu) and the Norton Simon (Pasadena)—had in-house policies that precluded mounting special exhibitions and therefore could not become part of the Festival project.

The OAF did not negotiate any museum sites, as it did for the dance and the theatre venues. All exhibitions mounted were the responsibility of the museum itself in association with OAF and, as such, cultural service agreements were made for the exhibit rather than for the space.

Field offices

Production offices were established for dance, theatre and music to serve as the base of operations for each Festival component. The Pasadena Holiday Inn served as the base for dance operations, the Westin Bonaventure for theatre and the New Otani Hotel for music. These production offices operated autonomously, but remained in contact with the Festival command center at the LAOOC's administrative headquarters. From these offices the co-producers and their staff monitored the scheduling and logistics of arriving companies, as well as housing, transportation, general hospitality and press relations.

The dance production office was established in two adjoining rooms at the Pasadena Holiday Inn from 16 May through 14 August 1984 and was immediately accessible to the Pasadena Civic Auditorium which was the primary dance venue. With the first dance production on 1 June and the last on 11 August, it was operational longer than any other venue office.

In the original projection, one room was designated for office operations, the other for hospitality. Equipment for the office area consisted of a word processor, personal computer, photo-

copier and telecopier, telephones, four desks, four 8-foot tables and the necessary chairs. For the hospitality room, a full-size refrigerator, a microwave oven and large cooler were made available, although space had not been allocated. It became necessary, due to space and staff numbers, to add a third room which evolved into the hospitality room, leaving the original two as working offices.

Satellite field offices were maintained in the Green Room of the Japan - America Theatre and the basement of the Pasadena Civic Auditorium. Office equipment consisted of a desk, file cabinet, typewriter, chairs and a telephone.

The theatre production office was established on the fifth floor of the Bonaventure Hotel and was operational from 18 May through 27 July. Theatre performances opened 7 June and closed 22 July.

Six satellite field offices were operated on site at Beverly Hills High School, Television Center/Studio 9 and UCLA's Royce Hall, The Little Theater, Schoenberg Hall and Ralph Freud Playhouse.

The music production office at the New Otani Hotel opened on 4 June. It shared a satellite office with dance production at the Japan-America Theatre (JAT). The original plan included a private field office for music at the JAT, but was eliminated under the assumption that the music co-producers could operate from their home institutions or from the music production office at the New Otani. The field office was reinstated on a share-basis when further investigation showed the home institutions were too far away and that the New Otani production office had limited space.

Equipment allocation for the theatre and music offices were on the same level as for dance; differences were found in the amount allocated according to the space available.

The main press operations office was also located on the fifth floor of the Westin Bonaventure Hotel, with satellite offices located at the Pasadena Holiday Inn and UCLA's Royce Hall. All three offices were operational by the last week in May.

The LAOOC Material Logistics Department coordinated production and field office installation working in conjunction with the logistics managers for dance, theatre and music. A comprehensive list of all office equipment and hospitality needs were submitted to the appropriate LAOOC departments between February and April 1984. The OAF logistics manager monitored installation, operation and removal of all equipment. Of the requested office equipment, the most underestimated

need at every venue was that of telephones. There were not enough telephone lines installed to handle incoming calls and, at the same time, make outgoing business calls. Additionally, most telephones were limited to local area calls only. This was meant to monitor and control long distance use. Both situations served only to complicate routine office procedures.

25.02.3 Sponsorship and funding

The varied components that were involved in the financial aspects of the Olympic Arts Festival make a concise recap difficult.

The Festival was not produced by a single entity with one accounting center, but by many co-producing organizations working in concert with the Los Angeles Olympic Organizing Committee.

The Festival's arrangements with many of its 37 co-producers under the cultural services agreement gave the co-producing organization responsibility and liability for their productions, both technical and financial. In the event additional funds were required, the co-producers had authority to bring in additional sponsors for their programs. As such, they were their own fiscal centers and did not report financially to the OAF management. Profits as well as losses were theirs.

Further, many of the performing arts companies presented in the Festival received financial support from their governments, thus significantly reducing costs to the LAOOC.

Finally, certain Festival costs were assumed by the operating budgets of other LAOOC departments: the Festive Federalism Look of the sites by Architecture and Construction, the design of the ticketing system by the Ticketing Department, legal services by the Legal Department, transportation by Transportation, and media centers by Press Operations. Other departments that partially assumed OAF costs included Government Relations, Accommodations and Material Logistics.

Nonetheless, the identified direct expenses of the Festival incurred by the LAOOC amounted to approximately \$11,500,000.

The revenue side of the Festival budget shared similar accounting difficulties. The total ticket revenue received for all performing arts events presented as part of the Festival came close to \$5,000,000. Total ticket sales for the performing arts:

Total ticket sales	
Direct Mail/ 186,000 tickets	\$2,838,000
TicketMaster/ 40,000 tickets	548,000
Box Office/ 58,000 tickets	1,544,000
Press/Artists/ 22,000 tickets	Complimentary
Total/ 306,000 tickets	\$4,930,000

Two million of this total was paid to, or collected directly by, the co-producers in the performing arts to help defray some of their expenditures. Therefore, revenues received by the LAOOC from ticket sales to offset direct expenditures amounted to \$3,000,000.

It should be noted that the LAOOC collected no revenues for any of the visual arts exhibitions presented. Admission revenues, if any, for these exhibitions went directly to the hosting co-producers to further assist in the defrayal of costs incurred in mounting the exhibitions.

Sources of funds for direct expenditures by LAOOC:

Sources of funds	
Times Mirror Company	\$5,000,000
LAOOC General Fund	3,000,000
OAF Ticket Sales	3,000,000
Other	500,000
Total	\$11,500,000

The category of "other" included concessions, sales of posters, programs, records, T-shirts and miscellaneous souvenirs.

The Times Mirror Company became the corporate sponsor of the cultural program of the 1984 Olympic Games in May 1982. Its sponsorship of \$5,000,000 provided the means by which OAF organizers could take artistic risks in presenting productions whose content was unique, non-traditional and, in some instances, controversial. The sum was paid in seven installments and designated to be used strictly by the Cultural Affairs Department. Additionally, in December 1983, Times Mirror provided funding for 20,000 official OAF posters and 13,000 press kit folders.

Olympic Arts Festival

The financial responsibility of the Olympic Arts Festival was a multi-level partnership shared by the LAOOC, the Times Mirror Company, the primary co-producers and their sponsors, as well as auxiliary supporters. Through this partnership, not only were the financial risks of the Festival shared, but also the rewards of producing and sponsoring one of the largest arts festivals ever mounted in the United States.

25.03 Festival program elements and review

25.03.1 Dance

From 1 June through 11 August 1984, Los Angeles became the dance capital of the world. From classical to contemporary, from folkloric to tap, the dance program of the Olympic Arts Festival explored a wide range of expression and movement.

The productions emphasized the diversity and individuality of dance as it is known today. Dance was the only medium to run the length of the Festival, indicating the parallels that can be drawn between the dancer and the athlete. The discipline, training and performance practices were of equal standard.

The dance program was initially conceived in three broad categories: folkloric, contemporary and classical. But with the boundaries vague, special attention was given to those companies that cut across disciplines. From the 94 participating companies representing nine countries, it was possible to explore dance from its

earliest ethnic roots to the cutting edge of performing art, dance theatre and beyond, to those artists who were creating new rules. In the 72 dance performances, there were 13 world, American or Los Angeles premieres.

Four foreign companies made their American debut as they showcased the depth and versatility of international dance. Two of the European companies were influenced by American choreographers and each added its own personality and concepts to the program.

Ballet was well represented at the Festival by the oldest companies in the United States and Canada. Added to that roster was America's first black classical dance company to establish an international reputation.

Modern dance, with its origin deeply rooted in the United States, was highlighted by American choreographers who have set standards by which much contemporary dance is measured. Many presentations crossed a variety of artistic frontiers, freely mixing dance, theatre and design within a single production.

Others, particularly the folkloric dance companies, faithfully recreated the dances that originated up to 1,000 years ago.

Special evenings were devoted to the California Dance Festival, where dancers and choreographers from northern and southern California presented programs highlighting a variety of dance styles and reflecting the multi-cultural heritage of the city of Los Angeles.

As the curtain dropped on the final Festival dance production, it was clear that two Arts Festival dance goals were realized: to take programming risks and to encourage a varied audience response from ecstasy to outrage, but never disinterest.

Dance facts and figures

Opening date/performance:

1 June/United States premiere
Pina Bausch's *"The Rite of Spring"*

Closing date/performance:

11 August/Dance Theatre of
Harlem—*"Four Temperaments"*,
"Fall River Legend", and *"Stars and
Stripes"*

companies performed 41 concerts, plus four children's and one seniors' concert

Japan America Theatre; Three foreign companies, 75 California companies, and one original historical presentation totaled 23 concerts, two children's and one seniors' concert

Number of performances sold-out:

- American Jazz Tap, four of five performances
- Ballet Folclorico de Guadalajara, one of two performances
- California Dance Festival, one of nine performances
- Dance Theatre of Harlem, four of seven performances
- Kodo, three of three performances
- Korean National Dance Company, one of two performances
- Les Ballets Africains, four of four performances
- Pina Bausch, one of six performances
- Royal Winnipeg Ballet, one of two performances
- Sankaijuku, two of two performances
- Twyla Tharp, two of two performances

Dance companies

Opening date/performance:

- 1 June/United States premiere
- Pina Bausch's "The Rite of Spring"
- Aman Folk Ensemble (USA)
- Pasadena Civic Auditorium
- "Folk Dances of 8 Nations" two performances: 29 June
- "California Heritage Suite" two performances: 30 June

Authenticity, precision and skill characterize dances of the Aman Folk Ensemble which celebrated its 20th anniversary in 1984. Based in Los Angeles, the internationally recognized folk ensemble takes its name from the Middle East variant of "amen", the universal word for blessing or affirmation. The "California Heritage Suite" program, choreographed by Robin Evanchuk, was a world premiere created specially for the Olympic Arts Festival. "Folk Dances of 8 Nations" showcased authentic costumes and dances from Hungary, Iran, Mexico, Romania, Tunisia, USSR, Yugoslavia and United States.

American Jazz Tap (USA)
Japan America Theatre
"Original Show"
six performances: 30 July-3 August
This "Original Show" was specially created for the Festival, bringing together many of the greatest tap dancers of all time to give an exuberant musical history of tap-one of America's indigenous art forms. Charles (Honi) Coles, Tony award winner for "My One and Only" and the founder and chairman of the New York dancer's club, the Copasetics, was among the

featured performers who demonstrated various tap styles from jazz to modern, from musical theatre to pop.

Ballet Folclorico de Guadalajara (MEX)
Pasadena Civic Auditorium
"Folk Dances of Mexico"
three performances: 13, 14 July
The Games of the XXIIIrd Olympiad represented the third Olympic gathering in which the Ballet Folclorico de Guadalajara has taken part. They received honors at the World Folklore Festival during the 1968 Mexico City Games and appeared as the official representative of Mexico in the ceremonies of the Munich Games in 1972. Based at the University of Guadalajara, Ballet Folclorico is one of the most authentic of all Mexican dance corps and has faithfully researched and recreated the country's colorful and intricate folk dances.

Bugaku (JPN)
Japan America Theatre
"Bugaku"
four performances: 19-22 July
The Arts Festival performance of "Bugaku" (Dance) from the Nara Kasuga Shrine marked what is believed to be the first time since World War II that a Japanese cultural group has performed at an Olympic cultural program at the invitation of the Organizing Committee. Having survived more than 1,000 years of cultural change, Bugaku remains a highly ceremonial form of dance/drama rarely seen outside the Imperial Palace and was seen for the first time in Los Angeles.

California Dance Festival (USA)
Japan America Theatre
L.A. Asian-Pacific Dance Festival
one performance: 8 June
L.A. Hispanic Dance Festival
one performance: 10 June
L.A. San Francisco/Los Angeles
Dance four performances: 13, 15 June, 5, 6 July
1984 Olympic Black Dance Festival
one performance: 16 June

Kinetikos Choreographers Showcase
two performances: 24, 25 July
California is the second largest center of dance in America and boasts over 200 companies. For the Festival, northern California joined southern California for four performances by artists from the Los Angeles Area Dance Alliance and the San Francisco Bay Area Dance Coalition to present member companies and soloists in dances encompassing various styles-ballet, ethnic, jazz, modern, the avant garde. For five evenings, four Los Angeles dance groups staged a series of diverse programs reflecting the rich multi-cultural heritage of the city: Asian, Hispanic and Black. Kinetikos completed this portion of the Festival by

showcasing the rising new stars in dance choreography.

Dance Theatre of Harlem (USA)
Pasadena Civic Auditorium
"Serenade", "Streetcar Named Desire", "Firebird"
three performances: 8, 10, 11 August
"Four Temperaments", "Fall River Legend", "Stars and Stripes"
two performances: 7, 11 August
"Concerto Barocco", "Le Corsaire", "Agon", "Troy Game"
two performances: 9, 10 August
Guided by the principles of George Balanchine and the New York City Ballet, Arthur Mitchell founded the Dance Theatre of Harlem in 1968 after the assassination of Martin Luther King, Jr. It is America's first black classical dance company to establish an international reputation.

The Feld Ballet (USA)-Pasadena Civic Auditorium
"Straw Hearts", "Intermezzo", "The Jig Is Up"
two performances: 15, 16 June
Eliot Feld, a Brooklyn-born choreographer for numerous national and international companies, formed the Feld Ballet in 1974. His list of choreographing credits has grown to 40 including his Festival offerings "Straw Hearts" and "The Jig Is Up", both Los Angeles premieres.

Groupe Emile Dubois (FRA)
Japan America Theatre
"Ulysse"
two performances: 11, 12 July
Founded in 1979, Groupe Emile Dubois made its United States' debut at the Olympic Arts Festival. A contemporary French group influenced by the Merce Cunningham style, it has emerged as one of the young energizers of contemporary French dance.

Kodo (JPN)
Japan America Theatre
"Selections"
eight performances: 26-27, 29-30 June, 1-2 July
Spoken, "kodo" means "heartbeat". Written, its characters say "drumming children". These Japanese demon-drummer/dancer-musicians from Sado Island began daily practices in 1971 using drums ranging from the size of a hand, to the O-daiko, weighing close to 1,000 pounds and requiring drumsticks the size of small logs. They are as visually arresting as they are musical virtuosi, and were presented in the Festival primarily as dancers.

15

15 An artist adds detail to an Olympic mural.

Korean National Dance Company (KOR)
Pasadena Civic Auditorium

"Selections"
three performances: 6,7 July

Founded in 1962, the Korean National Dance Company's performance at the 1984 Arts Festival marked its third Olympic Games appearance. Previously, it was part of the cultural celebrations at the Mexico City Games in 1968 and at the Munich Games in 1972. Its performance in Los Angeles was in honor of the 1988 Games of the XXIVth Olympiad in Seoul, Korea. A part of the National Theatre of Korea in Seoul, the company specializes in re-creation of traditional Korean dances and dance drama.

Les Ballets Africains (GUI)
Pasadena Civic Auditorium

"Selections"
five performances: 19–22 July

In their first United States appearance in 13 years, Les Ballets Africains, recognized as one of the world's leading dance companies, brought Africa's history, legends and traditions to life through dancing, poetry and music. The artists are drawn from a series of local, regional and national competitions. Many were selected as a result of notable activity in dance companies associated with trade unions or civic and social organizations.

Lewitzky Dance Company (USA)
Pasadena Civic Auditorium

"Confines", "Spaces Between", "Nos Duraturi"
one performance: 19 June

"Inscape", "Continuum", "Nos Duraturi"
one performance: 20 June

Bella Lewitzky, founder, artistic director and principal choreographer of the Lewitzky Dance Company, has been a Southern California contemporary dance leader for 40 years. Since its inception in 1951, the Lewitzky

Dance Company has been noted for its innovative sets and costumes, as well as for the superb training of its dancers. *"Nos Duraturi"* was specially created by Lewitzky for its world premiere during the Olympic Arts Festival to the music of Igor Stravinsky's *"Symphony of Palms"*.

London Contemporary Dance Theatre (GBR)

Pasadena Civic Auditorium
"New Galileo", "Forest", "Class"
one performance: 26 June

"Stabat Mater", "The Dancing Department", "Run Like Thunder"
one performance: 27 June

The London Contemporary Dance Theatre was the brainchild of Robin Howard, a London hotelier who established the Contemporary Dance Trust in 1966 and invited Robert Cohan, then co-director of the Martha Graham company to be Artistic Director. The company's performances in the Festival marked its first appearance on the west coast of the United States.

Merce Cunningham Dance Company (USA)

Pasadena Civic Auditorium
"Channels/Inserts", "Duets", "Pictures"
one performance: 2 July

"Locale", "Quartet", "Roadrunners"
one performance: 3 July

For some 40 years, Merce Cunningham has been a maverick of modern dance. Cunningham's work has become, for many, the standard by which most modern dance is measured. All six works presented at the Arts Festival were choreographed by Cunningham.

Nikolais Dance Theatre (USA)

Pasadena Civic Auditorium
"Pond", "Tensile Involvement", "Liturgies", "The Mechanical Organ"
two performances: 16, 17 July

Alwin Nikolais has been an innovator since he began choreographing in 1948. His use of lighting, masks and props, has resulted in choreographic effects often as evocative of theatre as dance. A new work, *"Mechanical Organ"*, presented in its entirety, was an Arts Festival world premiere, while *"Liturgies"*, commissioned by the Venezuelan National Cultural Council for the Simon Bolivar Bicentennial, was performed for the first time ever in Los Angeles.

Pina Bausch Wuppertaler Tanztheatre (FRG)

Pasadena Civic Auditorium
"Cafe Muller", "Rite of Spring"
two performances: 1, 2 June
"1980—A piece of Pina Bausch"
two performances: 4, 5 June
"Bluebeard"
2 performances: 7, 8 June

Bausch purposely was selected to open the Festival. Her reputation, style and approach has branded her as one of the premiere avant-garde companies in the world. She outraged some who walked out of the performances, enthralled others, and presented ideas that had never been seen in the United States before. The four pieces that Bausch's company presented were United States premieres and revealed the range and diversity of the choreographer/director's personal artistic vision.

Royal Winnipeg Ballet (CAN)
Pasadena Civic Auditorium

"L'estro Armonico", "Family Scenes", "Lento", "A Tempo E Appassionata", "Les Patineurs"
one performance: 22 June

"Our Waltzes", "Translucent Tones", "Giselle" pas de deux, "5 Tangos"
one performance: 23 June

Founded in 1939, Canada's oldest ballet company became fully professional in 1949 and received a Royal Charter grant from Queen Elizabeth II in 1953. Noted for versatility of repertoire and its dancers' technical excellence, the company has earned numerous gold medals in international ballet competitions.

San Francisco Ballet (USA)
Pasadena Civic Auditorium

"Selections"
two performances: 25, 26 July
America's first ballet company, now 50 years old and under the direction of Michael Smuin and Lew Christensen, brought to the Festival selections from the company repertory featuring highlights from the 50th Anniversary Gala: Opening movement from *"Serenade"* (G. Balanchine), pas de deux from *"Filling Station"* (L. Christiansen), *"Mobile"* (T. Ruud), excerpts from *"The Tempest"* (M. Smuin), *"The Beatles—Work in Progress"* (M. Smuin), and Fifth Campaign from *"Stars and Stripes"* (G. Balanchine).

Sankaijuku (JPN)
Pasadena Civic Auditorium

"Jomon Sho"
two performances: 9, 10 July

The group Sankaijuku originated in 1975 by Ushio Amagatsu, a participant in the development of *"Butoh"*, a dance style distinguished by its preoccupation with irregular bodies, an

atmosphere of sublimated eroticism, and a rigid, mechanistic movement that becomes ceremony—slow, powerful, intense. In addition to the American debut performances of *"Jomon Sho"* (Homage to Pre-history), these five white-ashed, nearly naked Japanese dancers presented their interpretation of Butoh and scaled down the front of the 110-foot high Dorothy Chandler Pavilion, hanging by their ankles.

Twyla Tharp Dance (USA)
Pasadena Civic Auditorium
"Nine Sinatra Songs"
one performance: 4 August
"Fait Accompli"
one performance: 5 August

Always an innovator in her use of music, ranging from the Beach Boys to Frank Sinatra to Jelly Roll Morton, Twyla Tharp has choreographed well over 50 works for a variety of settings: outdoor spaces, museums, gymnasia, stage, film and television.

25.03.2 Theatre

The theatrical portion of the Olympic Arts Festival explored a broad spectrum of language, culture, staging and acting styles.

Emphasis was given to presenting companies which had not previously performed in the United States: six organizations made their United States debut. Ultimately, companies representing 14 different countries and five continents, along with 16 United States troupes, presented 324 productions in nine different languages.

Language was a particular risk with theatre. A non-English language performance would speak to only a limited number in the audience. Consequently, two principles were used in selecting companies and their repertoires. First, they had to be highly visual—not dependent on language, and second, the stories had to be familiar enough to an audience that language would not be a significant factor.

It quickly became evident that one playwright fulfilled both these criteria: William Shakespeare. During the Festival, four companies presented six different Shakespeare productions in three languages—English, French and Italian—each with its own unique style ranging from French Kabuki to street theatre with a stage full of jugglers, magicians and acrobats.

Although no overall themes were specifically planned, several sub-themes subsequently emerged. One of the most prominent was the presence of strong directors, artists who had founded their own companies and whose vision permeated all aspects of their productions.

Several companies broadened the concept of theatre beyond its traditional boundaries. Within the Festival there were Chinese acrobats, an Australian circus with satire and without animal smells, a world premiere performance in a swimming pool, Italian slapstick comedy, Belgian street theatre featuring anthropomorphic power tools and participatory theatre.

American and Los Angeles theatre companies were selected with the same rigorous standards as the international companies. All six of the American regional companies had established national reputations for their unique approach to their work, while the nine Los Angeles companies were chosen by a panel after examining more than 30 proposals.

In keeping with the rest of the Festival, the theatre programs attempted to reach beyond the established arts audiences. While it presented several productions that were intellectually and emotionally challenging, there were numerous programs that appealed to families and children. There was a concerted effort to demystify the theatre-going experience and to encourage people to take a chance and to be a part of the Olympic experience.

In retrospect, the Olympic Arts Festival theatre components took risks—some were successful, other were important failures and a few were flops. Each, however, contributed a valuable ingredient to the overall Festival.

Theatre companies

Actors For Themselves (USA)
 Matrix Theatre
"Homesteaders"
 15 performances: 24 June–8 July
"Homesteaders", a West Coast premiere, was a two-act comedy-drama set on an island fishing community in southeastern Alaska that pitted the idealistic rebellion of the 1960s against the realities of the 1980s. The director was Sam Weisman.
 Formed in the early-1970s. Actors for Themselves was conceived as a theatre for actors to pursue their craft, as well as develop additional skills such as writing, directing and producing.

American Repertory Theatre (USA)
 Ralph Freud Playhouse, Macgowan Hall, UCLA
"School For Scandal"
 three performances: 25, 26, 30 June
"Six Characters In Search of an Author"
 three performances: 27-29 June
 Richard Brinsley Sheridan's *"School For Scandal"*, directed by Jonathan Miller, was originally produced for the American Repertory Theatre's 1982–1983 season, while Luigi Pirandello's *"Six Characters In Search of an Author"*, directed by the company's founder Robert Brustein, was the final work of the Theatre's 1983–1984 season.
 The ensemble, one of the few still performing in rotating repertory, emphasizes worthy but neglected works from the past, new American plays and innovative classical productions.

Antenna Theatre (USA)
 Royce Rehearsal Hall, UCLA
"Amnesia"
 28 performances: 16–22 July (4 performances daily)
 The production of *"Amnesia"*, directed by Chris Hardman, was an experiment with "walk-through", audience participation theatre. Each person wore a portable cassette player and walked through a designed setting listening to pre-recorded dialogue and interacting with live masked actors.
 Antenna Theatre was founded in November of 1980 by Hardman and bases its works on the idea that a major strength of live theatre and public art comes from the interaction with the community in which it is created and presented.

Carlo and Alberto Colombaioni (ITA)
 Schoenberg Hall, UCLA
"Original Show"
 eight performances: 17–24 June
 Brothers-in-law Carlo Colombaioni and Alberto Vitali are clowns in the age-old Italian theatrical tradition of the "commedia dell'arte" dating back to the Renaissance.

Their performances are divided into several parts: first, a portrayal of traditional commedia dell'art, and then, a more contemporary look at slapstick and parody, including take-offs of Hamlet, William Tell and American westerns. The Italian-spoken production did not need English translation.

The Cast Theatre (USA)
 The Cast Theatre
"Brain Hotel"
 18 performances: 22 June–8 July
"Brain Hotel, A Frontal Revue", was a one-hour, four-person collective monologue that has been compared to Joycean stream-of-consciousness writing on one hand, and to scat singing on the other.
 The Cast Theatre is dedicated to the development of new American playwrights through the production of their original plays.

Center Theatre Group/Mark Taper Forum (USA)
 Mark Taper Forum
"Wild Oats"
 11 performances: 10, 15, 16, 20, 21, 24, 26, 29, 30 June
"The American Clock"
 13 performances: 12–14, 17, 19, 22, 23, 27, 28 June, 1 July
 Arthur Miller's *"The American Clock"* is a play depicting a depression in the 1960s and bears resemblance to a large canvas as it presents an entire society, yet running through it as a counter motif, is the story of a single family. It was directed by Gordon Davidson. The 18th-century comedy *"Wild Oats"* was adapted by James McClure into a play about the American West and directed by Tom Moore.

The Center Theatre Group/Mark Taper Forum was founded in 1967 as an outgrowth of UCLA's The Theatre Group. Under the leadership of Artistic Director Davidson, the Taper has presented more than 200 productions, ranging from the classics to contemporary European and American plays.

Chengdu Acrobatic Troupe, The Central Ensemble of National Music (CHN), Ralph Freud Playhouse, Macgowan Hall, UCLA

The Chengdu Acrobatic Troupe and Central Ensemble of National Music/ six performances: 11–15 July
 The Olympic Arts Festival marked the first United States appearance for the Central Ensemble and the Chengdu Acrobatic Troupe. The Troupe, as it is known today, established itself professionally in 1952 and boasts a staff of more than 200 skilled and rigorously trained acrobats, jugglers, tight-rope walkers and clowns.

The Central Ensemble of National Music, founded in 1960, consists of a composition and research center, a wind and string orchestra with national instruments, and a chorus. Its Festival presentation included traditional and contemporary songs and folk melodies from throughout China.

Circus Oz (AUS)
Ralph Freud Playhouse,
Macgowan Hall, UCLA

"Original Show"

six performances: 4–8 July

The Olympic Arts Festival marked the first visit to the United States for Circus Oz. A collection of 11 performers and six technical specialists, Circus Oz was a combination of the Melbourne Soup Box Circus and the New Circus in Adelaide. Almost all members of the group perform a variety of functions, from bookkeeping and program selling to walking the high wire and eating fire.

The acts presented at the Festival involved traditional circus skills, such as clowning, juggling, and balancing, but all had been given a contemporary twist.

Cricot 2 (POL)

Television Center, Studio 9

"The Dead Class"

four performances: 5–8 July

"Wielopole, Wielopole"

five performances: 11–15 July

"The Dead Class" is described as a "dramatic seance." Based on the notes of S.I. Witkiewicz, a leading Polish playwright, this piece explores the fundamental philosophical problems of death.

"Wielopole, Wielopole" is believed to be roughly autobiographical of Cricot 2's founding director, Tadeusz Kantor, and was the name of the village (near Krakow) where Kantor was born in 1915. The production is a nightmare memory play concerning a half century of Polish cultural dislocation. Both plays were directed by Kantor.

Cricot 2 was founded in 1956, but dates back to the days of World War II when Kantor and a group of artists named themselves Cricot—an anagram of the Polish word for circus.

Ensemble Studio Theatre Los Angeles (USA)

Ensemble Studio Theatre

"Sporting Goods"

14 performances: 30 June–15 July

"Sporting Goods" was an evening of nine lo-minute plays based on the theme of sport and was specially created for the Festival. This format of thematically linked short plays has become a hallmark of the Ensemble Studio.

The Ensemble Studio Theatre was founded in New York in 1971. Eight years later, a group of Ensemble members, including William Devane and Jon Voight, formed the Ensemble Studio Theatre, Los Angeles. The company is unique in that all of its plays originate in the theatre workshop and are initiated by one of its members.

An Epidaurus Festival Production (GRE)
Television Center, Studio 9

"Oedipus Rex"

five performances: 28 June–1 July

This production of Sophocles' *"Oedipus Rex"*, directed by Mino Volanakis, marked the United States debut of the National Theatre of Greece. Performed with the stark accuracy of a modern thriller, it departed from the traditional attempts to faithfully reproduce the style of the ancient Greek theatre productions. The production was performed in Greek with an English synopsis available in the performance program.

The Goodman Theatre/Flying Karamazov Brothers (USA)
Ralph Freud Playhouse, Macgowan Hall, UCLA

"A Comedy of Errors"

six performances: 18–22 July

The five Flying Karamazov Brothers teamed with jugglers, musicians, rope-walkers, tap dancers, unicyclists, gymnasts, singers and belly dancers to present a new twist to Shakespeare's first play, *"A Comedy of Errors"*. The director was Robert Woodruff.

The Goodman Theatre is the second oldest continuing resident theatre in the United States, established in 1925 as a gift to the Art Institute of Chicago.

The Groundlings (USA)
Groundling Theatre

"Olympic Trials,

A Chick Hazard Mystery"

eight performances: 11–21 June

"Olympic Trials, A Chick Hazard Mystery" is a semi-improvisational mystery calling upon the skills of one of the Groundlings' most popular characters, Private Investigator Chick Hazard. Set in the context of the 1932 Olympic Games, the play sets Hazard against

such Prohibition-era types as Velocity Gold, Johnny Christmas and Carmen Ghia. Directed by Groundlings Artistic Director Tom Maxwell, this world premiere play was constructed in such a way as to invite the audience to help Hazard solve the case by inventing clues. This who-done-it mystery was specially created for the Festival and was the first event to sell out.

The Groundlings originally began in 1972 as a workshop project. The Groundling School began with 17 students of improvisation in 1979 and has expanded to more than 150 persons today.

Grupo de Teatro Macunaima (BRA)
Schoenberg Hall, UCLA

"Macunaima"

six performances: 9–14 July

The play, *"Macunaima"*, first performed in 1978, was adapted from a 1928 novel by Mario de Andrade. It tells the story of a journey that leads the rogue, Macunaima, from his Amazon jungle home to the streets of Sao Paulo and beyond to the heavens where he becomes a star. The performance, directed by Antunes Filho, was in Portuguese with no translation necessary.

Making its West Coast debut, the Brazilian-based Grupo de Teatro Macunaima receives its inspiration, as well as its name, from the legendary hero of the Taulipangues Indians, Macunaima (the "hero with no character").

Los Angeles Actors' Theatre (USA)
Los Angeles Actors' Theatre

"Sherlock's Last Case"

17 performances: 11–22 July

"Sherlock's Last Case" pits the legendary ace of 221B Baker Street against his arch-rival Professor Moriarity. This mystery is a world premiere written by Charles Marowitz, produced through arrangement with George W. George and directed by Robert Benedetti.

The Los Angeles Actors' Theatre was founded in 1975 as a multi-cultural professional theatre and performance laboratory with a commitment to the development of new plays and new interpretations of the classics.

L.A. Theatre Works (USA)
The Little Theater, Macgowan Hall, UCLA

"Agamemnon"

15 performances: 17–30 June

The L.A. Theatre Works' production of *"Agamemnon"* represented the group's second major collaborative effort with British playwright/actor/director Steven Berkoff. This American premiere, freely adapted from Aeschylus' Greek classic by Berkoff, was a story about the futility of war and the sacrifices made to wage it.

Formed in 1974, the L. A. Theatre Works has produced 21 plays and conducted more than 80 theatre, writing, dance, music and visual arts workshops in social institutions and in the community.

De Mexicaanse Hond (HOL)
The Little Theater, Macgowan Hall, UCLA

"Luisman's Law"

six performances: 17–22 July

The world premiere performance of De Mexicaanse Hond's Artistic Director Alex van Warmerdam's *"Luisman's Law"* is indicative of the company's unique style in which each element has achieved equal status: music, sets, dialogue, interpretation.

Broadcasting in the early days was often jammed by a peculiar whining howl caused by atmospheric disturbances. Dutch listeners dubbed this noise "The Mexican Hound" for reasons that remain mysterious. In 1980, a group of young performers from Amsterdam chose this curious expression as its name, having never actually heard this howl themselves.

The National Theatre of the Deaf (USA)
Schoenberg Hall, UCLA

"The Hero With a Thousand Faces"

five performances: 3–7 July

***The Hero With A Thousand Faces"*, adapted from a book by Joseph Campbell and directed by Larry Arrick, is a comedy about the influence that myths and fairy tales exert on man as he tries to come to grips with life's dilemmas and paradoxes. The production was a Los Angeles premiere.

Composed of hearing as well as deaf actors, the National Theatre of the Deaf was formed 16 years ago by Broadway designer David Hays. The company has created a new theatre form by merging spoken English and American sign language.

Olympic Arts Festival

The Negro Ensemble Company (USA)
Schoenberg Hall, UCLA

"A Soldier's Play"

five performances: 26–30 June

"A Soldier's Play", a murder mystery, revolves around an investigation of the fatal shooting of a black sergeant at a predominantly Negro World War II Army base in Fort Neal, Louisiana. The drama won the 1982 Pulitzer Prize for author Charles Fuller.

The Negro Ensemble Company was formed in 1966 after Robert Hooks, Douglas Turner Ward and Gerald Krone determined to create a permanent home in which black theatre artists could oversee, control and promote their own artistic destinies. The company has become America's foremost black professional theatre company.

Nightfire (USA)

Beverly Hills High School

Swimming Pool

"Liquid Distance/Timed Approach"
eight performances: 9, 17 June

"Liquid Distance/Timed Approach" was a world premiere created especially for the Olympic Arts Festival. It was inspired in part by the athletes who competed in the 1932 Olympic Games and featured not only actors, but also college athletes, children, 1932 Olympic swimming and diving champions—and a swimming pool.

Nightfire is an experimental performance art company which creates only original work under the direction of Laura Farabough.

Odyssey Theatre Ensemble (USA)

Odyssey Theatre Ensemble

"Edmond"

16 performances: 24 June–8 July

"Edmond" is the story of a man set morally adrift in a corrupt and violent world, a drama about Edmond's desertion of an unfulfilled marriage, his quest for the meaning of his own existence and the nightmare odyssey he experiences through New York City's underworld. A West Coast premiere, this Obie Award-winning drama was written by David Mamet and directed by Ron Sossi.

The Odyssey Theatre Ensemble was founded in 1969, when Sossi decided to demonstrate that experimental theatre could be widely enjoyed and fiscally solvent without sacrificing artistic quality.

Piccolo Teatro di Milano (ITA)

Royce Hall, UCLA

"The Tempest"

seven performances: 7–14 July

"Harlequin, The Servant of Two Masters"

five performances: 18–22 July

During the two-week engagement at the Olympic Arts Festival, Piccolo Teatro di Milano staged two of the productions for which it is best known: Shakespeare's *"The Tempest"*, presented in a manner that recaptures the Italian roots of the play; and Goldoni's *"Harlequin, The Servant of Two Masters"*, which after 35 years has become the group's signature piece. Both productions were directed by company artistic director Giorgio Strehler in Italian with English translation available in the program.

Strehler and Paolo Grassi ran the Piccolo Teatro di Milano together from the date of its inception in 1947 until 1968 when Strehler left to set up his own company. In 1972, Grassi took up the management of La Scala and Strehler returned to direct the company as he still does today.

Radeis International (BEL)

The Little Theater, Macgowan Hall,
UCLA

"Scaffoldings"

six performances: 2–7 July

"Scaffoldings", a United States debut, focused on three laborers working on a scaffolding struggling through another day. Because the Radeis International ensemble draws from elements of theatre and mime, as well as from the circus and cabaret, it refers to its productions as "new variety theatre."

The group was formed in Brussels in 1977, as the popular street theatre that had been the goal of Jos DePauw and Pat van Hemelrijk.

Room For Theatre (USA)

Room For Theatre

"Skylark"

12 performances: 12–24 June

Samson Raphaelson's 1939 comedy *"Skylark"* is a stylish romance about a hard-working husband, a hard-playing wife and the marriage they pursue together. Directed by Norman Cohen, this three-act play showcased all three of its artistic directors Dolores Mann, Beverly Sanders and Sylvia Walden.

Room for Theatre was founded in 1979 by Mann, Sanders and Walden who wanted to provide Los Angeles audiences with a unique experience by producing plays from the American repertoire of the 1920s, 1930s and 1940s which provide women with strong acting roles.

The Royal Shakespeare Company (GBR)

Royce Hall, UCLA

"Much Ado About Nothing"

11 performances: 7–16 June

"Cyrano de Bergerac"

six performances: 19–23 June

"Much Ado About Nothing" and *"Cyrano de Bergerac"* were

directed by Terry Hands, who became co-Artistic Director with Trevor Nunn in 1978. Both productions starred Derek Jacobi and Sinead Cusack, associate artists with the RSC.

More than 28,000 people viewed the 17 performances of the Royal Shakespeare Company for one of the highest-attended productions of the Olympic Arts Festival. Although the roots of the RSC date back to 1879, it was formed in its present configuration in 1960 under the leadership of (now Sir) Peter Hall.

Teatro Taller Epico de la UNAM (MEX)

The Little Theater, Macgowan Hall,
UCLA

"Novedad de la Patria"

five performances: 10–14 July

One of Mexico's foremost experimental theatre companies, Teatro Taller Epico brought to the Olympic Arts Festival a series of popular sketches assembled under the collective title *"Novedad de la Patria"* (News of the Fatherland). Based on the epic poem *"La Suave Patria"* by the early 20th century Mexican poet Lopez Velard, the play was written and directed by Luis de Tavira. The production was in Spanish with an English synopsis available in the program.

Le Theatre du Soleil (FRA)

Television Center, Studio9

"Richard II"

four performances: 13, 16, 20,
23 June

"Twelfth Night"

four performances: 14, 17, 21,
24 June

"Henry IV, Part I"

three performances: 15, 19, 22 June

Ariane Mnouchkine's company, Le Theatre du Soleil, made its American debut at the Olympic Arts Festival performing its productions of Shakespeare's *"Richard II"*, *"Twelfth Night"*, and *"Henry IV, Part I"*. The group recognizes no "star" as such and each of the 50-plus company members share in the work of producing theatre and are paid equally.

The production of *"Richard II"* relied on sets, costumes and masks drawn from the Italian commedia dell'arte and Japanese Kabuki, while *"Twelfth Night"* relied on conventions borrowed from India's Kathakali tradition. Presented in French and lasting up to five hours, more than half of the 11 performances were sold out.

Le Theatre Sans Fil,
Montreal, Quebec (CAN)

Schoenberg Hall, UCLA

"The Hobbit"

eight performances: 16–22 July

Founded in 1971, Le Theatre Sans Fil, presented Tolkien's *"The Hobbit"*. The production was brought to life by 48 rod puppets ranging from four to 12 feet high and coordinated precisely with lighting, music and narration.

The Olympic Arts Festival marked the West Coast debut of this 11-member company directed by Andre Viens and Claire Ranger. Seven of *"The Hobbit"* performances were in English while the 18 July production was given in French.

Victory Theatre (USA)

Victory Theatre

"Back To Back"

19 performances: 21 June–8 July

The Olympic Arts Festival presentation of Al Brown's *"Back to Back"* was a Los Angeles premiere directed by Tom Ormeny with a cast of two. The production was an acclaimed comedy about two soldiers sharing a foxhole in Vietnam, and the development of their relationship in a survival situation. It attends to the simple moment of time spent in an insane situation.

Dedicated to nurturing new playwrights, this Los Angeles theatre was opened in 1980 by Ormeny and Maria Gobetti.

Waseda Sho-Gekijo (JPN)

Ralph Freud Playhouse,

Macgowan Hall, UCLA

"The Trojan Women"

six performances: 18–23 June

In 1974, Tadashi Suzuki began to rework Euripides' *"The Trojan Women"* following his theme of de-Westernizing Japanese theatre. He recast this Western classic as the recurring nightmare of an old Japanese beggar-woman sifting through the rubble of post-war Japan. Kabuki and Noh were elements that were added to the production to rediscover the ritualistic origins of culture, East and West. The play was presented in Japanese with an English synopsis available in the program.

25.03.3

Music and opera

Musical events at the Olympic Arts Festival ranged from classical to pop, from opera to jazz. There was music under the stars and over the airwaves, string quartets and electronic synthesizers.

More than any other component in the Festival, music programming evolved into many festivals-within-a-festival: a chamber music festival, a contem-

porary music festival, a jazz festival, and gala performances by the Royal Opera of Covent Garden, as well as the Los Angeles Philharmonic Orchestra. Each of these mini-festivals was designed to honor specific feats in the field of music.

The concept of featuring youthful winners of the world's prestigious chamber music competitions was present in the earliest discussions regarding the shape the Festival musical component should take. In the seven concerts presented as part of the Chamber Music Festival, five were performed by chamber music's "gold medalists", still relatively unknown artists at the beginning of their careers and all under the age of 30. The remaining two concerts featured two of the established quartets residing in the United States.

The week-long Contemporary Music Festival focused on the various ways serious composers had been coming to terms with the potential of applied electronic technology. Dedicated audiences who attended every event in the Contemporary Music Festival experienced a broad range of styles from speech-song to computer generated music. Four world premieres and six United States premieres were presented, in addition to radio commissions by six American composers for broadcast by Festival co-producer KUSC-FM.

As one of the truly indigenous American contributions to the arts, jazz was presented by Los Angeles-based musicians in a six-hour marathon and as a mini-festival.

In 1932, the Los Angeles Philharmonic Orchestra mounted a series of gala concerts, "*Concerts in the Stars*", in the Hollywood Bowl. These concerts, honoring the Games of the Xth Olympiad, were the centerpiece of the cultural program. Again, in 1984, the orchestra honored Los Angeles and the Olympic Games with four concerts, including an opening gala which showed the range and diversity of this world class orchestra.

However, for many people, the pinnacle of the Festival was the 11 performances by the Royal Opera of Covent Garden. The three productions which were presented marked the United States' debut of the Royal Opera and the occasion was commemorated by a visit from Great Britain's Princess Anne.

The music programming of the Olympic Arts Festival was designed to present new works, new artists and new productions to both the Los Angeles audiences and the visitors from around the world. Music crosses

all cultural and geographical borders and it was appropriate that this musical diversity be presented at a time of international brotherhood and friendship.

Award, is based at Brandeis University and made its debut in March 1984 at Carnegie Hall, New York City. Concert selections for the Olympic Arts Festival included quartet compositions from Hayden, Mackey and Ravel. Mackey's "*String Quartet*" was a West Coast premiere.

The Evanston Saxophone Quartet (USA)

one performance: 7 June
Kyle Horch, soprano saxophone
Kimberly Brockett, alto saxophone
Edward C. Sabatino, Jr., tenor saxophone

Ronald E. Blake, baritone saxophone
The Evanston Saxophone Quartet, winner of the 1984 Coleman Competition in Pasadena, California, was formed by four students from Northwestern University in 1983. Their Festival program included selections from Scarlatti, Pierne, Pousseur, Glazunov, Desenclos, Bach and Lacour.

Guarneri String Quartet (USA)

one performance: 11 June
Arnold Steinhardt, violin
John Dalley, violin
Michael Tree, viola
David Soyer, cello

The Guarneri String Quartet, one of the world's most prominent chamber music ensembles, celebrated its 20th anniversary season in 1984. Its members, all Professors of Music at the University of Maryland, have remained unchanged since the group's inception in 1964. Their Festival selections were from Beethoven's quartet compositions.

Winners of the 32nd Munich International Music Competition (USA)

one performance: 14 June
Peter Matzka, violin
Teresa Turner-Jones, piano
Winners of the chamber music violin/piano category at the 1983 Munich International Music

Competition, Peter Matzka and Teresa Turner-Jones, are from the United States. Besides concertizing with Turner-Jones, Matzka is a member of the Vienna String Sextet and the Atlantis Trio. Turner-Jones also is a member of the Atlantis Trio as well as the Johann Strauss Damen Kapelle. The three part program included selections from Brahms, Ives and Schubert.

The Hagen String Quartet (AUT)

one performance: 18 June
Lukas Hagen, violin
Annette Bik, violin
Veronika Hagen, viola
Clemens Hagen, cello

Three members of the Hagen String Quartet—first violinist Lukas, cellist Clemens and violist Veronika Hagen—are two brothers and a sister whose father teaches viola at the Mozarteum in Salzburg, Austria. The quartet's fourth member, second violinist Annette Bik, is a fellow student at the Mozarteum. The average age of the group is just over 20. Their recent prizes include first prize at the 1983 Evian International String Quartet Competition and the gold medal at the Bordeaux Festival several months later. Mozart, Kodaly and Schubert were selections on the program which marked the group's United States debut.

Colorado String Quartet (USA)

one performance: 25 June
Julie Rosenfeld, violin
Deborah Redding, violin
Francesca Martin, viola
Sharon Prater, cello

The Colorado String Quartet takes its name from the University of Colorado, where the ensemble was formed by graduate students in 1976. Since then, the quartet (now based at the Julliard School of Music in New York) has won four major international competitions awards: 1983 Naumberg Award; first prizes in the first Banff International String Quartet Competition and the 1980 Coleman Chamber Music Competition; and second prize in the 1981 Evian International String Quartet competition. Program selections included selections from Haydn and a West Coast premiere of Laderman and Beethoven.

Sequoia Quartet (USA)

one performance: 28 June

Olympic Arts Festival

Yoko Matsuda, violin
Miwako Watanabe, violin
James Dunham, viola
Robert Martin, cello
The Sequoia String Quartet, the quartet-in-residence at California Institute of the Arts, first came to national attention after winning the 1976 Naumberg Chamber Music Award. After performing selections from Mozart and Bartok, the group combined with the Colorado String Quartet to present Mendelssohn.

Contemporary Music Festival (FRG)
Japan America Theatre
"Sternklang"
two performances: 18, 19 June
The American premiere of Karlheinz Stockhausen's "Sternklang" (Sound of the Stars), originally performed in 1971, was presented at the Veterans Memorial Park in Sylmar. The composition was written for five groups of singers and instrumentalists who are separated during performance as far as possible from each other. The singers and players are individually amplified over loudspeakers. Sound runners transport musical models from one group to another, where they are taken over and integrated. At 10 different moments, a centrally positioned signalman gives common tempi for all, and all the groups are synchronized with each other.

"The Double Life of Amphibians" (USA)
one performance: 20 June
Morton Subotnick's "The Double Life of Amphibians"; a tone poem, is a staged concert in three parts (Amphibians, Beasts, Angels). It is scored for 11 instruments, computer generated sounds, soprano, and two male voices (bass and tenor). A work in progress for four years, this was a world premiere of the completed version.

Sal Martirano, Charles Dodge, Rhys Chatham/Roger Reynolds (USA)
one performance: 21 June
Two world premieres were offered by Roger Reynolds and Sal Martirano. Reynolds' "Transfigured Winds" written for flute solo, 14 musicians and a digital pre-recorded tape. Martirano's "Thrown" has its roots in jazz and digital logic and gets its name from a composing process. Charles Dodge's "The Waves" was a West Coast premiere and is a work for a singer and computer. The final composer in the evening's presentation was Rhys Chatham whose four programs were entitled "Guitar Ring: The Out of Tune Guitar", "Journey I-III", "No. 2", and "Guitar Trio".

John Cage/CCMC Toronto (USA/CAN)
one performance: 22 June
John Cage, long associated with the Merce Cunningham Dance Company, presented "Variations IV". Cage's instructions for the work are that it is for any number of players, any sounds or combinations of sounds produced by any means, with or without other activities.

The Toronto, Canada-based CCMC is a nine-year association of five improvisation musicians who play at least two instruments each, as well as electronics and synthesizer.

Music from IRCAM (FRA)
two performances: 23, 24 June
The two concerts showcased the North American debut of work from Pierre Boulez' Institute de Recherche et Coordination in Paris (Institute for Research and Coordination of Acoustics and Music—IRCAM). This institute is the most advanced new music center in the world and nine of its international electronic composers presented five United States premieres and two West Coast premieres.

The Royal Opera of Covent Garden (GBR)
Dorothy Chandler Pavilion
"Turandot"
four performances: 9, 13, 17, 21 July
"Peter Grimes"
three performances: 11, 16, 19 July
"Die Zauberflote"
four performances: 12, 14, 18, 20 July
The Royal Opera of Covent Garden made its United States debut with its appearance in the Olympic Arts Festival. The announcement was made concurrently in Los Angeles and London on February 28, 1983. The premiere of "Turandot" marked the first time that the Royal Opera had ever premiered a production away from home and the occasion was commemorated by the presence of Great Britain's Princess Anne.

The Great Olympic Jazz Marathon (USA)
Hollywood Bowl
one performance: 23 July
The marathon of jazz encompassed six hours presenting some of the outstanding performers in traditional and contemporary jazz. Included was a special tribute to the late Count Basie.

The Westminster Abbey "Messiah" (USA)
Hollywood Bowl
one performance: 24 July
To commemorate its 200th anniversary, the 1784 Westminster Abbey performance of Handel's "Messiah" was recreated for the Festival. Baroque specialist Christopher Hogwood conducted the 200-member combined Los Angeles Philharmonic and Institute Orchestras and a more than 300-voice chorus.

An Evening of Rodgers, Hart and Hammerstein (USA)
Hollywood Bowl
one performance: 25 June
Five-time Oscar winner John Green conducted music composed by Richard Rodgers, Lorenz Hart and Oscar Hammerstein that saluted classic songs of the American musical theatre and the movies.

Prelude to the Olympics:
A Gala Concert (USA)
Hollywood Bowl
one performance: 27 July
On the night before the Opening Ceremonies of the Games of the XXIIIrd Olympiad, Michael Tilson Thomas conducted this gala world premiere of John Williams' "Olympic Fanfare", specially commissioned by the LAOOC for the Games. Included in the program were selections from Bernstein, Gould, Copland and Beethoven.

Olympic Jazz Festival (USA)
John Anson Ford Theatre
four performances: 2-5 August
Los Angeles-based vocalists and instrumentalists along with an All-Star Olympic Jazz Festival orchestra performed their own hits and new compositions written in celebration of the Games. The orchestra was conducted by arranger-composer Tommy Vig who co-produced the four performances.

25.03.4
Visual arts
Nineteen visual art exhibitions, five mini-festivals, three film programs and four commissioned projects transformed Southern California into an international art gallery during the Olympic Arts Festival. For the ten weeks of the Festival a panoply of artists and styles was presented, from the majesty of French impressionism to the personalized messages of contemporary muralists.

The broad range of exhibitions, festivals and films were devoted to visual arts from around the world, as well as Olympic-related themes. In keeping with the performing arts, many of the exhibitions crossed traditional boundaries, mixed mediums and cultures and defied categorization.

There were national and international collections of photographs, paintings, sculptures, prints, memorabilia and stamps, as well as commissions, and films and video, tracing cultural history from many nations and including a special section commemorating Olympic history. Many paintings and art objects were loaned by museums and governments around the world and have never before been seen outside their home institutions.

"Festivals-within-a-Festival" took place throughout the city of Los Angeles and were designed to encompass a wide variety of activities bringing together elements of many different cultural traditions. Visitors from around the world had the opportunity to explore international customs and art forms they previously might never have encountered.

Because Los Angeles is acknowledged as the movie capital of the world, it was only appropriate that film be prominently presented. As part of the overall event, national and international motion pictures, including documentaries, classics and the avant-garde, animation and short films and a special "Sports Film Festival" were programmed.

Finally, the commissions awarded for the murals, the fine arts poster series, the Olympic photographic essay and the Olympic Gateway featured many California artists, some of whom enjoy international renown and others whose reputations were just emerging. These commissions represent a lasting legacy to the citizens of the city, memories of the exhilaration, spirit and excitement of the Games of the XXIIIrd Olympiad.

Visual arts facts and figures

Number of exhibitions: 19
Number of festival and film events: 8
Number of commissions: 4
Number of locations: 26
Approximate paid attendance: 970,000

Visual arts

"Robert Graham: Studies for the Olympic Gateway"
Location: ARCO Center for Visual Art
Six-week exhibition
Total Attendance: 26,106
The development of the Olympic Gateway from preliminary maquettes to finishing details was the subject of this exhibition, with photographs, models of the Gateway's human figures and a video documentary about the sculptor and his work.

"Los Angeles and the Palm Tree: Image of a City"
Location: ARCO Center for Visual Art
Six-week exhibition

Total Attendance: 800-1,000/day
This exhibition featured the massive tree-planting program that was part of the city's official preparations for the 1932 Olympic Games. Through fine art works, period advertisements, movie stills and vintage photographs, the exhibition illustrated how the palm tree changed the Los Angeles skyline and affected the image of the city.

"California Sculpture Show"
Location: California International Arts Foundation/Fisher Gallery
10-week exhibition

Total Attendance: 10,000
A dozen large-scale sculptures created by 12 California artists were displayed in Los Angeles for the first

time before making a tour of European museums. Many of the works were located outdoors in the area surrounding the gallery and near the Olympic venues within the greater Exposition Park area.

"The Black Olympians: 1904-1984"

Location: California Museum of Afro-American History and Culture
Six-month exhibition

Attendance: 800-1,000 /day

This pictorial exhibit chronicling the history of black participation in the Olympic Games consisted of video tapes, movie clips, photographs, memorabilia, paintings, sculpture, prints and related items. Significant attention was given to early black Olympians.

"Los Angeles: Legacies of the 1932 Olympic Games"

Location: City of Los Angeles City Hall and Central Library
Two-month exhibition

Attendance: 15,000-both locations

Official archival documents, plans, photographs, programs, and other memorabilia of the 1932 Olympiad-many never before publicly displayed-comprised the City's official exhibition honoring the Games of the XXIIIrd Olympiad.

"Olympic Philarelic Exhibition"

Location: Pasadena Center
2½-week exhibition

Attendance: 2,500-3,000

This display, sponsored by Federated Philatelic Clubs of Southern California, brought together some of the most prominent stamp collections of Olympic philately including stamps from the private collection of IOC President Juan Antonio Samaranch. Stamps from 1896 honoring the first Modern Olympic Games to recent issues honoring the 1984 Games were displayed.

"A Day in the Country: Impressionism and the French Landscape"

Location: Los Angeles County Museum of Art
81-day exhibition

Attendance: 200,000+

Forty masterpieces from the Louvre Museum in Paris were included in the display of 125 paintings which enabled one to spend "a day in the country" with such well-known painters as Monet, Pissaro and Cezanne. This international exhibit was divided into nine sections, each devoted to a major landscape or type of landscape motif favored by the artists.

"The Games of the Xth Olympiad"

Location: Los Angeles County Museum of National History
4½-month exhibition

16

Attendance: 171,000+

This historical tribute to the 1932 Olympic Games consisted of three major exhibitions: memorabilia from the 1932 Olympics including flags and banners, photographs and official documents; the 1932 automobile salon displaying the most elegant cars produced in 1932; and USA 1932, a three-dimensional newsreel of American life during the depression.

"Australia: Nine Contemporary Artists"

Location: Los Angeles Institute of Contemporary Art
6½-week exhibition

Attendance: 6,000+

New art seldom seen in major shows and that has few equivalents in Southern California was featured in this presentation of the works of nine Australian artists.

"Art in Clay 1950s-1980s in Southern California"

Location: Los Angeles Municipal Art Gallery, Barnsdall Park
Five-week exhibition

Attendance: 4,423 combined with "The Works of Carlos Almaraz"

This extensive exhibition featured some 200 works spanning three decades of Southern California ceramic art from the 1950s to the present. It showed the evolution, revolution and continuation of expressions in clay by 31 artists chosen for their roles in the development of ceramic art.

"The Works of Carlos Almaraz"

Location: Los Angeles Municipal Art Gallery, Barnsdall Park
Five-week exhibition

Attendance:

4,423 combined with "Art in Clay"

This was a major exhibition of Carlos Almaraz, who first received recognition for his mural work in Los Angeles barrios. The show surveyed Almaraz' work which has earned him an international reputation. His was the only one-man show in the Olympic Arts Festival and he also was one of the commissioned fine arts poster artists.

"Automobile and Culture"

Location: Museum of Contemporary Art
Six-month exhibition

From Henry Ford's Model A to Pina-Farina's sleek Lamborghini, the automobile has transformed the way we live, work and play. This display which included more than 200 paintings, sculptures, drawings, paintings and photographs, as well as 20 classic cars, surveyed the ever changing image of the automobile and how it has reshaped our physical and mental landscape.

16 The Olympic Arts Festival has its own distinctive Look.

Olympic Arts Festival

"In Context"

Location: Museum of Contemporary Art
Three-month exhibition
Attendance: Both shows: 21,100

The exhibition spotlighted nine American artists in major monumental and environmental works whose public showings internationally coincided with the ten weeks of the Olympic Arts Festival.

"Two Exhibitions: Bay Area Paintings/ New Directions in New York"

Location: Newport Harbor Art Museum
Ten-week exhibition and education program
Estimated Attendance: 20,000

These two separate exhibitions were in-depth studies by artists who were honoring the cities of New York and San Francisco.

"Kahurangi: Treasures from New Zealand"

Location: Pacific Asia Museum
Six-month exhibition
Attendance: 6,100+

This exhibition included ancient artifacts of the Maori people, as well as contemporary Maori art such as carved bone, ivory and jade, unusual ceramics and textiles. The work of 22 master artists currently working in New Zealand was highlighted with a slide presentation and photographs.

"Art of the States: American Works After the 60's"

Location: Santa Barbara Museum of Art
Attendance: 18,000+

An exhibition of contemporary painting and sculpture from a private collection in California was featured along with a concurrent, ten-week lecture/performance series.

"Masks in Motion"

Location: Craft & Folk Museum, Pan Pacific Park
Nine-week exhibition
Attendance: 9,400

Held in conjunction with the annual "International Festival of Masks", this special exhibition contained representative masks from many of the countries participating in the 1984 Olympic Games.

"Olympic Rowing: Integrity and Tradition"

Location: University Art Museum, University of California/Santa Barbara
6½-week exhibition
Attendance: 7,000+

The exhibition described the history and techniques of rowing, using actual equipment, photographs, works of art and a video presentation. The exhibit included paintings, sculptures, prints, photographs and a major collection of postage stamps.

"The Mosaic Image: The First 20 Years of the Museum of Cultural History"

Location: Frederick S. Wight Art Gallery, UCLA
4½ week exhibition
Attendance: 3,000

The exhibition featured 300 of the most important pieces from the more than 60 shows in the 20-year history of the Museum of Cultural History. An Olympic gathering of world cultures was represented, drawing on collections of African, Oceanic, Asian and pre-Columbian artifacts.

Festivals and film

"Olympiad of Animation"

Location: Academy of Motion Picture Arts & Sciences
Attendance: 3,690

The first Olympiad of Animation featured new works by contemporary animators. Animation creations celebrating the Olympic spirit, as well as short animated films which have attained the renown of animators and audiences the world over were presented as benchmarks of excellence.

"1984 National Video Festival Olympics Screening"

Location: American Film Institute, Los Angeles campus

Attendance: 750

This was the fourth National Video Festival celebrating the most creative and innovative uses of the video medium and television. The theme "International Communications" looked at television from a world-wide perspective as a major social institution and cultural force.

"International Festival of Masks"

Location: Craft & Folk Art Museum, Pan Pacific Park

Parade Attendance: 22,000

Festival Attendance: 20,000

This three-day annual festival was a celebration of masked dance, theatre and music, mask making demonstrations, exhibits and market booths, international foods and a parade of masks, featuring mask makers, community organizations and other Festival participants.

"A Japanese Festival"

Location: Huntington Library, Art Gallery, Botanical Gardens
Two day festival

Attendance: 8,275

Similar to the Star Festival in Japan, "A Japanese Festival" featured Japanese dancers, an elegant tea ceremony, ancient Japanese music and a display of flowers arranged in the Japanese style.

"Bugaku: Treasures from Kasuga Shrine"

Location: Japanese American Cultural and Community Center
5½-week exhibition

Attendance: 6,000

The ritual masks and robes used in the performance of the sacred Bugaku dance/drama have been preserved in Japan's ancient

Kasuga Shrine's repository and were exhibited in conjunction with the Bagaku dance performances at the Japan America Theatre.

"FILMEX '84"

Location: Los Angeles International Film Exposition
Pickwood Theatre (950 seats); Nuart Theatre (500 seats); Four Star Theatre (780 seats).

Attendance: 100,000+

The largest public film festival in the world, "FILMEX '84": presented a 50-hour marathon containing more than 30 features and short subjects. It screened a comprehensive retrospective of official Olympic sport film documentaries, as well as a series of American independent feature films, children's films and animation.

"Plaza de la Raza Folklife Festival"

Location: Plaza de la Raza, Lincoln Park

Two-day festival

Attendance: 50,000

More than 50 artisans representing the different regions of Mexico, California and other areas of the Mexican-American culture in the United States blended together to participate in this two-day celebration of traditional arts of Mexico.

"TOPSail '84"

32-mile sailing parade

Attendance along beaches: Estimated 1.2 million

Five thousand vessels were part of the six-hour sail-parade from Manhattan Beach to Long Beach on the Fourth of July. More than 100,000 sailors manned the vessels. The Tallship Olympic Parade of Sail was the largest flotilla to sail the Pacific Ocean. The parade was culminated by a three-hour aerial and fireworks display.

17 Robert Graham's Olympic Gateway is unveiled on 1 June 1984.

17

Commissions

"The Olympic Mural Project"

In July 1983, the LAOOC, in partnership with the Brockman Gallery, commissioned ten Los Angeles mural artists to create original works adjacent to or on sites along the Harbor and Santa Ana freeway corridors leading to downtown Los Angeles. The ten mural artists included: Alonza Davis, Judith Francisca Baca, Glenna Boltuch, William Franklyn Herron III, Frank Romero, Terry Schoonhoven, Roderick Sykes, Kent Twitchell, John Wehrle and Richard A. Wyatt, Jr. As with the fine art poster series, the muralists were given great latitude to create any image they wished. A diversity of murals was produced, most depicting the athletes or some other aspect of the Games.

"The Olympic Poster Series"

The official fine arts posters for the Games were unveiled in January 1983. Sixteen artists produced posters for the series. They were: Carlos Almaraz, John Baldessari, Jennifer Bartlett, Lynda Benglis, Billy Al Bengston, Jonathan Borofsky, Richard Diebenkorn, Sam Francis, April Greiman, Jayme Odgers, David Hackney, Roy Lichtenstein, Martin Puryear, Robert Rauschenberg, Raymond Saunders and Garry Winogrand. The posters created were diverse in style, ranging from pure abstraction to photo realism. But each painting, drawing and photograph conveyed a personal vision of what the Olympics meant.

"The 1984 Olympic Photographic Commissions"

The 1984 Olympic Photographic Commissions were for ten internationally acclaimed fine arts photographers who were commissioned by the LAOOC to document the 1984 Olympic Games. The result of this aesthetic investigation was the subject of an exhibition and has been published in book form and is also available in a limited edition portfolio of selected photographs.

"Robert Graham: Olympic Gateway"

The LAOOC commissioned Los Angeles-based sculptor Robert Graham to create a permanent monument to the 1984 Olympic Games. The resulting sculpture was an 18-foot-high post and lintel structure, surmounted at either end by seven-foot male and female torsos. Molded into the posts themselves are human figures in a variety of athletic poses. The work, which stands before the peristyle end of the Los Angeles Memorial Coliseum, was unveiled on 1 June, as the inaugural event of the Olympic Arts Festival. Donated by the LAOOC to the Museum of Science and Industry, the Gateway serves as a legacy of the Games, an important reminder of the emotional impact the Games had upon the human spirit and the community.

25.04

Operational support

25.04.1 Housing

The Olympic Arts Festival was contractually responsible for supplying housing for 22 performing arts companies and five photographers. Additionally, it made blocks of rooms available for those companies responsible for their own accommodations.

The hotel selection criteria were as follows:

- Proximity to performance venues
- Rates
- Capacity
- Service and amenities
- Flexibility in rooming adjustments
- Designation as one of the 72 official Olympic Hotels

A hotel for each of the three major performance venues was identified and each entered contractual accommodation agreements with the OAF.

All the dance groups performing at the Pasadena Civic Auditorium were housed at the Pasadena Holiday Inn located across the courtyard from the Auditorium. The dance and music companies performing at the Japan America Theatre were housed at the New Otani Hotel, three blocks away.

The UCLA area lacked an Olympic hotel with the capacity to accommodate the theatre companies, hence the Westin Bonaventure Hotel located 15 miles away in downtown Los Angeles became the primary home for theatre. Lack of proximity between this hotel and performance venues made an efficient transportation system for artists staying at the Bonaventure critical.

21 Robert Graham's 25-foot sculpture is being set into place at the gateway of the Los Angeles Memorial Coliseum.

Companies that were not housed by the OAF were given the opportunity to obtain rooms at one of the three hotels under contract with the Festival. Financially, each company had the option of paying for its accommodations by 1 March or renegotiating its contract to deduct the cost of housing from its fee and having the OAF pay the hotel.

Each hotel incorporated several rooming list deadlines as part of the terms in the contracts negotiated with the OAF. An updated count of type and number of rooms being held for each company was due by December 1983 and an actual room assignment list, showing the names of the company personnel, was due by 1 April 1984.

Due to the early deadlines, several companies inflated their projected rooming list to protect themselves and, as a result, the initial list given to the hotel was larger than the actual room usage. Much administrative work could have been avoided if these accommodation requirement lists could have been turned in closer to the actual company arrival date.

OAF venue managers were assigned to each of the three hotels with the following responsibilities:

- Supervising arrival and departure of artistic guests, including the baggage voucher system, coordination of rooming lists with the hotel and overseeing check-out and payment of incidental expenses
- The set-up and dismantling of the OAF hospitality room, coordinating volunteers and monitoring the telephone
- Maintaining an ongoing relationship with the hotel staff
- Assisting co-producers with artist hospitality

An LAOOC financial control manager monitored each company daily and reconciled incidental expenses with the company manager the day before departure.

The Festival accommodations operation was a very workable system. It provided housing that was affordable for the LAOOC while being convenient and pleasant for the visiting companies.

25.04.2 **Material acquisition and handling** **Architecture and construction**

The Olympic Arts Festival construction needs were limited although highly specialized. After investigating the cost-effectiveness of using the resources supplied by the LAOOC Architecture and Construction Department, it was determined that OAF would subcontract any building needs.

With the exception of Television Center Studio 9, the Festival used existing facilities that did not require any physical renovation. A theatrical construction crew was hired to prepare Studio 9 as a theatre space appropriate to the technical requirements of the three theatre companies presented.

Festive Federalism

Festive Federalism was a graphic design scheme utilized to identify all OAF performance and exhibition sites. The strategy was to unify all Festival venues by employing similar yet different design elements from those used to identify the Games sites. This served to underscore the unity of the 1984 Olympic Games, both in athletics and arts.

The LAOOC's graphic designers developed preliminary plans which OAF management and site managers/owner-operators reviewed and modified. The plans had to meet the following design constraints:

- Be congruent with the existing architecture and landscaping of the OAF venues
- Be in keeping with Olympic design scheme
- Be affixed in such a manner as to make it difficult to vandalize or remove
- Be within the limited material and design budget and yet be applicable to all 48 sites

The process of getting each venue to approve the Festival Federalism treatment of the building or site was laborious and entailed a presentation of the proposed design renderings, a discussion of possible changes in the proposed design, an assessment of the engineering of the attachments and then a letter-of-agreement between parties granting the LAOOC the right to decorate the venues. This procedure was followed in all 48 venues and took more than four months to negotiate.

A kit of parts was developed which consisted of two-dimensional nylon kite-like structures in the shape of stars, circles and squares (elements of Festive Federalism), which could be attached to the face of buildings like signs, and eight-foot freestanding three-dimensional stars. All elements were fabricated and painted in Festive Federalism colors.

The installation schedule was planned in conjunction with the Architecture/Construction Department and the Festival look began appearing gradually throughout the city two weeks prior to the opening of each venue and was staggered throughout the ten weeks of the Festival.

Interior decorations were designed to augment the exterior treatment as well as to be incorporated into the existing layout of the lobby and foyers.

The LAOOC accepted the responsibility for the security of the decorations and insured each venue on a comprehensive general liability policy pertinent to the decorations. Elements of the decor that were damaged or destroyed by weather or vandalism were replaced on an ongoing basis during the Festival. The removal of decorations was done immediately following the completion of the Festival and the Look items were either donated to the specific venue or stored for later sale by the LAOOC.

Material logistics

The LAOOC Material Logistics Department had several functions: storage, moving goods locally, identifying resources and obtaining bids and requisitions. The system was designed for mass buying, advance purchases and storage before delivery.

The Olympic Arts Festival needs differed from those of the Games. Basically the Festival needed local freight movement, some storage, supplies for the field offices and an ability to make short-notice purchases.

The Material Logistics Department was not equipped to handle OAF's smaller, specialized moves, nor did it have sufficient personnel to meet the Festival's needs as the Games approached.

Therefore, the Finance Department established three methods for making necessary on-the-spot purchases:

- Petty cash distributed as needed to technical directors and line-producers for purchases under \$250
- Open accounts with various suppliers
- Pre-signed \$1,000 checks in the control of the venue accountants for emergencies

Goods purchased for the OAF venues were taken from suppliers directly to OAF venues.

For the Festival, the Material Logistics Department assisted in bidding, renting and supplying field offices where the purchase was large and could be made in advance or where the need was shared by another LAOOC department.

Freight

With regard to the responsibility for payment of freight transportation, the OAF contracted differently with each performing arts company.

Some contracts called for OAF to pay for expenses incurred by moving freight. In these cases F.B. Vandegrift, the LAOOC's official custom house broker, acted in the interest of the Festival to facilitate movement and customs brokering.

The companies which were responsible for their own freight expenses were urged to use Vandegrift but were not obligated to do so.

Additionally, Vandegrift was subcontracted to handle all local trucking movements in order to centralize the transportation efforts.

The OAF technical director at each venue communicated directly with each company and Vandegrift to coordinate all arrivals and departures of freight.

25.04.3 **Press and publicity support** **Pre-Festival planning**

A set of primary goals for the Olympic Arts Festival Press Operations Department was established early in the Festival planning stages. They served as organizational guidelines and as a foundation for the ongoing process of publicizing the Festival. The initial goals of the OAF Press Operations Department were:

- To create an awareness of the Festival, its objectives, premise and relation to the Games
- To sell tickets to the entire Festival through the editorial sections of the print and electronic media
- To sell tickets to specific programs
- To create and sustain an excitement about the Festival, encouraging participation by the Los Angeles community and interest within the LAOOC

As the Festival approached, additional goals were established focusing on the invitation to the international press and the preparation of Festival press centers.

Once the Festival began, it was the department's intent to furnish information on a timely basis about the individual companies and artists, as well as continuing to serve as an information center to the journalists from nearly 300 international publications.

The OAF Public Relations/Press Operations Department began operation in November 1982 with a part-time public relations manager. Seven months later the position was upgraded to full-time.

From January 1983 through January 1984 three separate press kits were compiled and distributed to national, state and local media. Each contained Festival background information, OAF personnel biographies and continual updates and profiles of the companies participating in the Festival. A performing arts telemarketing and marketing consultant was hired to assist in the promotional program, specifically along national lines.

In January 1984, a press conference was held to disseminate information regarding ticketing. At the same time advertising appeared in the local newspapers for direct mail ticket sales available through 1 May. The total circulation impact of 2,600,000 was reached through eight of the largest local newspapers.

22

22 Ernie Barnes, middle, the Sports Artist of the Olympic Games, displays his series of sport posters.

In addition, the OAF director visited with editors from the major newspapers and national magazines.

A total of 682,500 ticket order brochures were mailed to subscriber lists generated from local arts groups. The OAF used the official Olympic bank to passively distribute 293,400 more brochures throughout California.

In January 1983, the 15 Fine Arts Posters were unveiled at the Los Angeles Municipal Art Gallery, the first tangible evidence of the Festival.

In March 1984, the department mailed 500 invitations for accreditation to the press throughout the world. It was the contention of the Festival organizers that in order to have the widest possible circulation nearly every publication would be accredited regardless of size or obscurity. Also in March, staff members began locating Festival press offices.

When mail order ticket sales closed on 1 May, TicketMaster began carrying multi-faceted promotional advertising. Calendar listings and breakout display ads under the combined TicketMaster and OAF logo were carried in Southern California publications, along with radio and television spots.

Site selection, staffing, equipment

The initial press office plan called for four locations—downtown, UCLA, Pasadena and the Los Angeles County Art Museum. The museum location would have served many of the Los Angeles theatres, plus the exhibition sites in that general vicinity. Although the County Art Museum agreed to provide the space, it became problematic because of the necessity of hiring additional staff.

The Westin Bonaventure Hotel was selected as the downtown site, since most of the theatre companies were staying there and the OAF located its theatre production office there.

Additionally, it was accessible to two of the primary Los Angeles print media outlets—*The Times* and *Herald Examiner*.

The satellite theatre press office was located at UCLA's Royce Hall, while the dance press office was located next door to the dance production office at the Pasadena Holiday Inn.

The most efficient site was the Bonaventure in terms of size and layout, but it was underutilized by the press because of its location. The lack of short-term, low-cost parking contributed greatly to the lack of usage. Originally, the Bonaventure was to serve as a regular press conference area, but this plan was changed because of the parking situation. Conferences were moved to the venue sites.

After the site selections, the staff needs for each of the three offices were identified and an overall organizational chart was prepared. There were approximately 20 permanent paid staff plus volunteers. In retrospect, a minimum of one more paid staff member at each location would have helped.

The Bonaventure office had working spaces and typewriters for 24 members of the media, and six charge-a-call telephones and two telecopiers were installed. The interview area seated 32, while the lounge area had a capacity of 16. UCLA's Royce Hall provided space for 20 working media and was equipped with five charge-a-call telephones and one telecopier. Pasadena supported eight working media with three telephones and one telecopier. All three offices were equipped with copy machines.

All the press centers had too few telephones. There was a shortage of actual telephone lines for staff operational use and lines had restrictions on long-distance dialing. It was not until after the telephones were installed and shown to be inadequate that new telephones were ordered.

Equipping the OAF press centers came under the responsibility of the LAOOC Press Operations Department, which was not sufficiently versed in Festival production to understand its specific and sometimes unique needs. A more open line of communication between the two departments, both in the early planning stages and during Festival operations, would have enabled both groups to function more effectively.

Festival operations

The Bonaventure press office opened 28 May for press accreditation and dissemination of materials. A press kit, press operations media guide, Los Angeles visitor's guide, a briefcase and an Arts Festival pin were distributed. All other offices became operational within the same time period.

Once the Festival officially opened on 1 June, the staff at each of the three press offices was dedicated to serving the press covering the Festival.

The Bonaventure, functioning as the main office, served as a clearing house for general and specific Festival information. It supplied information about company photo calls, acted as a repository for photographs, generated press conference information or press releases and allocated press tickets.

The satellite offices fulfilled many of the same functions. In addition to distributing press tickets, these offices were usually the first contact for journalists who had specific questions or requests concerning companies or performances within the office's jurisdiction.

The press offices were open an average of 12 hours daily which was consistent with company rehearsals and performances. For example, on opening nights of performances, the applicable office stayed open one hour after the completion of the performance to service those journalists filing stories.

The three press centers hosted approximately 2,000 print and electronic journalists from 300 worldwide publications during the ten weeks. In that period, more than 1,000 press kits were prepared and distributed, along with 110 press releases and thousands of black and white and color photographs. Ten press conferences were arranged, as well as 60 separate photo calls.

Information was supplied for a daily calendar of events which was broadcast on two Los Angeles radio stations, and OAF prepared schedules were published on a daily or weekly basis in major Southern California newspapers.

There was extensive international television coverage with production crews from Mexico, France (two), Germany, Italy, Spain, Korea (two), Australia, Japan, Austria, and Canada. Korea broadcast material by satellite on a daily basis. France produced at least one 45-minute documentary plus news footage, and Austria produced a major documentary.

Press tickets

Press ticket allocation was the most cumbersome and unwieldy aspect of the Festival. A lack of early information made it impossible to anticipate press ticket needs. Information was requested on the accreditation form, but the request was vague and a large number of media did not respond. Additionally, for those who did respond, it was difficult to select dates so far in advance and many requests were either incorrect or changed by the time the Festival began.

No confirmation procedures had been established for press arrivals and many press members who had been allocated tickets were not aware of their allocation and did not show at the performances. Conversely, press members whose requests were denied due to space limitations and were not informed unknowingly came to the performance expecting a ticket. The press office did not have the staff manpower to call and confirm ticket allocations with each member of the media.

Ultimately, a procedure was established whereby journalists called each Monday to confirm their seats.

Originally, tickets were to be distributed at the weekly press briefings at the Bonaventure. When these briefings were relocated to the venue sites, it was decided to distribute the tickets at the box office of the applicable performances. For the first three weeks of the Festival ticket allotments were not available for distribution until the date of the performance. This meant press tickets had to be filled quickly, lists typed and runners dispatched to deliver them to the appropriate press offices. After three weeks of working under this "hurry-up" system, a weekly allotment was arranged.

Additionally, each journalist was given a program chit to exchange for a performance program.

Interaction with performing companies

The press department worked with three different types of organizations. The first was the visiting company for whom OAF press officers handled all interviews and photo calls; the second was the company that had its own press person assisting OAF accredited press in interviews and photo calls; and the third was the self-contained organization, primarily those residing in Los Angeles, that wanted to do everything for itself.

OAF press operations found that the less involved it was with an organization, the more tentative its association with the Festival and the less control OAF had in the press/publicity operation.

Many of the major companies were less professional than anticipated and problems often arose that reflected poorly on the OAF press staff. There were difficulties coordinating

interviews and press releases with some companies that provided exclusive service to their own constituencies at the expense of the overall media effort. The OAF press staff had to redirect the outside members of the press to these organizations for assistance.

Interaction with other LAOOC departments

The OAF Press Department interfaced with the LAOOC Press Operations Department in preparation for the Festival period and during it. LAOOC press operations handled the logistics of writing, mailing and tabulating all press accreditation applications. One of its staff was at the Bonaventure for the initial four weeks to issue the accreditation badges. This department was also responsible for physically setting up the press rooms, ordering and paying for the equipment and office supplies. The OAF media handbook was written and printed by the Press Operations Department.

The USC and UCLA Village staff coordinated access to the villages for OAF photographers and the LAOOC Design Department conceived the designs of the press kits and the press release paper.

In retrospect, the overall function of the Festival's Press Operations Department was never clearly defined—hindering its ability to function effectively and meet its prescribed goals.

25.04.4 Protocol

The job of the OAF Protocol Department was to provide hospitality to all participants of the Festival. Festival organizers believed that every participant should receive special attention and be made to feel welcome and appreciated.

To this end, the OAF Protocol Department arranged opening night cast parties for each company, assembled gift bags for every artist and established a hospitality center where artists and staff could meet and visit daily. Additionally, several large special event functions were planned to honor visiting dignitaries, premiere performances and acknowledge the brotherhood of the Festival staff.

The final function of the Protocol Department was to establish and maintain a master calendar designed to avoid schedule conflicts and to inform the OAF senior management which social functions they were required to attend. On several occasions the leadership of the Festival was required to make appearances at as many as three events in one evening.

Upon reflection, if an increase in any area of the budget were possible, the Festival organizers would have allocated more for protocol; specifically, artists' gifts. Each visiting company brought special souvenirs from its country to give Festival personnel, from the co-producers to the backstage crews. This was not taken into account by the OAF in the original gift planning and, in keeping with the desire to make the Festival a special occasion, additional special tokens from the Festival would have been highly appropriate.

Cast parties

The OAF Protocol Department planned a social event for every company that participated in the Festival.

These were in the form of cast parties held in private homes and underwritten by the respective host or hostess. Menus were simple, light buffet dinners, served with wine and mineral water. Many companies were large and homes with expansive gardens where guests could dine outdoors proved to be very successful. Each host and hostess was presented thank you gifts of tickets to the opening night performance, flower bouquets and certificates of appreciation.

Forty-two opening night cast parties were hosted for the theatre companies, 16 of which were in private homes, one was in a local restaurant and four were hosted by consulates.

Sixteen cast parties were held in private homes for the dance companies and seven for chamber music—two in private homes, five in the restaurant of the New Otani Hotel. These hotel parties were for very small groups of people.

The dance co-producer assisted protocol with cast parties as those events were underwritten by various sponsors.

All museum and gallery exhibitions were organized by local arts institutions which included the opening night receptions and parties.

The cast parties proved to be very successful, serving as a link between the people of the community and the visiting artists. They also honored the performers and gave them the opportunity to visit an American home.

Variety Arts Club

The Variety Arts Club located in downtown Los Angeles was established as a meeting place where artists, press and the general public could assemble in an informal manner. The club management, working with OAF protocol, agreed to extend its operational hours until 0200, accepted redeemable chits in exchange for alcoholic and non-alcoholic beverages, served supper and provided additional entertainment.

The club proved to be a comfortable open house, although it was used less than anticipated due to busy schedules. On the whole, it was used more by performing artists who enjoyed its ambiance. On occasion, requests were made for recommendations to discos and other supper clubs.

Artists' giftbags

More than 3,800 artists were given gift bags upon arrival at their designated hotels. The bags included a canvas tote bag silkscreened with the OAF logo, a Festival souvenir book, an artist's guide to the Festival and Los Angeles, an OAF pin, an LA84 button and an invitation to the Variety Arts Club with two free drink chits attached.

Social events

In addition to the cast parties the OAF Protocol Department planned several major social events to enable staff, honored guests and the public the opportunity to be a part of the atmosphere of festivity and celebration.

- Pre-Festival theatre kick-off: held on 20 May, the purpose of this party was to bring together staff from all the performing arts venues, giving the co-producing personnel and volunteers the chance to meet and develop a spirit of camaraderie before the work began. It was held at Television Center Studio 9, catered by a local restaurant and set up by the theatre staff.
- Robert Graham: Olympic Gateway Dedication: The 1 June unveiling of the Robert Graham sculpture was produced in cooperation with the Times-Mirror Company. Speeches were given by dignitaries representing the LAOOC, the OAF, the city of Los Angeles and the sculpture commission selection committee. VIP guests were invited to lunch on the Coliseum grounds.
- Surprise public reception celebrating the opening of the Olympic Arts Festival: audiences at the 1 June opening of Pina Bausch Wuppertaler Tanztheatre were the honored guests at this surprise reception that began immediately following the performance. Music, champagne and a 10-foot cake greeted everyone as they left the auditorium. Invited dignitaries participating in the cake cutting and festivities included the mayor of Los Angeles, the director of OAF, representatives of the LAOOC senior management and the dance co-producer. Following the public reception, the Pina Bausch Wuppertaler Tanztheatre company was given an opening night buffet supper at the Pasadena Civic Center. The party was set up for 100 guests including performers, technical crew, OAF staff and VIP guests.
- Princess Anne Luncheon: the Princess Anne luncheon was held on 8 July in the garden of a Los Angeles private home. The Princess was in California to commemorate the performance of the Royal Opera of Covent Garden at the Arts Festival. All LAOOC and OAF senior management was in attendance and presented Princess Anne with a gift of official Olympic Fine Arts Posters signed by the artists.

Olympic Arts Festival

- Milva Performance and Champagne Reception at the Japan America Theatre: scheduled on 8 July, this was an evening to say thank you to the many people who assisted the OAF staff in putting the Festival together. Guests were invited to a private performance by Milva Biolcati, followed by a champagne reception at the Variety Arts Center.
- Theatre strike party: the theatre component of the Festival closed on 22 July and the strike party was both a farewell to departing staff and an appreciation for a job well done. The picnic, attended by 350 staff and catered by an L.A. restaurant, was held at a park 15 miles outside Los Angeles.
- Closing Party: the closing party on 11 August was the only social occasion where the sole focus was the OAF staff, co-producers and others closely involved with the Festival. Held at the Variety Arts Club, the social meeting place for visiting artists, press and OAF staff, it had a special theme, "It's a Wrap", and everyone was given a bottle of wine with a specially designed OAF label as a gift of appreciation.

25.04.5 Support services

Arts organizations have a painful history of having resources pulled away at the last moment. Hence, they take a self-reliant posture as protection.

Many LAOOC departments perceived the Festival as having no needs or fewer needs than the Games, and therefore, had not included OAF in their planning or budgets. These perceptions delayed OAF's logistical progress considerably, and correspondingly, the Festival devised its own systems to solidify committed resources.

Accreditation

Whereas Games accreditation was a complicated system designed to protect the athletes, the system for the Olympic Arts Festival was simple and required only staff and artist identification. Accordingly, OAF planned a generic identification badge designed for venue access with the ability to convert to a security system, if necessary.

There were two access classifications:

- Front-of-house for existing staff and ushers
- Backstage for crew, artists and OAF staff

Visitors and 24-hour work crews were given a one-day stick-on badge.

Once the Festival became operational it was apparent that the badging system was not sufficient for backstage access and entry to performances.

Too many people backstage hindered production and created a theft problem at several venues. Access was restricted to specific areas by applying a stick-on color dot to the badge.

With performance entry, OAF had not anticipated the flood of artists who wanted to see other companies' performances, in addition to Festival staff wishing to view the productions. A policy was formulated allowing participants and staff to present their identification badge at the box office ten minutes before a performance and receive remaining tickets on a first-come, first-served basis.

Food services

The Arts Festival was operational six weeks before the LAOOC Food Services Department began purchasing and producing box lunches for all Games staff. Therefore, box lunches were not available at OAF venues. In lieu of the prepackaged meals, venue managers were allocated funds to purchase food items as deemed appropriate for each location.

Health services

The objective of OAF management and the Health Services Department of the LAOOC was to develop and implement a program which would provide medical attention to all Festival participants and spectators. Festival participants were defined as company members, venue staff and management or co-producer personnel who worked at any arts venue or field office. Performance sites were divided into three categories based on projected attendance:

- The small venues, 100 or less, were supplied with a first-aid kit and written emergency instructions for use by the house manager.
- The intermediate venues, 100-4,999, were staffed by a physician to render on-the-scene care.
- At the large venues, 5,000 or more, medical aid stations were provided in a manner comparable to that at an Olympic Games venue.

Physicians were drawn from an existing pool of volunteers who would also assist at the Games. Each volunteer had a two-week block assignment as the overall OAF Chief Medical Officer (CMO), during which he was available by telephone on a 24-hour basis. The CMO made arrangements with appropriate local physicians for further medical attention, when necessary.

All OAF staff directly involved at any venue attended a Red Cross cardiopulmonary resuscitation (CPR) and emergency first-aid class to prepare for possible on-site problems.

23 Extensive literature documents the individual performances, presentations and exhibits which make up the Olympic Arts Festival.

23

23

23

Two hospitals located close to the major hotels were established as primary care units for the Festival. Medical situations arising at the UCLA venue during the day were transported to the campus medical center. All medical concerns occurring in the hotel were channeled through the hotel venue manager who in turn contacted the CMO.

The program was a simple, yet comprehensive medical assistance plan and was utilized by an average of five companies daily.

Insurance

The goal of the LAOOC was to provide a comprehensive insurance program covering all people and property involved with the Arts Festival.

All performing arts companies were urged to carry their own personal medical and general liability insurance. Additionally, the LAOOC health plan was offered to all companies at a cost of \$30 per person for the duration of their stay at the Festival. However, the LAOOC carried its own insurance coverage to avoid possible complications with non-covered companies.

Upon arrival in Los Angeles, each company submitted a complete company and property list. This list was put on record with the LAOOC Insurance Department. All claims were reviewed and verified by venue management before being submitted to the LAOOC.

Five claims were made against the LAOOC policy-one property and four personal injury. The property claim involved damaged lighting at one of the theatre sites, and the personal injury claims ranged from an actress injured by part of the stage, an audience member tripping on stairs at a performance and a person breaking an ankle at an outdoor OAF venue.

Language services

To facilitate communication between OAF management, Staff, performers and crew, it was necessary to supply a sufficient number of qualified interpreters to assist at all Festival-related events.

A language services coordinator was assigned to the Olympic Arts Festival staff by the LAOOC Language Services Department. The responsibilities of the coordinator included organizing and scheduling the language services volunteer staff and working with the project and logistical managers for theatre, dance and music to establish a comprehensive plan. Headquarters for the coordinator was the theatre production office at the Bonaventure.

The plan called for 48 volunteer interpreters, fluent in nine languages, and a contingency staff of 10 to 15 alternates. The staff consisted of 10 Italian interpreters, nine French, seven

Spanish, five Greek, five Japanese, three Polish, three Chinese, three Portuguese and three Korean. All were tested and trained through the LAOOC Language Services Department.

The theatre component required the largest number of interpreters. It was the most international in flavor and the companies, for the most part, were large in number. Additional demands were made on the staff by the overlapping of production schedules.

The co-producer for dance hired one person whose only responsibility was to oversee dance language needs. This person began in May and spoke five languages fluently. Additional dance interpreters were supplied as needed.

LAX operations

OAF established a straightforward Los Angeles International Airport (LAX) entry procedure that was an off-shoot of the system designed by the LAOOC. Although the LAX in-processing procedure for the Games included accrediting athletes as they arrived, this was not necessary for Arts Festival participants. For the Festival, LAX operations consisted of meeting each plane, expediting baggage claims, loading all company members on a bus and transporting them to their respective hotels.

The original staffing plan called for an OAF coordinator, the LAX volunteer manager and the line producer or assistant producer, plus volunteers, to meet the planes. Once the Festival was operational, this was modified to one OAF staff member and several trained volunteers.

Security

The LAOOC/OAF defined the following situations as needing special security attention: large crowd performances, all opening nights, special performances with dignitaries (the Pre-Opening Gala and performances of the Royal Opera) and valuable property such as the philatelic exhibition.

Two types of security were organized. First, professional guards in uniform provided a security presence for crowd control and served as armed guards for the box office; and second, non-professionals responsible for backstage access, property protection and 24-hour coverage at specific locations.

During the first weeks of operation, the OAF experienced problems with petty theft, guards who did not appear for work and delays in making schedule changes because the LAOOC Security Department had to be notified before action was taken.

Ultimately, the OAF assigned a security coordinator to supervise the security plan at each theatre venue and obtained permission from LAOOC Security to make direct contact with the security subcontractor in dealing with schedule changes, additions or problems.

23

23

23

23

24 OAF banners and Sankaijuku dancers hang from the Dorothy Chandler Pavilion.

25 OAF performances showcase the entire spectrum of man's artistic expression, from ancient times to modern.

25

Spectator services

The LAOOC Spectator Services Department recommended that the OAF use the same concessionaire as the Games because of the concessionaire experience and convenience of overall LAOOC supervision. The concessionaire had no previous experience with arts event sales and treated OAF basically as a step-child in terms of commitment to the program, but did assign a staff person as the OAF liaison. Although contract and product line were late in developing, the OAF activity level, through LAOOC urging, improved.

The concessions program consisted of three main areas: novelty sales, food and beverage and programs. Most venues, with the notable exception of Television Center Studio 9, were responsible for provision and service of refreshments with OAF taking no share of sales revenue. Refreshments were limited primarily to beverage service.

At the 11 venues where OAF was responsible for the productions, the program and novelty sales also fell within its jurisdiction. At venues where an existing arts organization was presenting its own production, at mini-festivals, and at exhibitions, the presenting organization arranged directly with the contracted concessionaire to take merchandise on a cost - plus or consignment basis, or not at all.

After researching the types of items that sold well within various established arts organizations, the OAF chose a limited product line. The OAF management also wished to de-emphasize the commercial element of the Festival. The items chosen were a generic T-shirt and tote bag, the 15 Fine Arts posters, a souvenir book and a cloisonne pin of the OAF logo.

A merchandise policy was formulated and sent to all organizations participating in the Festival. This policy consisted of limitations on the use of the OAF logo on merchandise, sales of performing company merchandise, including importation formula and the sale of OAF merchandise at particular venues. OAF was responsible for the design of all OAF products while the concessionaire was responsible for the production and sale of the products and the sale of the visiting company product when the company had made the appropriate arrangements.

OAF organizers contracted with the Performing Arts Network to produce the Festival concert program and later contracted with same to sell programs at sites where there were no pre-existing vending arrangements.

Technology

Technology was vital for the OAF operation in several areas. It provided a communications link between co-producers in the field and the OAF/LAOC management. It made possible the frequent production of large amounts of documents before and during the Festival and it furnished computer programs to monitor the Festival budget.

A comprehensive request list was submitted to the LAOC Technology Department and several months were spent by Festival personnel convincing Technology the needs were valid.

Operationally, OAF utilized the following items:

- Seventy-four pagers (45 display, 29 tone)
- Nine car telephones for key staff
- Forty-five vehicle radios on one frequency
- One radio utilized as the transportation dispatch base
- Seven telecopiers
- Fifty-four telephone lines installed at twelve venues, varying from single line to lines/hold/rotary system
- Six word processors
- Four personal computers
- Seven photocopiers, ranging in capability, placed according to size of venue
- Two walkie-talkies loaned by the LAOC LAX operations group for the OAF's LAX system

Eight additional walkie-talkies were loaned by the Technology Department for three specific events, held on one day or over a weekend.

The use of this equipment within the Festival framework was extensive and invaluable. Technology resources were utilized to the fullest with emphasis on communications.

Uniforms

Rather than an official Look OAF uniform, the Festival opted for a dress code of a white shirt, dark (preferably navy) pants or skirt and an OAF identification badge with the Arts pin. This was the uniform for drivers, volunteers, ushers and house staff at venues that did not have its own uniform. The latter group also wore a magenta sash available through LAOC at no cost to OAF.

As planning evolved, OAF management provided hosts/hostesses and drivers a modified uniform of a polo-type shirt with the OAF logo.

Cost, time constraints and the fact that the theatre venues already had house staff uniforms were among the reasons the Festival did not feel any need to supply an official uniform.

26

25.04.6 Ticketing

The Olympic Arts Festival ticketing system was a modified version of the computerized system designed to process Olympic sports tickets. The OAF was responsible for the artistic aspects of the Festival as well as for attendant business and logistical arrangements. The LAOC Ticketing Department was responsible for the ticketing to all Festival performances. This included processing mail orders, filling customer requests, processing refunds, printing and distributing tickets and operating box offices at all performance venues.

In January 1984, the Olympic Arts Festival organizers reviewed the Olympic sports ticketing system to determine necessary modifications and draft a timeline of their own to implement. The basic differences between the two systems were the number of price scales per event (six-OAF, four-sports), the size of the fields

allowed by the computer for company and venue names (OAF sizes were larger) and the exclusion of the six-digit event codes in the ticketing brochure.

Other components and considerations in the evolution of the OAF ticketing system were:

- A review of all OAF contracts to determine ticketing considerations
- Completion of the OAF lockbox and order processing arrangements with First Interstate Bank
- Visiting every performance venue and developing a seating manifest which listed the total number of seats available and exact locations

In mid-January 1984, the OAF ticket order brochure was printed and released to the general public. The following ticketing procedures were outlined:

- Orders were filled on a first-come, first-served basis, with the special ticket packages given priority handling until 1 March 1984. Orders were filled automatically with best available seating. If an order could not be filled in the section requested, it was filled with tickets in the next best available seating section.
- The LAOC reserved the right to limit the number of tickets per order to any event, but this limitation was never applied.

26 The OAF theatre offerings proved popular with Los Angeles audiences, even though many of the performances were given in a foreign language.

- Cancelled checks or the charge card statement served as proof that the order was received.
- Ticket confirmation and/or refund acknowledgement would be mailed in April.
- Tickets ordered through the brochure prior to 1 March would be mailed in May. Tickets ordered through the brochure after 1 March and before 1 May were processed but not assured priority handling. Orders postmarked after 1 May were returned.
- All sales were final with the exception of sold-out events and handling errors made by the LAOOC.
- Wheelchair accommodation needs were requested on the order form.
- Change of address had to be noted in writing to the OAF. If someone could not be located by 28 May at the address on the OAF records to accept the tickets or a refund, the tickets or refund would be donated to the LAOOC Amateur Athletics Foundation.

While customer ticket orders were being processed, the Ticketing Department worked with OAF management to set inventory allocations for the more than 350 performances in the following categories:

- General public
- Physically challenged
- Co-producers
- Complimentary (company and venue)
- Foreign consulates
- IOC, IF and NOC guests
- LAOOC board of directors
- LAOOC patrons
- LAOOC sponsors
- Press, radio and television
- Seat kills
- Households
- Contingency

Once these allocations were set, ticket orders were processed and a space was reserved in the computer system for each person purchasing a seat for each performance.

A customized seating plan was designed for each venue to determine exact seating locations for each performance. Once this plan was completed, seat assignments were made utilizing the spaces reserved. The software created for the computer system effectively assigned all seats on a weighted round-robin basis.

Ongoing sales reports were provided to OAF management, venues and co-producers as needed and financial reports were prepared to support contractual payments made.

OAF mail order sales stopped on 1 May 1984. An agreement was made with a local computerized ticket sales service to allow the sale of all the unsold inventory. Orders received after the 1 May date were returned to the sender with a letter advising them of sales at TicketMaster.

Ticket printing and distribution

Ticket printing and mailing commenced on 15 May 1984.

The OAF ticket printing procedure was the same as for the sports tickets. The LAOOC system for processing orders and producing tickets was a departure from the prevailing practice of producing hard tickets (pre-printed) with each individual order being filled by tedious and error-prone manual methods.

The new approach combined, for the first time, modern computer technology with the latest developments in printing technology. The resulting product was customized tickets printed for each order. The number of OAF tickets printed for the mail order system was 225,000.

Delivery of tickets was accomplished through the registered mail system of the U.S. Postal Service. Under registered mail procedures, delivery of mail is made to the designated person who must sign for receipt. If the letter carrier was unable to deliver, the process of notification and delivery was repeated. The Postal Service maintains a system for tracing mail that is reported lost and undeliverable. Undelivered tickets were returned within 15 days to the LAOOC and were then distributed through the Ticket Distribution Center.

Ticket orders that had a balance due were routed to the Ticket Distribution Center rather than being sent directly to the customer. In early July, after consulting with the LAOOC Legal Department, the unclaimed, unpaid tickets were inventoried, and a notice was sent to customers allowing them a week to pick up their order.

All tickets still left after this point were counted, reconciled and categorized either as "deadwood" (past the date of performance) or as available for resale. Reports were completed and, when appropriate, seats were turned over to TicketMaster or returned to OAF box offices for resale.

Seating for the physically challenged

The Olympic Arts Festival accommodated not only wheelchairs but also the sight and hearing impaired, amputees and individuals with mobility problems. Those requiring physically challenged seating arrangements noted their requirements on the space provided on the ticket acknowledgement form or notified customer service.

All requests for physically challenged seating were compiled and categorized. A work sheet was prepared for each performance, and system queries were done for each customer order identifying ticketed performances, price scales ordered and received and seat locations. Most disabled customers had tickets to several events, and seats befitting each individual's needs were assigned performance by performance after reviewing venue seating diagrams and contingency seat locations. Physically challenged customers were contacted by telephone in advance of each performance advising them to call at the box office at the event to exchange their hard tickets for a special seating assignment. Approximately 250 orders requested physically challenged services.

Refunds

Refunds were given to customers who did not receive the tickets they requested due to sellouts or who received incorrect tickets because of LAOOC coding or data entry errors. When an LAOOC error was determined, the Ticket Distribution Center was authorized to take the ticket back, make a financial adjustment, reconcile the inventory and give TicketMaster the returned tickets for resale.

Box office operations

General planning of OAF box office operations began in early May 1984. Policies and procedures included:

- Standard practices of no refunds or exchanges
- No personal checks
- Release times for special inventory categories
- No release of special inventory tickets without payment or cost allocation arrangements

Meetings were scheduled between the manager of venue operations and the performance site box office treasurers. The purpose of these meetings was to incorporate LAOOC ticketing requirements into the normal day-to-day operations.

Box offices were created at three venues with no existing facility and were staffed by OAF personnel:

- Beverly Hills High School
- Television Center/Studio 9
- Veterans Memorial Park in Sylmar

Box offices for the Royal Opera and concerts at the Hollywood Bowl were managed and staffed by the Los Angeles Philharmonic Orchestra Association. The OAF's primary concern at these venues was to insure that the disabled customers received the proper ticket exchanges at the box office.

With the exception of the L.A. Theatre Works, all the Los Angeles theatres controlled their own ticket inventories and the OAF had no involvement in the box office operations.

Special inventory tickets

Special inventory tickets included: LAOOC-held seats (house holds), complimentary tickets for the artists and theatres, press seats and contingency seats. A special inventory coordinator was hired in early June whose responsibilities included the sale and distribution of this group of tickets.

Artist complimentary tickets were given to the line-producer 48 hours prior to the company's first performance. Theatre complimentary tickets (JAT and Pasadena) were delivered prior to the Festival's opening. Press allocations were prepared on a weekly basis for the public relations manager. A system was developed with the OAF press department to turn back any unused seats to the box office on the night of the performance.

Day-of-performance ticketing procedures

TicketMaster closed ticket sales for that day's performances by 1600 hours and LAOOC personnel verified TicketMaster counts. The unsold spaces were converted to printed tickets and delivered to the on-site box offices for walk-up sale.

Each venue received a box office kit for every performance consisting of: TicketMaster audit reports, ticketing adjustments, master inventory report, house seat sales, disabled seating requirements, box office statements, cash turn-in sheets and the consignment form for any unused special category seats released for public sale. Final statements were prepared by a ticketing representative and verified by finance.

Box offices usually opened at 1800 hours and remained open one-half hour after curtain time (usually 2030 hours). Box offices were responsible for sales, will call, lost tickets and "never received" tickets, disabled seating

OAF ticket sales by performance category

	LAOOC capacity*	Tickets sold	Complimentary tickets	Gross revenues
Dance	137,550	99,893	8,054	\$1,396,153
Theatre	123,745	93,001	7,733	\$1,582,901
Music	47,494	38,866	2,304	\$1,218,695
	308,789	231,760	18,091	\$4,197,749

*Capacity after unsold tickets were returned to the Los Angeles theatres, the Hollywood Bowl, and for the performances of the Royal Opera.

shifts and general information about the OAF as a whole. For lost or stolen tickets, seat locations were verified, and a replacement ticket was issued to the customer.

OAF ticketing personnel accomplished a very large task in a very small time period. Operational planning should have begun several months earlier and several areas in the system could have used streamlining: the customization of seat plans for each performance required a tremendous use of human and machine resources; the omission of event codes in the ticket brochure increased human handling of each order by 200 percent; the ticket brochure should have included not only the fine print terms and conditions, but also advice on order completion and warnings of possibilities of split seats, scheduling conflicts and price scaling.

OAF had the opportunity of using the experience gained by sports in the area of space reservation and ticket acknowledgement forms to improve the Festival operations. Starting with seat assignment through ticket printing, however, the Olympic Arts Festival led the way and its experiences helped sports through the procedures.

25.04.7

Transportation

External travel arrangements

By contract, the Festival was responsible for making travel arrangements for five theatre companies, seven dance companies, five chamber music ensembles, eight photographers and seven philatelic exhibition participants.

The OAF Logistics Department worked with the co-producers and LAOOC Travel Department, booking airline tickets several months in advance to obtain the best fares and to guarantee space.

Actual tickets were issued four to six weeks ahead of the travel date, insured and sent by courier or diplomatic pouch to the company or individual artist. Once the ticket was issued, any changes or extensions were the responsibility of the company or artist.

In a few cases where contracts were still in the process of being negotiated, the travel needs were projected and booked to guarantee rates and seats. The projections were 90 percent correct.

Number of performances ticketed by the LAOOC

Dance	60
Theatre	281
Music	33
Total	374
Orders received:	23,864

OAF mail order ticket processing flow

Month	Number received	Percentage
January	1,647	6.9
February	13,769	57.7
March	3,842	16.1
April	2,601	10.9
May	2,005	8.4
Total	23,864	100.0

Average mail order: \$248.00

Ticket packages: 822 mail order purchasers opted for one of the four ticket packages yielding priority processing

The only difficulty was operating around a sponsoring airline, limiting the flexibility of scheduling. A non-stop flight was the most convenient route for the foreign companies, but use of the official Olympic airline mandated a plane change in New York. In one case, the Polish company, Cricot 2, after landing in New York, was delayed 24 hours due to weather. The OAF was financially responsible for the overnight stay of the entire cast and crew.

27

Local transportation

The contractual agreements between the OAF and the international and national dance, theatre and music companies stipulated that the LAOOC would provide reasonable transportation in and around the Los Angeles area for each company.

It was not possible to determine the exact day-to-day travel requirements of the companies. Therefore, a transportation system of maximum flexibility was designed. Vehicles and drivers were assigned to companies, rather than scheduling routes and departure times between points.

Internal transportation was broken down into three categories:

- Round-trip transportation from LAX to the hotels
- Round-trip transportation from the hotels to cast parties
- Transportation from the hotels to other OAF venues for rehearsal and performance activities

The LAOOC Transportation Department assigned a transportation director to the OAF in April 1984. The director was responsible for creating and implementing a 24-hour Festival transportation system which included number and type of vehicles for the fleet and hiring, through Festival Staffing, one assistant, three dispatchers and 80 drivers.

27 Each OAF venue is decorated with the unique Look utilizing colorful banners and sonotubes.

Olympic Arts Festival

While the Festival was operational, the transportation director worked from the theatre operations office at the Bonaventure and from the dispatch center located in a trailer across the street from the Los Angeles County Music Center.

The assistant, the dispatchers and drivers were hired in May and were recruited predominantly from the performing arts community, including students and fellow artists.

Dispatchers worked a day shift, 0600 to 1530 hours, and a night shift, 1500 to 0030 hours, five days a week. The third relief dispatcher worked four days, taking two of the day shifts and two night shifts.

All drivers were required to have a valid California driver's license, a familiarity with OAF venues and the area of Los Angeles and the willingness to work within a flexible schedule. Within the group of 80 drivers, there were approximately 10 different language capabilities, which proved beneficial.

Original transportation plans called for vans and drivers to be permanently assigned to each group throughout the duration of their stay. The assignment of vehicles worked, while the permanent driver assignments did not. A second part of the original plan was to give drivers a work schedule one week in advance. With the company schedules changing continually, driver shifting was necessary to fill shortages and to spread the assignments as fairly as possible when work was slow. With the continual schedule changes, drivers usually did not have more than 12 hours advance notice and often had less.

A possible solution to the last-minute schedule change dilemma would have been the formation of a motorpool similar to that used during the Games. Drivers would have been on call in a central location to drive, if needed. The disadvantages in this system were: the lack of a physical location for a driver lounge at the OAF dispatch center, the unnecessary expense of paying drivers

who were not working, the need for more supervisors and the long periods of inactivity as there were no short runs similar to those during Games transportation.

The base of dispatch operations was a 26-foot mobile home located in a parking lot across the street from the Music Center. The area was surrounded by a chain link fence guarded by a camera monitoring system inside the Music Center. An LAOOC security guard was on duty from 2300 to 0600 hours daily for both vehicle and personnel protection.

The mobile home contained a base radio unit, one single telephone line with call-waiting indicator, a photo copying machine, some benches and a restroom.

The vehicle inventory ranged from 25 to 44 vans and station wagons, depending on the number of companies in town. Two-way radios were installed in 29 vehicles, including five station wagons.

Additionally, each theatre venue was assigned a cargo van and maintained a 20-foot truck for equipment pick-up.

The dispatch center was shut down 24 July when the theatre portion of the program was completed. The assistant transportation director, one dispatcher and five drivers were based out of the dance operations office in Pasadena for the remainder of the Festival. The transportation director continued to monitor the Festival operation, but was given auxiliary duties with Games transportation.

Despite continual schedule changes that required daily adjustments, all venues and field offices made an effort to keep the dispatch center as up-to-date as possible. This policy enabled the transportation personnel to respond quickly and efficiently to all areas of need.

26

Olympic Family Services

26.01 Concept and scope

The Organizing Committee's Olympic Family Services (OFS) program was designed to coordinate the presence of the Organizing Committee at all international gatherings and to prepare a warm and hospitable welcome to Southern California for all visiting members of the Olympic Family.

These basic functions were performed with great care and strict adherence to International Olympic Committee (IOC) protocol throughout the existence of the Organizing Committee. Protocol, as a common base by which all Olympic business is conducted, is an essential element of the international Olympic movement.

Among the responsibilities of the Protocol Department, the LAOOC's entity in charge of providing Olympic Family services, were the following:

- Administering to the needs of the IOC and its members
- Planning and execution of the 88th Session of the IOC
- Welcoming members of the Olympic Family arriving at Los Angeles International Airport for the Games, helping them through customs and immigration and arranging special transportation to the Biltmore Hotel for accreditation
- Producing and conducting a guest program to entertain the wives, husbands, children and guests of IOC members and NOC and International Sports Federations (IFs) presidents and secretaries-general during delegation visits and the Games

- Developing and managing the host-hostess program to administer to IOC members and presidents and secretaries-general of IFs and NOCs
- Hosting and caring for visiting missions and National Olympic Committee (NOC) delegations
- Fulfilling requests from visiting Organizing Committee delegations from Calgary and Seoul and delegations representing bid cities for future Games
- Providing overall administration and security at the Biltmore Hotel
- Utilizing calligraphy in providing uniform and distinctive writing used for Olympic business
- Distributing gifts
- Writing, publishing and distributing a protocol handbook
- Hosting social functions sponsored by the LAOOC

In addition, the chief of protocol served as the LAOOC's personal liaison to the president of the IOC and the IOC Executive Board during the Games. The chief of protocol met with the IOC president each morning to discuss the day's schedule and review the events of the previous 24 hours.

A Protocol Department became necessary and was created late in 1979 when the LAOOC began hosting numerous visiting IOC members and representatives and delegations of the various International Sports Federations (IFs) and NOCs.

At that time, the LAOOC formed a general policy for dealing with the Olympic Family. To protect itself from the group pressures of the IOC, IFs and NOCs, it decided its best interests would be served by appealing to the self-interests of the individuals concerned. To that end, the LAOOC committed itself to being a generous host to its many international guests within the limits imposed by its overall policy of fiscal conservatism.

The Protocol Department did not develop an identity of its own until 1982 when the LAOOC began intense preparations for the January 1983 meeting of the IOC Executive Board with the NOCs. Until then, protocol responsibilities had been incorporated with a group of other departments including Accommodations, Torch Relay, Ceremonies, Licensing, Sponsorship, Merchandising and Awards.

Preparations for the January 1983 meetings were top priority items, as decided by the executive management of the LAOOC, and staff members in all departments were instructed to focus their efforts to the successful conclusion of those meetings. The Protocol Department, which played a key operational role in the meetings, probably spent more effort in the detailed planning for these meetings than it did for the Games. Its efforts were successful and from its experience, the Protocol Department developed its operational plans for the Games.

26.02 Protocol responsibilities

26.02.1 Relationship with government

The Protocol Department did not deal directly with government in discharging its responsibilities to the Olympic Family. It was LAOOC policy to channel all business that pertained to the government through its Government Relations Department. Further, the LAOOC did not represent the U.S. Government, but only the private, non-profit corporation responsible for the organization of the 1984 Olympic Games.

26.02.2 Delegation visits to Los Angeles in the pre-Games period

Beginning in 1981 and continuing through May 1984, 105 delegations (representing various NOCs and other Olympic Family groups) made official, individual visits to Los Angeles. Delegations, on the average, consisted of five people who stayed four days.

These visits served a dual purpose; they gave the LAOOC an opportunity to explain to the delegates its plans for the Games and to demonstrate the progress being made. They gave visitors a chance to tour the venues and the athletes' villages where they could inspect the security conditions, medical facilities, transportation plans

1
1 LAOOC Aquatics Commissioner Jay Flood (left) and LAOOC President Peter V Ueberroth (second from left) lead a delegation from the People's Republic of China on a tour.

2
2 Members of an International Amateur Athletics Federation delegation tour the Los Angeles Memorial Coliseum.

and all other operational facets that pertained to the well-being of their athletes.

Conversely, these delegation visits provided the LAOOC an opportunity to learn about previous Olympic experiences through the first-hand knowledge of the delegates.

The flow pattern of official delegation (IOC, IF, NOC, OCOGs and others) visits to Los Angeles, beginning in September 1981, was as follows:

Month/Year	Number
September 1981	2
October 1981	1
November 1981	1

As noted, 155 different delegations came to Los Angeles for the meetings in January 1983. A total of 26 delegations came to the meeting between the IOC Executive Board and the IFS in February 1982.

All venue and athletes' village tours were regarded as official tours. The LAOOC did not authorize "unofficial" tours to any Olympic sites or venues. Tours, with the exception of those for members of the media which were handled by the News Department, were scheduled and arranged by Olympic Family Services.

Arrangements and clearances were made through the appropriate channels and Olympic Family Services also

made sure that visitors were given appropriate receptions along the tour. Venue tour guides were well-informed about the venues and passed along to the visitors detailed and pertinent information designed to aid their athletes during Olympic competitions. The visitors were grateful for this information and for the efforts made by the tour guides and LAOOC staff members to answer all their questions.

26.02.3 Games period: Arrival and departure assistance

The LAOOC's goal in arranging transportation for arriving and departing VIPs was to minimize the discomforts that normally confront international travelers. To accomplish this, the LAOOC, through extensive planning, reduced the number of officials needed to comply with and complete the required government entry procedures.

The LAOOC received great cooperation in this endeavor from private, state and federal agencies. The U.S. Department of Customs played a key role in expediting credentialed members of the Olympic Family through their procedures at Los Angeles International Airport (LAX). In many cases, Customs' functions were modified to suit the LAOOC's efforts.

The LAOOC's arrival/departure team consisted of one protocol manager, one assistant manager and 20 volunteers who shared two work shifts. Volunteer selections were based on skills, experience, appearance and flexibility. Part of their training consisted of a strenuous protocol development program that emphasized public speaking and international protocol.

The arrival/departure teams' office was located at the Bradley International Terminal of the Los Angeles International Airport. It was staffed by the protocol manager and assistant manager and equipped with two telephones and two EMS terminals.

Although the Olympic Family Services program at the Biltmore Hotel (headquarters for the IOC during the Games) did not become operational until 14 July, VIPs began arriving as early as 9 July. The number of arrivals, as expected, escalated dramatically as the Games approached. All customs and immigration procedures of VIP Olympic Family members were conducted in a special Olympic Family VIP Lounge located on the customs level of the LAOOC's Olympic Arrival Center at LAX.

Departures began as early as 31 July and continued throughout the Games. Arrangements were based on information provided by the guests and essentially included transportation to the airport and luggage assistance. The last departure was by IOC President

3

Juan Antonio Samaranch on 14 August. All staff was dismissed that day.

Recruitment and selection of the LAX protocol staff began in March 1984. Of 65 applicants who were screened and interviewed, 20 were selected for the staff and an additional four were chosen as alternates. Twelve of the 20 were fluent in two or three languages and one volunteer spoke four. Total language capabilities of the staff were: German, French, Russian, Spanish and Italian.

The LAX protocol staff worked two shifts, from 0700 to 1600 and from 1500 to 2400, and was deployed as needed according to the advance arrival information provided by the VIPs. Upon notification of a VIP arrival, the protocol manager assigned a language-qualified protocol escort to assist the VIP. This was accomplished through an assignment sheet that contained a general profile of the VIP and members in his or her traveling party. The escort greeted the guests and then accompanied them to a pre-arranged customs and immigration station. The escort assisted in the baggage handling and directed them to the transportation that had been arranged by the manager on duty. All transportation was provided by the LAOOC'S LAX motorpool.

VIPs staying at the Biltmore were accredited there, while all others were accredited at the Olympic Arrival Center at LAX.

From 9 July to 10 August, the protocol staff greeted, processed and transported 1,264 VIPs and guests to the Biltmore Hotel or to other hotels. All Biltmore guests were assigned a vehicle and a driver on a full-time or pool basis.

3 An LAOOC venue tour guide (center) passes on information to a visiting delegation.

Olympic Family Services

While some Olympic Family members departed before the Games were over, the first as early as 2 August, early departures on the whole were few. However, the early departures helped ease the burden that the protocol staff carried when Olympic Family members made their mass exodus on 13 and 14 August.

On those two days, VIPs were transported to LAX by bus and dropped off at the appropriate terminals. Each terminal was staffed by eight hosts/hostesses who were responsible for greeting the VIPs, assisting them with baggage and escorting them to the appropriate airline counter or lounge.

Early departing VIPs were the recipients of more personalized service since it was possible for assigned drivers to transport them to LAX. At LAX, they were met by escorts who assisted with the luggage and airline check-in.

26.02.4 Games period: VIP host/hostess program

The purpose of the host/hostess program was to provide friendly and personal service while extending the finest possible hospitality to all members of the Olympic Family during their stay in Los Angeles for the Games. Hosts and hostesses were assigned to all Olympic sites and Olympics-related sites including all venues, the athletes' villages, the Main Press Center and the Biltmore Hotel. Those chosen to serve at the Biltmore were designated as VIP hosts and hostesses.

The program was launched during the spring of 1982 when the LAOOC sent notices to members of the Citizens Advisory Commission announcing the meetings of the IOC and NOCs in Los Angeles the following January. The

LAOOC attached a form to the notice and requested that those interested in serving as a host or hostess for the event fill out and return the form. More than 1,200 responses were received. From this base, the LAOOC ultimately selected and provided uniforms for hosts and hostesses, including 50 who were placed in a reserve pool.

The experiences derived from the January 1983 meeting were essential in developing a four-stage operational plan for the implementation of the host/hostess program. The four stages were recruitment, system assignment, training and actual operation. Active recruitment began in January 1984; system assignment and training were completed by 30 June; and the program was operational from 12 July through 14 August.

Recruitment was done by referrals only. Applicants first were screened during one-on-one interviews and then participated in group interaction sessions where final choices were made. Each candidate was evaluated in four areas: bilingual or multilingual capabilities, international experience, availability and flexibility. The selection process yielded 153 VIP hosts and hostesses and another 25 who were assigned to a reserve pool.

Once chosen, each VIP host and hostess went through the system assignment phase. This phase covered several months and included: submitting a Games staffing application which placed the volunteer's identity into the system computer; signing a terms and conditions letter; and eventually being accredited, badged and outfitted with the appropriate uniform.

Concurrent with the system assignment stage, VIP hosts and hostesses were trained through an at-home program. Each was given packages of material that contained extensive information on the background of the Olympic movement, the LAOOC and the IOC and its members. In addition, the training packages outlined specific job descriptions, responsibilities, rules for appearance and behavior and protocol procedures.

On 30 June 1984, VIP hosts and hostesses attended a general orientation for all volunteer hosts and hostesses at UCLA and afterwards attended a specialized briefing in which the Biltmore operation was presented in detail. They were given scheduling information and informed of the two types of VIP host/hostess assignments: VIP pool and VIP "dedicated," the latter being the assignment to a specific VIP or group of VIPs. Of the 153 VIP hosts and hostesses, 130 were given "dedicated" assignments and the remaining 23 were assigned to the pool. If a dedicated host or hostess was not utilized by the individual or group, the host or hostess became part of the pool.

The operation at the Biltmore covered two shifts: from 0645 to 1500 hours and from 1400 to 2200 hours. Permanent positions were established within the hotel during each shift, such as at the host/hostess information/arrival desk, protocol desk, Olympic Club, dining room and lobby stations. The VIP pool was on duty for each shift and alternated weeks for early or late duty. Those with dedicated assignments had schedules that matched the VIPs to whom they were assigned and, otherwise, helped out whenever possible. Staffing at the major social functions was rotated in an attempt to give all hosts and hostesses an opportunity to attend. The completion of the fourth stage of the program was accomplished with the closing down of the Biltmore operation on 14 August.

Overall, the program worked well and ran at 100 percent capacity throughout the Games.

26.02.5 Games period: Programs for guests

The Organizing Committee prepared six guest programs for members of the Olympic Family and their guests during the Games period. It also arranged tickets to Disneyland and Knott's Berry Farm for Olympic Family members.

The six programs that were organized and run by the protocol staff were as follows:

- A fashion show, champagne luncheon and beauty seminar at Saks Fifth Avenue in Beverly Hills on 25 July.
- A three and one-half hour tour of Disneyland on 26 July. The guests were divided into French, Spanish and English language groups.

- A two-and-one-half hour San Pedro cruise on a colorful two-deck river boat on 30 July. The guests were served a prime rib luncheon and entertainment was provided by a three-piece band.
- A breakfast at Neiman Marcus and a presentation of California and United States fashion on 2 August. This was followed by a visit to the J. Paul Getty Museum in Malibu.
- A Universal Studios tour followed by a shopping tour of Olvera Street in downtown Los Angeles on 8 August. The guests were divided into French, Spanish and English language groups.
- Guests were divided into small groups and escorted on a shopping tour of Rodeo Drive in Beverly Hills. After shopping, guests were treated to a champagne luncheon at the Excelsior Restaurant.

Two buses were used to transport guests for each program and from five to 10 multilingual hosts and hostesses were included for linguistic support, depending on space availability.

Additionally, the Protocol Department scheduled three teas at the Biltmore Hotel, but cancelled the last two because of poor attendance at the first. Numerous cancellations without advance warning presented logistical problems for the protocol staff as guests tended to sign-up for programs well in advance but failed to cancel even if they knew later they could not attend. However, overall, the LAOOC's guest program was an overwhelming success and enjoyed by all who did attend.

26.02.6 Games period: Special events

The Protocol Department was responsible for arranging LAOOC special events during the Games. Among them were the following:

- The First Interstate Bank Athletic Foundation gala dinner honoring IOC President Juan Antonio Samaranch
- A luncheon for the wives of IOC members at the home of former Olympic swim star Johnny Weissmuller
- A luncheon for the wives of IF members and Organizing Committee commissioners at the Universal Studios commissary
- A luncheon for the wives of NOC members, attaches and envoys at Lawry's California Center
- A luncheon for the wives of IOC Executive Board members at the Bistro Garden in Beverly Hills

Protocol also assisted NOCs and observer delegations bidding for future games in planning and staging their own social events.

4 An LAOOC hostess greets visiting athletes.

26.02.7

Observer delegations

Three Olympic Organizing Committees and 10 candidate cities sent working and observing delegations to Los Angeles for the Games. The sizes of the delegations ranged from one person to a rotating group of six accredited members. The LAOOC was as helpful as possible, particularly in the distribution of promotional literature and invitations to social events. For the most part, members of visiting delegations were unobtrusive and cooperative but reports were received from several venue managers about representatives from one of the visiting missions who made demands for access to unauthorized areas.

Protocol dealt with the following delegations representing the organizers of past and future Games:

Calgary, Canada (1988 Olympic Winter Games)

Calgary sent waves of observers to the Games. A total of 38 persons received "O" credentials on a rotating basis. The delegation maintained a suite of offices on the fourth floor of the Biltmore Hotel. Its members demanded little from the protocol staff except assistance with invitation distribution and help in arranging meetings with LAOOC staff to gather information. After its report to the IOC, it held a news conference. The majority of the delegation arrived 21 July. Its leaders left 6 August and the remaining members left 12 August.

Sarajevo, Yugoslavia (1984 Olympic Winter Games)

The delegation, which consisted of 19 persons, held a press conference following its final report to the IOC session on 26 July. Most of the delegations arrived on 20 July and departed 12 August.

Seoul, Korea (1988 Summer Olympic Games)

At least 32 members of the Organizing Committee received "O" credentials on a rotating basis. Six of its members were involved in the exchange of the Antwerp Flag at the Closing Ceremonies. The delegation maintained a promotional booth in the Regency Room of the Biltmore Hotel throughout the Games and held a large reception in the Crystal Ballroom on 31 July. It also held a press conference following its report to the IOC on 26 July. Delegation members began arriving on 19 July and the last left on 13 August. This delegation made numerous requests of the LAOOC.

Delegations from the following candidate cities attended the Games:

Albertville, France (1992 Olympic Winter Games)

This was not an official working delegation and asked for nothing in the way of assistance. Its three members received "O" accreditation as part of the Paris delegation and the French NOC. They arrived on 23 July and departed 1 August. They resided at the Biltmore Hotel.

Amsterdam, The Netherlands (1992 Olympic Games)

The delegation consisted of 32 people and represented the Dutch government and public authorities, the Dutch Olympic Committee and Dutch sport federations. The members received "G" and "O" accreditation. The bulk of the delegation arrived 20 July and stayed at either the Biltmore Hotel or the Ramada Inn in Beverly Hills. This delegation was busy during the Games. It conducted activities daily, consisting of luncheons, cocktail receptions and press conferences, and culminated its campaigning with a large and lavish reception on 2 August to officially announce its candidacy for the 1992 Games. The delegation departed on 4 August.

Barcelona, Spain (1992 Olympic Games)

The working and observing delegation from Barcelona consisted of 15 people, seven of whom stayed at the Biltmore and the rest at a private residence. The mayor of Barcelona was the leader of the delegation and along with his wife received "G" accreditation. The others received "O". "The delegation rented space for a pictorial and architectural display of its city in the Regency Room at the Biltmore Hotel and held a cocktail reception at a private residence. Most of the members of the delegation arrived on 18 July and departed on 12 August.

Berchtesgaden, Federal Republic of Germany (1992 Olympic Winter Games)

The managing director of the Berchtesgaden committee was the only representative. He arrived on 18 July and departed 12 August. He received an "O" accreditation. Although he resided at the Biltmore and held a reception there to announce the Berchtesgaden candidacy, he confined most of his activities to the Los Angeles Hilton Hotel.

Brisbane, Australia (1992 Olympic Games)

The four members of the delegation resided at the Ambassador Hotel. They arrived 28 July and departed 5 August and kept a low profile throughout their stay. They did hand out some promotional literature through the Australian Olympic Federation during the time of the 88th Session of the IOC.

Cortina, Italy (1992 Olympic Winter Games)

There were 11 delegation members, but only five were considered official and received accreditation. They arrived on 18 July and stayed at the Ramada Inn in Beverly Hills. The delegation maintained a working office

5

at Casa Italia in Century City and conducted a limited amount of promotional work at the Biltmore Hotel. Its only social function was a dinner party at Casa Italia. Delegation members departed in groups, beginning 24 July and ending 11 August.

Falun, Sweden (1992 Olympic Winter Games).

The delegation, consisting of eight persons, arrived 18 July and departed 27 July. Two members stayed at the Biltmore Hotel and the rest at the Westwood Plaza Hotel. The delegation booked the Athenian Room at the Biltmore for daily hospitality functions culminating with a reception for H.R.H. Prince Bertil of Sweden on the afternoon of 26 July. The husband of Mayor Illemor Rudholm, who led the delegation, unfortunately suffered a heart attack at the reception and was taken immediately to Good Samaritan Hospital for treatment and recovery. The delegation made many requests of the protocol staff, ranging from typing to invitation distribution to additional accreditation to helicopter service for Prince Bertil.

Lillehammer, Norway (1992 Olympic Winter Games)

The delegation arrived in groups. The first group of six arrived 22 July and departed 30 July, the second arrived 29 July and departed 5 August and the last group was in Los Angeles from 4 to 14 August. All delegation members resided at the Biltmore Hotel and booked the Mediterranean Room for hospitality functions. They received "O" accreditations.

Paris, France (1992 Olympic Games)

The eight-person delegation included Jacques Chirac, the mayor of Paris, and resided at the Biltmore Hotel. The mayor and his entourage received "B" accreditations. The delegation advance man arrived 21 July and the

5 From left, Los Angeles Mayor Tom Bradley, IOC Director Monique Berlioux, LAOOC President Peter V. Ueberroth and LAOOC Chairman Paul Ziffren take a pause during an IOC reception.

Olympic Family Services

rest arrived 26 July. Other than hosting a lavish brunch in the Crystal Ballroom 29 July, the delegation quietly went about its business and departed Los Angeles on 1 August.

Sofia, Bulgaria (1992 Olympic Games)

Only two members of the five-person delegation ever contacted the LAOOC and that was for accreditation assistance. The delegation, which arrived 21 July, did not hold any social functions. It is not known when they left Los Angeles.

A sixth candidate city for the 1992 Olympic Games, New Delhi, India, was not represented in Los Angeles.

26.02.8 Calligraphy

The LAOOC used calligraphy on invitations, envelopes, place cards, adhesive name badges, press conference cards, certificates and signage. Calligraphy was used extensively for social events during the Games period.

A staff of 12 addressed approximately 9,000 envelopes for the mayor's reception, the pre-Opening Gala at the Hollywood Bowl, the First Interstate Bank Athletic Foundation reception and the opening of the 88th Session of the IOC at Dorothy Chandler Pavilion, as well as for other receptions and dinners given for various Olympic Family members. It also provided adhesive name badges for numerous luncheons for wives of IOC, NOC and IF members and printed place cards for private dinners. A private office for the calligraphy staff was maintained in the Biltmore Hotel during the Games period.

26.02.9 Use of gifts

The use of gifts for protocol purposes began even before the LAOOC was formally organized. In the early period following formation of the Organizing Committee, the LAOOC procured and distributed gift items it felt appropriate on a case-by-case basis. Beginning simply with "Los Angeles 1984" lapel pins, the gift program grew to large proportions as the number of delegations and officials visiting Los Angeles rose steadily.

By late 1982, the Protocol Department determined that a standardized gift program was necessary and that the level of gifts distributed to recurring types of visitors should be determined for protocol purposes.

The LAOOC's gift list was divided into four categories and, by category, included gifts which were distributed from January 1983 through the Olympic Games.

LAOOC Gift Items

"A" List

<i>Item</i>	<i>Cost</i>	<i>1983 Orders</i>	<i>1984 Orders</i>
Fine arts poster series (15 signed by artists)	\$3,000	25	0
Fine arts poster (1 signed by artist)	200	50	0
Fine arts poster series (15 unsigned posters)	225	125	100
Collector pin sets	85	40	40
Commemorative stamps in leather cases	60	150	50
Leather briefcase	54	244	200
4-foot by 6-foot LAOOC flag	50	25	40
Gold-filled cuff links	50	15	10
Ladies silk scarf	38	100	500
U.S. Olympic silver dollar	32	75	100
Lap blanket	19	75	200

"B" List

<i>Item</i>	<i>cost</i>	<i>1983 Orders</i>	<i>1984 Orders</i>
Paperweight	\$ 25	125	10
Jewelry box	22	100	10
Cross pen	20	300	45
Belt buckle	17	150	5
Silk handkerchief	15	15	3
Gold-plated cuff links	15	150	10
Beach towel	15	100	52
Fine arts poster (unsigned)	15	250	10
Book: "An approved History of the Olympic Games"	10	500	2
Blazer button set	10	100	5
Large sport bag	9	600	52
Small sport bag	7	400	30
5-pin set	8	300	20
Polo shirt	10	0	45
Sweatshirt	13	220	44

"C" List

<i>Item</i>	<i>Cost</i>	<i>1983 Orders</i>	<i>1984 Orders</i>
Leather or suede notebooks	\$ 8	650	600
Sam T-shirt	7	100	75
Sam necktie	7	225	300
Playing cards	5	125	100
Lucite clipboard	5	450	550
7" Sam the Olympic Eagle doll	4.50	72	300
Sam the Olympic Eagle mug	2.50	75	45

"D" List

<i>Item</i>	<i>Cost</i>	<i>1983 Orders</i>	<i>1984 Orders</i>
2-pin set	\$ 4.00	785	600
Key chain	3.85	400	600
Baseball cap	3.00	225	300
4" Clip-on Sam the Olympic Eagle doll	2.50	50	50
4" x 6" desk flag	2.25	200	150
Sport towels	3.25	0	500

The "A" list consisted of IOC members, heads of state, national governing body (NGB) senior officers, individuals of ambassador rank, NOC presidents, IF presidents, chefs de mission, official sponsor senior management and Organizing Committee of the Olympic Games (OCOG) presidents.

The "B" list consisted of NOC and IF secretaries-general, deputy chefs de mission, OCOG vice presidents, venue

owners and operators, attaches, IF technical leaders, IOC commission members and official sponsor service management.

The "C" list consisted of OCOG visitors and volunteers, among others.

The "D" list consisted of customs helpers, skycaps, bellboys, waiters and waitresses, car valets, hotel personnel and others.

Additionally, the LAOOC presented leather 88th Session of the IOC portfolios and ceramic plate sets to all IOC members during the Games and 1,400 gift packs to all VIPs. The gift packs—from in-kind commitments—contained a "Welcome" nylon sport bag, Bushnell binoculars, leather-cased playing cards, a commemorative medallion, a commemorative certificate and an automobile bumper sticker.

26.03 Relationship with the IOC

26.03.1 Protocol responsibilities of the Organizing Committee at meetings of the IOC

Beginning with its inception in 1979 and continuing each year, the LAOOC hosted successively larger meetings of the various international groups comprising the Olympic Family. In addition to the descriptions below, the IOC's specific requirements for facilities and services are covered in Chapter 18.

The LAOOC first played host to the IOC executive director and IOC president during visits in 1979 and 1980, and, in February 1981, organized its first formal IOC gathering—a meeting of the IOC Executive Board at the Century Plaza Hotel in Century City.

The meeting was attended by the full IOC Executive Board, several of whom were accompanied by spouses. The IOC secretariat was represented by six persons and was provided office space and furnishings, including telephones and telex equipment, at the hotel. Although the meetings lasted only two days—24 and 25 February—the agenda covered a one-week period and included a tour of the existing major venues and four social events. The meeting provided a tremendous learning experience for the LAOOC which at that time numbered only 20 staff members. Even though it was a small meeting with only 30 guests, the LAOOC staff gained experience in hotel arrangements, blocking space for meetings and functions, language services, protocol, transportation needs and venue tour operations.

One year later, the LAOOC hosted a larger gathering of the IOC. This was a meeting of the IOC Executive Board with the IF presidents, secretaries-general and delegates at the Huntington Sheraton Hotel in Pasadena, California. The event, which drew approximately 350 delegates, utilized virtually all of the hotel's

facilities. In fact, it was necessary to acquire additional rooms for guests at the Pasadena Hilton. The agenda for the event covered the period from 31 January to 7 February 1982 and included meetings of the IOC Press and Medical Commissions, venue tours and a gala dinner for 500 hosted by the LAOOC at the Biltmore Hotel. The LAOOC staff, which had grown to 65, gained further experience in secretariat operations of the various groups of the Olympic Family and maintained an on-site secretariat of its own. For the first time, the LAOOC used volunteer interpreters and venue tour guides to assist Olympic Family members.

In January 1983, the LAOOC, which then consisted of a staff of 325, hosted the meetings of the IOC Executive Board and the NOCs at the Biltmore Hotel. There were approximately 650 delegates who attended the meetings. By this time, the Biltmore had been selected as IOC headquarters for the Games, giving the meeting additional significance as a small scale dress rehearsal for LAOOC operations during the 88th Session of the IOC and the Games. Over the 1 O-day agenda, which included several social events and venue and village tours, the LAOOC tested its departmental operations to identify problem areas. Volunteer hosts and hostesses were utilized in large numbers and, those who later worked the Games, received invaluable experience. The meeting also served as an opportunity for the LAOOC's staff and the hotel staff to coordinate operations,

In the year preceding the Games, the LAOOC's Olympic Family Services also arranged and hosted the visits of the IOC executive director on three separate planning trips, in July 1983, December 1983 and May 1984.

26.03.2 Protocol responsibilities during the 88th Session of the IOC

The Protocol Department of the LAOOC was responsible for organizing and arranging the 88th Session of the IOC, including the gala opening. All details for the opening and the session were required to meet the precise guidelines specified in the 1978 provisional edition of the Olympic Charter and had to be approved by the IOC in advance.

For example, for the gala opening, the IOC approved use of the Dorothy Chandler Pavilion in downtown Los Angeles as the site, the guest list, the program and the design for the badges, logo, invitations and tickets. Also, since the charter mandated that all information concerning an upcoming session must be distributed no later than two months prior to the event, the LAOOC notified all IOC members and IF and NOC presidents and secretaries-general of the details of the session through an informal letter mailed on 18 May 1984. The formal invitation, which subsequently was approved by the IOC executive director, was distributed the following month.

The session ticket was identical to the Olympic "Festive Federalism" sport ticket except that the sport pictogram depicted on sport tickets was replaced by the 88th Session logo. Also, the group seating area appeared where the seat number appeared on the sport ticket. IOC members were assigned seats on the day of the event. Tickets for approximately 700 local guests were mailed during the first week in July.

On 24 July, 15 (46-passenger) tour buses, each making two trips, transported approximately 1,000 people from the Biltmore Hotel to the Dorothy Chandler Pavilion. Four of the 15 buses were assigned exclusively to IOC members. In the confusion, it was sometimes difficult to separate IOC members from the rest of the group.

There were 152 hosts and hostesses assigned to assist guests at the Dorothy Chandler Pavilion and they performed a number of functions. They were utilized as follows:

- Thirty were assigned to IOC members. They were in attendance at the meeting for IOC members in the Gold Room at the Biltmore Hotel, accompanied them on the bus to the Dorothy Chandler Pavilion, escorted them to their seats and then to the Founders Room at the Dorothy Chandler Pavilion following the program.
- Twenty were responsible for coordinating the bus loading and unloading of other Olympic Family VIPs.
- Twenty-four were stationed at 12 program distribution areas (two per area) at the Dorothy Chandler Pavilion.
- Twenty-eight were present at 14 entrances (two per entrance) to direct guests to seating areas.
- Six were stationed at the three turnstyle entrances (two per entrance).
- Sixteen were present to assist the loading and unloading of guests at eight elevators (two hosts and hostesses per elevator at each of the two elevators on each of the four levels).
- Twelve were stationed in front of the pavilion to greet and direct guests as they arrived.
- Six assisted ticket distribution outside the entrance to the pavilion.
- Ten were assigned to set-up and prepare for the reception and Founders Room presentation and to direct and assist guests.

The IOC prepared agenda indicating that the session would cover two and one-half days, beginning 25 July and ending 27 July, but the IOC was able to conclude its business on 26 July.

6

7

The sessions were conducted in the Crystal Ballroom on the Galeria level of the Biltmore Hotel. The LAOOC installed interpretation booths on balconies overlooking the room and, although IOC protocol requires U-formation seating for its members, limited space in the ballroom forced the LAOOC to modify the single U-formation by adding a smaller "U" within the larger one. Room set-up and installation of decorations and equipment was completed in a day and one-half and teardown was achieved in one day.

26.03.3 Protocol responsibilities at IOC headquarters during the Games

As the official headquarters for the Olympic Family, the Biltmore Hotel went through the LAOOC's venue development process so that other operational departments could coordinate their responsibilities and services with those of the Protocol Department.

It took the LAOOC one week to move in and set up the Biltmore Hotel to become operational by 14 July 1984. Its major functions at IOC headquarters were located on the Galeria level of the hotel and consisted of the following:

6 The LAOOC's USC Village Administrator, Anita DeFrantz (left) leads LAOOC President Peter V. Ueberroth (second from left) and IOC President Juan Antonio Samaranch on a tour of USC.

7 Inside the Dorothy Chandler Pavilion at the gala opening of the IOC's 88th Session.

- In-processing and hospitality services were available in the Galeria Room. There, the LAOOC had staff to handle finance, accommodations, accreditation, transportation, travel, meal tickets and host and hostess request functions. Welcome gifts were distributed there, as were Olympic Family tickets.
- The LAOOC's Protocol Office was located in the Olympic Room. Day-to-day management operations were carried out there and, beginning with the opening of the 88th Session, it was open 24 hours per day. It also served as the LAOOC's Government Relations office.
- The IOC secretariat was located in the Music Room. The LAOOC installed complete office facilities for an administrative staff of 25, including 20 desks, a key telephone system, two high volume Xerox copying machines, Electronic Messaging System (EMS) terminals and two telex machines.
- The Olympic Family dining room was located in the Renaissance Room. Breakfast, lunch and dinner were served there daily from 15 July through 13 August. Olympic Family members were admitted by meal ticket. The California Room, a private dining room, was used to serve lunch and dinner to IOC secretariat members.

Olympic Solidarity headquarters was located on the Conference level of the hotel. It contained an office for the Solidarity director, Solidarity secretariat and, beginning 24 July, a lounge area called the Olympic Club. The Olympic Club became a popular gathering place for Olympic Family members who possessed "A", "B" and "G" credentials. There, refreshments were served and television and information material was available.

Also on this level were offices for the IOC sports director and sports secretariat, the IOC protocol director and First Interstate Bank's full-service facilities. Hospitality areas for Lillehammer, Norway, which was bidding for the 1992 Olympic Winter Games, and Falun, Sweden, also bidding for the 1992 Olympic Winter Games, were also on this level.

The LAOOC's security staff occupied two areas on the Conference level—a command center with representatives of the LAOOC—the hotel and the Los Angeles Police Department and a lounge and briefing area for contract security employees.

The exhibition area of the hotel, which was located in the Regency Room, was utilized for several purposes. The LAOOC's Technology and Material Logistics departments had headquarters there and, during the IOC session, LAOOC operated a press sub-center with full filing and writing facilities. The Technology Department also provided a complete results service. Exhibit space was allocated for the Seoul Olympic Organizing Committee to promote the 1988 Games. Amsterdam, bidding for the 1992 Olympic Games, maintained an attractive exhibit and beer bar that featured fresh flowers that were transported from the Netherlands on a regular basis. Barcelona had an exhibit promoting its bid for the 1992 Games, and a small area was reserved for Cortina, Italy which was bidding for the 1992 Olympic Winter Games.

A full communications and message center, featuring EMS, telecopying facilities and message distribution, was located in the Main Galeria. The U.S. Postal Service provided complete mail services and did a brisk business throughout the Games period.

In addition to the Session Hall in the Crystal Ballroom, other meeting rooms were provided for the IOC Executive Board and the IOC Medical Commission. The IOC Executive Board had access to the Colonnade Room throughout the Games, while the IOC Medical Commission had a large one-bedroom suite and three adjacent rooms on the third floor of the hotel.

Olympic Health Services provided medical care in two of the adjacent rooms: one was used as a reception room and the other for treatment. The main suite living room was used by the commission members for daily meetings and was equipped with simultaneous interpretation equipment. The bedroom of the main suite served as a medical command center that coordinated and monitored the medical activities throughout the Olympic area. The LAOOC medical director occupied the third adjacent room, thus consolidating all medical and related services into one central area.

26.04 Summary

The services provided to Olympic Family members throughout the five-year existence of the LAOOC were well received and proved beneficial in solidifying relations between the LAOOC and the Olympic Family members it served. The LAOOC's policy to provide warm hospitality and to treat all its guests with dignity and grace in a friendly and comfortable environment was adhered to at all times by LAOOC staff members.

While the overall responsibility for maintaining a high level of service to Olympic Family members fell on the Protocol Department staff, the senior management of the LAOOC involved staff members from other departments in hosting visiting delegations on a regular basis. Upon joining the LAOOC, each new employee was assigned a country which had a recognized NOC and was required to study and become familiar with that nation's history and its political and social systems. This heightened the overall international awareness of the LAOOC staff and stressed the singular purpose of playing host to people from all over the world.

The January 1983 meetings proved to be a valuable training ground for the LAOOC and the Protocol Department, particularly for its VIP host and hostess program which was created specifically for the event. With its success at the meetings, the host and hostess program was expanded and developed further for its equally successful operation during the Games.

While numerous problems surfaced and some criticism was levied, the overall performance by the LAOOC in the area of Olympic Family services was outstanding. Problems, for the most part, were solved instantaneously and while most criticism was trivial in nature it was far outweighed by praise and genuine heartfelt appreciation by those the LAOOC served.

27

27.01

Concept and goals

In this electronic age of radio and television, the printed word is still the most permanent means of mass communication. By using the print medium as its primary method for providing information, the Organizing Committee left many lasting projects which document its communication efforts with local, national and international audiences.

A wide variety of publications and printing projects were needed to spread news of the Games to International Olympic Committee members, the National Olympic Committees, worldwide media, Olympic supporters and the general public in the United States and other nations. Many of these publications were required by the Olympic Charter (1978 Provisional Edition) and many more were deemed essential by the LAOOC in its determination to host a successful Games. Additional printed material was produced which was entirely optional yet enhanced the communication efforts of the many departments within the Organizing Committee.

It was the goal of the Publications Department to provide informative, well-written, easily understood and pleasingly designed printed matter which would communicate the LAOOC's preparations to the general public and to the Olympic Family. At the same time, the Design Department was given a mandate to implement a specific Look for the Games, taking some responsibilities from the Publications Department. The small publications staff (three in October 1982, five by February 1984 and eight during the Games) also assisted other LAOOC departments with various needs and, specifically, aided the Licensing Department in the selection of two official publishers to produce the "Official Olympic Souvenir Program" and the "Official Olympic Guide to Los Angeles" and eventual review of all editorial matter.

In meeting its responsibility to help other departments with their communications needs, the publications staff was involved in more than books, magazines, newsletters and brochures. The scope of responsibilities grew to include projects such as badges, certificates, folders, invitations, special awards, stationery and anything else that required the services of a designer, typesetter and/or printer.

The magnitude of the work needed was clearly demonstrated by the preparations necessary for the IOC Executive Board meeting with the NOCs in January 1983. In a six week period, the Publications Department was involved in producing more than 20 individual projects ranging from invitations to a 132-page arrival guide. The workload increased over the following months, particularly during the 1983 pre-Olympic (LA83) sporting events.

It is worth noting that in a report to the IOC in 1981, there is mention of an additional 20 publications planned prior to the 1984 Games. This total was easily surpassed in early 1983 and a final count included more than 500 diverse printing projects completed in the three years prior to the staging of the Olympic Games.

The Publications Department went through a series of administrative and thematic changes as planning for the Games progressed. As a result, the common thread which ties different publications projects together was missing in the early stages. Although considerable attention was devoted to producing attractive publications, a consistent look was not maintained until late 1983 when the Organizing Committee adopted an overall color and design plan. This was accomplished in part by a close association with the LAOOC Design Department, which, because of the increasing number of projects, inherited much of the necessary production work as the Games drew closer. The Publications Department retained control over editorial content.

Many LAOOC publications were conceived late, brought to either the Publications or Design department in a wide variety of forms and styles, then executed under terrific deadline pressures. The Organizing Committee would have benefited by funneling all printing projects through only one department to help maintain a consistent editorial message and graphic continuity.

In the 18 months prior to the Games, several hundred publications were produced and many were used extensively in assembling the "Official Report of the Games of the XXIIIrd Olympiad." Together, these publications leave lasting documentation of the successful communication and organization of the Games.

27.02

Review of LAOOC publications

In an effort to communicate its organizing achievements to a vast audience, the LAOOC planned, designed, produced and printed countless books, brochures, documents, flyers, forms, guides, handbooks, magazines, maps, posters, newsletters, reports and even office stationery supplies.

One of the first publications printed was called "Our First 1,000 Days: A Human Audit," which summarized the

LAOOC's early organizing efforts and served the dual purpose of a public relations tool and general information brochure. This four-page, two-color brochure was the first to use the *Star in Motion* logo, making it easily identifiable to the 1984 Games.

Other major publications produced by the different operating departments included:

- Accommodations
 - Registration card
- Accreditation
 - Accreditation badges
 - Olympic Family identity cards
 - Olympic Family identity card manual
 - Olympic Family accreditation badges
 - Olympic Family badge brochure
 - Olympic Family ticketing system
 - Olympic Family list and folders
 - Access controllers handbook
 - Application for media accreditation
 - Media accreditation badges
- Architecture
 - Signing standards manual
- Arts Festival
 - Program information and ticket order form
 - Artists' guide
 - "Los Angeles Times" insert
 - Commemorative book
 - Festival event programs
- Awards/Ceremonies
 - Opening Ceremonies program
 - Closing Ceremonies program
 - Pageantry production manual
 - Participant award certificates
- Corporate Relations
 - Licensees' newsletter
 - Licensee enforcement report forms
 - Licensee incentive programs
- Design
 - "Graphic Standards Manual"
 - Designer posters series
 - Look posters
 - Street/building decoration brochure
 - Bumper stickers
 - Certificates
 - Invitations
 - International events brochure
 - IOC Executive Board/NOC stationery
- Executive
 - First Official Report to IOC
 - Interim Report to IOC

**27.02.1
 Publications required
 by the Olympic Charter**

Rule 56, the publications section of the 1978 Provisional Edition of the Olympic Charter, mentions three major projects required of the Organizing Committee by the IOC. Those publications are: 1) an explanatory brochure for each Olympic sport distributed not less than one year before the Games; 2) an official report completed within two years after the close of the Games; and 3) an official "programme" for the competitions (i.e., souvenir program).

Additional publications required by the Olympic Charter included: IOC medical controls brochure (Rule 27); entry and scoring forms (Rule 35); identity document cards (Rules 38 and 49); participant awards (Rule 45); publication of official results (Rule 49); and official invitations and entrance tickets (Rule 60). The number of publications mandated by the IOC, then, represents a very small percentage of the hundreds of projects completed by the LAOOC in its planning for the Games. Descriptions and details of a select few of these IOC-required projects follow.

Explanatory brochures

The earliest major publication project was a joint effort between the LAOOC Sports and Publications departments. The IOC-required "Explanatory Brochures" became a challenging three-year project beginning with a preliminary outline in late-1980 and ending with the final product in late-1983. Approval from three distinct entities was required—the IOC, the appropriate International Federation officials and the LAOOC sport commissioner—before any sport's brochure could be printed in final form. Delays in completing the overall task were caused by ever-changing rules, a lengthy technical translation process and sensitive political policies.

Each bilingual "Explanatory Brochure" was self-contained and included a table of contents, overall schedule of the Games and general information about the IOC, the LAOOC, the appropriate sport federation and the host city, Los Angeles. Competition information including dates, sites, equipment and events was also explained.

While each brochure was essentially an independent project, a total of 3,000 were distributed in a slipcover as complete sets. Following is the length of each "Explanatory Brochure" as approved by the IOC and the respective International Federations:

Sport	Pages
Archery	33
Athletics	66
Baseball	39
Basketball	51*
Boxing	35
Canoeing	35
Cycling	48
Equestrian Sports	51
Fencing	61
Football	65
Gymnastics	210*
Handball	51*
Hockey	49
Judo	31
Modern Pentathlon	47
Rowing	35
Shooting	43
Swimming	55
Tennis	35
Volleyball	43
Weightlifting	35
Wrestling	39*
Yachting	42

*Includes 2-4 page errata

Future organizing committees should be aware that each explanatory brochure contains critically sensitive rules and regulations governing its sport and requires administrative approval from many official sources. An early start is recommended. Time can also be saved by using an already-approved existing translation and by requiring federations to consider rule changes effecting Olympic competition well in advance of publication deadlines.

IOC medical controls

Several publications concerning the IOC's stringent medical guidelines were assembled by the LAOOC, though only the "IOC Medical Controls" brochure (Rule 27) was specifically required. This 36-page manual explained the IOC's position on drug abuse and includes the medical code (Rule 29) of the Olympic Charter. Also included was a list of forbidden substances and clear procedural guidelines for the selection of athletes to be sample tested for doping control and gender verification.

Two additional publications—the "Pharmacy Formulary" (152 pages) and a "Medical Guide" (116 pages)—provided supplemental information about services available to athletes and members of the Olympic Family during the Games; 4,000 of each were printed. A concise, eight-page "Olympic Health Services" brochure summed up these other major publications.

The "Pharmacy Formulary" served as a reference guide on such topics as the importation of medications into the United States, polyclinic services, general drug information, prescription procedures and policies regarding medication use during the Games.

The "Medical Guide" included explanations of health services provided at the village polyclinics, official hospitals, venues and training sites as well as emergency medical services. Special attention was devoted to sports medicine, physical therapy, radiology services, environmental health, doping control and spectator first aid.

Communique

In early 1983, the IOC Executive Board made a special request to the Organizing Committee for increased direct communication between the LAOOC and NOCs. As a result, the bilingual, bimonthly four-page newsletter "Communique" was conceived and published exclusively for the National Olympic Committees. This NOC newsletter made its debut on 1 March 1983 and continued for 30 issues through 15 May 1984.

"Communique" informed and advised NOC officials of dozens of issues which would effect them before and during the staging of the Games in Los Angeles. It updated NOC officials on LAOOC preparations and detailed the various steps required of them before arriving in Los Angeles. A selection of topics explained in "Communique" included:

- Accommodation location and fees
- Accreditation process and materials
- Arts Festival information
- Charter flights
- Chef de mission manual
- Competition sites
- Congresses schedule
- Deadline reminders
- Doping control
- Electronic Messaging System (EMS)
- Food services
- Host/hostess program
- International Broadcast Center
- Main Press Center
- Medical insurance
- Schedule of events
- Technology at the Games
- Ticket allocations
- Training sites
- Transportation information
- Village information

Publications

"Communique" addressed hundreds of topics in simple language for the benefit of all parties: the IOC, the LAOOC and the target National Olympic Committees. This highly successful project became a welcome communication tool during the year before the Games, and future organizers should consider even earlier distribution of a similar publication.

Entry and scoring forms

Before athletes were allowed to compete, entry forms had to be filled out. Similarly, officials required forms to regulate and judge the competitions. To fulfill these form requirements for the Games in Los Angeles, a seven-month project (from January through July 1984) was undertaken to design, produce and print more than 450 different registration and scoring forms.

Sports such as yachting and gymnastics required many different forms because of their complex scoring and appeals system with a variety of events and equipment. Other sports such as football and hockey required less detail but their forms had to be equally exacting as well as in triplicate.

Following is the number of forms required for each sport contested in Los Angeles:

Sport	Forms
Archery	10
Athletics	20
Baseball	6
Basketball	8
Boxing	17
Canoeing	14
Cycling	20
Equestrian Sports	1
Fencing	22
Football	4
Gymnastics	59
Handball	5
Hockey	6
Judo	8
Modern Pentathlon	16
Rowing	7
Shooting	13
Swimming	38*
Tennis	6
Volleyball	12
Weightlifting	6
Wrestling	5
Yachting	126
Athlete registration	21
Officials	1
Total	451

*Includes swimming, diving, water polo and synchronized swimming.

These forms represented the most complete, accurate and up-to-date Olympic registration and scoring documents ever assembled. They were designed to be easily understood and to be used in a variety of ways. In designing the sports forms, for example, both the Sports and Technology departments were consulted to insure compatibility with data input systems and Games results systems. While it was necessary for the LAOOC to produce hundreds of these forms since previous documents were either unavailable or outdated, future organizing committees should avoid repeating such a time-consuming and expensive publication project. The use of existing forms which have gained approval from Olympic and International Federation officials is strongly encouraged.

Official reports

As part of its agreement as host of the Games, the LAOOC submitted an "Official Report" to the members of the IOC at its regularly scheduled

sessions. These reports provided the IOC with updates on the status of the Organizing Committee's efforts.

Generally, the reports contained updates in the areas of: accreditation, Arts Festival, ceremonies, customs, finance, facilities, government relations, housing, medical program, press operations, protocol, public relations, security, staffing, ticketing, transportation, village operations and youth programs. Distribution of these official reports adhered to the following timeline:

Publication title	Date	Total pages
First Official Report	7/16/80	69
Interim Report	4/81	28
Second Official Report	10/1/81	85
Interim Report	2/82	36
Third Official Report	5/27/82	78
Fourth Official Report	3/26/83	151
Fifth Official Report	2/6/84	64
Final Official Report	6/1/85	1,586

1 The "Stars in Motion" series consists of six issues, designed to inform the Olympic Family of the progress of organization in Los Angeles.

2 "Olympic Update" began in late 1982 and is used to inform the general public of news regarding the Games in Los Angeles.

The final "Official Report" was compiled by a staff of some 15 editors and research writers along with a design director, office manager, photo editor, production manager and six administrative assistants. This staff gathered reports from each operating department manager and conducted personal interviews to gather background material before composing the chapters and sections of the report.

Since the LAOOC made a commitment to terminate nearly all full-time employees at or soon after the conclusion of the Games, the "Official Report" staff was reassembled from existing full-time staff to begin work in September 1984. With a 39-chapter topic outline as its guide, the staff set out to produce their 1,586-page document in two parts: Volume One/Organization and Facilities and Volume Two/Competitions. The brunt of the research and writing (in English) was completed by 15 January 1985 with translation into French completed by 1 May 1985.

A highly-respected Los Angeles design firm was awarded the contract to design and produce both volumes. In addition to the principal, who was directly involved in the project, the firm also utilized two project managers, three design coordinators, two production coordinators and a half-dozen production artists. Site drawings and charts were subcontracted to a local architectural graphics studio, which employed a team of up to 10 delineators.

Keyboarding of manuscript was done in-house onto a micro-computer using word-processing software. The LAOOC transmitted data via modem to a local computer typesetting company for immediate output of final typeset text. This saved the time-consuming step of re-entering final text and allowed for quicker editing and proof reading by the "Official Report" editorial staff.

The two-volume, hard-bound set was made available for purchase to an exclusive list of Olympic sponsors, supporters, staff members and ticket buyers, with a 31 January 1985 deadline for orders. Price of the oversized publication was set at \$485

plus handling, shipping and applicable sales tax, bringing total cost to \$550 in the United States and \$600 for deliveries to foreign countries. An anticipated press run of 2,000 copies was revised accordingly based upon the number of sales orders received.

The report was presented to members of the International Olympic Committee at its 90th Session (2-6 June 1985) in Berlin, German Democratic Republic, just nine months after the project was begun. General distribution to subscribers was completed by August 1985.

Supplemental official reports

Supplemental reports for the benefit of members of the IOC Press Commission were assembled by the LAOOC Press Operations Department. These contained updates and information on the media services (accreditation procedures, housing, telecommunications, etc.) being planned for journalists who would cover the Games.

Distribution was as follows:

Publication title	Date	Total pages
First Press Commission Report	4/29/81	31
Second Press Commission Report	2/1/82	34
Third Press Commission Report	5/22/82	26
Fourth Press Commission Report	1/17/83	37

Two additional reports ("Facilities for Journalists, Volume 1" and "Facilities for Journalists, Volume 2") were submitted to IOC Press Commission members and to all accredited media six months and three months prior to the Games.

Results publications

To meet the IOC's requirements to publish official results and a souvenir program for the Games, the LAOOC formed a staff dedicated solely to producing a daily publication which combined the two functions. To that end, the LAOOC Technology Department inherited responsibility for a series of three publications all known as the "Olympic Record," each published independently of the Publications Department.

3 A distinctive press kit cover is used by the News Department and special news release paper is designed for information on specific topics, such as sports.

4 The "Olympic Countdown" series consists of five separate issues between late 1981 and early 1984.

6

5 Vehicles for communication to specific groups include the LAOOC's "Spirit News" for the Olympic Spirit Team, "Communique" for National Olympic Committees and "Facilities for Journalists" for news media coming to the Games.

6 The "Olympic Record" is available to spectators at all venues and contains not only results and start lists, but also information on what to look for.

Best known was a daily souvenir program titled "Olympic Record/Day 1-15," which contained official start lists and results for each sport—more than 6,000 in all—as well as a French and English editorial section. This daily publication featured pertinent short stories which captured the flavor of the Games and informative articles on how to enjoy watching the many Olympic competitions.

An "Olympic Record/Entries" book which listed alphabetically all registered athletes for every event was published just before the Games. The third results publication was the "Olympic Record/Results" book printed immediately after the Games which included all official results.

The daily "Olympic Record" was actually made up of two sections: 1) a 20-page, pre-published "fixed" wrap-around section which was written and produced in the months leading up to the Games, and 2) a "live" inside section of variable length ranging from 32 to 64 pages. This latter portion had up-to-the-minute previews of events taking place that day and summaries of action from the previous day's competition in addition to official start lists and results.

Programs were sold to spectators at each venue for \$3, with complimentary copies made available to Olympic Family members. Accredited members of the media could pick up a copy of the inside section at the Main Press Center or at venue press sub-centers.

Program sales totaled approximately 395,000 copies over a 15-day period (26,333 sales average per day), for an average of one program sold for every 15 spectators (15:1 ratio). Projections had been overestimated and the LAOOC was prepared to print as many as 150,000 copies per day, but print runs were decreased to approximately 80,000 per day to meet the lower-than-expected demand.

27.02.2 Publications required by the LAOOC

In addition to IOC-required publications, the Organizing Committee produced many publications it deemed necessary for a successful Games. These projects were generally initiated on an "as needed" basis, proposed by operating departments as a way to enhance overall organizing efforts. Most could be classified as general information publications, while others

were technical or special events publications. The most useful of these publications expanded and improved over time when updates became necessary due to an increasing demand for information.

Olympic Countdown series

Perhaps the single most useful publication conceived by the Organizing Committee was the "Olympic Countdown" series. This general information book gathered widely disparate bits of information from various departments into a single, exhaustive document providing a summary of the LAOOC's organizing activities. It first appeared in November 1981 as "Our First 1,000 Days" and was updated in four subsequent "countdown" editions. The chronology of this publication follows:

The countdown series evolved from a book which was initially intended as an in-house informational tool and expanded into a complete reference manual that served several purposes. Besides being used by LAOOC personnel, it was used as a general information guide for the press/radio/television media, as a new employee handbook and as a public relations tool.

The "Olympic Countdown" books contained sections that addressed issues and areas most often questioned by the media and the public. Major section topics included: the International Olympic Committee, the International Federations, National Olympic Committees, how Los Angeles was awarded the Games, organization of the Games, Olympic facilities, and Olympic sports and competitions.

Future organizing committees should consider publishing similar multi-purpose reference books beginning as early as four years before the Games. Biannual updated editions which are widely distributed to the IOC, NOCs, international media and supporters of the Olympic movement would greatly enhance worldwide understanding of the upcoming Olympiad.

Media guide; information for journalists guides

In January 1984, the Press Operations Department distributed a guide outlining all facilities and services available to news media reporting on the Games from Los Angeles. Titled "Facilities for Journalists, Volume 1" (100 pages), it provided a summary of procedures in areas such as: accreditation, housing, information services/results, photographic services, media services at the Main Press Center, radio/television services at the International Broadcast Center, media services at the competition sites, telecommunications and media transportation.

Olympic Countdown	Date issued	Total pages	Print run
<i>Our First 1,000 Days</i>	November 1981	100	6,000
<i>819 Days To Go</i>	1 May 1982	104	8,000
<i>667 Days To Go</i>	30 September 1982	130	7,000
<i>454 Days To Go</i>	1 May 1983	158	20,000
<i>200 Days To Go</i>	9 January 1984	172	25,000

In April 1984, a supplemental edition titled *Facilities for Journalists, Volume 2* (128 pages) was distributed to the media around the world. This second volume served as a companion reference source to the first volume and concentrated on the use of charts, diagrams, maps and photographs to explain graphically exactly what media services were available and where they were located. Approximately 10,000 copies of both volumes were printed and distributed. Finally, a *Media Guide* (176 pages) for press/radio/television journalists was distributed at the Main Press Center where members of the media received their accreditation badges shortly after arriving in Los Angeles. A total of 12,000 of these handbooks for press, radio and television journalists was distributed to media and selected full-time and volunteer LAOOC staff who worked directly with the media. This completed a trilogy of publications designed to completely describe and explain available media services during the Games.

One additional information guide for journalists was completed in time for the Olympic Arts Festival which opened on 1 June 1985. This 80-page guide provided details on each of the festival artists and principal venues as well as an overview of the planning for the 10-week event.

Olympic ticket information and order form

Requests for tickets to 1984 Olympic events began pouring into the Organizing Committee offices from the moment the IOC awarded the Games to Los Angeles in early 1979. But only after four years of negotiating for competition sites and arranging schedules could public ticket sales begin.

In August 1983, more than 3.5 million Olympic ticket information brochures were distributed through a major national department store chain (Sears, Roebuck & Co.) and two regional banks headquartered in Los Angeles (First Interstate Bank) and

New York City (Manufacturers Hanover Trust). Demand for the brochure was so great that supplies were exhausted in less than one month and a reprint of another two million brochures was distributed. The 32-page publication included descriptions of and preliminary schedules for each of the 23 sports with detailed instructions on how to order Olympic tickets. An easy-to-use order form and return envelope was attached to the centerspread.

The Olympic Arts Festival independently produced 1.2 million copies of a similar ticket information brochure (36 pages) which was distributed throughout Southern California and through direct mail. Profiles of festival participants and a complete schedule of events was included along with a detachable order form and return envelope.

Customs manual

The LAOOC arranged for official customs and entry procedures which applied only to accredited delegations of the IOC, the NOCs and the International Sports Federations. The required entry provisions were detailed in a 48-page, pocket-sized booklet entitled *Customs and Shipping Manual* for the exclusive use of Olympic Family officials.

This comprehensive customs manual explained U.S. requirements concerning baggage inspection, immunization and shipping of equipment as well as the importation of food products, pharmaceuticals, firearms, horses and currency. A total of 25,000 copies were produced.

27.02.3 Optional publications

The following projects served as invaluable public relations, community relations and corporate relations tools in the months leading up to the Games. While all were optional publications, they greatly enhanced the efforts of the Organizing Committee.

Stars in Motion

Six full-color magazines in French and English were produced to keep the Olympic Family informed of preparations for the Games. Known as the *Stars in Motion* series, these 48-page magazines (only issue 4 was larger, with 72 pages) were also

7

9

8

7 Twelve issues of the "Villager" provide extensive information for village residents during their stay in Los Angeles.

8 This colorful book portrays the diversity of the Olympic Arts Festival and is available as a souvenir to spectators at each performance.

9 This last edition of "Olympic Neighbor News" was widely distributed in local newspapers throughout the Southern California area just prior to the Games.

Publications

popular with sponsors, government officials and advisory commission members. The first issue appeared in late 1982 followed by four issues—winter, spring, summer, fall—in 1983. The final issue of the magazine was published early in 1984.

"Stars in Motion" not only communicated information to several important markets but also clearly established the Organizing Committee's ability and commitment to produce high quality publications. The series was extremely well received and additional issues would have been welcome. Print runs for the six issues were:

- No. 1; 20,000
- No. 2; 15,000
- No. 3; 30,000
- No. 4; 30,000
- No. 5; 30,000
- No. 6; 30,000

LA83 Events

The crush of publications projects taken on by the LAOOC began a full year before the Games with a series of championship-style competitions known as the LA83 events. Los Angeles played host to world-class competition in archery, canoeing/rowing, cycling, gymnastics, swimming and water polo, and a wide variety of publications were produced for each.

Everything from invitations and entry forms to souvenir programs and awards were produced for each of the competitions. The LA83 events thus provided the publications staff an early indication of the demands that would be placed on it in the months leading up to the Games.

Newsletters

The monthly newsletter "Olympic Update", which documented preparations for the Games and contained short stories of interest for the public, was primarily designed to be used by sponsors and licensees. A total of 13 issues were produced prior to the Games.

"Olympic Neighbor News" was a newsletter specifically directed to Los Angeles neighborhoods where Olympic competitions would take place. A wide range of Olympic-related subjects was discussed and local residents were encouraged to welcome and be part of the Games. More than three million copies of the final issue (an eight-page tabloid) were distributed by

mail or as newspaper inserts in July 1984, including a Spanish language version in the largest local Spanish daily.

Special interest newsletters for local government officials, LAOOC speakers' bureau members and Organizing Committee employees were also produced by the Publications Department. All were informative public relations tools which helped open internal and external lines of communication.

Newspaper insert

In association with the "Los Angeles Times", a program began in July 1983 allowing the LAOOC a minimum seven pages of editorial commentary once a month in the Sunday "Home Magazine" section. Thanks to the high visibility of this project (the "Times" is one of the largest daily newspapers in the United States with a Sunday circulation of more than 1.3 million), this 13-month series was a positive and influential public relations tool which helped stimulate interest in the Games.

A variety of subjects were covered every month, including each of the Olympic sports to be contested. The "Home Magazine" insert demonstrated to the Southern California public that the LAOOC was not just an

unseen entity but was an active organization preparing to make the upcoming Games a success.

Licensed publications

Two separate licensing agreements were reached to produce an "Official Olympic Guide to Los Angeles" (ABC Publishing, 296 pages, \$5.95) and an "Official Olympic Souvenir Program" (Sports Illustrated, 324 pages, \$10) for the Games. The Publications Department's role in regard to both outside productions was to review all editorial copy for factual accuracy.

Although there was some unexpected overlap of content in the two official publications, the independent projects were attractive and well received by the public. The "Guide to Los Angeles" sold approximately 127,000 copies while the "Souvenir Program" sold some 50,000 copies.

The LAOOC also licensed an official "Games of the XXIIIrd Olympiad/Los Angeles 1984 Commemorative Book" produced by International Sport Publications, Inc. (288 pages, \$44.95).

10 The LAOOC's commemorative book was produced by International Sports Publications.

11 The LAOOC combined with the "Los Angeles Times" to inform the public about the Games through inserts in the "Times" popular "Home Magazine" section.

12 The Look of the Games extended even to newsletters, news release paper for the Olympic Arts Festival and to OAF stationery.

13 ABC Publishing combines facts about Los Angeles with interesting information about the Games in the "Official Olympic Guide to Los Angeles."

14 Television viewers find extensive information about each sport in the "Olympic Access Guide."

10

11

11

This commemorative book was heavily marketed before, during and after the Games and sold approximately 100,000 copies through mail orders and in bookstores nationwide before the December holiday season. "Commemorative Book" sales continued into 1985. It featured editorial and photo essays on each of the 23 sports contested at the 1984 Games.

The Publications Department also had limited involvement in reaching agreements with official map licensees (Thomas Brothers and Gousha), an official TV viewer's guide ("Olympic Access", 96 pages, \$4.95) and the book "Los Angeles: The International City" (by Publication Associates of Los Angeles, Inc.).

Ticket Buyers' Guide

As a courtesy to Olympic ticket holders, the LAOOC prepared a comprehensive brochure providing transportation information in relation to competition sites. This guide encouraged ticket holders to take advantage of public transportation to Olympic venues and

gave added insight into spectator services and seating arrangements. More than 300,000 "Ticket Buyers' Guides" were distributed directly through the mail with another 50,000 handed out at nine Los Angeles area ticket centers. The guide remained in great demand up to the start of the Games.

Villager

The Publications Department's final major project was a tabloid newspaper for Olympic athletes entitled "Villager." Twelve issues were printed from 14 July through 11 August in an effort to assist administrators in communicating important information to village residents as well as helping to make their guests' stay more enjoyable. The "Villager" contained information specific to each of the three villages (UCLA, UCSB and USC) as well as stories of general interest to residents.

27.03

Summary

The LAOOC Publications Department was successful in producing a large variety of publications which suited three distinct clients: 1) the Olympic Family; 2) the media; and 3) the general public. Some of the projects were direct requirements of the Olympic

Charter, some were deemed necessary by various operating departments if Los Angeles was to host a successful Games and still other projects were clearly optional yet produced as a way to enhance communication and, hence, overall organizing efforts.

Publication projects suffered in the early stages due to a lack of direction and planning. Specifically, the IOC Charter provided little direction since it mandates only a few publications, while the LAOOC failed to plan a coordinated publications program on which to base its needs. In the future, it is advisable to do long-range projections of overall publication needs and set earlier production deadlines. This will allow for a better orchestrated pattern of information to be disseminated to the various publics.

But like any vast, fast-growing organization, the LAOOC needed its publications in a relatively short period of time while at the same time maintaining a viable theme and proper management. Responsibility for these projects overlapped when the Design Department received its mandate to

implement a consistent Look of the Games in late 1983. As a result, uniformity was a missing element in many Organizing Committee publications.

Not only was the style of LAOOC publications inconsistent, but since each printing project was independent of all others, there was also no consistent format. As a result, there were as many shapes and sizes to official publications as there were projects. It is suggested that standardized formats be adopted in future Olympic publications efforts.

Once the markets were identified, however, the LAOOC did a good job in turning out attractive publications which served a wide variety of uses. These publications were the Organizing Committee's primary method of communicating effectively with an increasingly interested worldwide audience:

- The Olympic Family was kept informed with the help of "Stars In Motion" magazine and the bimonthly NOC newsletter "Communique."
- The media was kept informed first with the "Olympic Countdown" series, then a series of handbooks ("Facilities for Journalists/Volume 1 and 2" and the Games' "Media Guide") which supplemented periodic News Department releases.

11

12

13

14

Publications

- The general public was kept informed with the help of newsletters (*"Olympic Update"* and *"Olympic Neighbor News"*), newspaper inserts (*"Los Angeles Times/Home Magazine"*) and several general information brochures.

The Publications Department was successful in producing needed tools for the ongoing information and public relations efforts of the LAOOC. To avoid duplication and confusion over responsibility of projects, it is recommended that a combined publications and design department should work together from the outset in determining a consistent format for all printed material in addition to a uniform look and style.

As it was, the Publications Department proved to be resourceful and successful beginning with the January 1983 IOC Executive Board/NOC Meeting when it produced nearly 20 publications in a short period of time. That success continued through the LA83 events which, due to the short preparation time between events, provided an excellent test of the publication staff's ability to produce.

The Publications Department learned that for some projects mandated by the IOC such as the *"Explanatory Brochures"*, *"IOC Medical Controls"* brochure and results publications (*"Olympic Record"*), a separate staff dedicated to each publication is needed. These are large efforts that require independent staffs.

As for overseeing the production of outside licensees, this worked in favor of the LAOOC since it made an early commitment not to become a publishing house. If projects such as the *"Official Olympic Guide to Los Angeles"* and the *"Official Olympic Souvenir Program"* were to be produced in-house, they would have required their own dedicated staffs as well.

The *"Official Report of the Games of the XXIIIrd Olympiad"* is an extremely large project which also requires a dedicated staff and a lengthy preparation period to produce a useful, lasting document. For the best results in compiling a report of this magnitude, a research/writing staff should be collected prior to the Games to finalize a table of contents while planning information is still meaningful and available. By beginning preparations for the *"Official Report"* early, heads of operating departments can be told which records and documents to keep for future research and publication.

Given the time-sensitive demands placed on a very small staff, the Publications Department far exceeded the minimum requirements of the IOC and LAOOC and served the needs of their three principal clients: the Olympic Family, the media and the general public. It also served the needs of Olympic sponsors, suppliers and licensees.

Overall, then, the publications produced by the LAOOC were colorful, well designed, informative and fully sufficient to meet the needs of those who received them. In the 18 months prior to the Games, the Publications Department met the requirements of operating departments whose own needs became apparent only a short time before final products were needed.

28

**28.01
Structure of
LAOOC public relations**

The LAOOC Public Relations Department was formed in late 1979 and in the next five years was headed by seven different individuals. Before being renamed the Communications Department early in 1984, several distinct programs addressing the overall public relations objectives of the Organizing Committee were initiated. A half dozen departments were formed under the Public Relations Department umbrella, each concentrating on communication needs specific to the LAOOC and designed with local, national and international interests in mind. In turn, each of these departments addressed several areas which, when combined, played a key role in shaping popular public opinion for the Games. These departments and the issues they dealt with were:

- Community Relations Department; Olympic Neighbor program and establishing and operating the LAOOC satellite office in south-central and east Los Angeles
- Public Information Department; telephone information bank, correspondence information pool, remote ticket and information centers, and venue information kiosks
- Audio-visual Department; photography, films and videotapes, and radio/television public service announcements
- Speakers Bureau; LAOOC information service
- Olympic Spirit Team; former Olympic athletes
- Publications Department; see chapter 27

The work of these Public Relations Department divisions was supplemented by several other LAOOC operating departments, many of which had their own public relations or publicity staff. Most notable were:

- News Department; generated all LAOOC news releases and organized all news conferences through its established contacts with domestic and international media.
- Olympic Arts Festival; solicited interest throughout the arts community as a semi-autonomous branch of the LAOOC.
- Torch Relay; promoted enthusiasm and an intangible "Olympic Spirit" across the country as the Olympic flame made its way from New York to Los Angeles.
- Youth Programs; established contact with youngsters by coordinating sports clinics and competitions, jamborees, art contests and school programs.

**28.01.1
Public relations
concepts and goals**

A number of LAOOC staff members, including key top administrators, returned from the XIVth Winter Olympic Games in Sarajevo with one major concern. That concern was for the seemingly low-level of public support for the Games of the XXIIIrd Olympiad by residents of Los Angeles and surrounding communities. How and when would the general public learn to embrace and support the modern-day Olympic movement in Los Angeles?

This challenge was significant because Southern California is characterized by its diverse geography and many ethnic groups. Los Angeles is also a city in which a large number of events occur annually, which tends to make local residents indifferent or even suspicious of one more event invading their city. A campaign that successfully encouraged the local populace to participate and/or support the Games was perceived as a necessity in order to make the Games a true success.

Many factors combined to soon create a tremendous wave of popular public opinion. In February 1984, extensive media coverage of the Sarajevo Winter Games served as a reminder that the Los Angeles Olympic Games would soon follow. In May, the Soviet-led boycott rallied many United States citizens and was followed by the running of the torch relay which helped instill a sense of patriotism and pride in communities across the country. As the LAOOC continued its last-minute organizing efforts, the Olympic movement garnered more and more visibility, support and respect.

The theme "Play a Part in History" became an LAOOC slogan to promote ideas and programs, and to encourage individual and community involvement in the Games. The groundswell of positive public opinion spread in direct proportion to the nearness of the Olympic flame to Los Angeles and the nearness of the impending Games.

However, none of the above factors were the result of a specifically implemented public relations program. While many individual ideas and a few public relations campaign ideas were proposed, a program to proactively influence public opinion on a wide-scale basis was never carried out.

Instead, the LAOOC public relations program was generally designed to keep people informed of what the Organizing Committee was doing rather than to sell the Games. The LAOOC's philosophy was that the Games did not need to be force-fed to the public; rather, the Games would spontaneously sell itself. The Olympic Games are the world's most anticipated athletic event and it was assumed that people would naturally become interested, enthusiastic and supportive as the Games approached.

Once the momentum began, there was no doubt the Games would be well received in Los Angeles. Residents who were once skeptical, then curious, ultimately greeted their visitors in record numbers with the simple, appropriate theme "Welcome." Together, the athletes, spectators, officials and organizers played their part in both Los Angeles and Olympic history.

**28.01.2
Early public relations programs**

Early public relations efforts surrounded the announcement and perpetual use of the LAOOC's official emblem, *Star in Motion*, and official mascot, *Sam the Olympic Eagle*. The Olympic Charter mandates that no publicity for the upcoming Games may be sought until the close of the Olympic Games preceding it. With that restriction, the LAOOC was prepared to reveal its emblem and mascot in dramatic fashion at a kickoff news conference on 4 August 1980, immediately following the close of the Games of the XXIInd Olympiad in Moscow.

The introduction of Sam was expanded from a news conference into a major ceremony open to the public which was held on the steps of Los Angeles City Hall. Simultaneous ceremonies with an identical *Sam the Olympic Eagle* were held at the World Trade Center in New York City. The LAOOC also unveiled its new Olympic emblem, the *Star in Motion* above the five interlocking Olympic rings, and over the next four years, these two official LAOOC symbols were used by the LAOOC, sponsors, suppliers and others in promoting the 1984 Olympic Games.

A musical program preceded the Los Angeles event which included Mayor Tom Bradley, entertainer Bob Hope, LAOOC Chairman Paul Ziffren, Executive Vice President/General Manager Harry L. Usher, several former Olympians and other city, county, state, federal and Organizing Committee officials. Ceremonies in New York featured Mayor Ed Koch, LAOOC President Peter V. Ueberroth and a dozen former Olympic athletes. In addition to the introduction of *Sam the Olympic Eagle* and the *Star in Motion*, announcements of the first official Olympic sponsors were also made.

After making his first national network television appearance the morning of 5 August 1980 in New York, *Sam the Olympic Eagle* began a 24-city promotional tour to familiarize the country with his identity and prompt the public to think about the Los Angeles Olympic Games. Dozens of news conferences and public appearances over a 38-day period followed, including these cities:

Tour stop	1980 Date
New York, N.Y.	4-5 Aug.
Baltimore, Md.- Washington, D.C.	6-7 Aug.
Philadelphia, Pa.	7-8 Aug.
Newport, R.I.	9 Aug.
Pittsburgh, Pa.	10-11 Aug.
Atlanta, Ga.	12 Aug.
Miami, Fla.	14 Aug.
Tampa- St. Petersburg, Fla.	15 Aug.
Chicago, Ill.	17 Aug.
Minneapolis-St. Paul, Minn.	18 Aug.
Indianapolis, Ind.	20 Aug.
Detroit, Mich. (four-day rest period)	21 Aug.
St. Louis, Mo.	26-27 Aug.
Dallas, Texas	27-28, 30 Aug.
Houston, Texas	29 Aug.
Austin, Texas	31 Aug.
San Antonio, Texas	1 Sept.
Colorado Springs, Colo.	2 Sept.
Denver, Colo.	3 Sept.
Seattle, Wash.	4 Sept.
Portland, Ore.	5 Sept.
San Francisco, Calif.	8 Sept.
Sacramento, Calif.	9 Sept.
San Diego, Calif.	10 Sept.

Along the way, *Sam the Olympic Eagle* visited the permanent home of the United States Olympic Committee (Colorado Springs) and the host city for both the 1982 National Sports Festival and 1987 Pan American Games (Indianapolis). He was introduced to large crowds at professional baseball games in New York, Baltimore, Philadelphia, Pittsburgh, Chicago, Minneapolis-St. Paul, St. Louis and San Diego, and at American football games in Tampa and Houston. Sam also toured convention centers, country clubs, hospitals, hotels, museums, parks, shopping malls and even a zoo. In many cities, Sam was introduced by and shared

Public Relations

center stage with the McDonald's Corporation mascot, Ronald McDonald. As an official LAOOC sponsor, McDonald's gained special permission to use *Sam the Olympic Eagle* to help promote its nationwide youth sports programs and Ronald McDonald Houses (children's medical treatment facilities) located in cities across the country.

Television stations affiliated with the host broadcaster, ABC, in each of these cities were given first opportunity to broadcast *Sam the Olympic Eagle's* appearance upon arrival. While Sam was at center stage throughout the tour, three distinct messages were delivered to city officials and media by LAOOC spokespersons at news conferences in every city along the tour:

- Financially, the LAOOC projected a surplus.
- Logistically, existing site improvements and construction projects would be readied for the Games well in advance.
- Politically, the LAOOC was optimistic for worldwide participation at the 1984 Olympic Games.

A detailed itinerary for *Sam the Olympic Eagle's* entourage is typified by the following two-day appearance in Pittsburgh, 10–11 August 1980:

<u>Day</u>	<u>Itinerary</u>	<u>Day</u>	<u>Itinerary</u>	<u>Day</u>	<u>Itinerary</u>
Sunday		1640	Sam proceeds to awards table and is introduced to audience.	1100	Breakfast with sponsors ends.
1030	Arrive hotel, downtown Pittsburgh.	1700	Sam walks through crowd back to hotel.	1115	Sam dresses, meets McDonald's Corporation sponsors in hotel lobby, traveling party departs for photo session.
1045	Television interview at hotel with LAOOC spokesperson.	1715	Sam arrives at hotel and retires for the evening.	1200	Arrive at site of photo session with Sam and Ronald McDonald.
1115	Traveling party departs for baseball stadium.	1900	Staff member returns to stadium to retrieve truck	1240	Photo session ends, Sam leaves for hotel.
1130	Arrive at stadium, Sam dresses, support truck parked near security exit.	1900	LAOOC spokesperson calls local radio station for 15-minute taped interview.	1310	Arrive at hotel, traveling party prepares for departure.
1145	Television interview at stadium with spokesperson and Sam.	2155	LAOOC spokesperson calls second local radio station for 30-minute live interview.	1330	Lunch.
1200	Sam returns to holding room to rest and await start of game.			1425	Traveling party leaves for local television station.
1245	Sam goes to field to shake hands with baseball team mascot, introduced to fans and stands for national anthem.	Monday		1445	Arrive at television station.
1300	Sam returns to holding room, removes costume, eats lunch and watches first game.	0800	Traveling party checks out of hotel.	1500	Television interview with LAOOC spokesperson and Sam.
1425	Sam dresses in costume for second game.	0830	Sam goes to hotel holding room, waits for news conference.	1525	Sam leaves interview and removes costume.
1455	Sam escorted again to playing field where he throws out first ball.	0845	LAOOC spokesperson arrives for news conference.	1530	Spokesperson completes interview.
1500	Sam returns to holding room, removes costume and goes to truck.	0900	News conference begins, Sam introduced, spokesperson gives speech.	1545	Traveling party leaves for Pittsburgh airport.
1600	Sam dresses in truck.	0930	News conference ends, media proceeds to breakfast with sponsors, LAOOC spokesperson stays in room to grant radio/television interviews, Sam returns to holding room to remove costume and rest.	1610	Arrive at airport, check in baggage, return rented support truck.
1620	Traveling party escorted across river to sailing regatta			1630	Check in for flight to Atlanta.
				1700	Leave Pittsburgh.
				1900	Arrive Atlanta, drive to downtown hotel.

4

4 More than 75,000 spectators welcome the world to Los Angeles at the "Big Picture" event the day before the opening of the villages.

The nationwide *Sam the Olympic Eagle* tour succeeded in gaining widespread notoriety for the Olympic-related character and for the LAOOC's planning efforts. An early commitment to an identity program featuring symbols, emblems and mascots is highly recommended to future organizing committees when they are in the early stages of attracting public attention.

28.01.3

The expanding role of the News Department in public relations

In many instances, the LAOOC's best public relations efforts were derived from news events which occurred over the natural course of organizing the Games. In the early organizational structure of the LAOOC, the News and Public Relations departments worked in tandem to accomplish similar goals; News aimed to inform the public through the media and Public Relations hoped to promote the Games by the same avenue. If there was a newsworthy event that was also a good public relations vehicle, then the reliance was on News Department personnel—who had a relationship with the media—to give the event visibility.

In 1980 and throughout most of 1981, for example, the LAOOC announced its Olympic competition site selections in news conferences nearly every month. This brought natural, unforced attention—and attraction—to the organizing efforts taking place well in advance of the Games. And since many of the newly selected Olympic venues were announced on-site, the LAOOC earned recognition in many outlying communities. From a public relations standpoint, the LAOOC was applauded for its efforts to hold costs to a minimum by using existing arenas, stadiums, gymnasiums and parks. Even the few construction projects undertaken were judged as a public relations success since they were paid for by official Olympic sponsors (i.e., swimming pool by McDonald's Corporation and cycling velodrome by Southland Corporation), and not at taxpayer expense.

The LAOOC also reaped large public relations rewards from a joint news conference with another of its major Olympic sponsors, Atlantic Richfield Company (ARCO). On 4 December 1980, it was announced that ARCO would underwrite construction costs of seven new world-class synthetic surface running tracks in the Los Angeles area for pre-Olympic training.

This brought attention to several Los Angeles area communities where the selected high schools and colleges which received these major gifts were located. Recipients included: Birmingham High School (Van Nuys), California State University at Los Angeles, Jackie Robinson Stadium, Los Angeles Southwest College, Occidental College, Santa Monica City College, UCLA and USC.

Two other early construction and improvement projects shed favorable light on the LAOOC. In mid-1981, the Organizing Committee announced the construction of a new office building on the UCLA campus which would serve as its headquarters. The \$4 million price tag was paid primarily by the LAOOC, with the university receiving the building as a gift following the Games. Later that year, the LAOOC announced an \$800,000 program for major improvements to Los Angeles' Exposition Park, site of athletics (Coliseum) and boxing (Sports Arena) competitions plus Opening and Closing Ceremonies. The combined public relations/news value was not overlooked as this news conference was held at Exposition Park's Rose Garden.

The following is a chronological review of major LAOOC policy and/or organizing decisions which helped form positive public opinion and were featured in News Department releases from late 1982 up to the Games.

Economic impact study and city agreement

28 October 1982. An economic impact study revealed that more than \$3.3 billion in economic benefits would be generated throughout Southern California as a result of primary expenditures and induced spending relating to the 1984 Olympic Games. The study was conducted by an independent Los Angeles-based research and consulting firm, which also estimated tens of thousands of new jobs would result from the Games as well as increased state and local government revenues. City of Los Angeles and LAOOC officials also signed an agreement guaranteeing that local taxpayers would not pay for any Olympic-related costs; this fulfilled a pledge made in the original proposal to bring the Games to Los Angeles not to use local government funding.

Promotional billboards

23 December 1982. A program to erect a series of billboards aimed at increasing awareness of the Games and youth programs sponsored by the LAOOC was announced. Olympic gold medal winners and youngsters were featured on the promotional billboards along with the motto "*Grow with the Olympics.*" Designed by the LAOOC, the approximately 50 billboards were donated as a public service by Gannett Outdoor Advertising.

Olympic youth art

2 February 1983. More than 330,000 elementary school children in Southern California were encouraged to participate in an Olympic art program jointly sponsored by the LAOOC and Levi Strauss & Co. Cash prizes were awarded to schools with the highest level of student participation and the project generated more than 70,000 separate pieces of art. Fifteen oversized collages measuring eight feet by four feet each were assembled from the artwork of elementary school children in Southern California and unveiled at the Los Angeles Children's Museum on 30 August 1983. These collages were displayed in public areas and at Olympic sites in the year preceding the Games. Individual pieces of art were presented to arriving Olympic athletes as a welcome gift.

Citizens Advisory Commission

19 February 1983. Strong community interest and support helped the LAOOC reach its goal of 3,000 members appointed to the Citizens Advisory Commission. The advisory commission was made up of 23 boards, including: awards, business, ceremonies, city/county government, cultural/fine arts, disabled persons, finance, hotels/housing, international relations, labor, licensing/merchandising, medical, Olympians, physical facilities, publicity/public relations/publications, sport federations, television, visitor relations and youth programs.

Los Angeles beautification program

21 March 1983. LAOOC and city officials combined to launch the Los Angeles Beautiful-LAOOC Olympic Youth Beautification Program on the first day of spring. The beautification program promoted environmental awareness among youth, clean-up campaigns, and planting roses and trees at Olympic competition and training sites, along with schools and other locations. Some 20,000 rose plants were donated for public gardens, parks and cities across the country, including 7,500 to the city and county of Los Angeles.

Olympic youth art

14 April 1983. Students enrolled in grades seven through 12 and living in any of 12 western states were encouraged to compete in a youth art program sponsored by the LAOOC and First Interstate Bank. Cash prizes, scholarships and certificates were awarded for art which was judged at the local, county and state levels before grand prize winners were announced on 1 October 1983.

Olympic ticket plan

13 June 1983. A major news conference revealing the distribution plan for 5.5 million Olympic tickets was held on the UCLA campus with representatives from the LAOOC and national and regional ticket brochure distributors. LAOOC policy decisions concerning the distribution of order forms, number of tickets, number of events, ticket prices, payment requirements, processing of orders, ticket limits, notification, delivery and refunds were covered in this greatly anticipated news event.

Torch relay revealed

28 July 1983. The LAOOC revealed plans to carry the Olympic Torch through all 50 states and the District of Columbia en route to the Games in Los Angeles in an unprecedented relay that could generate as much as \$30 million for youth sports programs. The longest-ever Olympic Torch Relay would begin 8 May 1984 in New York City and end 82 days later on 28 July at the Los Angeles Memorial Coliseum, covering 19,000 kilometers (nearly 12,000 miles) and pass through 1,000 communities throughout the United States. The LAOOC designated 10,000 kilometers of the relay route as "Youth Legacy Kilometers" to benefit three youth organizations—the Boys Clubs of America, the Girls Clubs of America and Family YMCAs. (The relay route was later revised to 15,000 kilometers through 33 states.)

Interreligious Council

16 September 1983. The Interreligious Council of Southern California was chosen as coordinator of religious services for visitors and residents during the Olympic Games. The announcement was designed to strengthen interfaith relations by giving diverse religious communities—Christian, Jewish, Buddhist, Moslem, Hindu, Baha'i, Sikh and others—an opportunity to work together toward a common goal. Interreligious Council projects during the Games included planning services, building community support, coordinating individual interfaith religious observances and publishing an Olympic directory of religious services.

Youth Legacy Kilometer Program

4 January 1984. The LAOOC announced plans for additional youth organizations to benefit from the torch relay's Youth Legacy Kilometer Program. The Special Olympics, a program designed to help more than one million handicapped children and adults in year-round sports training and competition, was the first to be added to the list of charitable organizations eligible to receive benefits designated by sponsors of the torch relay's Youth Legacy Kilometers.

LAPD pins

16 January 1984. The LAOOC presented several thousand Olympic pins to the Los Angeles Police Department (LAPD) for distribution to police officers. The souvenir *Star in Motion* pins were worn by LAPD personnel as part of their uniform in the months prior to the Games.

Olympic wheelchair events

9 February 1984. In a joint announcement with Primo Nebiolo, president of the International Amateur Athletic Federation (IAAF), the LAOOC confirmed that two wheelchair events would be included in the Olympic Games program. During the Games, the IAAF provided officials and the LAOOC covered the expense of holding the 800-meter race for women and the 1,500-meter race for men, the first competition for handicapped athletes in the history of the Olympic Games.

Satellite offices

2 April 1984. Los Angeles civic leaders joined the LAOOC in ribbon-cutting ceremonies that marked the opening of the Exposition Park-South Los Angeles Community Relations Office near the L.A. Memorial Coliseum and Sports Arena. The office was established as part of the Olympic Neighbor Program to serve as a center for Olympic-related information and coordination of programs designed to enhance community involvement.

Pershing Square redevelopment

10 April 1984. The LAOOC contributed \$200,000 in support of the privately funded Pershing Square Redevelopment Project in downtown Los Angeles. The LAOOC's financial commitment was used for the first phase landscaping portion of the project, which was completed in time for the Olympic Games.

Olympic Youth Jamborees

14 April 1984. The first of five Olympic Youth Jamborees was held at a Los Angeles high school, with other jamborees later staged at schools in other Southern California communities (the South Bay, the San Fernando Valley, Ventura County and East Los Angeles). The events featured an Olympic-style torch-lighting of a jamboree flame (similar to the Olympic torch and flame) and youth competition in several athletic events with participants being awarded Olympic-style medals by Spirit Team (former and present Olympians) members. Additional color and pageantry was provided by fully costumed folklore dance groups representing the United States, Mexico, Africa, Cuba, Korea, Japan, the South Pacific and the Caribbean.

Torch relay begins

8 May 1984. The Olympic Torch Relay began at the United Nations Plaza in New York City, preceded by ceremonies involving local, national and international dignitaries. The 82-day, 15,000-kilometer relay ultimately raised millions of dollars for national youth groups through its Youth Legacy Kilometer Program.

The Big Picture

13 July 1984. Celebrities were recruited to participate in "The Big Picture" co-sponsored by the LAOOC and the downtown Los Angeles Central City Association. More than 15,000 Angelenos joined Mayor Tom Bradley and other civic and business leaders for a photograph session welcoming the world to Los Angeles.

The Big Picture was photographed one day prior to the opening of the Olympic villages and served as a dramatic way to kick-off many activities and events in anticipation of the Games in Los Angeles.

Summary

While admittedly relying on the News Department for highly credible, no-cost publicity, the Public Relations Department made little if any headway in finalizing an actual program it could implement to influence public opinion. Several short-term public relations ideas were proposed by a variety of operating department managers, but the LAOOC seemed content with the favorable publicity generated by events and the News Department on a regular basis.

The need for a distinct public relations program aimed at shaping public opinion lessened as the Games drew closer; the building momentum and growing anticipation for the event itself far exceeded the potential value of any contrived attempt to garner public support. However, the importance of several public service programs designed to enhance communication and foster understanding about the Olympics grew in significance.

The Public Information Department, for example, filled a need for more direct contact with Southern California residents by creating a telephone hotline that the public could call to voice concerns, ask questions or offer support. The Speaker's Bureau and the unique Olympic Spirit Team offered even more personal contact by dispersing LAOOC staff members and Olympians to share information and experiences with the public. And the visibility of the Community Relations Department increased when it established satellite LAOOC offices to address troublesome local issues in minority communities near Olympic venues.

Combined, these service programs provided the communication needed to share the Olympic excitement throughout the greater Los Angeles area.

28.02 Community relations

Possibly the most challenging area within the Public Relations Department was that of Community Relations. In January 1984, just six months before the Games, the entire Community Relations staff consisted of three people. It was apparent that members of the communities where Olympic events would be held believed that planning for pre-Games or actual Olympic events was being conducted without consideration of their needs or interests. The challenge for the LAOOC, therefore, was to develop policies, programs and procedures whereby people in the community could become involved with preparations for the Games.

The Organizing Committee had to overcome preconceived notions that it was a large, monolithic, westside organization with little or no insight to communities in downtown and other Los Angeles areas. Advice from qualified people who understood both the community and the goals and tasks of the LAOOC was sought, and additional staff was hired to address the growing community concern and discomfort.

The Community Relations staff opened an office in the Exposition Park area near the Coliseum in early April 1984 under the direction of two administrators—a director of programs and a director of operations—and five additional staff members. This gave residents of the south-central L.A. community—mostly black and Hispanic—direct and easy access to the LAOOC, a lack of which was one of the primary concerns of local civic leaders. In May 1984, the LAOOC opened a second satellite office in East Los Angeles, an area with a majority Hispanic and Asian population.

With the establishment of an Exposition Park office, the successful Olympic Neighbor programs—23 in all, each oriented around the various sports venues throughout Southern California—moved to this central office. These programs provided a link between the many communities which hosted Olympic competitions and the LAOOC. Olympic Neighbor groups consisted of local residents who were concerned about the success of the Games, were interested in the impact on the community and actively exhibited a strong desire to be involved in Olympic activities.

The LAOOC recognized the need for a community relations program as early as two and one-half years before the Games when former Olympian John Carlos (1968 bronze medalist in the 200-meter dash) was hired to develop community outreach ideas. A department responsible for these programs was slow in developing, though, as it was first believed that the Community Relations Department should proceed under the direction of the LAOOC's Government Relations Department before settling under the auspices of the Director of Public Relations. Once that administrative decision was reached, the Community Relations Department identified a number of projects which it would help develop over the next 24 months. They were:

- Olympic Neighbor program
- Banner allocation program
- Community action program
- Neighborhood Olympic viewing sites program

Olympic Neighbor program

The Olympic Neighbor program was developed to assist communities that immediately surrounded an Olympic competition site or village. As area residents became increasingly aware of the work of the LAOOC and the impending arrival of the Games, a need developed for more organized community involvement. Under the direction of the Community Relations Department, more than two dozen Olympic Neighbor organizations were created to coordinate Olympic-related activities in their area and address local questions about the Games. An LAOOC community relations officer acted as the communication link between the LAOOC and the local chapter's steering committee. Total membership in each Olympic Neighbor group averaged 350. The goals of each Olympic Neighbor program were three-fold:

- To participate in LAOOC activities in support of the Olympic Games
- To advise the LAOOC of specific Olympic-related concerns affecting local communities
- To promote goodwill and friendship with visitors to the Games from other countries

Each group operated independently of the others in order to maximize the creative energies needed to address concerns and solve problems specific to local communities. The success of each program rested on the enthusiasm and cooperative efforts of local participants, and incentives such as weekend sports festivals, poster contests and receptions with Olympians were productive. In all, more than 5,000 volunteers eventually worked with activities related to the Olympic Neighbor program in these Southern California communities:

Volunteer Olympic neighborhood groups

Community	Olympic neighbor group	Nearest sport site
Anaheim	Orange County Olympic Committee	Wrestling
Arcadia	Arcadia Olympic Commission	Equestrian
Carson	Carson Olympic Spirit Committee	Cycling
Coto de Caza	Coto de Caza Olympic Neighbors	Modern Pentathlon
East L.A.	East Los Angeles College President's Advisory Board	Hockey
Fairbanks Ranch	Fairbanks/Rancho Olympic Neighbors	Equestrian
Fullerton	Fullerton Olympic Neighbors	Handball
Inglewood	Inglewood Olympic Neighbor Committee	Basketball
Long Beach	Long Beach Committee for the 1984 Games	Volleyball/ Fencing/Yachting
Malibu	Malibu Olympic Neighbors	Water Polo
Mission Viejo	Mission Viejo Olympic Neighbors	Cycling
Monterey Park/ San Gabriel	CSULA Olympic Neighbors	Judo
Ojai	Ojai Valley Olympic Neighbors	Canoeing/Rowing
Oxnard	Oxnard 1984 Summer Games Task Force	Canoeing/Rowing
Palo Alto	Palo Alto/Menlo Park Olympic Neighbor Committee	Football
Pasadena	Pasadena Olympic Neighbors	Football
Prado Recreational Area	Chino Valley Committee for the 1984 Games	Shooting
Santa Barbara	Santa Barbara Olympic Neighbors	Canoeing/Rowing
Ventura	Ventura Community Coordinating Council	Canoeing/Rowing
West L.A.	West L.A. Olympic Neighbor Steering Committee	Gymnastics/ Tennis
Westchester	Westchester/LAX Committee for the 1984 Games	Weightlifting

Banner allocation program

In April 1984, the LAOOC presented a cooperative idea to decorate city streets throughout Southern California with the festive Look of the Games. In conjunction with the Architecture and Design departments, the Community Relations staff would deliver banners and flags to any city or community that would absorb the expense of installation. The response was overwhelming, as 83 of some 130 Southern California municipalities enrolled in the banner allocation program.

The banners were installed at every Olympic sports venue, along major arterials leading to Olympic venues, and along torch relay, cycling road race, marathon and walk routes. These colorful banners presented a festive atmosphere for visitors and residents alike, and proved so popular that they became a target of souvenir hunters before the close of the Games. After the Games, host communities donated the banners to local organizations and/or individuals who provided funding to install the banners. Unused fabricated banners were auctioned at local fundraisers in order to raise revenue for local youth groups.

Community Action program

In the month prior to the Games, the Community Relations Department initiated its final push for civic involvement with its Community Action Program (CAP). More than two million promotional items carrying the *Welcome LA84* symbol in festive colors were distributed throughout Southern California, including 1.5 million bumper stickers, 650,000 buttons and 200,000 posters. The *Welcome LA84* slogan was translated and produced in 16 different languages to foster goodwill in Los Angeles' many ethnic communities as well as among foreign visitors to the Games.

Much of the *Welcome LA84* material was distributed through Community Relations Department satellite offices at Exposition Park and in east Los Angeles, as well as at businesses near the Olympic villages and as incentives to LAOOC volunteer and paid staff. Other groups and organizations targeted by CAP to receive these promotional materials included:

- Chambers of Commerce
- City governments
- Information booths

- Handicapped groups
- Hospitals
- Neighborhood groups
- Libraries
- Parks
- Police departments
- Recreation areas
- Schools
- Sponsor corporations
- Steering committees
- Ticket centers
- Venues
- Villages
- Youth organizations

Neighborhood Olympic viewing sites

In order to make the Games visible to as large a cross-section of Los Angeles' diverse population as possible, the LAOOC devised a program to establish neighborhood Olympic viewing sites. Television sets were installed at selected community-service facilities so that nearby residents could, as a group, watch and enjoy the Olympic Games. Seven viewing sites were selected based on the ethnic diversity of the surrounding community, the facility's administrative and social stature within the community, potential daily attendance, available security for equipment, operating hours which coincided with television broadcast hours and administrative manpower to staff the facility. Video equipment was provided by LAOOC sponsor Sanyo Electric Company, and other promotional (bumper stickers, buttons, pins, posters, etc.) and consumable items (popcorn, soft drinks) were distributed by Community Relations volunteers at each site.

Perhaps the most successful neighborhood Olympic viewing site was in downtown Los Angeles at the Midnight Mission, a community center designed to aid unemployed transients. This site also aroused the media's attention during the Games with eight newspaper and seven television reports describing the enthusiasm displayed by viewers who took advantage of the program.

28.03

Public information

28.03.1 Area of responsibility

The LAOOC created a Public Information Department in April 1983 as a direct response to a growing need to assemble and disseminate information and respond to inquiries and requests from an increasingly interested general public. The basic concept was to provide the Southern California community, the state of California and the nation as a whole, all non-News Department information generated by

the LAOOC. This allowed the News Department to service its main clients—members of the print and broadcast media—without the interruption of a curious general public.

The public information staff gathered a variety of information as vast as the Organizing Committee itself, establishing a unique and effective system of in-house reporters who maintained regular contact with each LAOOC operating department. General information in areas such as employment, housing, licensing, merchandising, sports, ticketing and transportation was collected, and Public Information Department assistance was also offered to high-visibility endeavors such as the Olympic Arts Festival, Olympic Torch Relay and Olympic Youth Programs.

In the process of gathering data to service pressing information needs, the Public Information Department also distributed a monthly employee newsletter to fill a void in internal communications. Many LAOOC operating departments, which by late 1983 and early 1984 were growing at exponential rates, were faced with inefficiencies due to a lack of staff knowledge regarding even the most basic administrative policies and procedures. Since the Public Information Department received most if not all pertinent data, it also made a concerted effort to share it as the LAOOC's in-house general information resource center.

The Public Information Department, then, evolved into a much-needed clearinghouse for both internal (administrative) and external (general information) communications. And in the process, four major areas of responsibility were defined to best serve the needs of the general public and the LAOOC:

- Telephone requests and inquiries
- Written requests and inquiries
- Remote ticketing and information booths
- Venue information operations at information kiosks

Staff volunteers who served as telephone bank operators were the single most vital resource which made these external communication efforts a success. In the process of relying very heavily on their services, the Public Information Department evolved into the LAOOC's in-house expert on

motivating and providing incentives for unpaid staff. To boost morale among volunteers working in the pre-Games period, for example, the Public Information Department organized and implemented a series of welcoming celebrations along the route of the torch relay. More than 50,000 T-shirts and flags were distributed to volunteers and their families to help foster a sense of pride and teamwork.

The Public Information Department also coordinated several special events involving the entire Organizing Committee staff, such as: an LAOOC-night at Dodger Stadium in September 1983; an all-staff Christmas party in December 1983; and a special commemoration of the birthday of United States civil rights leader Dr. Martin Luther King in mid-January 1984. These events provided firm evidence of the level of appreciation and respect felt for the organizing efforts of paid and unpaid staff alike.

One final contribution which evolved from the effective internal and external communications was the formation of the LAOOC Alumni Organization. This group was a natural outgrowth of the positive attitude displayed by volunteers, designed to preserve the spirit generated by the Olympic movement in Los Angeles. Out of some 44,000 volunteer and full-time Games staff members given the opportunity to join, more than 25,000 (approximately 57 percent) submitted alumni membership forms. In November 1984, a 374-page membership directory containing nearly 20,000 names was published and distributed. Holiday greeting cards were sent to LAOOC Alumni Organization members in December, and a quarterly newsletter was begun in 1985.

28.03.2

Public information telephone bank

The first obvious need addressed by the Public Information Department was to resolve the growing backlog of written and telephone inquiries and requests directed to the LAOOC. There had been no real organized effort or ability to respond to the increasing number of public inquiries regarding the Olympic Games and the best solution was to immediately form a telephone information operation. A "phone bank" was created with a core group of six volunteers in May 1983 that grew to a total of more than 80 volunteers at the time of the Games.

At its peak, this telephone information bank had as many as 120 volunteers handling one out of every two calls coming into the LAOOC's Marina Center headquarters. Call volume averaged 1,500 calls per day during the peak pre-Olympic period, then grew to a maximum of 8,300 calls per day during the Games.

A separate phone bank telephone line (305-8383) was installed in May 1983, and immediate operator-assisted referrals began coming into LAOOC headquarters. A listing for "LAOOC Public Information" was also published in all Southern California telephone directories along with a list of subjects which could be broached by dialing that number. This public information telephone number was also promoted through a series of radio and television public service announcements as well as on community-wide billboards. A separate phone line was installed for deaf or hearing-impaired persons.

By providing a centralized phone bank to handle calls from the public, other LAOOC operating departments were relieved of the increasing burden of handling unsolicited, time-consuming telephone inquiries. Any call coming into the main switchboard (305-1984) requesting general information about the Organizing Committee and/or the Games itself was directed to the Public Information Department.

The information phone bank was staffed entirely by volunteers under the supervision of public information staff. Through the course of operations, several volunteers assumed supervisory responsibilities based upon their performance, capabilities, interest and desire. Staff supervisors designed and maintained an on-going training program, necessitated by the exclusive use of volunteers working only two or three days per week. A comprehensive training notebook and regularly updated bulletin boards kept volunteers abreast of changes in policies and procedures, particularly in the period immediately preceding the Games.

Increased demand led to expansion of the public information program during the months leading to the Games and

caused the phone bank to become the single largest volunteer-staffed program within the LAOOC. Volunteer operators were trained to handle inquiries on a wide range of Olympic-related matters, including:

- LAOOC programs (Olympic Arts Festival, torch relay, youth services, etc.)
- Olympic venue information (parking, handicapped access, policies affecting spectators, staff, etc.)
- Referrals to non-LAOOC affiliated agencies (primarily in the field of residential rentals, visitor information, etc.)
- Sponsor/licensee/supplier information (availability and location of licensed merchandise, etc.)
- Tickets (availability, prices, sales locations, etc.)
- Transportation (available public transportation to venues, suggested traffic routes, etc.)

Shortly after the beginning of 1984, several other operations were consolidated with phone bank operation. The employment phone hotline, run by the Human Resources Department for volunteer recruitment purposes, and the Olympic Torch Relay information line were incorporated into the existing general Olympic information area. This reduced the duplication of efforts among departments and added to the overall efficiency and ease of public communications with the LAOOC. In a two-month period preceding the Games (20 May–14 July 1984), the following inquiry topics were logged from nearly 50,000 calls:

<i>Subject of inquiry</i>	<i>Percent</i>
Employment opportunities	34.0
Tickets	12.3
Sports	7.2
Volunteer opportunities	4.2
Transportation	4.1
Games staffing problems	3.8
Accommodations	3.0
Merchandise	3.0
News/press operations	1.7
Olympic Arts Festival	1.5
Sponsors	1.3
Torch relay	1.1
Olympic coins	0.8
Miscellaneous	22.0
Total Calls: 47,379	100.0%

During the actual period of the Olympics, the information telephone bank became subject to the same restrictions and procedures required under the Games staffing system for Olympic venues. Volunteers who had

previously staffed the information operation but had indicated a desire to work at outside Olympic venues were dispersed to new assignments. In turn, a new group of 150 volunteers was recruited specifically to staff the phone bank as their Games assignment. The existing training notebooks containing information on all LAOOC activities helped integrate new staff members into the existing system.

The phone bank created by the Public Information Department was extremely well planned, operated and received. Once the general public had the ability to call the LAOOC directly to talk about their concerns and questions, they could feel more a part of the Olympics in Los Angeles. This concerted effort of servicing the local community would have been welcome at an earlier date when public opinion about the LAOOC was first being formed, but the building enthusiasm and support for the Games were enough to keep this oversight from becoming a long-term detriment. Future planners would be well advised to provide a similar ongoing public service early in their organizing efforts.

28.03.3 Correspondence and informational materials

In addition to telephone inquiries, the information telephone bank staff also handled general inquiries received through mail addressed to the LAOOC. With the continuing flow and increasing volume of mail received, a series of standard reply cards and form letters were designed to answer questions regarding ticket requests, souvenir requests and general information. The department's regularly updated information notebooks were the primary source of information used in responding to other correspondence inquiries. Many of these informational requests came from foreign addresses and, with the assistance of the Language Services Department, received a response from the Public Information Department.

The Public Information Department also produced a general information brochure in conjunction with the Publications Department for distribution to the general public. A total of

750,000 eight-panel brochures were produced in two separate print runs, first in an English-only format and then updated as a bilingual (Spanish and English) publication to serve Southern California's large Hispanic community.

This general information brochure contained summaries of highly visible LAOOC programs such as the Olympic Arts Festival, the Olympic Patron Program, the torch relay and youth services. It also featured information on official LAOOC and Olympic symbols (Olympic rings, pictograms, *Sam the Olympic Eagle* and the *Star in Motion*), and visitor information such as accommodations, ticket availability and transportation. Projects affiliated with the LAOOC such as the Olympic souvenir coin and stamp programs were also reviewed. This 4x10-inch brochure was mailed directly to people making written inquiries for background information about the LAOOC and the Olympics and were also distributed by LAOOC personnel making public appearances on behalf of the Organizing Committee.

In the course of handling all general correspondence from the public at large, the Public Information Department also disseminated other LAOOC-generated publications. The "Olympic Update" newsletter, brochures on *Sam the Olympic Eagle*, lists of LAOOC sponsors, licensees and suppliers, Olympic coin flyers, U.S. Postal Service stamp brochures, visitor accommodations information brochures and other publications were mailed upon request.

28.03.4 Remote ticketing and information centers

The Public Information Department, in conjunction with the Ticketing Department, established and operated nine LAOOC Olympic Ticketing and Information Centers in June 1984, which were located in major shopping centers throughout Southern California. An information program was designed specifically to service the needs of ticket purchasers at the centers, with a particular emphasis placed on the availability of public transportation to Olympic sites. Ticket purchasers also sought information on the sports making up the Olympic program, teams and athletes participating, and (in team sports) pairings and competition schedules.

7

8

7 Spectators flock to the venues and to the yellow-topped information centers.

8 Ticket buyers patronize Olympic ticket centers.

Other information made available through brochures and order forms included LAOOC Youth Sports programs, Olympic Arts Festival ticketing and performance schedules, and Olympic-related programs such as Olympic coins, stamps and commemorative (California) license plates. In addition, staff at each Ticketing Center gathered information from merchants regarding availability and location of LAOOC-licensed merchandise within each shopping center. Ticketing Center information agents were trained in ticketing procedures as well as answering general information questions, though some inquiries were referred directly to the Public Information Department's telephone bank at the Marina Center. Each information booth was equipped with a telephone to enhance communication with LAOOC headquarters and for use in the event of medical or security emergencies. In return, public information staff members kept personnel at the outlying Ticketing centers abreast of policy changes and/or updated information on a regular basis.

28.03.5

Venue information operations

The Public Information Department staffed and operated at least one information kiosk at each Olympic venue for the convenience of the spectator public. In cases such as the

equestrian event at Fairbanks Ranch, the cycling road race at Mission Viejo, and in the Exposition Park/Coliseum/Sports Arena area, up to nine information facilities were set up to handle the geographical expanse and spectator volume involved.

General information concerning Games competition and events schedule, venue policies and facilities, overall LAOOC operations, transportation options, emergency resources and nearby community services was readily available. Volunteers were recruited to staff these information kiosks and to assume management responsibility for individual venue operations under the supervision of Public Information staff.

Venue information operations were based largely on experience gained through participation in the series of pre-Olympic (LA83) events sponsored by the LAOOC. The 23 Olympic sites were divided among nine full-time Public Information staff members, who recruited volunteer staff for their venues with the help of Olympic Neighbor programs and other local community resources. Reference materials specific to each venue were assembled, volunteer staff was trained and detailed operational plans for each venue were prepared and approved.

In general, designated volunteer coordinators assumed total on-site management responsibility at each venue during the Games. The information kiosks opened approximately 90 minutes prior to the scheduled start of competition. Public information staff members maintained an on-site presence as necessary, particularly during the first day of competition while the volunteer coordinator dealt with venue management and resolved problems.

LAOOC policy precluded the distribution of printed information materials other than officially licensed or LAOOC-generated publications at the venues. Therefore, public information volunteers staffing the kiosks were trained to verbally answer questions dealing with:

- Location of facilities within or near the venue
- Specific information regarding individual athletes, competition and/or teams
- Emergency information such as first aid and security
- Non-emergency information such as nearby shopping areas or service stations

- Information regarding community services or tourist attractions
- General Olympic and LAOOC program information such as schedules, tickets, etc.

A standardized information notebook was prepared for each venue that outlined emergency, community, and Organizing Committee information and policies, along with non-Olympic related resources and agencies that might benefit the visiting public. Additions and alterations to this notebook's format were made at the discretion of each venue's public information coordinator to maximize its usefulness at each Olympic site.

Each information kiosk was staffed by three trained volunteers, one of whom was a coordinator or supervisor. Language-skilled personnel were also recruited to serve at information booths where deemed necessary. Virtually every kiosk was equipped with a telephone in order to communicate with centralized public information operations at LAOOC headquarters, as well as with management and other departments within each venue. It should also be noted that these telephone communications proved extremely valuable in assisting venue spectators and staff in many medical and/or security emergencies.

Communications between LAOOC Public Information Department headquarters at the Marina Center and venue coordinators were conducted on a regular basis via a schedule of mandatory telephone check-ins. Daily Electronic Message System (EMS) report forms were also required to be sent. Conversely, any information collected by centralized public information management was distributed to the venues via EMS. This procedure proved to be particularly helpful in regards to ticket availability during the time of the Games.

28.03.6 Reflections on the public information program

The overall success of the LAOOC's public information program can be attributed to two factors; the use of a large and dedicated volunteer work force, and a flexible staff structure. Recognizing the Organizing Committee's commitment to use volunteers during the Games, the Public Information Department recruited, trained and utilized volunteers in all early phases of its operations.

Through the efficient use of volunteer staff, the information program saved the LAOOC a substantial amount of money in salaries and guaranteed the quality of work generated during the Games period. Broadly speaking, the work of volunteers in Public Information was of superior quality and their enthusiasm and dedication was sustained at a higher level.

The Public Information Department's structure, which combined both centralized and venue-oriented staff reporting and responsibilities, allowed for much-needed flexibility and added to the program's depth and versatility. The amount of cross training and dual responsibilities shared between venue operations and the phone bank, for example, allowed for maximum intercommunication and exchange of information. An overall program for similar direct communication between future Olympic organizing committees and the local, national and international publics they impact is strongly encouraged.

28.04 Audio-visual, radio and television

28.04.1 Audio-visual: Film, photography and video

The Audio-visual Department had primary responsibility for producing videotape and film projects in conjunction with the Public Relations Department to help foster understanding of the LAOOC's planning efforts. These projects helped mobilize public support, promote enthusiasm, enlist volunteers and spread information about Olympic tickets, the Arts Festival, the Olympic Torch Relay and transportation alternatives during the Games.

As a support and service arm for LAOOC operating departments, the Audio-visual Department had responsibility for the following areas:

- Production of all films, videotapes, radio and television public service announcements (PSAs) and multi-image presentations for operating departments within the LAOOC
- Planning, coordinating and staging large-scale LAOOC staff meetings, seminars, training sessions, press conferences (except those handled by the News Department) and social events
- Photography and film processing for all events requested by LAOOC operating departments
- Maintenance of slide, film and videotape libraries for LAOOC use
- Duplication of films, prints and slides for LAOOC use
- Providing technical consultation and services to corporate sponsors and government agencies when resources permitted

While the Audio-visual Department began operating on a limited basis in June 1983, technical resources prevented the department from being fully operational until February 1984.

By that time, a complete organizational and tracking system was developed for each technical area (videotape, film, photography, etc.) and forms were developed for lending equipment and scheduling services. Additional equipment was purchased from March to May 1984 as demand for these audio-visual services increased.

Photography

Prior to staffing the Audio-visual Department, the LAOOC relied on outside contractors to produce films, videotapes, visual aids and even photographs. Before the appointment of a full-time staff photographer, many official Organizing Committee functions went undocumented, while others were covered by two or more photographers who had been contacted due to overlapping responsibilities by different operating departments. With a growing demand for black-and-white and color photography on increasingly shorter notice, the first audio-visual employee hired was a staff photographer in September 1983.

Nearly 50,000 photographs (1,385 rolls of film) were taken by the photography staff in the six-month period closest to the Games (15 February–20 August 1984); 80 percent of the film developed was color reversal (slide) film and 20 percent was color or black- and- white negative film for prints. A total of 1,888 photos were printed and an additional 2,469 color slides were duplicated. Pre-Olympic and Games photographs—more than 100,000 total images—were also shot and filed at a Los Angeles photo studio contracted for special projects.

Film and video

The first film featuring the LAOOC and its preparations for the Games was produced by the LAOOC's host broadcaster, ABC, in late 1982 and premiered at the January 1983 meeting of the IOC Executive Board and NOCs. This 32-minute film entitled "*Sharing the Dream*" recalled the glory of past Olympiads and previewed the planning for the Games in Los Angeles. It included an overview of the Organizing Committee, a look at Olympic venues, the Olympic Arts Festival, youth programs, athlete villages and transportation planning. When the Public Relations Department made a commitment to audio-visual promotional aids, one of its first mandates was to update this original film presentation. The result was a 14-minute production in both videotape and 16 mm format, also titled "*Sharing the Dream*" which premiered in June 1983. This in-house promotional piece depicted the commitment of the LAOOC to its sponsors and to developing a youth sports legacy, and invited the world to support and attend the Games.

9

10

9 The Olympic Spirit team in action.

10 The LAOCC audio-visual department keeps a filmed record of Games' planning.

More than two dozen film and/or video productions followed those early efforts, including a cooperative venture with an official Olympic sponsor. As part of United Airlines' regular in-flight video programming, nine three-minute short films dealing with various aspects of the Games were produced by the LAOCC. These shorts were part of the "United Report" and aired every four weeks on a rotating basis in late 1983 and early 1984 to an estimated 900,000 passengers monthly. Major LAOCC video and/or film titles included:

- "Sharing the Dream," on 16 mm film, 32 minutes, January 1983 (see above)
- "Sharing the Dream," on videotape and 16 mm film, 14 minutes, June 1983 (see above)
- "United Report," nine 3-minute reports on videotape, 1983-84 (see above)
- "To Leave a Legacy," on videotape, 5 minutes, September 1983 (described the Olympic Torch Relay and how it was designed to benefit United States youth programs)
- "1984 Olympic Villages," on videotape, 14 minutes, October 1983 (described accommodations, medical facilities and meals for athletes at the villages)
- "LA83 Events," on videotape and 16 mm film, 10 minutes, November 1983 (described preparations for the Games with reference to the LAOCC-sponsored pre-Olympic competitions)
- "Olympic Arts Festival," on videotape, 4 minutes, January 1984 (promotional videotape which featured the Arts Festival and ticket sales)
- "Look of the Games," on videotape, 6 minutes, February 1984 (originally a six-projector slide show which was transferred to videotape and described overall design of the Games)
- "Play a Part in History," on videotape and 16 mm film, 7 minutes, May 1984 (orientation film that encouraged volunteer participation for Games staffing)
- "Legacy of the Flame," on videotape and 16 mm film, 7 minutes, June 1984 (first documentary on the cross country Olympic Torch Relay)
- "An American Odyssey," on videotape and 16 mm film, 9 minutes, July 1984 (updated documentary on the torch relay)
- "America Runs," on videotape and 16 mm film, 12 minutes, October 1984 (final documentation of the coast-to-coast torch relay including the lighting of the Olympic flame at the Games)

The most visible project coordinated by the Audio-visual Department was the Olympic Torch Relay trilogy produced immediately before and after the

Games. Part one ("Legacy of the Flame") covered the early stages of the relay; part two ("An American Odyssey") followed the Olympic flame from the East Coast to the West Coast; and part three ("America Runs") documented the historic relay from its New York City beginning to its arrival in Los Angeles and the Coliseum.

28.04.2 Public service announcements in the pre-Games period

In its efforts to increase public awareness well in advance of the Games, the LAOCC Public Information Department implemented a multi-faceted media campaign involving the public service aspect of television and radio broadcasting in Southern California. Topical public service announcements (PSAs) were generated for each of the 1983 pre-Olympic (LA83) events as well as for special LAOCC projects, including the Human Resources Department's Employee Lend-Lease program and volunteer staff recruitment efforts.

An initial series of eight television PSAs were created by an independent producer under contract to the LAOCC. These announcements centered on the personal achievements of several former Olympic athletes and were completed in September 1983, then previewed for local public service directors at an LAOCC-sponsored reception. The series was well received and was given significant local airplay through fall 1983 and winter 1984. These PSAs were also distributed to major cable television systems and to several cable networks in the United States and were also made available to United Airlines for use on its in-flight programming.

A series of radio PSAs featuring Olympic athletes and coaches from the New England area was produced and distributed in Boston, Massachusetts and other markets in the northeastern United States. A similar series of announcements geared toward Olympic football was produced in San Francisco and other northern California markets. Combined, these public service announcements helped promote ticket sales at the football venues at Annapolis, Harvard and Stanford.

The final public service campaign generated by the Public Information Department was coordinated with the marketing and public relations efforts of the Olympic Torch Relay. A 30-

second television announcement was produced using existing materials, then made available to the torch relay staff for distribution as necessary. Subsequent efforts in the production of public service announcements were undertaken by the Audio-visual Department of the Public Relations Department.

28.04.3 Public service announcements during the Games period

Among the many last-minute projects organized by the Public Relations Department was a public service announcement campaign for both radio and television in mid-June 1984. The purpose of this campaign was to saturate the greater Los Angeles area with two main messages: 1) transportation options, particularly the Olympic Shuttle Bus system and 2) the Olympic Neighbor Committee programs, particularly the "Welcome to L.A." campaign.

After witnessing the wave of enthusiasm that swept through Sarajevo at the XIVth Winter Games, LAOOC management was hopeful that similar public opinion would spread throughout Southern California as the Games approached. The LAOOC hoped to initiate a "good neighbor" policy to encourage visitors to attend the Games and also to educate Los Angeles residents on transportation alternatives in hopes of avoiding potential traffic problems.

Advertising was ruled the most effective way to transmit these messages, but funds were limited and time was short. It was determined that the quickest, least expensive and most highly visible method of forming public opinion was through radio and television PSAs using celebrities from the local entertainment industry. A telephone and letter-writing campaign helped enlist the support of well-known entertainers such as Bob Hope, Phyllis Diller, Lou Rawls, Rich Little, Cathy Lee Crosby, Ricardo Montalban and others.

A total budget of \$20,000 covered the cost of taping, materials, editing and production; the entire project was completed in just four weeks after the proposal was submitted. Normal timelines would have required a three to four-month production schedule. The quality of the final product and the urgent nature of the theme was enough to convince 38 radio stations and 13 television stations to begin airing these public service announcements almost immediately. Following are examples of actual PSA scripts recorded for broadcast on radio and/or television:

Transportation public service announcements

0:10 — "Hello, I'm Monty Hall, with a deal. During the Olympics, avoid traffic by taking an Olympic Shuttle Bus. That way, everyone's a winner!"

0:20 — "Hello, I'm Ed McMahon. No doubt about it, we love our cars here in L.A. But during the Olympics, let's try to cut down on traffic. Join a carpool or, better yet, take the Olympic Shuttle Bus. For information, dial (telephone number). With that number... (telephone number)... you'll be playing your part in history."

0:30 — "Hi, I'm Cathy Lee Crosby. During the Olympics, you'll hear a lot about "teamwork." But it doesn't just apply to our athletes... it's important that we all work together. Now, traffic could be a problem. So, for those two weeks, let's team up and keep traffic down. How about a carpool with friends and co-workers? Or better yet, park your car and take an air-conditioned Olympic Shuttle Bus. For information on special routes and schedules, call (telephone). We'll all be glad you did."

"Welcome to L.A." public service announcements

0:10 — "Hello, I'm Ed McMahon. Let's play our part in Olympic history, and show the world just how friendly and helpful L.A. can be."

0:20 — "Hello, I'm Monty Hall. You know, I've seen some deals in my time, but this summer's Olympic Games takes the prize. It's a chance for each of us to play a part in his tory.. by showing the world how friendly and helpful we can be. So, let's work together to make this the greatest Olympics ever. Deal?"

0:30 — "Hi, I'm Cathy Lee Crosby. The Olympic Games are fast approaching... and you'll hear a lot about the 'Olympic Spirit' in the weeks to come. It's more than gold medals and national pride... it's a spirit of international cooperation and understanding. We can all play a part in Olympic history by showing the world how helpful and friendly our city can be. Remember, the Olympic Games only last for two weeks. So please, let's all join together and make our guests feel at home!"

28.04.4 Radio and television

Several radio and television features were produced by outside programmers and sanctioned by the LAOOC to promote understanding and interest in the Olympic movement. "The Olympic Minute", a series of 60-second radio spots, presented an overview of the Olympic Games from ancient times to the present day, with a special focus on Los Angeles and the Games of the XXIIIrd Olympiad. The 260-segment series, designed for broadcast one per day, five days a week, began on 1 August 1983 and continued through 27 July 1984. A weekly television

program previewing the 1984 Olympic Games began airing on the national USA Cable Network on 3 August 1983. This 30-minute program entitled "Countdown to '84: Sarajevo and Los Angeles", ultimately aired in 18 countries and was translated into several languages. Each weekly program featured news from pre-Olympic competitions worldwide, profiles of likely Olympic participants, updates on records and analysis of Olympic events and favorites.

28.05 Speaker's Bureau

28.05.1 Formation of the bureau

The Speakers Bureau was one of the first activities formed by LAOOC administration once the organizing effort began in May 1979. At that time, the public had very little knowledge of the Olympic Games coming to Los Angeles and of the approach the LAOOC would take in staging the Games through the private sector. There was much concern and some fear that the Games would bring massive costs, transportation tie-ups and security problems to Los Angeles. Many residents were skeptical that the Olympics would actually take place in their city, nor were they excited about the prospect.

This was the challenge, then, when the Speakers Bureau met for the first time on 27 June 1979. A dozen former Olympic athletes gathered under the direction of a manager and in five years the participants numbered more than 150 speakers, drawn from the local civic and business community, the LAOOC staff and additional athletes who were part of the Olympic Spirit Team.

The Speakers Bureau experienced its largest growth during the year before the Games when demand increased and speech topics became more specific. As local groups became increasingly aware of how the Olympics would affect them, they wanted to learn as much as they could about issues such as construction, design, finances, food services, health services, security, tickets, transportation and volunteer services.

In the five-year period during which the bureau operated (July 1979–July 1984), approximately 2,000 speeches were made to an estimated audience of 560,000 people. In peak periods before the Games, up to 60 speeches were given during a month, sometimes as many as seven or eight per day. The majority of speeches were during lunch or dinner hours to local businesses, chambers of commerce, homeowners groups, professional organizations, schools and service clubs.

Given enough lead time (three to four weeks), all requests for speakers were

honored if possible, although a minimum audience of 50 was requested. The bureau did not provide speakers for pro-con debate situations or if there were other speakers on the program. All speaking engagements were coordinated by the LAOOC Speakers Bureau office and not by the individual speaker; direct requests to members were referred to the bureau office so proper arrangements could be made. To fill a request, a speech profile form was sent to the organization to confirm the appearance (time, location, subject matter, etc.) and to obtain background information about the organization and its members. This data was helpful in determining the most appropriate Speakers Bureau member to address the organization. Other details such as who would be seated at the head table, who would introduce the speaker, names of public or political officials expected to attend and potential press coverage were also requested. A complete file on each speaker was maintained and a biography was mailed along with a letter confirming the speaking engagement to the organization making the request.

28.05.2 Recruitment and training

Speakers Bureau members were almost exclusively recruited from within the ranks of the Organizing Committee and among local supporters of the Olympic movement. LAOOC management, sports commissioners and staff from all operating departments augmented athletes and business people in filling requests for speakers.

Speakers received regular mailings of all Organizing Committee news releases and publications, and attended periodic meetings and briefing sessions to keep them current with LAOOC developments. Bureau members were also provided with a notebook containing up-to-date fact sheets on LAOOC structure, financing, official sponsors, tickets, transportation and venues. Before making their first presentation, new speakers were encouraged to attend and monitor an Olympic speech given by a more experienced, long-term member of the bureau. The Speakers Bureau notebook also included a section on communications skills and how to better prepare for and deliver an effective speech.

It was understood that no speaker would accept personal payment for an Olympic speech. However, the Speakers Bureau did maintain an active honorarium program. All monies received for speeches went into an LAOOC-maintained fund which helped support local youth-oriented charitable organizations. The speaker could indicate the choice of an honorarium recipient, if desired. During the five-year operation of the bureau, more than \$100,000 in honorarium monies were received and passed on to community charities.

Members of the Speakers Bureau played a vital role in shaping the positive feelings of the people of Los Angeles which culminated in their enthusiastic support and resulting success of the Games. Future organizers are encouraged to create a similar speakers bureau as part of an overall public relations program designed to inform and stimulate interest in the Olympic movement.

28.06 **Olympic Spirit Team**

28.06.1 **Concept of the team**

The LAOOC adopted a philosophy for making the 1984 Olympics a "Games for the athletes" early in its planning stages. Part of this concept called for harnessing the resources of participants from previous Olympic Games. To implement this plan, the Organizing Committee first went to a group known as the Southern California Olympians, an active Olympic alumni organization with more than 700 members. An invitation to join a new "Olympic team" was extended to each, as well as to a few specially selected Olympians who lived in other parts of the United States; some 350 responded favorably. From that group, 84 Olympians were initially selected in March 1983 to represent the Olympic Spirit Team, with the total reaching 250 members by January 1984.

The Spirit Team was made up of past and present Olympic athletes who volunteered their time to help promote the Games by sharing their personal experiences with people throughout Southern California and the United States. Operated independently of the LAOOC Speakers Bureau, the Spirit Team was implemented as a way to generate widespread enthusiasm for the upcoming Games. It also gave Olympians a chance to participate in the Olympic movement off the field of play.

Whereas the Speakers Bureau was intended to provide current information about the Organizing Committee, Spirit Team members shared their memories of previous Olympic competitions in an effort to promote personal involvement and support for the upcoming Games. The LAOOC also entrusted the Olympic Spirit Team with three main messages to deliver to its audiences: 1) that the Games could be

hosted in Southern California without financial liability to area taxpayers; 2) that more than two and one-half billion people worldwide would watch the Games taking place here; and 3) that the Games would leave an enduring legacy in Southern California.

Establishing the Spirit Team was an innovative and potentially far-reaching step in garnering favorable public attention. The individuals making up the group not only had considerable media appeal, but they were strongly motivated, articulate and enthusiastic. These former athletes were well-versed on Olympic affairs and were able to share captivating personal experiences spanning decades of Olympic history. They were able to inspire many youngsters, volunteers and entire communities by giving their time and energy to promoting sports, the Organizing Committee and the Olympic Games.

28.06.2 **Recruitment and training**

Spirit Team members were selected on the basis of past experience with the media, an active history of involvement in Olympic and sports affairs and a willingness to give speeches and interviews on behalf of the LAOOC. The group was intended to represent the broad scope of Olympic participants and their experiences, hence, membership was not restricted to medalists and included representatives of all ages.

Men and women representing each Olympic sport were on the Spirit Team roster and more than 50 members were from outside Southern California. Most competed for U.S. Olympic teams including winter Games teams, although a handful competed for other countries (Australia, Canada, Federal Republic of Germany, Great Britain, Korea and Thailand). Spirit Team members had competed at Games dating as far back as 1920 and some of the most active Spirit Team members were the more than a dozen who participated in the Games of the Xth Olympiad held in Los Angeles (1932).

The 84 original Spirit Team members attended meetings in Los Angeles in early March 1983 to receive an introduction to the LAOOC's organizing efforts. They were given brief presentations by the heads of major departments within the LAOOC and attended a series of workshops dealing with topics such as public speaking, interview techniques, talk-show formats and presentations. They also visited several of the Olympic sports venues and attended community receptions around Los Angeles.

Spirit Team administrators introduced an information notebook containing background data on the LAOOC, fact sheets on different operating departments and venues and tips on good communication skills; a similar fact book was later assembled for Speakers Bureau members. Fact sheets were included on topics such as the Olympic Arts Festival, security, sports, tickets, transportation, villages and youth programs. This information was augmented by regular mailings of news releases and publications pertaining to Organizing Committee activities.

A monthly newsletter, "*SpiritNews*", was also produced to keep Spirit Team members abreast of LAOOC policy changes, upcoming activities and general news that pertained to Olympic-related matters. The newsletter also served to bind the large group together as a fraternity, keeping the members in touch with each other as well as events. Finally, a second Spirit Team conference was held in mid-April 1984 to update members on the status of the organizing efforts for the Games and to promote the Olympians' involvement with the torch relay.

28.06.3 **Review of participation, procedures and effectiveness**

The Spirit Team participated in more than 5,000 events of varying nature and size from March 1983 through July 1984. Olympians appeared in virtually every type of parade held during that time period and visited many track (athletics) meets, swim meets, sport demonstrations, sports clinics and youth sports festivals. They attended Boy Scout and Girl Scout troop functions and toured hospitals, convalescent homes, juvenile halls and half-way homes where they spoke with residents and officials. They appeared at many award ceremonies, flag-raising, health fairs, physical education conferences, academic conferences and classrooms.

Olympians gave speeches to groups ranging in size from 50 to 50,000. The largest audiences were at pre-game or halftime activities at local sports stadiums, and other large groups greeted Spirit Team members at school assemblies, universities, military bases and service clubs. They also went to the Braille Institute and non-partisan city, county and federal government events of many kinds. The Spirit Team worked in support of the efforts of the LAOOC's Olympic Neighbor program, attending opening kick-off activities in several communities. Special events included media appearances with local and national radio and television networks, as well as participation in filming and video taping sessions for the Organizing Committee's public service announcements.

The Spirit Team was supportive of the work of other LAOOC departments such as the torch relay. Several members traveled to other states to stimulate interest in cities where the

torch would pass through. They delivered speeches, gave newspaper interviews and appeared on local radio and television talk shows. Many of the Olympians also carried the Olympic flame for a kilometer along the coast-to-coast torch route.

The Spirit Team was also a major benefactor of the LAOOC's Youth Services Department and its "Grow With the Olympics" program. About 80 members volunteered to assist the youth program by addressing school assemblies and escorting teenagers to various sports competitions during the Games. Olympians also served as marshals, judges, linesmen, timers and award presenters at the Youth Services clinics held in 1983 and 1984.

A series of forms was developed to schedule and coordinate the movements of Spirit Team members. Information sought from organizations requesting Olympians included: time, place, location, driving distance, parking availability, audience size, audience median age and diversity, type of event (speech, reception, awards ceremony, dinner, special event, etc.), length of speech, subject matter of speech, media presence and, if necessary, lodging opportunities. With this information in hand, the Spirit Team member best suited for the engagement was asked to fill the request; acceptance was based on the individual's personal schedule and desire to fill the engagement. Each speaker was later asked to return an evaluation form reviewing the event and the organization did the same. This provided helpful information in placing Olympians at subsequent events. Requests for a speaker were filled in most cases, but the Olympians had agreed in the early organization of the group not to meet commercial, political, denominational, special-interest or charity event requests.

As the Games approached, the number of requests by private and public schools increased so dramatically that it became difficult to meet every request. Nearly every school in Southern California (more than 2,000) made a request for an Olympian in the six months preceding the Games. Priority was ultimately given to LAOOC-initiated events and other activities which embraced large student populations in order to maximize the Spirit Team's effectiveness and conserve resources. Hindsight revealed that an organized program to reach the schools earlier could have helped lessen the high demand which nearly overwhelmed the Spirit Team.

29

29.01 Concept and goals

The overall goal of the Organizing Committee's Security Department was to provide a secure environment for the staging of the 1984 Olympic Games. The success of this endeavor was critical to the efforts of the Organizing Committee and especially difficult. Given the enormity of the Games' stage and audience, the individual freedoms inherent in U.S. society as guaranteed by the *Constitution of the United States* and the widely dispersed system of Olympic venues, the Olympic Games presented a tempting target for a wide variety of disruptive activities, ranging from international terrorism to massive demonstrations. Making the task particularly difficult was the fact that, as a privately run and financed corporation, the Organizing Committee—unlike previous Games organizers—possessed no law enforcement capabilities. Instead, it had to contract and coordinate security through more than 50 local, state and federal law enforcement agencies in whose jurisdictions the Games were staged. Whereas previous organizers could devise a blanket security plan that covered both Olympic and non-Olympic venues within the greater Olympics area, the Organizing Committee was fiscally and legally obligated to sharply define the parameters of its security responsibilities.

In addition to its broad, overall responsibility of ensuring a secure environment for the athletes, coaches, trainers and all members of the

Olympic Family, including journalists, the direct responsibilities of the Organizing Committee's Security Department were to:

- Protect property and assets belonging to or under contract to the Organizing Committee
- Ensure orderly behavior of spectators
- Enforce paid admission to events
- Enforce accreditation rules specified in the IOC Charter and established by the Organizing Committee
- Protect athletes at the villages, venues and training sites, and provide in-transit security for athletes to and from the villages, venues and training sites
- Protect transportation vehicles supplied by the Organizing Committee
- Provide accreditation control at the villages, venues and training sites
- Provide security for IOC officials and protect property at the Biltmore Hotel
- Provide VIP protection for a limited number of designated IOC officials
- Protect special areas, including, but not limited to the press, broadcast, accreditation, doping control and computer centers
- Protect Organizing Committee facilities, including, but not limited to headquarters at the Marina Center, the Ticketing Process Center, the Design Center, warehouses, community relations offices, job recruitment and job training sites, the administration operations

center, Security Central Operations (SCO), the Uniform Distribution Center and the vehicle pool. Deter those disposed to disrupt the Games.

Coordinate law enforcement efforts at the local, state and federal levels. Ensure that the level of security was adequate, but not excessive so that the primary focus of the Games remained on the athletic event and not on security operations. Oversee interstate security operations for the Olympic Torch Relay.

To satisfy these responsibilities the Security Department developed a concept of augmenting law enforcement with the significant deployment of unarmed private security guards. The guards' principal role was to be the "eyes and ears" of law enforcement. It was never intended for them to have law enforcement capabilities.

29.02 Explanation of the jurisdictional system

Law enforcement by jurisdiction, as used during the Olympic Games, was not designed specifically for the Games. The U.S. has historically been enforced by jurisdictions—federal, state and local—the Olympics were no exception. This is so because of the forefathers' fear of potential abuses of power by a national police force. Law enforcement by jurisdiction is the law of the land, but, nonetheless, is a complex system because of overlapping jurisdictions, particularly those between federal and local authorities. To make it work for the Olympic Games

required a great deal of coordination and cooperation among the many agencies involved.

Among the local, state and federal law enforcement agencies responsible for the planning and operation of security for the Games included the:

- Los Angeles Police Department
- Los Angeles Sheriff's Department
- California Highway Patrol
- Anaheim Police Department
- Long Beach Police Department
- Pasadena Police Department
- Arcadia Police Department
- Inglewood Police Department
- Beverly Hills Police Department
- Monterey Park Police Department
- Pomona Police Department
- Fullerton Police Department
- Carson Police Department
- University of California, Santa Barbara Police Department
- University of Southern California Police Department
- County of Los Angeles Fire Department
- Los Angeles City Fire Department
- Ventura County Sheriff's Department
- Orange County Sheriff's Department
- San Bernardino County Sheriff's Department
- San Diego County Sheriff's Department
- California National Guard
- California Department of Transportation
- State Board of Equalization
- California Department of Justice

¹ Unarmed private security guards augment the presence of law enforcement officers during the Games.

- California State System
- University of California System
- Federal Bureau of investigation
- Immigration and Naturalization Service
- Federal Aviation Authority
- Bureau of Alcohol, Tobacco and Firearms
- U.S. Secret Service
- U.S. Coast Guard
- U.S. Customs
- U.S. Postal Service
- U.S. Department of Justice
- U.S. Department of State
- U.S. Department of Defense

29.02.1

Conceptual plan

Local law enforcement had primary jurisdiction at all Olympic venues and sites. At the venues, primary and secondary jurisdictions were divided as follows:

At the athletes' villages at the University of Southern California (USC), the University of California, LOS Angeles (UCLA) and the University of California, Santa Barbara (UCSB), campus police forces ostensibly had primary jurisdiction but because they lacked sufficient resources to adequately secure the athletes, they relinquished much of the responsibility to the law enforcement agencies that had secondary jurisdiction: the Los Angeles Police Department (LAPD) at USC and UCLA and the Santa Barbara Police Department at UCSB.

In-transit security fell under the jurisdiction of numerous agencies. Because of the distances involved in traveling to and from the athletes' villages and the numerous venues and training sites, athletes' buses passed through approximately 40 different law

enforcement jurisdictions. To minimize communication problems and maintain an efficient security cover for athletes, the Organizing Committee and the Los Angeles County Sheriff's Department (LACSD) developed an athlete transportation security plan for all routes within Los Angeles County. The Sheriff's Department, having had considerable experience in transporting prisoners by bus, was assumed to have the ability and knowledge to secure the movement of athletes' buses and had the authority to take law enforcement action within the geographical boundaries of the county.

The Organizing Committee and the California Highway Patrol developed a plan to secure routes between the UCLA and UCSB Villages and sites in and around Santa Barbara County. The California Highway Patrol (CHP) was empowered to take law enforcement action within the geographical boundaries of all three counties and routinely patrol many of the highways over which athletes' buses traveled. The Orange County Sheriff's Department provided security for buses traveling within the geographical boundaries of Orange County.

29.02.2

Jurisdictional agreements

among federal and local agencies Overlapping responsibility between the Federal Bureau of Investigation (FBI) and local law enforcement, particularly the LAPD, as perceived by the media at large was the subject of much debate for many months before the Games. This debate focused on which agency would play the lead role in the event of an international incident, such as a terrorist action. Despite longstanding relationships between the agencies and their understanding of concurrent jurisdictions, this was a real issue until jurisdictional responsibilities were agreed to by the parties involved.

The sheriff of Los Angeles negotiated a memorandum of understanding with the FBI on behalf of all local law enforcement except the LAPD during late fall 1983. In this memorandum, the sheriff relinquished authority to the FBI in cases involving international incidents. The LAPD signed its memorandum of understanding with the FBI during early spring 1984 but left negotiable ultimate authority over several areas of responsibility in regard to international incidents.

29.03

Coordination between the Organizing Committee and the outside law enforcement agencies

Coordination for security planning between the Organizing Committee and the more than 50 law enforcement agencies in whose jurisdictions Olympic activities would occur was achieved through the Olympic Law Enforcement Coordinating Council (OLECC) and the Security Planning Committee (SPC).

Members of the OLECC consisted of the following:

- Peter V. Ueberroth
President
LAOOC
- Edgar N. Best
Vice President/Director of Security
LAOOC
acting for Mr. Ueberroth
- Daryl F. Gates
Chief of Police
Los Angeles Police Department
- Sherman Block
Sheriff
Los Angeles Sheriff's Department
- Richard T. Bretzing
Special Agent in Charge
Federal Bureau of Investigation
- H. Kenneth Hill
The White House
- William Anthony
Director
Department of General Services
State of California
- Charles Ussery
Chief of Police
Long Beach Police Department
- Members of the SPC consisted of the following:
- Edgar N. Best
Vice President/Director of Security
LAOOC
- William M. Rathburn
Commander
Los Angeles Police Department
- Paul Myron
Commander
Los Angeles Police Department
- Ken Rude
Captain
California Highway Patrol
(Representing State of California)
- Charles W. Clark
Deputy Chief
Long Beach Police Department
(Representing Independent Cities)
- John C. Barber
Assistant Vice Chancellor
UCLA
(Representing Campuses)
- John T. Hall
Supervising Agent
Federal Bureau of Investigation
(Representing ATF, DEA, CG, SS)
- Quintin L. Villaneuva, Jr.
Regional Commissioner
United States Customs
(Representing remaining Federal agencies)
- Ashley (Skip) Williams
Special Agent in Charge
Secret Service
(Consulting Member)
- Harold Ezell
Regional Commissioner
Immigration and Naturalization Service

29.03.1 Beginning concept

OLECC was established in 1981 to coordinate the needs of the various cities and communities having Olympic security responsibilities and ultimately became the policy-making body for Olympic law enforcement planning. OLECC consisted of seven members who met quarterly during the beginning stages of planning and later bi-weekly. They represented the major law enforcement agencies involved in planning Olympic security. By mutual agreement, the local independent cities were represented by one member. OLECC reviewed information from and provided direction to the SPC which was responsible for the planning and coordination of local, state and federal law enforcement.

29.03.2 Development of Olympic Law Enforcement Coordinating Council

In January 1979, before the Organizing Committee was actively involved in security planning for the Games, the LAPD, the LACSD and the FBI took the lead and coordinated security planning. The cornerstone of the planning, which continued through the Games, was the recognition of jurisdictional autonomy. Their planning in the beginning stages consisted mainly of intelligence gathering and extensive fact-finding missions to various international sporting events such as the Pan American Games, the Commonwealth Games, the Asian Games and the 1980 Olympic Winter Games at Lake Placid, New York.

At a meeting called by the president of the Organizing Committee on 26 October 1981 and attended by 15 top-level federal security personnel and heads of 15 of 16 local law enforcement agencies, widespread coordination for security operations for the Games commenced. Following a review of the planning that had already taken place and general discussion of overall concepts, a group of five spokespersons was chosen to represent the Games on security matters.

When this group evolved into OLECC and became the primary law enforcement policy maker, others were added. Its members were:

- President of the Organizing Committee
- Chief of the LAPD
- Sheriff, LACSD
- White House aide (representing the federal government)
- Special agent in charge, Los Angeles, FBI (representing local agencies of the federal government)
- Chief of the Long Beach Police Department (representing the independent cities)
- Director of the Department of General Services (representing the state of California)

At a second meeting in November 1981, an eight-member group was selected to handle day-to-day security operations. This group became known

as the Security Planning Committee (SPC) and reported directly to OLECC. It consisted of representatives from the Organizing Committee, the LAPD, the California Highway Patrol (representing the state of California), Long Beach Police Department (representing the independent cities), UCLA (representing the campuses), the Los Angeles FBI office (representing the Drug Enforcement Agency, the Bureau of Alcohol, Tobacco and Firearms, the U.S. Coast Guard and the U.S. Secret Service) and U.S. Customs (representing the remaining federal agencies). Later, the Secret Service became a full participating member.

The SPC coordinated the efforts of 16 subcommittees that addressed specific areas of concern to law enforcement relative to the staging of the Olympics. The subcommittees were:

- Accreditation
- Air support
- Bombs/explosive ordinance devices
- Communications
- Community relations
- Crime prevention
- Criminal justice system
- Dignitary protection
- Emergency response
- Intelligence
- International entry
- In-transit security
- Olympic village security
- Rumor center
- Traffic control
- Training
- Transportation
- Venue/vital point security

The Organizing Committee director of security chaired the SPC until January 1983. At that time it was decided that the chairmanship would be rotated among the FBI, the LACSD and the LAPD. Each held the position for six months at a time, beginning with the FBI, followed by the LACSD and, finally, the LAPD.

The Integrated Planning Group (IPG) was formed as an adjunct to security planning and served as a common point of contact for all the agencies involved with security and traffic and as a resource center for the various agencies. Formed by the LAPD and LACSD, it was joined by the California Highway Patrol (CHP), U.S. Secret Service, State Department, Immigration and Naturalization Service, U.S. Customs, Bureau of Alcohol, Tobacco and Firearms, FBI, Department of Defense, California Department of Transportation, UCLA Police Department, California State Police and the Los Angeles City Fire Department.

29.03.3 Role of the federal government

The policy of the Organizing Committee was to pay for all government services it requested and not pay for those it did not request. Included in the latter were ongoing services that

government agencies were obligated to perform during the course of their own duties as dictated by legislative and constitutional mandate and services over which the Organizing Committee had no legal jurisdiction or power.

The private financing of the Games and the Organizing Committee's pledge to the people of Los Angeles not to use taxpayer money to stage the Games made it fiscally impossible for the Organizing Committee to rely on outside agencies to determine exactly what constituted Olympics-related security costs. There was much debate in the media and by local politicians over the nature of the Organizing Committee's security responsibility and the legitimacy of the parameters it had drawn.

During a meeting at the White House among President Ronald Reagan, IOC President Juan Antonio Samaranch and Los Angeles Olympic Organizing Committee President Peter V. Ueberroth on 29 January 1982, Reagan assured Samaranch that the U.S. government, acting within the scope of its responsibility to the Games, would provide whatever assistance was needed by local government to meet security requirements and ensure safety at the 1984 Games. Thus, later in the year, as a result of a 29 October 1982 meeting between government and SPC representatives, the White House agreed to provide local law enforcement agencies with logistical support equipment, worth \$50 million, that they needed to provide adequate security for the Games. This logistical support supplied through the SPC consisted of sophisticated communications equipment, as many as 100 helicopters, intrusion detection systems for the villages, miscellaneous medical equipment and construction of a state-of-the-art Olympic Security Coordinating Center.

29.03.4 Role of local law enforcement authorities

In addition to their normal law enforcement responsibilities, local law enforcement agencies were contracted to provide law enforcement services at all Olympic facilities and directly related Olympic facilities within their jurisdictions. These services were paid for by the Organizing Committee, terms of which were negotiated on an individual basis between the Organizing Committee and the local law enforcement agency.

29.03.5 Use of Organizing Committee funds for law enforcement

Through negotiations with individual law enforcement agencies with jurisdiction in Olympic areas, the Organizing Committee paid for all services and equipment needed to meet its responsibilities in securing the Games. These negotiations at times were difficult and lengthy because law enforcement often disagreed with the limits the Organizing Committee imposed on itself, therefore, law enforcement submitted costs it thought necessary for maximum exposure.

These negotiations between law enforcement and the Organizing Committee were unique in that law enforcement services in the United States are guaranteed by law and are not for sale. But because of the structural nature of the Organizing Committee and its obligation to stage the Games at no cost to the taxpayer, the Organizing Committee had to pay for law enforcement services at a fair cost determined in negotiations. The goal of the Organizing Committee in negotiations with all law enforcement agencies was to reach a balance between the levels and quality of law enforcement provided and cost effectiveness. To accomplish this, the Organizing Committee stressed its financial obligations to the public and pointed out that its resources were limited and extremely fluid and would remain so until and, perhaps, through the Games. It was essential for the Organizing Committee to be fiscally conservative during negotiations, because the inclination of law enforcement was to cover worst case scenarios. This was in direct opposition to the purpose of the Organizing Committee which was to stage an Olympic Games and not an international security event.

The most controversial contract negotiations took place with the city of Los Angeles and the Los Angeles Police Department and were not settled until the week the athletes' villages at UCLA and USC opened, despite the fact that an agreement had been reached between the parties two years earlier.

On 28 October 1982, officials of the city of Los Angeles and the Organizing Committee signed an agreement guaranteeing full reimbursement for all city services provided for the Games at no expense to local taxpayers. The agreement provided that Olympic-related costs estimated at \$19.3 million were to be paid from the Olympic Trust Fund or, if the monies in the fund were inadequate, by the Organizing Committee. It established that the Organizing Committee would bear security costs inside the villages and the venues and in transit and provided for a \$2.75 million contingency fund for the LAPD to cover costs should an emergency arise during the Games. The contingency fund was above and beyond the LAPD's \$15 million share of the \$19.3 million the Organizing Committee agreed to pay to the Olympic Trust Fund.

The LAPD, however, reserved final authority to determine the level of security needed within its jurisdiction, claimed upon review that it needed an additional \$9.4 million to properly do its job. Although the Organizing Committee resisted at first, it had no choice but to comply with the demands

2

3

4

- 2 Security for Opening and Closing Ceremonies was essential for the fireworks display, crowd control, access control, dignitary protection and the lighting of the Olympic torch.
- 3 Access into the villages and venues was coordinated by the private security force.
- 4 Venue security command posts, such as this one at the Biltmore Hotel, were set up to serve as on-site operations centers.

of the LAPD since the opening of the Games was imminent and the cooperation of the LAPD was absolutely necessary for the successful staging of the Games. On 9 July 1984, the Organizing Committee formally agreed to pay for the services the LAPD demanded.

Other Organizing Committee security agreements with local municipalities occurred on:

- 26 April 1983; the LAOOC agreed to reimburse Ventura County \$148,655.10 for all county costs; including security.
- 1 June 1983; the LAOOC agreed to pay Orange County \$252,881.18 for costs of police and fire protection and all other county services during the Games.
- 27 June 1983; the LAOOC agreed to pay San Bernardino County \$35,000 for security-related services at the Prado Recreational Area shooting venue.
- 8 August 1983; the LAOOC agreed to pay the city of Monterey Park \$131,609 for security costs and other expenses at the Olympic hockey competition at East Los Angeles College.
- 15 November 1983; the LAOOC agreed to pay the city of Anaheim \$110,000 for security-related costs to stage the wrestling competition at the Anaheim Convention Center.

29.04 Security coordination within the Organizing Committee

The Security Department maintained direct liaison with the various Organizing Committee departments to coordinate all aspects of security. Although the responsibilities for managing other departments remained with the respective department heads, Security was a factor in many departments and was granted the latitude it required to suit its purposes and accomplish the goal of securing the Games. Those departments it affected most were Accreditation, Accommodations, Architecture/Construction, Ceremonies, Food Services, Technology and Transportation.

29.04.1 Accreditation

The Security Department served in an advisory capacity to ensure the integrity of the accreditation process, specifically the printing and

dissemination of accreditation documents. It also coordinated the background investigations of more than 100,000 volunteers, sponsor employees and subcontractors with the appropriate law enforcement agencies. Overall structure of the accreditation system and systems delivery remained the responsibility of the Accreditation Department.

Security also coordinated access control to the villages, venues and other controlled areas. Security mainly was wary of non-accredited persons holding village/venue passes and emergency service passes.

As part of the coordinated effort between the Organizing Committee Security Department and law enforcement, an accreditation subcommittee was created by the Security Planning Committee. The subcommittee, which was chaired by the Organizing Committee's assistant director of security for the northern venues, was responsible for enacting legislation allowing the Organizing Committee to receive information relative to background investigations of applicants for conviction of crimes.

29.04.2 Accommodations

Security closely monitored the influx of requests to the Accommodations Department and ascertained the level of activity and any threat assessment of individuals or participating countries. Security and Accommodations planned arrangements from a security standpoint and minimized potential danger to certain high-risk delegations by placing them in strategically advantageous locations within the villages.

29.04.3 Architecture/construction

Security worked with Architecture in the construction and design of buildings, fences and other structures to enhance security precautions and allow for crowd control without diminishing the festive and athletic atmosphere of the Games. For example, Security's involvement resulted in precise positioning of fence lines around the villages, venues and bus yards for maximum security.

29.04.4 Ceremonies

The Security Department took an active role in preparing for Opening and Closing Ceremonies, providing input regarding the fireworks display, crowd control, access control, dignitary protection and the lighting of the Olympic torch. Security and law enforcement established a joint command post in

the press box of the Coliseum and mobilized a joint communications network to ensure immediate response should the need arise.

Fortunately, no significant incidents occurred during either the Opening or Closing Ceremonies to warrant the intervention of law enforcement personnel despite attendance that approached 200,000.

29.04.5 Food services

Personnel were assigned from Security to monitor and secure the Olympic Family food distribution process for the villages and venues. Careful consideration and scrutiny was given to all food and beverages. All vehicles transporting Olympic Family food were screened, sealed and secured to prevent tampering. The operation proved successful, since there were no incidents or attempts to disrupt the distribution and consumption of Olympic Family food.

29.04.6 Technology

State-of-the-art technological equipment designed and provided by Organizing Committee sponsors supported the efforts of Security at all Olympic venues and sites. The technological needs of security were analyzed well in advance of the Games and provided for in a timely and effective fashion. In some areas, Security negotiated contracts directly with suppliers for such equipment as metal detectors, magnetometers, X-ray screening devices, anti-terrorist screening devices, locks and alarms.

29.04.7 Transportation

Detailed plans for athlete bus routes were coordinated well in advance of the Games with law enforcement and Security. Each bus route had at least one alternate route and was part of the massive planning involved in securing an effective and workable transportation system devised through the efforts of the Transportation and Security departments.

29.05 Development of the private security forces

The concept for the broad use of private security was a direct result of the free enterprise structure of the Organizing Committee. Because the LAOOC was unable to use public funds

to stage the Games and as a private corporation had no control or authority over law enforcement, the Organizing Committee was forced to devise an alternative to the traditional means of providing security for the Games. The massive deployment of private security was cost-effective and at the same time did not reduce the coverage of security for the Games.

29.05.1 Role of private security

Private security guards had no law enforcement capabilities and were not permitted to carry weapons. Their basic role was to augment the overall security effort by being the "eyes and ears" of law enforcement.

Their distinctive uniforms, which were designed by the Organizing Committee, consisted of a tan shirt and trousers, a blue belt with brass buckle, a blue beret, an attached beret badge and black shoes. During the Games, the security guards, who became known as "the Blue Berets," examined accreditation, checked athlete baggage, walked fence line perimeters, rode the athlete transportation system, patrolled athlete dormitories and secured doping centers. At all security sites except the transportation system, security officers were equipped with hand-held radios at the ratio of one radio per ten security officers. Each security officer on a bus was equipped with a radio. In the transportation system, the ratio was one radio per five security officers. Guards also employed the use of hand-held metal detectors.

Thirty days in advance of the Opening Ceremony, thousands of security officers were in place to protect equipment and regulate the movement of persons and materiel in and out of the villages, venues and training sites and on the transportation system.

29.05.2 Plan for recruitment

The Security Department's recruitment plan went into operation on 2 January 1984 with an anticipated hiring need for 20,000 private security guards for a total of 13,000 posts that would be manned for the Games. It was accurately anticipated that there would be a 33 percent attrition rate. The plan, which consisted of two major components, was monitored by two Security Department staff members.

The first component was the direct hiring of 150 persons to train the guards over a period that would last fewer than three weeks just prior to the Games. The trainers recruited were mostly experienced educators and

teachers whose jobs allowed them the opportunity to work the Games during the summer months.

The second component involved the hiring of the guard force itself. The plan was to turn over this massive task to three independent guard companies which would then each subcontract parts of the hiring to two smaller guard companies, bringing the total involvement of companies to nine. The plan divided the manpower responsibilities of the primary guard companies into the following three distinct areas:

- 6,000 guards for the villages and the two northern venues at Lake Casitas and Pepperdine University
- 3,000 for the central venues
- 4,000 to cover the southern venues and the transportation system

Recruiting programs were directed at specific resource pools on college campuses, such as ROTC programs, criminal justice programs, student-athlete groups and coaching associations. All guards were recruited and hired according to standards set by the Organizing Committee. A guard was required to be at least 18 years old, be certified by the state of California, be a high school graduate, have no criminal record, complete and pass a psychological test, be physically fit and have a neat physical appearance.

The recruiting plan went well until late May when one of the primary companies, the one responsible for providing 3,000 guards for the central venues, dropped out because of financial reasons. Since there was limited time remaining, the Security Department did not recruit another primary company. Instead, it consolidated the resources available and divided the recruiting needs of the central venues between the two remaining primary guard companies and arranged for the addition of another secondary company.

Despite the setback, the goals of the program were met and approximately 13,000 qualified private security guards worked posts during the Games.

29.05.3

Training procedures

Training for 12,312 private security guards was conducted by 150 trainers hired by the guard companies from 23 June through 12 July. The Security Department rented five sites in and

around Los Angeles to serve as training centers: Birmingham High School, Hamilton High School, Dorsey High School, Roosevelt High School and Manual Arts High School.

Guards were required to attend two training shifts that covered 24 hours of instruction in the following subject areas:

- Olympic security overview
- Report writing
- Legal matters
- Crowd management
- Accreditation procedures
- Radio procedures
- Wearing of the uniform
- Metal detection device procedures
- Law enforcement coordination with private security
- Post orientation
- Anti-terrorist awareness
- Powers of arrest responsibilities
- Roles of the police and private security
- Interrogation procedures
- Use of force
- Searching procedures

Specialized training was conducted for a total of 3,955 guards in bomb and explosive detection, communications, in-transit security, metal detection and use of X-ray screening devices.

The following is a chart of the day-by-day training activity of the contract security guards, with the attendance figure a cumulative number of guards who went through the five centers:

Date	Attendance
25–26 June	1,836
27–28 June	1,921
29–30 June	875
2–3 July	1,439
5–6 July	935
9–10 July	908
11–12 July	806
13–14 July	360
16–17 July	894
18–19 July	912
20–21 July	203
23–24 July	694
25–26 July	529
Total guards trained	12,312

At the conclusion of training, guards who completed the course and passed an examination were presented certificates of completion and deployed throughout the Olympic security system—in the villages, venues, transportation system and at the training sites.

A breakdown of the day-by-day specialized training by subject matter is as follows:

Training program by subject matter

Date	Bomb/ EOD	Communi- cations	In-transit	Metal detection	Scanray	Daily total
6/27	101	43	44	129	124	441
6/28	0	0	0	56	28	84
6/29	324	50	47	253	312	986
7/2	0	25	24	0	24	73
7/7	286	116	119	518	359	1,398
7/9	0	0	0	20	20	40
7/13	224	224	224	0	0	672
7/18	55	55	55	0	0	165
7/20	17	17	17	0	0	51
7/25	15	15	15	0	0	45
Total	1,022	545	545	976	867	3,955

29.06

Major areas of Games planning

The Organizing Committee's planning was conducted by its director of security, two security administrators, three assistant directors and seven area security managers.

The responsibilities of the assistant directors and area managers were divided into three geographical areas—northern, central and southern—and consisted of developing security plans for villages, venues and training sites, ensuring security of the accreditation process and coordinating with law enforcement agencies at the federal, state and local levels.

The security administrators were responsible for planning and managing private security, in-transit security, helicopter operations, dignitary protection, security for Organizing Committee facilities, acquisition of security equipment, internal investigations and corporate sponsor briefings.

29.06.1

Security at the venues

The objectives of venue security were to provide a safe environment for participants, officials, members of the Olympic Family, spectators and employees of the Organizing Committee and to maintain order and protect the integrity and spirit of the Games. It was achieved through the joint efforts of the Security Department (venue security manager), Organizing Committee management (sport commissioner and venue manager) and local law enforcement.

A Venue Security Command Post, operated and staffed by the venue

security manager or his designee, was located within the restricted area of each venue and served as an on-site operations center adjacent to or in the proximity of the venue management headquarters. From this post, the venue security manager or his designee maintained constant communication with Security Central Operations at the Marina Center, headquarters of the Organizing Committee.

Local law enforcement had its own command post, the Law Enforcement Venue Command Post, or could utilize a separate law enforcement-related command post at an appropriate nearby location to direct the activities and staffing of law enforcement personnel. The law enforcement commander maintained radio communications with agency personnel, with his agency's command post, or with the Law Enforcement Central Command Post, according to the local agency's established operating procedures.

A comprehensive security plan was developed for each venue and covered the pre-competition, training, competition and post-competition phases. The plan contained material on the physical description of the site, the schedule of events, the National Olympic Committees (NOCs) participating, a roster of key participants, delineation of responsibilities among the security components, command and control procedures, traffic, parking, crime prevention, emergency resources and response, defection procedures, bomb threats, helicopter landing sites, threat assessment, interpreters, operations centers for television and news media, accreditation, perimeter access, medical services, supplies and

5

5 Athlete buses were screened for explosive devices at each of the three villages before being boarded.

equipment, radio and telephone communication procedures, property control and security development and post descriptions.

Levels of security varied from venue to venue, but generally were as follows:

- Private security guards were uniformed but not armed and did not perform any law enforcement roles unless authorized and under the direction of law enforcement personnel.
- A limited number of off-duty, armed law enforcement officers were utilized for security of cash transfers.
- Uniformed and non-uniformed armed police officers were on the scene to fulfill law enforcement roles under the direction and control of the law enforcement commander.

29.06.2

Security at the villages

Planning for the villages was expanded beyond the original sites at the University of Southern California (USC), University of California, Los Angeles (UCLA) and University of California, Santa Barbara (UCSB) to include athlete housing for wheelchair athletes at Loyola Marymount University and housing for football participants at Annapolis, Harvard and Stanford. The focus of village security was to provide secure living quarters and surroundings in which athletes could relax and prepare for their events free from fear and worry of disruptions of all kinds.

To achieve this goal, the following security resources and concepts were developed and used:

- Auxiliary lighting was provided to augment that which already existed and to illuminate unusually dark areas.
- The security operation at each village was monitored on a 24-hour basis by a village security manager and his designated assistants, all of whom were permanent Organizing Committee personnel. They coordinated their efforts with the Organizing Committee village management, contract guard management and the law enforcement command structure.
- Communications networks involving the perimeter and interior fence patrols, interior village foot patrols, pre-designated exterior points and housing units were operated to link the vital security components which were the village command post, private security force and law enforcement.
- Cost-effective technology was utilized in the form of sensors, alarms, video equipment and a state-of-the-art intrusion detection system which was requested by local law enforcement through the Special Planning Committee and provided by the Department of Defense. It was installed on the interior and exterior of the fence configuration.

- Fences were the first line of security and presented a physical barrier as well as a psychological deterrent and a visible symbol of the Organizing Committee's commitment to an effective security program. Village fences consisted of a double layer of eight-foot high chain link fence on the perimeter of each village.

Approximately 20 feet separated the perimeter fences and three strands of barbed wire were added to the top of the exterior perimeter fence. A single eight-foot high chain link fence was also installed around each major housing unit. With each ring of concentric ring fence, intrusion became more difficult.

- Additional law enforcement officers were utilized at key entry points such as the village perimeters, housing pods and other sensitive areas within the village. The law enforcement officers provided an armed response to intrusion or violation of law as needed. Fortunately, armed response was not needed during the Games.

- There were X-ray screening and metal detectors at all village entrances as well as metal detectors at each interior pod.

- Private security guards patrolled the interior and exterior pod fences at the villages, operated the X-ray screening devices and metal detectors, screened motorized traffic and checked accreditation at village entrances. They were also selectively deployed in the housing units, along main streets, in the exercise areas and in the press areas. The security guards were unarmed and were equipped with radios, hand-held metal detectors and, where needed, flashlights.

29.06.3

Security at the training sites

The security deployment of manpower at the training sites called for an average ratio of 10 security guards to two law enforcement officers. Security personnel at the sites checked the accreditation of athletes, trainers, coaches and other National Olympic Committee delegation personnel who used the facilities. They also patrolled exterior perimeters, maintained order and generally protected practice areas and equipment.

29.06.4

In-transit security

The Organizing Committee was responsible for providing security for competing athletes as they were transported to and from the villages, venues and practice sites within the Olympic area. The cornerstone of the Organizing Committee's plan was to evaluate threats against individual

countries by the use of threat analysis and provide varying degrees of protection in direct relation to the threat. Protection was provided through a combination of route patrol, escort and strategic point security with air and special weapons support.

The distances involved in transporting athletes frequently required that athlete buses cross as many as 40 separate law enforcement jurisdiction boundaries. To maintain communication and efficient security cover, the Organizing Committee jointly developed an athlete transportation security plan for routes within Los Angeles County with the Los Angeles Sheriff's Department which was empowered to take law enforcement action within the boundaries of the county and had considerable experience in providing security for bus transportation.

The Organizing Committee also joined with the California Highway Patrol in planning security for athlete bus routes between the UCLA and UCSB Villages and for routes to sites in and around Ventura and Santa Barbara counties. The CHP was empowered to take law enforcement action within the geographical boundaries of all three counties and routinely patrolled many of the routes involved in the transportation of Olympic athletes. The Orange County Sheriff's Department provided security cover for buses traveling within the geographical boundaries of Orange County.

The Organizing Committee had an agreement in which the Los Angeles Unified School District and ARA Transportation would provide approximately 500 school buses to be used for the transportation of athletes during the Games. The buses, which were operated by ARA Services, a private corporation, generally accommodated 50 passengers each and were scheduled to run on a precise time schedule and over precise routes that would allow athletes enough time to reach their competitions with a minimum of delay and inconvenience.

Drivers, who worked for the Organizing Committee's Transportation Department, received special training and were instructed to follow the prescribed routes or the prescribed alternative routes if necessary. A private security guard was on board each bus to maintain communications with law enforcement and the transportation coordination tower (TCT).

Athlete buses were stored in three areas—the Veterans Administration lot located near the UCLA campus for athletes staying at the UCLA Village; the lot at the General Motors Corporation South Gate plant for those at the USC Village; and a lot adjacent to the UCSB Village (Lot 13) for the athletes staying there. All lots were protected by chain link fence and secured 24 hours a day by private security guards.

Buses were screened for explosive devices before being boarded by athletes. The screening procedure was done at a designated area at each of the three villages.

The security guard on board the bus used a predetermined code to allow the bus access to the village area. From the entry point, the bus proceeded to an area for the disembarkation of the athletes. The bus was then screened for explosive devices that may have been planted in-transit. After screening, the bus went to the village exit area where Transportation and Security personnel loaded athletes from the transportation coordination tower. The TCT was the center for all athlete loading as well as for bus scheduling and assignment of law enforcement escort vehicles to the buses. The Security Department and law enforcement were represented in the tower and responsible for providing in-transit security support.

The Los Angeles County Sheriff's Department committed 200 sheriff's deputies and 100 vehicles to support the in-transit security system within Los Angeles County over a period lasting from 13 July to 15 August. Additionally, the department provided one helicopter in each of four zones for air support.

The LACSD escorted athletes traveling by nation to and from competition where threat analysis indicated that enhanced protection was warranted. But exceptions were made in cases where intelligence data indicated a possible threat against buses carrying athletes from a variety of nations. If additional law enforcement personnel existed after escort assignments were made, they were assigned to specific route patrol.

29.06.5 Security at Organizing Committee facilities

Security staffing at Organizing Committee facilities was provided by California Plant Protection (CPP), an independent private security guard company, and managed by a Security Department staff administrator. Security was provided at the Marina Center and at six satellite locations on a 24-hour basis. Each facility used a captive badge system and the necessary equipment such as video monitors, metal detection devices and hand-held radios to implement an effective level of security.

Security systems at the facilities were constantly monitored and adjusted according to criteria such as local crime patterns and the number of people requiring access. The adjustments made were usually in terms of security

LAOOC Security central operations

Law enforcement helicopter

Athlete bus

Security officer
LAOOC security radio
(common to law enforcement)
5-channel non-secure bus radio (existing)

Athlete bus security officer has continuous communications with the transportation tower located at each village. Law enforcement vehicles and helicopters. All transmissions are monitored by the bus towers as well as local, state, federal and military tactical command posts.

guard manpower and the types of security hardware installed at the facility. In making them, careful consideration was paid to maintaining an effective level of security without creating a major disturbance to the daily operations at the facility.

California Plant Protection security guards assigned to the Organizing Committee were approved by the Security Department. Most were college graduates and qualified linguists. They were subject to security background checks as were all permanent Organizing Committee staff and volunteers working at Organizing Committee facilities. CPP had more offices than any other security service in Southern California and had a sound financial background. It had an excellent reputation with the Bureau of Collection and Investigation Services.

The Security Department appointed and trained confidential document control monitors within each Organizing Committee department. Document control consisted of locking filing cabinets and properly identifying sensitive documents with special red folders and stamps. A shredder was also provided and a confidential document shredding policy was implemented. Periodic checks by security officers were conducted in each of the facilities to insure that sensitive documents and articles of value were properly stored and protected.

Bomb/fire evacuation technicians were assigned to each Organizing Committee department. They were trained in searching techniques and evacuation procedures by the security staff and received advanced training by the Los Angeles County bomb/arson squad. Each technician was assigned a special pager that relied on a graduated code system to determine threat level and appropriate response. In a test of the system at the Marina Center, the entire facility was evacuated and searched in 11 minutes.

Security at the facilities also included parking lot control and anti-vehicle theft procedures. At the Marina Center, guards patrolled the parking lot using three silent golf carts. If a driver habitually violated parking regulations, he was contacted by Security and asked to comply with the rules.

To facilitate overall security, Security distributed a manual to each new employee that explained policy regarding access to the Marina Center and other facilities. The manual also described the badging system, confidential document control, bomb/fire evacuation procedures and at-home and in-transit security for the employee.

6

6 Aerial observation of Olympic venues during the Games was aided by three blimps, which could be equipped with television cameras and zoom lens.

6

**29.06.6
Helicopter coordination**

The Security Department established liaison with the Federal Aviation Administration (FAA) and law enforcement to restrict air traffic in and around the venues and villages from 14 July through 12 August.

An air support subcommittee was formed by the Security Planning Committee (SPC) to identify certain helicopter landing sites for emergency operations during the Games. The appropriate law enforcement agencies and the FAA were part of the subcommittee that reported to the SPC.

The subcommittee prohibited commercial air traffic from entering air space within a one-mile radius and up to 25,000 feet of all venues and villages. Helicopter landing sites were restricted to:

- Only special personnel (the president of the United States and the presidents of the Organizing Committee and International Olympic Committee) were allowed access to helicopter landing sites as they were deemed necessary to the staging of the Games. Generally, other dignitaries were not allowed access.
- Law enforcement during emergency operations
- Emergency medical support during medical operations

The coordination of helicopter landing requests required the presence of an Organizing Committee representative at the air support command post during the Games.

In addition, the aerial observation arm of the security force was aided by three blimps; two Goodyear airships operated by the LAPD and the Fuji blimp operated by Organizing Committee Security. Blimps had several advantages over helicopters since they had the capability of hovering over a trouble spot for hours before refueling and, when equipped with television cameras and zoom lens, produced a better quality picture.

**29.07
Games operations**

The Security Department's Security Central Operations (SCO) was based at the Marina Center and staffed 24 hours a day, beginning at 1600 hours 12 July. The Organizing Committee's vice president/director of security was in command of the operation.

The function of the SCO was to command and coordinate general security operations for the Games. This included continuous liaison with all segments of Olympic security and with the Organizing Committee staff

and operations center, which was also based at the Marina Center. The SCO staff monitored all security operations and provided a decision-making and problem-solving capability, if needed. The majority of problems at villages and venues, however, were solved at those sites. The SCO was also poised to act as the official Security Command Post for the Games, an option that was never exercised.

Radio communication throughout the Organizing Committee security network, including the village and venue command posts, the transportation coordination tower (TCT) and the Hughes helicopters, were monitored by the SCO. Communication between security managers and the area security managers was also conducted via mobile wide-area radio.

Dedicated telephone lines were available between the SCO and the village command posts and the Los Angeles Memorial Coliseum and the TCT. Three electronic phones with multiple lines were in service at the SCO to accommodate the needs of the other venues.

29.07.1 Appearance of the President of the United States

Securing the Los Angeles Memorial Coliseum for the President of the United States' appearance and participation in the Opening Ceremony of the Games of the XXIIIrd Olympiad was coordinated through the efforts of the Secret Service (the agency responsible for protecting the president), the Organizing Committee and the LAPD.

The Dignitary Protection Subcommittee of the Security Planning Committee began planning for the president's visit in August 1983. Representatives from the White House staff and the Secret Service became actively involved the following March. The Secret Service worked with Coliseum management as well as with representatives of the Organizing Committee's Security Department and venue development program to survey the Coliseum and determine the necessary work or renovations that would be needed to provide a secure environment for the president.

The necessary construction included renovating the press box where the president and his party viewed the Opening Ceremony and installing tents and fences to cordon off and secure areas. Approximately 500 Secret Service agents, private security and law enforcement officers were utilized in securing the Coliseum for the president's appearance.

The Secret Service utilized law enforcement resources on hand, particularly that of the LAPD which enforced crowd control and generally assisted the Secret Service in all areas of security. On 28 July, the Coliseum and the press box were swept for explosive devices prior to the

president's arrival and the press box was sealed. The president arrived at the USC Village by helicopter and was driven by motorcade to the Coliseum where he was escorted to the press box. Afterwards, he was escorted to the motorcade and driven to the helicopter pad.

29.07.2 Securing high-risk delegations

Extra security precautions were required to provide protection for several National Olympic Committee delegations that were considered high risk. Two examples were the delegations of Israel and Turkey. High risk delegations were greeted at the Olympic Arrival Center at Los Angeles International Airport, placed under heavy security and transported by motorcade to the appropriate athletes' village.

The routes were secured prior to transport and blocked off enroute. Special surveillance cameras and helicopter surveillance were also utilized along the route to maintain security until the teams arrived in the village. Additional security personnel were assigned inside the village and housing areas. These security components consisted of LAPD, private security guards and, in some instances, the delegation's own security guards. Those guards, however, were prohibited from carrying arms inside the villages.

29.07.3 Deployment of law enforcement

As many as 7,000 law enforcement officers were committed to the Games and Games-related security by the local law enforcement agencies that had jurisdictional responsibility. Of those, 2,659 law enforcement officers policed the venues, the villages, the Los Angeles Memorial Coliseum at Opening and Closing Ceremonies, in-transit security and the Biltmore Hotel.

At the venues, 24-hour coverage was provided by 838 law enforcement officers working regular day shifts and an overnight shift. Of the 838 officers, 335 worked each of the two regular day shifts and 168 worked overnight.

The deployment for the in-transit security system required 450 law enforcement officers. The breakdown by agency was as follows: 200 officers deployed by the Los Angeles Sheriff's Department, 175 by the California Highway Patrol, 50 by the LAPD and 25 by the Orange County Sheriff's Department.

7

The LAPD deployed 300 law enforcement officers each at Opening and Closing Ceremonies. It also deployed 150 officers at the USC Village and another 125 at the UCLA Village. The UCSB Village was policed by 28 officers of the Santa Barbara County Sheriff's Department.

The LAPD deployed another 18 at the Biltmore Hotel which served as headquarters for the International Olympic Committee.

The deployment of each regular shift by venue was as follows:

Venue	Jurisdiction	No.
Archery	Long Beach PD	11
Athletics	LAPD	34
Baseball	LAPD	15
Basketball	LAPD	20
Boxing	LAPD	20
Rowing/ Canoeing	Ventura County SD	14
Cycling	Los Angeles SD	11
Equestrian	Pasadena PD	12
Fencing	Long Beach PD	8
Football	Pasadena PD	37
Gymnastics	LAPD	27
Handball	Fullerton PD	8
Hockey	Monterey Park PD	11
Judo	LAPD	15
Modern	San Diego	11
Pentathlon	County SD	
Swimming/ Diving	LAPD	14
Tennis	LAPD	11
Volleyball	Long Beach PD	16
Water Polo	Los Angeles SD	12
Weightlifting	LAPD	14
Wrestling	Anaheim PD	14

7 Security was a very important part of the Olympic Arrival Center.

29.07.4 Review of incidents during the Games

Of the 645 incidents that were reported to the SCO from 12 July through 15 August, none disrupted the Games and Organizing Committee security handled 76 percent of them without the aid of law enforcement.

It should be noted that there were incidents that occurred at the various venues and villages that were not of a serious nature and were not reported. Included among the 645 notifications to SCO were:

- Access control problems, 42
- Arrests, 17
- Assaults, 16
- Bomb threats, 61
- Crowd control problems, 68
- Fires, 1
- Inquiries, 21
- Late athlete buses, 18
- Metal detection, 10
- Power failures, 18
- Radio problems, 14
- Staffing problems, 8
- Stalled athlete buses, 9
- Thefts, 26
- Vandalism, 7

The only blemish on the security record of the Games of the XXIIIrd Olympiad occurred at Los Angeles International Airport on 13 August, the day following the Closing Ceremonies, when an officer of the LAPD placed an explosive device in the wheel well of a bus belonging to the Turkish delegation. At first, the officer was credited with discovering and disarming the device, but within 24 hours his duplicity was uncovered.

An example of diligent security occurred on 31 July when an unescorted athletes' bus on its way to

the villages from a training site at California State University at Los Angeles, was followed by a suspicious vehicle. An alert Organizing Committee security guard on board noted the license number of the vehicle and reported it to SCO. Within minutes, two law enforcement helicopters and three ground units had the suspect under surveillance. A subsequent search of the vehicle revealed the suspect was carrying home-made explosives.

29.08 Summary

The goals and objectives set forth in the early stages of security planning were realized on 15 August 1984 when the last NOC delegation departed Los Angeles International Airport safely.

The responsibilities of the Organizing Committee were fulfilled without a major incident occurring, a tribute to approximately 18,000 Organizing Committee security and law enforcement personnel who worked to make the Games a success.

The concept of blending law enforcement and private security developed by Organizing Committee Security proved to be sound and workable. Law enforcement was highly complimentary of the performance of private security, as outlined in several memos received by the Organizing Committee. One typical memo from a law enforcement commander at the UCLA Village praised the performance and initiative of the security guards in screening buses for explosive devices.

One lesson of the Los Angeles Games that can be applied to the security planning of future Games is the blending of private security and law enforcement. Because of the structural and fiscal limits imposed on the staging of the Los Angeles Games, the organizers had to cope with paying for law enforcement. At previous Games, providing security was the responsibility of the host city, not of a small, powerless and private committee. This forced the organizers to re-think security planning and seek ways to reduce the excessively high costs paid to secure previous Games without reducing coverage.

The LAOOC examined every post that had to be secured for the Games and,

with the consent of law enforcement, substituted a private security guard for a law enforcement officer where possible and where it would not endanger the public or create a dangerous situation.

In addition to being a significant factor in the great success of the overall security effort for the Games, the private security system benefited the general security of the citizenry of Southern California by preserving local law enforcement manpower for local deployment and maintenance of normal levels of security. This was a significant factor in the overall decrease of serious crime in the Olympic area during the time of the Games.

Another significant factor was the cooperation of the people of Southern California. Their enthusiasm, first generated by the 82-day, cross-country run of the Olympic Torch Relay and brought to a high pitch by the Opening Ceremonies, carried through the Games and created a positive force and a mutual drive for the success of the Games that effectively eliminated any destructive tendencies that the event might have fostered.

Although it is unlikely that future organizers will be as limited as the private Los Angeles organizers in providing security during the Games, it should be noted that the concept of private security, in addition to its cost effectiveness, would greatly enhance the look of the event and reinforce public perception that the event is an international sporting one, not an international security event.

However, the key to the success of the Games' security operation was the cooperation of the law enforcement agencies involved, which banded together to achieve a common and noble goal. Law enforcement agencies assigned their best personnel to the project early. Given the high caliber of the leadership involved, sufficient time and the ideals of the event itself, it was inevitable that the end product would be a good one.

30

Sports Administration and Competition Management

30.01 Areas of responsibility and program for development

While the duties and goals of an Olympic organizing committee are extensive and varied, its ultimate purpose is still the staging of the most fair and competitive athletic events possible. To this end, the LAOOC's Sports Department was formed five years prior to the 1984 Games to plan and implement the actual sports competitions.

The Sports Department was responsible for the selection and acquisition of all competition and training sites; determination and acquisition of sports equipment; preparation of the schedule of events; preparation of the sports explanatory brochures and registration and scoring forms; organization and planning of the competitions and communication with the International Federations and U.S. national governing bodies. Through each sports commissioner and the staff assigned to each sport, the department was also responsible for the planning of each venue's operation, and, ultimately for the total venue management and operation during the Games.

In its infancy, the Sports Department consisted of a director of sports, appointed in June 1979. By December 1983, the department had grown to 95 full-time, permanent employees and by April 1984 the number had more than doubled to 210. At the time of the Games, approximately 8,300 paid and

volunteer staff members comprised the various competition staffs while venue operational staff in excess of 25,000 could be considered to have been within the purview of the department.

The first priority of the director of sports in 1979 was the selection of the necessary sports facilities. This process continued in the fall of 1980 when a vice president of sports was named, who in concert with the LAOOC's senior management, began the process of selecting the sports commissioners. Local and civic business leaders with proven managerial capabilities were selected to manage each of the 23 sports and were handed full operational control of their sport's venue during the time of the Games. In the interim, they worked with the LAOOC staff to develop their sport's operating plans.

By April 1982, three assistant vice presidents were added and assigned specific day-to-day responsibilities for the ongoing, detailed work necessary for each sport. Commissioners began to piece together initial operating plans, conceptualizing how they thought their sport, venue and staff would operate during the Games. The department's staff continued to grow and by May 1983, the department hierarchy was again revised to include

associate vice presidents with broader responsibilities. The evolution continued in September 1983 when sports managers, many of whom had been with the department as assistant vice presidents, were assigned individual sport responsibilities, reporting directly to a commissioner. Each of the three associate vice presidents (AVPs) (later vice presidents) were given oversight responsibility for several sports and the added responsibility of other Sports Department functions: one AVP was responsible for sports equipment, schedules and training sites, as well as for athletics, baseball, boxing, judo, modern pentathlon, weightlifting and wrestling; one AVP was responsible for staffing and personnel, information and publications, and archery, fencing, football, gymnastics, swimming, tennis, volleyball and yachting; the third AVP oversaw the officials and athlete registration function and supervised basketball, canoeing, cycling, equestrian, handball, hockey, rowing and shooting. Other staff members were added to individually coordinate each of the Sports Department functions, i.e. equipment, schedules, training information, staffing and publications, officials and athlete registration.

By early 1984, most of the commissioners had begun to work full-time on the Games and the appointment of competition directors and venue managers in each sport was under way. In many instances, the sports manager became the competition director. The

role of the competition director was to plan and later implement field of play and other competition-related functions, under the direction of the commissioner. The venue director, also responsible to the commissioner, was responsible for all service functions outside of the field of play. These services, such as concessions, waste management and medical services provided indirect support for the competition itself.

To the extent that all competition took place on time before appreciative crowds and without significant incident, the goals of the Sports Department were fully achieved, but not without extensive planning.

One of the first steps in the successful organization and implementation of the technical aspects of 21 Olympic sports and two demonstration sports, was the development and education process undertaken by the commissioners. Beginning in the summer of 1981, when many of the commissioners had been identified, milestone charts were developed for each sport. This required the commissioners to address each phase of the conduct of their sport-21 segments in all-so that a time-phased planning document could be developed.

2

1 Colorful competition sites provide the stage for energetic fans attending the Games.

2 Athletes perform before capacity crowds in stadiums such as the Coliseum shown here.

While the milestone charts were being developed, sports operating plans were written. These helped determine the level of preparation for the nine LA83 events and were completed in draft form by December 1982. Five were selected and subjected to intensive interdepartmental review and analysis.

Once the operating plans were ready, drafts of the sports procedural manuals were prepared. These included an in-depth look at the structure of the organization for each event and detailed management of the competition, secretariat, technical services of the sport, federation and national governing body liaison, administrative services, doping control and medical services and awards ceremonies. Competition and training scenarios were developed, including a minute-by-minute event schedule. Competition staff was identified and duties defined, including start and finish dates. This process continued through the latter part of 1983 and early 1984.

In summer 1983, the concept of venue development was created to work in conjunction with each sport to detail plans for the venue operation. This process helped all departments to follow consistent policies within the venues and made the venue "work" physically.

Other pre-Games planning tools included the preparation of time lines and projected activity reports to assist each sport in planning activities and meeting deadlines.

Aside from the planning of each sport, agreements with training site owners and equipment manufacturers were finalized, plans for the registration of athletes and officials continued and competition forms were prepared.

Table top discussions began in spring 1984 for each sport and were designed to bring together venue management personnel, including both Games' staff and permanent staff, and competition management. These sessions anticipated problems at the site during the Games and tested each department's ability to react to both normal day-to-day procedures and worst-case scenarios.

Training on a much broader scale began in June 1984 when venue-wide one-day orientations were held at each venue site. The Human Resources Department organized these sessions which were run by the commissioners. Individual departments held training sessions at the LAOOC's administrative headquarters or available venues in the months preceding the Games.

The changeover from the planning period to the operations phase necessitated major shifts in the functions performed by individuals within each department. This process, called "venuization" began when individual department managers began reporting to the sport commissioner instead of to central department heads, except in the case of security. Security managers at the venues did, however, work closely with the commissioners at all times. Some venues staged mock competitions a few days before the Games and began to coordinate the efforts of all departments and the level of service provided. Other venues relied on experience gained in the LA83 events. Every commissioner was required to organize a dress rehearsal of some kind before competition began. Games' staff did not begin working at the venues until any where from several weeks prior to the competition to a few days prior to competition.

The final duties of each commissioner at the venue involved overseeing the venue close-out process, which was mostly left to the Construction and Material Logistics departments.

30.02 Commissioner program

30.02.1 Concept and goals

The purpose of the commissioner program was to identify a permanent senior manager for each sport at an early stage, who was skilled in both management and operations and well acquainted with the LAOOC's complex pre-Games planning and organizational structure. The realization of the program resulted in a smooth transition from the planning stage to Games-time operations and near-flawless competitions.

The commissioner program was announced on 25 November 1980, and shortly after, the LAOOC began looking for local civic and business leaders with proven managerial capabilities to manage each of the 21 competition sports and the two demonstration sports.

The commissioner had overall responsibility for the operation at his venue prior to, during and after the Games. In some specific areas, such as protocol and hospitality, the commissioner had direct responsibility for providing services at the venue. In other areas, the commissioner coordinated services provided by support departments.

Above all else, the commissioner was to blend services provided by each of the departments into an organic whole. The commissioner was directed to prepare and operate the venue in a manner consistent with overall LAOOC policy so that each would be perceived as part of a unified whole.

3

3 Equestrian Commissioner Michael Morphy (right) and LAOOC Group Vice President/Sports Chuck Cale in discussion with the President of the FEI, Prince Philip.

30.02.2 Development of the commissioner program

After the program was announced in late 1980, the search began for proven leaders to fill the 23 sports positions. In most cases, one commissioner was named per sport, with the exception of athletics, baseball, basketball, equestrian and football, where two commissioners were named (husband and wife teams were named for basketball, equestrian and football). Of the original 27 individuals named, 21 remained through the duration of the program. For various reasons during the latter half of 1982 and the first half of 1983, several commissioners stepped down or were reassigned.

During the summer and early fall of 1982, the concept of commissioners-at-large was developed with the intention of providing a pool from which replacements could be taken. These positions were filled with individuals meeting the general criteria for commissioners so that additional top-level management talent, familiar with the Games, could be used to assist in the resolution of problems. Fortunately, there were no cases of death or disability in the commissioner ranks requiring the utilization of the commissioners-at-large for such replacement purposes. However, the commissioners-at-large were helpful in various roles during the Games with two assisting at individual venues, another overseeing athlete registration and a fourth accompanying a special gymnastics guest.

In the early stages of the program, each commissioner worked to become acquainted with his sport, but only worked part-time until six to 12 months before the Games. A prime responsibility of each commissioner was to develop a good relationship with his IF and U.S. national governing body. Each commissioner traveled to the appropriate world and regional championships to view the current state of the sport's organizational activities and to attend IOC, IF, NOC and association meetings, at which the commissioner presented information and sought to resolve pending issues. In a preparatory effort, each commissioner, beginning in summer 1981, was required to develop time-phased planning documents in which every phase of the conduct of the sports event was addressed. This detailed analysis led to sport operation plans which helped determine the level of preparation for the nine LA83 events. In January of 1982, commissioners were provided with a checklist of questions they should be able to answer while meeting with the IFs. In general, the relationships developed between the commissioners and the IFs were excellent and greatly helped resolve competition issues at the time of the Games.

While working closely with the Sports Department staff, the commissioners helped to develop sport procedural manuals in 1982. This process continued into 1984 but was supplemented by the introduction of the venue development process. The amount of time spent by each of the commissioners on the preparations varied dramatically prior to January 1984.

Beginning in January 1984, the commissioners began at varying times to serve full time, with the exception of two who began in 1983. At this time, an effort was made to complete the hiring of the competition and venue directors to accelerate the planning and organization of all aspects of competition and venue operation.

The process of "venuization" began as the horizontal lines of authority, with each department manager reporting to a central department head, changed to a vertical management structure, with the commissioner at the head at each venue. This process helped department managers who would work together at the venues, get acquainted with each other and understand the authority of the commissioner at the venue during the time of the Games. Venues that had not begun this process by the end of April were forced to do so when a series of table-top discussions began-one for every sport-in order to pinpoint lines of authority and interaction between departments.

30.02.3 Relationship with the permanent staff

Because most of the commissioners were involved in private business and were only asked to work part-time prior to 1984, it was important for them to develop good working relationships with the LAOOC permanent staff, particularly those in the Sports Department. The day-to-day planning of the sports was handled by the LAOOC permanent staff while the commissioner concentrated on IF liaison and supervised overall development. Some commissioners became more involved than others, depending on their availability or knowledge of the sport. For example, the swimming commissioner, also an architect, was involved in the planning and construction of the Olympic Swim Stadium and the rowing commissioner designed the rowing and canoeing courses at Lake Casitas.

Each sport was always represented within the LAOOC by a permanent staff member. In the early stages, this was the vice president/sports. Assistant vice presidents, and later associate

vice presidents, supervised groups of sports while other staff members kept up with the operating plans and daily correspondence. Many of the early assistant vice presidents became sport managers and provided the immediate supervision of each sport in the planning stages.

During the venue development process and when operating plans were being written, the commissioner worked with individual support departments and the venue development team to plan every aspect of the overall venue operation. The commissioner coordinated with the LAOOC central departments for support services, but was directly responsible for appointing staff and making all arrangements for competition support, community relations, facility coordination, maintenance, personnel, VIP services and protocol. The commissioner appointed a food service manager to implement a pre-arranged food service plan but all security planning was done without input from the commissioner.

The commissioners' responsibilities and authority during the final pre-Games months were outlined on an area-by-area basis in a document entitled "*Commissioner's Mandate for the Preparatory Phase.*"

The commissioner was responsible for providing the Accommodations Department the necessary information to arrange for hotel and student residence hall rooms for the commissioner, out-of-state staff and IF officials and for updating this information on a regular basis. The commissioner was also responsible for assisting in the collection of all monies due from the IF and was responsible for the coordination of reimbursement of expenses for technical delegates, support officials and other out-of-area staff. Finally, the commissioner was responsible for cooperating with the Transportation Department to arrange transportation for IF officials and out-of-area staff from their accommodations to the venues.

In the area of accreditation and access control, the commissioner ensured that each of the venue staff was properly accredited by making sure that all staff members were processed through the Games Staffing System, badge pictures were taken and that the appropriate access level was assigned to each staff member. The commissioner also reviewed the access zones contained within the venue development plan.

A venue ceremonies manager was appointed at each venue and the commissioner's responsibilities were to confirm ceremony times and assist in the planning of the actual staging of the awards ceremonies.

The commissioner had overall responsibility for the competition arrangements, beginning with all aspects of the operation of the

competition. This included obtaining necessary approval and support of the IF and providing services to the international officials. The commissioner selected the competition announcers in consultation with the Language Services Department which certified French-speaking announcers. The commissioner ensured the appropriate planning of training site operations in concert with the training site personnel within the Sports Department.

Community relations in and around the venue were the joint responsibility of the commissioner and the LAOOC community relations staff, which had already initiated some community programs.

Spectator Services negotiated all novelty and concessions contracts. The commissioner's responsibility for this area occurred during the Games. However, the commissioner did work with Spectator Services to determine any sport-specific products to be sold at the venue.

The commissioner's authority in relationship to construction and design was limited by the construction budget, the venue schematic drawing from venue development and the plan for the venue Look. The commissioner could propose changes in the design, but such modifications had to be consistent with the overall intent of the Look and any materiel changes followed the process for changing venue development plans. The commissioners monitored the procurement of all governmental permits while the Construction Department had sole authority to enter into contracts for construction and design services.

The commissioner could propose to Corporate Relations which sponsors and suppliers should have a presence at the venue while senior management made the final decisions. The commissioner could solicit "sponsors" to extend services such as hospitality at the venue, but these actions had to be approved by Corporate Relations.

Regarding finance, central departments that provided services or equipment to the venue developed their own budgets, while the commissioner developed budgets for competition, venue services and protocol. The Finance Department developed procedures which allowed the commissioner to spend funds from the venue budget as well as from a contingency fund.

Food Services planned its functions while the commissioner was allowed to appoint a venue food services

manager and plan staff meal procedures. The commissioner worked with Food Services to plan catering for hospitality.

Government Relations was involved in any contract with a government agency that impacted a site. Within certain guidelines, the commissioner developed a working relationship with local officials who had jurisdiction over the venue. After consulting with the Government Relations Department, the commissioner could represent the LAOOC before public hearings.

The commissioner worked with Olympic Health Services to ensure that the chief medical officer coordinated preparations for sports medicine, spectator first aid and doping control services at the venue. The commissioner could not alter the doping control collection procedures, the handling of specimens or the number of tests to be conducted.

Because Language Services supported the operational flow at the venue, the commissioner assisted this department in understanding the venue's need for language support.

When necessary, the commissioner negotiated for maintenance services with the venue owner or another party with all contract approval coming from senior management. Maintenance included routine clean-up, custodial services and grounds maintenance as well as unscheduled maintenance and repair.

The Material Logistics Department handled the actual requisitioning, storing and delivery of supplies, furniture and equipment for each venue and the commissioner was responsible for ensuring that all necessary items were ordered and delivery dates and timetables arranged in consultation with the venue material supply coordinator.

The commissioner had the overall responsibility to ensure that sufficient staff was obtained for the venue during the Games. This included reviewing each department's effort in obtaining the staff for which they were responsible. The commissioner and the appropriate support department jointly approved the appointment of key venue managers representing that support department. The commissioner could cut the number of staff from the approved venue development plan with the concurrence of the affected support departments but could not increase staff numbers without following certain required approval steps for changes in the venue development plans.

The Press Operations Department developed its own plans at each venue with commissioner input. Any changes to the venue development plan, such as changing the location of the mixed zone or photo positions, required joint approval of the commissioner and the Press Operations Department.

Prior to the Games, public information was handled centrally but during the Games the commissioner had complete authority over public information.

Security, as mentioned, was controlled by the central department, though the commissioner had the authority to allocate, move or change the number of non-security guard access controllers up to the budgeted number of access controllers.

All technology services including results, telecommunications, timing and scoring were coordinated by the commissioner. The allocation of radios, pagers, televisions, EMS terminals and photocopiers was made in conjunction with the Technology Department, as was the rental or purchase of additional sponsor-supplied items. The commissioner was also responsible for planning which information was displayed on scoreboards though all requests for changes in Swiss Timing services were channeled through the Technology Department.

The LAOOC negotiated individual contracts with the host broadcaster and official film producer and any proposed changes in camera positions, interview areas or compound locations were coordinated with the Television Operations Department. The commissioner negotiated with the host broadcaster to produce a schedule for its catering trucks and other support functions during the days of competition.

The commissioner was encouraged to work with the Ticketing Department to promote ticket sales at venues with significant numbers of unsold tickets such as football and hockey. The Ticketing Department had a small presence at most venues during the Games to resolve on-site ticket holder problems and had a greater presence where on-site ticket sales occurred.

The Transportation Department specified the bus loading and unloading areas for athletes, press, IF officials and spectators and carried out the pre-Games planning of these operations. The commissioner was responsible for assisting parking and transportation operations at the venue.

Uniforms were distributed centrally and the commissioners were responsible for designating which employees received specific levels of uniforms.

Protocol services at the venue were the commissioner's responsibility and were planned in consultation with Olympic Family Services and Government Relations. The

4

commissioner organized parties and functions and determined invitation lists. The commissioner recruited the hosts and hostesses for the venue who were trained by the central Protocol Department.

30.02.4 Relationship with the venue owner

Once most of the venue rental agreements were signed, LAOOC senior management initiated programs to acquaint the owners with LAOOC policies and, more importantly, to introduce owners and operators to LAOOC staff that was directly involved in the venue operations.

An Olympic venue policy manual was developed to provide general information to the venue owners.

Each facility was given a *Star in Motion* flag and a plaque designating the facility as an official LAOOC venue site. Commissioners met regularly with individual venue owners to develop good community relations and to meet with local police and fire department officials. Venue owners and community members often raised concerns about potential traffic problems, noise and other issues and the commissioner was able to act as a liaison between the Organizing Committee and the venue.

Many of the initial venue rental agreements were signed when the commissioners were appointed, but a few commissioners became directly involved in the site selection and negotiation process.

All commissioners were charged with following up on the initial agreements to ensure that all aspects of the venue contract were finalized and unresolved issues were solved. A checklist was developed by the Legal Department to assist the commissioners in completing negotiations. General contract items included definition of

4 Cycling Commissioner Pete Siracusa discussing the placement of Olympic venues with UCLA Village Vice President Frank Smith.

Sports Administration and Competition Management

facilities and property boundaries, access dates, rental payments and/or amount of revenue to be shared with the owner and responsibility of existing site management during the Games.

While rental agreements were being amended and contracts finalized, the commissioners helped venue owners understand their rights, privileges and restrictions as the operators of Olympic venues.

- Facility owners were allowed to declare in their regular advertising that the venue was the "Site of the 1984 Olympic (name of sport) Competition." In addition, venues could prominently display an on-site sign declaring they were the site of the selected competition. Guidelines were developed for the specific use of each sign.
- Beginning 1 August 1983, the venue owners could utilize the LAOOC emblem (*Star in Motion*), the mascot (*Sam the Olympic Eagle*) in their venue's sport poses and the relevant pictogram (hereinafter referred to as symbols) in their regular business advertising, subject to certain conditions and limitations.
- In accordance with the 1978 provisional edition of the Olympic Charter, commercial advertising was not permitted inside the stadiums or sports arenas during the Games. This meant that no commercial presence or advertising was permitted on, near, or that could be visible from the field of play or the surrounding spectator seating areas. Advertisements consistent with LAOOC standards were permitted in areas away from the field of play, such as the lobby area. Venue owners were encouraged to allow official sponsors the opportunity to participate in any such advertising. No advertising was permitted on any sports equipment, including the scoreboards, used during the Games. Also, no unofficial banners or signs could be displayed in the venue during the Games.
- Venue tours became an important issue as LAOOC staff and various sport International Federations needed to become acquainted with the venues. To ensure that these tours were conducted in a smooth and efficient manner, certain guidelines were developed, limiting the number of LAOOC staff members authorized to request site access for tours. All tours were given by LAOOC staff members.

30.02.5 Responsibility at the time of the Games

The commissioner's authority at the time of the Games was clearly defined in a document produced in June 1984 called the *"Commissioner's Authority*

Memo. "It was widely distributed in an attempt to familiarize staff with the line of authority at the venue level. Guidelines were initially set forth in the *"Commissioner's Mandate for the Preparatory Phase"* which was also required reading for key management.

Once the process of "venuization" began for each venue, the commissioner's authority became more widely recognized and understood. This responsibility was executed in a manner consistent with overall LAOOC policies and in the event of an emergency, problem or dispute at the time of the Games, the commissioner's decision was executed. Appeals, if any, were made later.

The Operations Center was available for a number of services for the commissioners during the Games including approval of expenditures of more than \$20,000; providing a contingency budget if the commissioner's budget was exhausted; settling disputes between a commissioner and a central support department; reallocating scarce resources or approving transfers of staff between sites and disseminating information on central policy decisions. Several overall guidelines were spelled out for the commissioners in the authority memo:

- With reasonable cause, the commissioner could suspend or terminate any LAOOC Games staff member.
- The commissioner could change access privileges of any venue staff member.
- The commissioner could authorize expenditures against his or her budget, while central departments retained control of their own budgets. That included those portions of the department's budget allocated to the venue including the budgets allocated by Construction, Press Operations and Health Services.
- The commissioner had control over all contractors operating at the site, including security guards, and could eject anyone causing problems through a request to the contractor's highest-ranking manager on site. Because some third party firms operated at several sites, the commissioner notified the Operations Center regarding any problems with these contractors.

The boundaries of the commissioner's authority:

- Accommodations; the commissioner could request a small number of contingency rooms for use during the Games for unanticipated demands and could authorize rooms at the LAOOC's expense for additional venue staff, up to the limit of the venue budget.
- Accreditation; while the central department developed guidelines and procedures for the issuance of

5

venue and hospitality passes, these passes were completely within the control of the commissioner. He could also authorize changes in the access privileges of any staff member at the venue except those with only zone 9 (public area only) who might not have undergone a security check. The commissioner was asked to consult with the venue director, venue security manager and access control manager before changing zone assignments. The commissioner was not allowed to authorize the issuance of Olympic Family accreditations ("A," "B," "C," "D," "E," "F," "G," "J," or "O").

- Architecture and Construction; the Construction Department was responsible for any actual building at the site. The commissioner could make minor additions and corrections as required, within his own budget. The commissioner could change the office assignments of the staff and the flows within the site and was instructed to carefully inspect the signs at the site and to order changes as appropriate to facilitate spectator movement.
- Awards; because it was difficult for international broadcasters to accommodate changes in the start times of the ceremonies, the commissioner could only make a change when absolutely necessary, and only after notifying the Operations Center. The conduct of the actual awards ceremony was to

5 Aquatics Commissioner Jay Flood explaining some of the finer points of water polo (which he played as a youth) to youngsters prior to the start of the III FINA World Water Polo Cup in 1983.

- be identical among sites and any changes had to be approved in advance by the central awards ceremony director. It was the responsibility of the IOC to select award presenters. If the IOC member designated was not present, the Olympic Family Services protocol office at the Biltmore Hotel was contacted and if that presenter failed to show, the commissioner appointed a presenter.
- Competition; changes to the competition schedule could only be made with IF and host broadcaster concurrence. The Operations Center was notified immediately if any session was to start earlier than scheduled or later than five minutes after the scheduled time.
 - Concessions; types and prices of merchandise were set centrally for most venues.
 - Dress rehearsal; the commissioner was responsible for staging one or more dress rehearsals at the venue prior to the start of competition.
 - Finance; each venue had a petty cash fund of several thousand dollars and the venue finance manager provided pre-signed blank checks valid for payments up to \$500, \$1,000 or \$1,500 for emergency purchases. The commissioner could authorize overtime payments for staff, within the budget, but could not change a staff member's pay rate without approval from the Operations Center.
 - Food service; the commissioner was responsible for all food services at the venue including disposing, other than by sale, of unused athlete and staff lunches and other food, consistent with public health rules. In some cases, the food was donated to a charity or other worthy cause. The commissioner had complete discretion over who had access to any venue parties or hospitality functions (though the transporting of competitors for such purposes was prohibited). The commissioner could authorize a second box lunch for staff working in excess of 10 hours.
 - Games staffing; staff added at the last minute were not issued accreditation without a security check. The commissioner could, however, issue staff public area badges.
 - Health services; any changes to the doping control process could be made only with the concurrence of the doping control supervisor and chief medical officer, who had to clear such changes with the central department head. In the event of a life-threatening medical emergency, the chief medical officer was temporarily in charge of the immediate surroundings and all resources directly related to the emergency. The commissioner was responsible for carefully planning the roles of the venue director, competition director, chief medical officer, security manager and others during such emergencies, including a detailed understanding of the multicasualty incident plan. Absent an emergency, the commissioner, with input from the chief medical officer, could order changes in the deployment of venue-specific health service resources, staging areas, supplies and staff.
 - Language services; the commissioner had complete authority to determine venue-specific language priorities and could request additional staff from the central pool on an "as available" basis.
 - Materiel supply; the commissioner was responsible for all materials needed within the venue and ordered any last minute supplies through the Material Logistics Department. If such supplies were not available centrally in a timely manner, the commissioner could procure them from an outside source.
 - Olympic Family Services; the commissioner could, with the assistance of security, remove an unruly member of the Olympic Family from the site and confiscate his accreditation badge. This was to be done only in extreme cases and the commissioner was to consult with the protocol manager, competition director, venue press chief or chief medical officer as appropriate and notify the Operations Center of any such occurrence.
 - Press operations; no staff member or contractor ("L" and "K" accreditations) could grant press interviews without explicit permission of the commissioner or venue press chief. All "L" and "K" accredited staff agreed to such restrictions when signing their Terms and Conditions agreement or Games accreditation application. The commissioner or other venue spokesperson was not allowed to discuss the details of security without clearance from the central department authority. The commissioner, with the concurrence of the venue press chief, could authorize the removal of a disruptive "E" accredited person. Confiscated badges were turned over to the venue press chief who contacted the proper authority at the Main Press Center. Accredited members of the press had the right to cover all events and incidents as long as they remained within the designated press zones. The commissioner could admit, using a venue pass, non-accredited written press and photographers to the public area of the venue only.
 - Security; the venue security manager had day-to-day responsibility for coordinating with law enforcement and supervising private security at the site while the commissioner was encouraged to develop a close rapport with the highest-ranking law enforcement commander. Law enforcement had authority at a venue when a breach of the law occurred or when there was a clear and present danger to public safety. Until then, their role was advisory. If such an incident occurred, law enforcement was responsible for all activities directly related to the incident, but not for other ongoing operations of the venue. The necessary precautions in the event of a bomb threat were determined by the commissioner upon the advice of the venue director, security manager and law enforcement commander. If a threat occurred, the Operations Center was notified and was consulted if evacuation was a possibility.
 - Technology; the commissioner was responsible for allocating all technology equipment to the various department at the site.
 - Television; the commissioner was responsible for implementing LAOOC television policy at the venue and, pursuant to the LAOOC agreement with the host broadcaster, no unaccredited broadcasters or electronic news-gathering crews were allowed into the venue for any purpose. The commissioner enforced the policy that specified that NOC or IF filming was for non-commercial use only.
 - Ticketing; the only way someone could be admitted to a venue without a ticket was by having the proper accreditation, venue pass or emergency services pass. The disposition of the house "contingency tickets" for problems such as blocked seats was set forth in the ticketing procedures, over which the commissioner had no control.
 - Training sites; with the exception of competition sites and the Wooden Center (gymnastics), all training sites were operated by Sports Department personnel. Training schedules at the competition sites were the responsibility of the commissioner.
 - Transportation; the commissioner could request, but not order, an additional competitor bus or Olympic Family vehicle. The commissioner had complete authority over the venue-specific fleet, consistent with motorpool policies and complete discretion regarding the issuance of parking passes for staff, contractors, the IF and others.
 - Uniforms; the commissioner could order the Uniform Department to provide an outfit for staff added at the last minute, though the department could not promise the requested style or color uniform. The commissioner could not procure uniforms from another source.

30.02.6 Summary

To avoid the "revolution" that has often occurred when other major sport competition organizers have moved into their venues, the LAOOC introduced the concept of sport commissioners. Not only did the commissioners have the ultimate authority at their venues but had been so involved in pre-Games planning that management decisions at the time of the Games were based upon years of preparation.

Though each commissioner's dedication varied during the pre-Games period, there was no question that the commissioner's program provided excellent Games-time management. Notable relationships formed with the IFs prior to the Games and the ability of the IF to consistently communicate with one individual made a positive difference in the resolution of competition issues during the Games. Most commissioners were heavily involved in the planning of all aspects of their venue, though a background knowledge of the particular sport was not a prerequisite for the position. Some commissioners were extremely involved in designing their fields of play; a few assisted in the site selection process. All were responsible for fine-tuning contracts with the site owners.

Each of the venues functioned during the Games without major incident and the presentation of the competitions was nearly flawless. Venue staff clearly recognized the single authority concept which eased potential confusion caused by day-to-day problems.

30.03 Competition management

30.03.1 Coordination with the International Federations

The Olympic Charter stipulates that "The IOC is the final authority on all questions concerning the Olympic Games and the Olympic movement," However, the IOC delegates to the International Federations specific authority in the technical control of the sports that they govern. Each International Federation is completely responsible for the staging of its sport during the Games.

Each International Federation (IF) is a worldwide organization that governs all competitions and technical aspects of a particular sport. Each is comprised of member national organizations of sport from various countries. In 1984, there were 23 IFs controlling sports on the Los Angeles program. All IFs hold world championships of their own. In the Olympic year, most federations do not hold a world championship but recognize the Games competitions in their sport as the premier event for the year.

Each federation has a president, secretary-general and two technical delegates. The president and secretary-general usually are more involved in the conceptual and early developmental stages of their sport as it fits into the program of the Olympic Games. The

technical delegates' duties are much more specific and deal primarily with the technical operation of the competition.

The earliest involvement the IFs had with Los Angeles was when the city was preparing to submit its bid to the IOC for the award of the Games. City officials talked to the majority of the federations about the type of facilities that would be offered as competition venues in 1984.

Upon award of the Games and formation of the LAOOC, one of the first tasks of the Organizing Committee was to select the sites for competition and training. Approval of the proposed indoor venues such as The Forum for basketball, Pauley Pavilion for gymnastics and the Los Angeles Memorial Sports Arena for boxing was relatively easy to obtain from the appropriate IFs.

However, some venues, such as the rowing and canoeing site, posed numerous problems. After originally considering the construction of a permanent rowing/canoeing facility, then looking at nearly 30 different sites for temporary use, the LAOOC finally recommended Lake Casitas as the venue, which the rowing and canoeing federations approved. The same was true of the equestrian federation and its search for an appropriate site for the endurance portion of the three-day event. Fairbanks Ranch was finally agreed upon. The LAOOC also held extensive discussions with the federation governing modern pentathlon. In past Games, the five events of the modern pentathlon were held at the five venues of the respective sports since officials and the field of play were already there. However, the event was hosted at one location in Los Angeles, and the federation was forced to supply its own officials for each of the sports except fencing.

The approval process of each federation involved visits by the technical delegates to the venues. Although the LAOOC agreed to pay for two official visits for each technical delegate, each visited Los Angeles a number of times. After the sites were agreed upon, each federation began the process of approving all other aspects of the field of play as well as the formation of the competition schedule. This process took from 1981 to the end of 1983. The next stage of approvals involved training sites and training periods, equipment, publication of each explanatory brochure, office space for federation officials and layout of the field of play. The selection and approval of equipment often required months of discussion.

After all aspects of the field of play were determined, each federation turned its attention toward support and logistical arrangements that had to

be made. Each federation was concerned about transportation to and from venues, the availability of cars and drivers, uniforms, access privileges, accreditation procedures and the availability of rooms at nearby hotels. These elements took from six months to one year to finalize.

The approval process for the LAOOC was handled by each of the sports commissioners. One of the goals of the commissioner program was to provide each federation with the same contact person within the LAOOC during the planning process. This provided an easy flow of information and a buildup of trust between the two organizations.

During the LAOOC's early stages of development, each commissioner attended world championships to observe details of competition management. After viewing a number of events, each commissioner translated the strengths and weaknesses of the events observed into the best possible plan for Los Angeles. Even at this early point in the development of the LAOOC, many of the commissioners were very well known to members of their respective federations. This smooth relationship between the commissioners and IFs was a major ingredient of the many successfully staged competitions in 1984.

The International Federations also had the responsibility for appointing internationally qualified judges for the Games. The number in each sport was determined by each federation with the help of the IOC honorary director of sports, who acted as a coordinator between all federations and the LAOOC.

In 1982, it was announced that the travel and lodging expenses of the international officials would be paid for by the IOC. The LAOOC did pay for the transportation and lodging of all supplemental or national judges. The LAOOC planned to use officials from Southern California who were approved by the national governing body in each sport to improve the caliber of local officials in the lesser-known Olympic sports.

Ten International Federations chose to hold general business sessions or congresses in Los Angeles during the Games. During a congress, delegates from each sport typically conduct federation business, which may include election of officials and passage of regulations which govern the conduct of the sport.

Unlike previous Olympic Games, the LAOOC did not assume ultimate responsibility for the planning, management and funding of the

Federation congresses during Games

Federation	Date	Location
FINA	25 July	Pepperdine University Law School Amphitheatre, Malibu, California
IHF	25–26 July	Westgate Hotel, San Diego, California
FIVB	25–26 July	Hyatt Regency Hotel, Long Beach, California
FIG	25–26 July	Airport Hilton and Towers, Los Angeles, California
UIPMB	25–26 July	Conference Center Coto de Caza, California
IWF	27 July	Airport Hilton and Towers Los Angeles, California
FIAC	27 July	Hyatt Regency Hotel, Long Beach, California
IAAF	31 July–1 August	Westin Bonaventure Hotel Los Angeles, California
IYRU	5 August	Hyatt Regency Hotel, Long Beach, California
AIBA	10 August	University Hilton, Los Angeles, California

federation congresses. The LAOOC did, however, identify and secure congress meeting sites and select individuals and companies to provide interpretation services upon request. The LAOOC assisted in identifying the best sources for all other services that might be required by the federations. Although the LAOOC's objective was to assist the International Federations in putting on their own congresses while assuming no financial responsibility, the LAOOC recognized that the quality of the congresses would be a direct reflection upon the LAOOC. In consideration of the financial status of the IFs and to continue the good relationship between the LAOOC and the IFs, every effort was made to assist them in putting on their congresses in the most efficient and inexpensive way possible while preserving their quality. The LAOOC's approach to congresses was significant in two ways:

- Since the federations were required to pay for services, they were more selective in deciding what was important to have, what was important to accomplish, how much time and what languages were needed.
- Second, because the distinction was clearly drawn between the resources available to delegates accredited to the Games and those available to congress delegates who were not accredited, federations had to make arrangements for unaccredited delegates who were not guaranteed accommodations, transportation, credentials and tickets.

30.03.2 Formation of the competition secretariat

The operation of the competition secretariat differed greatly from sport to sport during the Games. The staging of the competition was the ultimate responsibility of each IF and the organization of staff needed to accomplish this depended mostly upon the complexity of each sport. Each

sport designated a group of people to provide the administrative link between the federation and the LAOOC competition management. This group formed the competition secretariat.

The staff for each was typically comprised of one secretariat manager, one to three office managers and two to four clerks, depending upon the size of the competition and the working relationship between the federation and the LAOOC. The secretariat managers were usually employed by the LAOOC two to six months prior to the Games with the other staff members added just before the Games.

The duties of the secretariat varied from general office work, transportation and protocol duties to day-to-day control of the competition. The following comparison of the competition secretariats in the sports of football, wrestling and athletics serves to point out how each organization differed.

Football—The main function was to assist members of the FIFA with matters concerning competition, including distribution of rules or mandates of the federation made on a daily basis to the participating teams; arranging for the transportation of the delegates within Los Angeles; assisting with office equipment such as telex, photocopiers, word processors, typewriters and walkie-talkies. The secretariat also worked closely with the Protocol Department to arrange for outings for the members of the delegation and their spouses. The office of the secretariat was clearly provided to support the FIFA, specifically since the federation even

used their own secretaries. The office of the secretariat was equipped with telephones, three electric typewriters, photocopying machine, telecopier and word processor.

Wrestling—The wrestling secretariat consisted of only one individual. He was heavily involved in USA wrestling and was chosen by the commissioner. The duties of this competition secretary included controlling the flow of bouts for the tournament, collection and distribution of all competition-related data and verifying all information and results. The secretary reported directly to the competition director and to the FILA technical delegate for competition. He had total responsibility for the flow of information to and from the pairings masters, the communications staff, the head officials, the FILA bureau and the teams. The secretary held a valid FILA license as a pairings master. Other specific duties included:

- Supervision and coordination of preparations for weigh-ins
- Supervision and coordination of communications from weigh-ins to pairings masters and to the personal computer pairings entry operator
- Determination, in consultation with a FILA technical delegate, of the number of rounds to be wrestled by each weight class each session, the order of weights to be paired and wrestled and the mat assignment of each group of each weight class
- Verification of the official entry list for each weight class and approval of changes authorized by the FILA delegates
- Supervision and coordination of the distribution of results to announcers, pairings masters, personal computer pairings and results computer system
- Verification of the identity of award winners and provision of data for announcers and ceremonies staff

Athletics—A full-time athletics secretariat manager was hired six months prior to the Games. This person also served as the sports manager and reported directly to the commissioner of athletics. Prior to the Games, the general duties of the sports manager/secretariat included handling all contacts with team officials and organizing the operation of the athletics desk in the sports information office of each village. The preparation of a team manual, an athletics procedures manual and an officials manual were additional duties, as well as organizing the administration competition secretariat to confirm all entries, qualifying standards, declarations, seeding, drawing and results distribution.

During the Games, the sports manager/secretariat managed 24 volunteers who worked at the Coliseum and village sports information centers. The hours of operation were generally 0800-2230 from 22 July to 13 August.

The operation at the villages included the following:

- Confirmation of participation of athletes
- Transfer of written questions from team leaders to technical officials
- Distribution of result/start lists

The operation at the Coliseum involved:

- Assisting the team leaders and coaches
- Coordinating messages via EMS/telephone from the villages
- Coordinating all tasks for each preliminary and final event including final entries, preliminary lists of entries, final lists of entries, number assignments, seeding, confirmation of participation, start lists, lists of participants, results distribution, results cards, scratches and protest procedures.

The facilities at the Coliseum included the following:

- Working room with EMS terminal and printer, telecopier, personal computer, two desks, three tables, two telephones and one television
- Result/Start list distribution room with individual boxes for each nation and event
- Secretariat room with copy machines, four telephones, four desks and chairs, four typewriters and one television
- Secretariat manager's office with one television and one desk and chair

It was obvious that within the organization of competition management for each sport someone had to be responsible for the administrative details that supported the actual races, matches and games. Whether a competition secretariat was formed and given critical duties to support the events or whether those duties were undertaken by another aspect of the competition management depended largely on the relationship between the federation and the commissioner.

30.03.3 Provision of equipment

In 1980, the LAOOC Sports and Corporate Relations Departments initiated the process of acquiring equipment for all sports competitions. Even though many of the competition sites had not been finalized, the LAOOC wanted to conclude as many supplier agreements as possible at an early date.

The first step in the acquisition process was to determine the type and the amount of equipment that was

required for each sport. It was also necessary to determine, by sport, which equipment had to meet the requirements set forth by each International Federation and which equipment was less regulated. The hockey federation, for example, required that the LAOOC purchase the hockey balls from one of several manufacturers, whereas the LAOOC could purchase the goal standards and nets from any manufacturer as long as the standards and nets met certain specifications.

The goal was to negotiate the best agreement which would provide the sport with state-of-the-art equipment while also limiting the number of suppliers to a workable number. This was accomplished by using companies who could provide equipment for several sports, such as the Porter Equipment Company which provided standards for basketball and water polo and goals and nets for football, handball and hockey. Toledo Scale was also a large supplier and provided weighing equipment for 12 sports.

The LAOOC was interested in using United States suppliers where appropriate, but ultimately used many foreign companies because they manufactured the best products for certain sports. The LAOOC also looked for suppliers who had been associated with previous Olympic Games.

The second step in the acquisition process was negotiation of the contracts. The agreements with the equipment suppliers had the same set of basic provisions (not all provisions were included in every contract) which included the following:

- Each supplier had to supply equipment for all training sites as well as the competition site.
- Each supplier was required to ship the equipment to the LAOOC at its own expense.
- Each company was responsible for providing staff to manage its product which included repair, installation, maintenance and take down.
- Each supplier had to donate some equipment to the LAOOC, who often passed it on to youth groups during or after the Games.
- The larger companies were required to make a royalty payment for use of the LAOOC logo.

Some of the sports required only a few types of equipment, but others such as fencing and athletics required numerous pieces. Typically in past Games, organizers purchased equipment for athletics from five or six federation-approved companies or had a number of different sponsors. The LAOOC decided, however, to designate a distributor of athletic equipment as an official supplier. This agreement stipulated that the supplier, UCS, would be responsible for the procurement, inventory, issue, shipping,

replacement and cleaning of all athletics equipment. It is estimated that this arrangement saved the LAOOC almost \$1 million.

The following is a listing, by sport, of the equipment required by each federation as well as the equipment that was necessary but not specifically regulated.

Archery

- Athletes could bring their own bow and arrows.
- The LAOOC was required to provide facilities for purchase of replacement bows and arrows.
- Target standards, faces and backs had to meet specifications but could be purchased from any manufacturer.

Athletics

- The IAAF had strict requirements for acquisition of all equipment including manufacturers and model numbers.

Basketball

- The ball had to meet federation standards and be purchased from an approved manufacturer. Playing surface and standards had to meet specifications but could be purchased from any manufacturer.

Boxing

- Gloves had to meet federation standards and be purchased from an approved manufacturer.
- Speed bags, headgear and rings had to meet specifications but could be purchased from any manufacturer.

Canoeing/Kayaking

- The LAOOC supplied canoes and kayaks for rental and each had to meet federation standards.

Cycling

- Competitors supplied their own bicycles. The LAOOC had to name an official supplier of repair work and parts.

Equestrian

- The LAOOC was not required to supply any equipment.

Fencing

- Fencers provided their own pieces of equipment.
- The pistes had to meet IF specifications but could be purchased from any manufacturer.
- All scoring and other electrical equipment had to meet federation standards and be purchased from an approved manufacturer.

Football

- The ball had to meet federation standards and be purchased from an approved manufacturer.
- The goals and nets had to meet specifications but could be purchased from any manufacturer.

Gymnastics

- All equipment had to meet federation standards and be purchased from an approved manufacturer.

Handball

- The ball and the flooring had to meet federation standards and be purchased from an approved manufacturer.
- The goals and nets had to meet specifications but could be purchased from any manufacturer.

Hockey

- The ball and playing surface had to meet federation standards and be purchased from an approved manufacturer.
- The goals and nets had to meet specifications but could be purchased from any manufacturer.

Judo

- The tatami had to meet federation standards and be purchased from an approved manufacturer.

Modern Pentathlon

- The fencing requirements were the same as the sport of fencing.
- Athletes provided their own firearms for shooting and the LAOOC provided the targets which had to meet specifications but could be purchased from any manufacturer.
- The LAOOC provided the horses. All riding equipment had to meet IF specifications but could be purchased from any manufacturer.

Rowing

- The LAOOC supplied only the weighing equipment for the shells.

Shooting

- The athletes provided their own firearms; the LAOOC provided the targets which had to meet specifications but could be purchased from any manufacturer.

Swimming

- Equipment consisted mostly of small items that could be purchased from any manufacturer.

Volleyball

- The standards, nets, flooring and balls had to meet specifications but could be purchased from any manufacturer.

Water Polo

- The balls and goal standards had to meet IF specifications but could be purchased from any manufacturer.

Weightlifting

- All bars and disks had to meet federation standards and be purchased from an approved manufacturer.

Wrestling

- The mats, platform and training dolls had to meet federation standards and be purchased from approved manufacturers.

Yachting

- The LAOOC supplied the Finn boats for competition. They had to meet certain specifications but could be purchased from any manufacturer.

Baseball

- The balls had to meet federation standards and be purchased from an approved manufacturer.

Tennis

- The balls had to meet federation standards and be purchased from an approved manufacturer.

Of the 36 contractors (20 official suppliers) that supplied sports equipment, 21 companies were accredited to service and repair their equipment during training and competition.

The number of technicians required to service and maintain each company's equipment was set by the Sports Department prior to the development of third-party accreditation procedures. Once the procedures were established, the companies were contacted in March 1984 both to verify the number of accreditations they would need and to inform them of the accreditation policies and procedures. A total of 21 companies and 154 technicians were accredited.

Sports managers and commissioners were then consulted with regard to the assignment of access zones. Depending on the equipment supplied, some technicians required access to the field of play and athlete warm-up areas. Others needed entry solely to venue management or competition support areas.

Initially, third-party contractors were not allocated uniforms, however, because a large number of sports equipment technicians were required to be on the field of play, uniforms were approved for all sports equipment contractor personnel.

After the suppliers were identified in each sport it was up to each sports manager to identify any other equipment necessary for competition. This equipment, often minor in nature such as scorecards and judges' chairs, became part of each sport's materiel supply needs and was purchased directly.

The process of identifying and acquiring sports equipment required almost four years of effort between the Corporate Relations and Sports departments. The supplier agreements negotiated with sports equipment companies worldwide provided the best equipment for the athletes while also saving the LAOOC millions of dollars. The following is a complete roster of official equipment used during the Games:

Roster of official equipment

<i>Item/Model</i>	<i>Manufacturer/country</i>	<i>Quantity</i>	<i>Item/Model</i>	<i>Manufacturer/country</i>	<i>Quantity</i>

30.03.4 Technical officials and judges

The LAOOC was charged with hosting nearly 2,300 technical officials and judges during their stay in Los Angeles. Besides providing accommodations and food, the LAOOC provided transportation, uniforms, medical services and other support so that officials and judges could concentrate on their technical responsibilities.

The officials were divided among the following categories:

- "B" officials; presidents, secretaries-general, technical delegates (and one guest each) from the 23 International Federations
- "D" officials; juries of appeal members, technical committee judges, technical staff members, referees, judges and timekeepers
- "L" officials; support officials from the host country; such as statisticians, linesmen, timekeepers and ball boys

Coordination of the various services for the officials started as early as 1981. The most important and ultimately most difficult task was to determine the exact number of technical officials and their functions. Some International Federations waited until very late to select their technical officials which made the process of planning services very difficult. Deciding upon the scope of services to be provided during the Games was also dependent upon determining the officials' functions. This was somewhat difficult since many sports had different titles for officials who seemingly did the same job. For example, the jury of appeal in one sport actually did the timing, while in another sport there were official timers in addition to the jury of appeal.

Approximately six months prior to the Games, the LAOOC developed an officials' coordinator program to take the pressure off the sports managers and coordinate all aspects of the officials' stay. Ultimately, 23 officials' coordinators were appointed, one for every sport.

The officials' coordinator's primary task was to work with the sports officials to ensure that they were ready to work in the right place, at the right time and in the right uniform. This involved coordinating services such as transportation, accommodations, publications, escort to the Uniform Distribution Center and providing information about each of the services. Each coordinator made special arrangements to have offices or information desks at the venues to meet the officials' needs.

The coordinators quickly identified the necessity of providing consistent information to the officials and decided that a "Guide for Technical Officials" would best meet the need. The guide was originally intended for "B" and "D" officials not staying at the Biltmore Hotel, but some sports also

provided them to the Biltmore "B"s as well. The guide for each sport was divided into three sections: general, local and sport-specific. French translation was provided for the general information and on request by the sports for the second and third sections. It was also decided that "L" officials (LAOOC staff/support officials) should be given the local and sport-specific information.

The guides were distributed by mail (probably the most useful method) to the technical officials; some were placed in the officials' accommodations upon arrival and others were distributed by the coordinators.

The following is a summary of the services the LAOOC provided for technical officials:

Accommodations

"B" officials (IF president, secretary-general, technical delegates and guests) stayed at the Biltmore Hotel. "D" officials stayed at various hotels or campus housing units in the Los Angeles area.

Accreditation

Upon presentation of the officials' Olympic identity card, the accreditation center confirmed eligibility, verified amounts owed for accommodations and issued an accreditation badge. "B" officials residing at the Biltmore Hotel were accredited there. All others ("B"s not staying at the Biltmore, "D" officials and special "J"s) were accredited at the Olympic Arrival Center at the Los Angeles International Airport.

Upon arrival at LAX, Olympic Family members were met by an LAOOC host or hostess. Each baggage claim area contained an information booth and passengers from outside the United States were directed to special immigration lines for processing. Each person was then escorted through U.S. Customs inspection and then to the Olympic Arrival Center (OAC). Category "B" officials staying at the Biltmore were transported there for accreditation and non-Biltmore "B"s and "D"s were accredited at the OAC, then transported to their assigned housing.

Food Service

The Olympic Charter provided that all technical delegates are entitled to receive lodging and meals at the expense of the Organizing Committee. To meet this requirement, an official's voucher was submitted and approved by the LAOOC sports commissioner or manager for that sport and was redeemable for cash through each venue's finance office. The competition director, officials' coordinator or venue finance manager was responsible for coordinating per diem distribution.

8

8 Competition officials in action at the Los Angeles Memorial Coliseum.

Foreign "D" officials' travel, accommodations and meals were paid by the IF. National (USA) "D" officials and support and senior competition staff received travel, accommodations and meal expenses only as agreed by the IFs and LAOOC.

"B" -accredited officials were entitled to food services including:

- Olympic Family lounges at venues
- Soft drinks and fresh spring water
- Food and/or snacks at discretion of venue protocol manager
- Other food service areas at venues as arranged by venue protocol managers
- Concessions available for purchase

"D" -accredited officials were entitled to food services including:

- Staff lounge at each venue, except as otherwise organized by each sport
- Box meals; sandwich, salad, fruit, dessert and snack
- Soft drinks and fresh spring water
- Concessions available for purchase

Games results information

All venues, villages and the Biltmore Hotel carried results on the Electronic Messaging System (EMS). It was available 24 hours per day from 28 July to 15 August for all accredited Olympic personnel. Daily results, all results and athlete profiles were available in both English and French.

Health Services

"B" and "D" officials were provided personal urgent medical care at sports medical stations or spectator care stations during events. "B" officials at the Biltmore could obtain personal urgent medical care at the Biltmore Hotel 24 hours per day and also at the village polyclinics and venues.

If a problem arose when an official was not at a venue, hotel or village, he was directed to the nearest hospital emergency room and identified as a member of the Olympic Family.

Language Services

Interpretation services at the venues were dispatched through a language services office and were available one hour before competition, during competition and one hour after competition.

At the villages, language services were available through either the language services office or NOC service center.

Services were available 14 July–15 August from 0700–2200 daily and on-call assistance was available 24 hours daily.

Interpreters were available at the Olympic Arrival Center from 13 July–27 July (thereafter through the Main Press Center) from 0600–2400 hours. Standby assistance was available on request.

At the Main Press Center (MPC) interpreters were available 28 July–13 August from 0800–2300 hours. Standby assistance was available on request. Translation service was available from 14 July–13 August.

Ticketing

Each "B" and "D" official could attend events in his or her sport without tickets and sit in the "B" and "D" stands, respectively.

"B" officials' ticketing was provided as follows:

- Complimentary tickets to Opening and Closing Ceremonies were available at the Biltmore Hotel or Olympic Arrival Center.
- Information on complimentary tickets for selected high-demand events was available at accreditation. These tickets were issued on a first-come, first-served basis on the day before the event. Each official was able to obtain one ticket per session and up to a total of three tickets per day. "B" officials could authorize a representative to pick up tickets by obtaining a card from the Accreditation Department or at the Ticketing desk in the Galeria Room of the Biltmore Hotel.

"D" officials' ticketing was provided as follows:

- Complimentary tickets to Opening and Closing Ceremonies were available upon completing the accreditation process at the Olympic Arrival Center.
- Tickets were not required to attend events in the sport the official worked at. Tickets to other events could be purchased as available to the general public.

"J" special accreditation" ticketing was provided as follows:

- Tickets were not required for events in the officials' own sport.
- Tickets to other events could be purchased as available to the general public.

Transportation

"B" and "D" officials housed at hotels and campuses had access to the technical officials' shuttle. The service ran directly between the hotels/campuses and the sport venue. Vehicles were allocated to each sport and officials could also ride on the media transportation system which operated between the media hotels and Main Press Center (MPC), between the MPC, villages and venues and between the MPC and International Broadcast Center (IBC).

IF presidents and secretaries-general each were provided a car and a driver. For large events, such as Opening Ceremonies, large shuttles were used. Local transit buses (Southern California Rapid Transit District) were available for scheduled stops at or near all venues.

Uniforms

Upon arrival in Los Angeles, the officials' coordinator arranged for the officials to be transported to and from the Uniform Distribution Center. Some sports provided their own uniforms and some federations dictated the proper attire.

Besides the services provided to the officials, each was presented with a gift bag and a certificate. Different gifts were ordered and distributed for "B" and "D" officials.

"B" Gifts	"D" Gifts
Athletic bag	Athletic bag
Medallion	Single pin
Three-pin set	Medallion
Photo album	
Neck tie	

Certificates were provided to all officials. A calligrapher personalized the certificates; an enormous task given that officials were added, subtracted and substituted by the federations as late as one week before the Games.

Recommendations

The technical officials' and judges' program of services was extremely successful given its late start. Most of the recommendations during the Games centered around closing the gap between services provided to "B" and "D" officials. Other recommendations included:

- Provision of similar non-Olympic services such as social events and tours for both "B"s and "D"s. The true difference in rank between badge-holders in these categories was not as great as suggested by differences in accreditation level.
- Provision of a number of interpreters for the officials at the competitions to assist in communications with each other.
- Provision of systems of transportation specifically reviewed for adequacy for the use of officials.
- Provision of better opportunities for officials to receive their uniforms. It would have been helpful if one person in each sport could have been designated to handle all uniform arrangements.

In order to provide the best possible stay for the large number of officials, a dedicated number of personnel needed to be hired and trained approximately six months prior to the Games. This time frame allowed each officials' coordinator the proper amount of time to learn all other department functions as well as plan all details necessary for the diverse group of officials. The planning required for accommodations of 2,300 officials cannot be overestimated.

30.04 Competition sites

30.04.1 Philosophy of rented versus new sites

Sport facilities of almost every kind were abundant in the greater Los Angeles urban area, allowing the LAOOC to make extensive use of existing sites. Even though this concept required greater distances between some of the venues than if new facilities were built, millions of dollars in construction costs were saved.

Conducting a study of Los Angeles' numerous major sport facilities was one of the LAOOC's first tasks. Once these existing structures were identified, the most popular sports were assigned to fit each venue and contract arrangements were initiated with the venue owners. In some cases, facility agreements were made with the venue owner before a particular sport was assigned.

Another advantage the LAOOC had over past organizers was that it could adapt many sites to fit Olympic competition needs. For the first time since 1960, a lake was used for the rowing and canoeing competitions, avoiding the need to construct a costly competition basin. The yachting venue was close to other Olympic competition sites for the first time since 1956 and an existing marina was converted for use. A Southern California horse racing track with plenty of existing stable facilities was turned into an equestrian venue. An existing recreational archery range was converted for temporary Olympic use. For the first time ever, a central venue was created for the modern pentathlon with only minor construction necessary at the site.

Despite the abundance of excellent competition facilities in the greater Los Angeles area, the LAOOC knew early that some new sites would have to be built. The LAOOC decided that any sites that had to be built would be built early and with someone other than the LAOOC responsible for cost overruns. The LAOOC also decided that any new permanent facilities would be built to be compatible with the post-Games needs of the venue owners.

Two new sites were planned early in 1980 and funding was solicited from LAOOC sponsors. On 7 August 1980, it was announced that the McDonald's Corporation would underwrite the cost of building a new world-class swimming and diving stadium at the University of Southern California (USC). Since USC had no permanent need for the thousands of seats required for an Olympic event, temporary bleachers with a seating capacity in excess of 17,000 were erected. The LAOOC initially considered construction of a temporary pool but McDonald's made the construction of a permanent pool

possible. Ground was broken for the swimming and diving pools on 30 December 1981 and the new facility was dedicated 7 July 1983.

On 28 August 1980, the LAOOC announced that a velodrome would be built with funding from the Southland Corporation. Early in 1981, California State University at Dominguez Hills was selected as the venue site for the Olympic cycling track events and groundbreaking began on 9 July 1981. The facility was certified by the IF on 10 May 1982.

After an extensive search for a suitable site for the shooting ranges, the Prado Recreational Area in San Bernardino County was named as the site on 21 June 1983. Original plans called for the construction of temporary facilities, but permanent ranges were installed and donated to the San Bernardino County Department of Parks and Recreation.

New temporary facilities were constructed for rowing and canoeing at Lake Casitas, for the cycling team time trial event at the Artesia Freeway, for the cycling individual road race course in Mission Viejo, for the endurance test of the equestrian three-day event at Fairbanks Ranch Country Club near San Diego, for the yachting events at the Long Beach Downtown Shoreline Marina and for the archery events at El Dorado Park in Long Beach.

In all other venues, existing facilities were modified to fit venue and competition needs. In the case of tennis, the Los Angeles Tennis Center on the UCLA campus was a new facility, but was not built specifically for the Games.

30.04.2 Selection and acquisition program

The major private and city-owned facilities in the greater Los Angeles area were identified in the bid to host the Games. The Los Angeles Memorial Coliseum, the Memorial Sports Arena, the Rose Bowl, The Forum, the Anaheim Convention Center and the Long Beach Convention and Entertainment Center were all deemed potential sites for the most popular sports because of their seating capacity and location. Beginning in 1979 and 1980, the LAOOC assigned sports to fit the venues. Almost without hesitation, the Coliseum was the early choice for athletics. Though major restoration work was needed to upgrade the aging facility that had served as the main stadium during the 1932 Games, an agreement was reached with the venue owners on 9 November 1980. But it was not the LAOOC's first venue agreement. On 24 March 1980, an agreement was signed between the LAOOC, the city of Long Beach and the Southern California Yachting Association for use of the Long Beach Marina as the yachting venue.

Once the major sites were examined and sport assignments made, the LAOOC began looking at major universities and public and privately-owned facilities for the rest of the sports. San Diego was considered close enough for travel but San Francisco was considered too distant (with the exception of preliminary football games). As venues were identified, the Sports Department determined which sport would fit. Ultimately, the IF had to approve the venue selected for its sport.

A basic rental agreement was prepared and signed between the venue owner and the LAOOC and later modifications to the contract were made before a final contract was signed.

The following is a review of each facility and when the initial rental agreement was signed:

Archery

El Dorado Park, Long Beach, California. A recreational range built in 1972, the rental agreement with the city of Long Beach was signed 29 May 1980. A portion of the Sepulveda basin, located northwest of Los Angeles, was initially considered as a potential site, but the recreational range at El Dorado was more than adequate in size and the surrounding park atmosphere was deemed perfect. Temporary venue facilities (tents and trailers) were erected at the site.

Athletics

Los Angeles Memorial Coliseum, Los Angeles, California, built in 1923. The initial rental agreement with the Los Angeles Coliseum Commission was signed 9 November 1980. Opening and Closing Ceremonies were also held in the Coliseum, though the Rose Bowl was considered. There was never really any other choice but the Coliseum for athletics.

Baseball

Dodger Stadium, Los Angeles, California; built in 1962. Initial rental agreement was signed with the Los Angeles Dodgers, Inc., on 15 September 1981. The Dodger organization is one of the finest and the only question regarding use of Dodger Stadium was its availability during the Games.

Basketball

The Forum, Inglewood, California, built in 1967. The rental agreement with California Sports, Inc., was signed 30 April 1980. The Forum had been considered for boxing or possibly gymnastics while the Sports Arena had been suggested for basketball. But because the basketball schedule was so long and demanding and the Sports Arena area (Exposition Park) was so congested, it was decided to hold basketball in The Forum.

Boxing

Los Angeles Memorial Sports Arena, Los Angeles, California, built in 1959. The rental agreement was signed with the Los Angeles Coliseum Commission on 11 June 1980. The shape and seating capacity of the Sports Arena was highly compatible for boxing, though boxing had been considered for The Forum.

Canoeing and rowing

Lake Casitas, Oak View, California. New temporary facilities were built for the Olympic Games and the agreement with Ventura County was signed on 29 June 1981. Numerous lakes in California were examined as potential rowing sites after it was determined that the cost of building a rowing/canoeing basin was prohibitive. Lake Casitas proved to be an outstanding choice. Because the lake was a reservoir and recreational facility, the LAOOC was required to follow certain construction guidelines and use restrictions.

Cycling/track events

Olympic Velodrome, California State University at Dominguez Hills, Carson, California. Built specifically for the Games by the Southland Corporation in 1982, the site was selected on 5 February 1981.

Cycling/team time trial course

Artesia Freeway, Los Angeles County, California, 25-kilometer segment. An agreement was signed 18 July 1984. Because the course had special requirements and public roadways were used, the agreements for the team time trial and road race courses were reached very late. The course for the team time trial needed to be a straight, flat 25-kilometer segment. Early considerations included a desert course. The Artesia Freeway is an extremely heavily traveled route and the LAOOC had less than one day to close the freeway, construct temporary facilities, conduct the race and clear the area.

Cycling/individual road race course

Olympic Road Course, Mission Viejo, California. The 15.85-kilometer (9.85-mile) loop course was acquired through an agreement signed 12 June 1984. The course was scenic and included changes in grade. Residential streets were blocked during the event. The LAOOC had three days to construct and tear down the auxiliary facilities.

Equestrian

Santa Anita Park, Arcadia, California, built in 1934. A rental agreement was signed with the Los Angeles Turf Club (LATC) on 23 April 1981. A joint venture agreement was signed, delegating the management of the event to the LATC. Facilities for the care and stabling of horses were extensive and grooms, veterinarians and farriers were also housed at the venue. Hollywood Park had also been considered, as was the Los Angeles Equestrian Center in Griffith Park.

Equestrian/three-day event, endurance test

Fairbanks Ranch Country Club, San Diego, California. This was a temporary course constructed specifically for the Games and a rental agreement was signed 8 June 1983. Many sites were examined for this event, but the need to find an area free from the summer heat was essential. Fairbanks Ranch, just a few miles from the Pacific Ocean, was an excellent choice, but was 110 miles south of Santa Anita. Horses and competitors were transported to the area for temporary housing prior to and during the competition.

Fencing

Long Beach Convention and Entertainment Center Exhibition Hall and Terrace Theater, Long Beach, California, built in 1962. The rental agreement was signed with the city of Long Beach on 10 July 1980. The use of the Terrace Theater for the fencing finals was not included in the initial agreement. However, the agreement did include the facility's main arena as the Olympic volleyball site. The LAOOC needed a large, open area of at least 80,000 square feet to accommodate the fencing pistes during the preliminary competition and the Exhibition Hall offered 100,000 square feet.

Football

Rose Bowl, Pasadena, California, built in 1922. The rental agreement with the city of Pasadena was signed 19 May 1983. The Rose Bowl was a natural to serve as the main stadium for football, but the IF dictated that four sites be used for the preliminary rounds. The LAOOC conducted an exhaustive search to find facilities that met FIFA field width requirements and spectator capacity. Finally, the LAOOC decided to conduct the 16 first-round games at paired sites: two on the East Coast of the United States and two on the West Coast. This concept worked extremely well and brought a piece of the Games to spectators thousands of miles away from Los Angeles.

Football

Harvard Stadium, Harvard University, Cambridge, Massachusetts, built in 1903. The rental agreement was signed 19 May 1983. Harvard Stadium was the site of six first-round games.

Football

Navy-Marine Corps Memorial Stadium, United States Naval Academy, Annapolis, Maryland, built in 1959. The rental agreement was signed 7 May 1983. Six first-round games were played here.

Football

Stanford Stadium, Stanford University, Stanford, California, built in 1921. The rental agreement was signed on 11 May 1984. Preliminary, quarterfinal and semifinal games were played in Stanford.

Gymnastics

Pauley Pavilion, University of California, Los Angeles (UCLA), Los Angeles, California, built in 1965. The agreement on basic terms (including the Olympic village to be held on campus) was signed with UCLA on 25 February 1981. UCLA was interested in hosting a high-visibility sport at its premier basketball facility. The question was raised whether the competition podium would fit into the arena without losing too many seats (it did) and the second challenge was the need for a suitable warm-up facility. Newly built Wooden Center, adjacent to Pauley, was selected even though it would be located inside the village perimeter fence at the time of the Games. A scaffold bridge was built between the two to allow the athletes a secure path from their warm-up area to the competition site.

Handball

Titan Gymnasium, California State University at Fullerton, California, built in 1965. The rental agreement was signed with the university on 26 March 1981. The IF had initially demanded the LAOOC find two different sites for the preliminary handball competition. But because handball was not considered a high-demand spectator sport in the United States, the LAOOC did not want to tie up two large facilities for the competition. Fullerton served very well for the preliminary men's games and all women's matches while The Forum was converted for the men's finals, which a near-capacity crowd of 13,000 attended.

Hockey

Weingart Stadium, East Los Angeles College, Monterey Park, California, built in 1951. The rental agreement was signed 14 April 1982. The LAOOC initially looked for a stadium with a grass field and a medium-sized seating capacity. The East L.A. College stadium was equipped with seating for 22,000, more than enough for the hockey competition. With a large grant from the Weingart Foundation, a philanthropic organization, stadium facilities and areas around campus were refurbished. The LAOOC also installed synthetic turf on the stadium infield.

Judo

Eagles' Nest Arena, California State University at Los Angeles, Los Angeles, California, built in 1959. The rental agreement with the university was signed 7 January 1981. Several sites were evaluated on the basis of existing air-conditioning and adequate training facility space. This facility fit those needs very well and the gymnasium, though small, provided an intimate and friendly setting for the judo competition.

Modern Pentathlon

Coto de Caza, Trabuco Canyon, California, built in 1967. The rental agreement was signed on 2 March 1982. For the first time in the history of the Olympic Games, a central venue was developed for the modern pentathlon competitions. A covered riding ring was converted to a fencing arena; a shooting facility was constructed; running took place on the open, grassy area of the surrounding residential community and an existing equestrian center was utilized for jumping. Swimming took place in Heritage Park Aquatic Center in nearby Irvine, California.

Shooting

Prado Recreational Area, Chino, California. Built in 1984 specifically for the Olympic Games, an agreement for use of the site was signed on 21 June 1983. After an extensive search, the Olympic shooting ranges were constructed at Prado. A location in Las Vegas, Nevada, among others, had been considered. Original plans were to build temporary ranges, but it was later decided to donate permanent facilities to the San Bernardino County Department of Parks and Recreation.

Swimming, diving, synchronized swimming

Olympic Swim Stadium, University of Southern California (USC), Los Angeles, California, built specifically for the Olympic Games by the McDonald's Corporation in 1983. The site was selected on 7 August 1980. At the time Los Angeles was awarded the Games, there was no pool in Southern California that met FINA specifications. Funding from McDonald's made the construction of a permanent facility possible, though a temporary pool was considered. Moveable bulkheads transformed the pool into a 30-meter, by 30-meter pool for the synchronized swimming competition and reduced wake during the swimming competition.

Tennis

Los Angeles Tennis Center, UCLA. This site was selected in 1983. Although the center was not built specifically for the Games, a push was made to finish the stadium in time for the Games. The LAOOC had looked for existing facilities and had an alternate site planned should construction not proceed on schedule. The stadium was completely finished in time for the Games.

Volleyball

Long Beach Arena, Long Beach, California, built in 1962. The rental agreement was signed 10 July 1980. The facility offered adequate seating and support facilities and both volleyball and fencing were accommodated at the Long Beach Convention and Entertainment Center.

Water Polo

Raleigh Runnels Memorial Pool, Pepperdine University, Malibu, California, built in 1975. The rental agreement was signed on 2 February 1982. To alleviate scheduling difficulties in the USC-Exposition Park area, water polo was assigned its own venue, since the addition of synchronized swimming to the aquatics schedule placed an added burden on the aquatics venue.

Weightlifting

Gersten Pavilion, Loyola Marymount University, Los Angeles, California, built in 1981. The agreement was signed on 15 January 1981. Since Gersten was constructed to serve as LMU's basketball arena, the LAOOC set the platform on the arena court and arranged seating on three sides. The conversion of the arena from a basketball gymnasium to an Olympic weightlifting hall was very successful. A temporary warm-up hall was built adjacent to the facility and an existing gymnasium was utilized for training.

Wrestling

Anaheim Convention Center, Anaheim, California, built in 1967. The rental agreement was signed 15 January 1981. This facility was considered as a potential site for several sports but the size of the required wrestling podium dictated the use of a facility such as Anaheim. A large convention area adjacent to the arena was converted into a day village for the athletes.

Yachting

The Long Beach Downtown Shoreline Marina, Long Beach, California, built in 1983. The initial rental agreement with the city of Long Beach, signed 20 March 1980 was the LAOOC's first site agreement. The agreement was later modified to specify the Downtown Shoreline Marina as the site instead of the nearby Alamitos Bay area. When the original agreement was signed, plans for the new marina had not yet been developed.

30.04.3 Review of the building and rental agreements

A basic contract format was developed to promote consistency in the early LAOOC-venue owner rental agreements. The plan was to establish as many venue sites as early as possible using the basic rental agreement format, then finalize contracts later. Nine venue agreements were reached by the end of 1980, nine more were arranged in 1981 and three agreements were signed in 1982. Only the two East Coast football sites, the shooting site, the equestrian three-day event endurance site, the tennis site and the cycling road sites were resolved after 1982.

Access dates were an important part of every venue arrangement. In retrospect, the LAOOC generally did not allow enough time to move in and out of venues, but in many cases, had no choice in the matter. Many of the major arenas and stadiums already had other events planned in the weeks before or after the Games. In the case of The Forum, complete access could not be obtained until 0800 on 16 July—the venue had to be ready for training by 23 July.

The move-in of telephone lines and vehicles, television cabling and other electrical needs had to be accomplished months before the Games. In most cases, venue owners were generous in allowing the LAOOC

and contractors to perform such tasks long before the official access date. In early contract arrangements, basic move in and move out dates were 15 July and 15 August. At the Coliseum, the LAOOC had complete access on 1 June 1984, and though all was in readiness at the time of the Games, the schedule was rushed.

Basic contract elements usually included:

- Access; the LAOOC's exclusive access dates and any earlier non-exclusive access dates were negotiated with each site owner.
- Concessions; program and novelty sales were controlled by the LAOOC, generally through its master concessionaire. Food and beverage concession sales were generally controlled by the venue and provided by the existing concessionaire with provision, where possible for the sale of sponsor products. At venues without pre-existing contracts with concessionaires, the LAOOC would subcontract with third parties to provide such concessions. In some instances revenue-sharing provisions were negotiated relating to all or some of the concession sales and in certain cases improvements to concession facilities were also included.
- Condition of facilities; if the venue owner agreed to vacate the premises or remove furniture and equipment prior to the LAOOC's exclusive access date, this was specified. Facility and property boundaries including parking areas and specific areas or rooms to be used by the LAOOC were always identified.
- Construction; the scope of temporary and permanent improvements was always addressed. In some cases the LAOOC made permanent improvements; the venue owners often agreed to make other improvements in time for the Games. Insurance; risk assignment, including responsibility for basic insurance arrangements such as workmen's compensation and comprehensive general liability and property insurance were specified in all contracts.
- Maintenance; maintenance of the facility and waste removal was, for the most part, arranged through the venue owner, although special hauling services were often separately arranged by the LAOOC. Areas to be cleaned or maintained and frequency of waste removal were identified.

- Materiel supply; in some cases, certain venue supplies were utilized by the LAOOC and were specified. Use of on-site warehouses was addressed, if pertinent, and any items that the LAOOC might have had to remove and store were detailed.
- Personnel; often, existing facility staff was utilized to perform spectator service functions such as ushering and ticket taking. Payment and use of these persons was detailed.
- Press Operations; the LAOOC had complete control over broadcast rights. Any press releases had to be approved through the LAOOC News Department before distribution.
- Rental agreement; this was the essential part of every contract. In some cases, the venue owner received a percentage of the gross ticket, concessions and novelty sales. In other cases, a daily flat rental charge was specified. More specific details such as the level of lighting to be provided, utilities and payment terms varied from venue to venue. The LAOOC occasionally made facility improvements in exchange for a portion of the rent while owner-provided improvements were also a consideration in the rental amount.
- Security; the central LAOOC Security Department made all security arrangements for the venues. The use of local police and fire departments was negotiated on a venue-by-venue basis.
- Transportation; availability of parking spaces and control of parking lots was basic to most venue contracts. Parking prices and distribution of parking revenues were arranged as well. The LAOOC handled all transportation of athletes and the media.
- Ticketing; ticket sales and prices were exclusively controlled by the central LAOOC Ticketing Department although on-site sales were in some instances conducted by the venue under the control of the LAOOC.
- Miscellaneous; other standard provisions included restriction of site advertising, use of LAOOC symbols, site decoration and graphics, accreditation, uniforming of venue staff, medical services, advertising and publicity, and event management, all of which were ultimately controlled by the LAOOC. Provisions relating to cancellation or postponement of the Games or events of default were also addressed.

Summary

From the time of the bid for the Games, the LAOOC's philosophy was that construction of competition sites would be limited to sports for which

there was no suitable facility currently existing. This philosophy was carried out without exception, since the LAOOC only constructed new permanent sites for swimming and diving, cycling and shooting.

Temporary facilities were constructed for all other venues, unless suitable arenas or stadia already existed.

Identification of the venues was a major priority. Once accomplished, sports were assigned to fit the venue. Preliminary rental agreements were drawn up and later, contracts were finalized. Individual sport commissioners played a key role in the resolution of all contract issues.

Even though some may have considered the Los Angeles venues to be overspread, the scattering of competition sites prevented a saturation of activities in any one area, with the exception of the Exposition Park and USC areas. This alleviated traffic congestion and allowed spectators living in different areas of the greater Los Angeles area to view Olympic events in their own neighborhoods.

Thanks to the wealth of sports facilities in the Southern California area, the LAOOC was able to find suitable sites for all Olympic events without facing the cost of massive construction and the trauma of construction deadlines. The venues proved fully satisfactory for Olympic competition and were the foundation of the successful physical operation of the Games of the XXIIIrd Olympiad. The tremendous cooperation of the many venue owners helped the LAOOC to complete the difficult temporary Olympic conversion tasks in the short pre-Games construction period.

30.05 Development of the program

30.05.1 Program development and new events

The selection of sports included in the program of events for the Games was governed by the 1978 provisional edition of the Olympic Charter. The Charter states, "The official programme should include at least fifteen of the following sports: archery; athletics; basketball; boxing; canoeing; cycling; equestrian sports; fencing; football; gymnastics; handball; hockey;

judo; modern pentathlon; rowing; shooting; swimming, including diving and water polo; volleyball; weightlifting; wrestling; yachting."

In its bid to host the Games of the XXIIIrd Olympiad, the LAOOC proposed to host all 21 of the aforementioned sports. All were contested in Munich, Montreal and Moscow and it was generally understood that most of the sports would continue to be on the Olympic slate for some time.

Although the program by sport did not vary at all from the past few Olympic Games, the LAOOC did add 18 new events to the existing sports. The process of selecting the new events involved International Federation applications to the IOC Program Commission for additions to each sport. The IOC, in turn, asked the LAOOC whether there were any objections to the proposals. As a general rule, the LAOOC objected to most proposals that added athletes to the program for fear that it would not be possible to accommodate them.

However, the LAOOC was interested in a number of new events for women, including the marathon, 3,000-meter run, 400-meter hurdles, rhythmic gymnastics, the individual road race in cycling and the synchronized swimming duet event.

Based on the event additions requested by the International Federations, the IOC and LAOOC jointly agreed to the addition of 18 events. Fifteen of the events were new (three for men, 11 for women, one open to both), and three (two for men, one for women) were added after being discontinued from earlier Games.

The selection of the demonstration sports of baseball and tennis was made by the LAOOC after entertaining proposals from other recognized federations and approved by the IOC. Each federation had to demonstrate that they could conduct their competition using their own financial resources and that they had sufficient organizational ability to stage a top-notch international event.

Other criteria the LAOOC used in selecting the demonstration sports were whether the facilities were available in or around Los Angeles and if the sports were of general interest to the United States population. Obviously, Dodger Stadium and the Los Angeles Tennis Center (a proposed tennis stadium at the time) were excellent facilities and the LAOOC felt ticket sales would be as great for baseball and tennis as for other Olympic sports. The LAOOC also wanted to choose sports which had the potential to stay on the Olympic program.

The non-participation of certain National Olympic Committees following the announcement of the Soviet boycott in May 1984 altered a few of the events offered during the Games of the XXIIIrd Olympiad.

At the IOC Executive Board Meeting in Lausanne 28–30 May 1984, the board accepted the requests of the LAOOC and the respective International Federations for changes in four sports.

In cycling, the maximum number of participants entered per NOC was changed to include:

- Individual sprint, two participants (changed from one)
- Individual points race, two participants (changed from one)
- Individual pursuit, two participants (changed from one)
- Team pursuit, five participants (one reserve) (changed from four)
- Individual race (men), four participants (changed from three)
- Individual race (women), four participants (changed from three)
- 100-km team race, five participants (one reserve) (changed from four)

In shooting, the maximum number of male competitors per NOC was increased from 14 to 16 which meant that in every event the limit of two competitors per NOC could be reached without repetition.

In synchronized swimming, the solo event was added based on the condition that participants were chosen from among the competitors for the duet competition. No additional competitors were allowed.

In baseball, the number of teams was increased from six to eight. The additional teams were invited by the LAOOC.

The non-participation of the Soviet-bloc countries also necessitated the re-draw of many of the team sports such, as football and basketball, as well as individual sports such as fencing and rowing. Several sports felt the level of competition drop with the absence of the non-participating National Olympic Committees.

The following summarizes the program of events as offered during the 1984 Olympic Games (224 events in 23 sports):

Sport	Men's events	Women's events	Mixed events	Total events
Archery	1	1	0	2
Athletics	24	17	0	41
Basketball	1	1	0	2
Boxing	12	0	0	12
Canoeing	9	3	0	12
Cycling	7	1	0	8
Equestrian	0	0	6	6
Fencing	6	2	0	8
Football	1	0	0	1
Gymnastics	8	7	0	15
Handball	1	1	0	2
Hockey	1	1	0	2
Judo	8	0	0	8
Modern Pentathlon	2	0	0	2
Rowing	8	6	0	14
Shooting	6	3	2	11
Swimming/Diving/Polo/ Synchronized Swimming	18	18	0	36
Volleyball	1	1	0	2
Weightlifting	10	0	0	10
Wrestling	20	0	0	20
Yachting	0	0	7	7
Baseball*	1	0	0	1
Tennis*	1	1	0	2
Totals	146	63	15	224

*Demonstration sports

Changes to the program for the Games of the XXIII Olympiad

Sport	Event	Change
Archery		No changes
Athletics	Women 3,000 meters	New event
	Women Marathon	New event
	Women 400-meter hurdles	New event
	Women Heptathlon	Replaced Pentathlon
Basketball		No changes
Boxing	Men Super heavyweight	New event
Canoeing	Women Kayak fours (K-4)	New event
Cycling	Men Individual points race	New event
	Women Individual road race	New event
Equestrian		No changes
Fencing		No changes
Football		No changes
Gymnastics	Women Rhythmic all-around	New event
Handball		No changes
Hockey		No changes
Judo		No changes
Modern Pentathlon		No changes
Rowing		No changes
Shooting	Men Air rifle	New event
	Women Air rifle	New event
	Women Pistol match	New event
	Women Standard rifle	New event
Swimming	Men 200-meter medley	Reinstated event
	Men 4 x 100-meter relay	Reinstated event
	Women 200-meter individual medley	Reinstated event
	Women Synchronized swim duets	New event
	Women Synchronized swim solo	New event
Volleyball		No changes
Weightlifting		No changes
Wrestling		No changes
Yachting	Open Boardsailing	New event

30.05.2 Schedule development

The development of the schedule of events was a long and arduous process that began in late 1979. The first task was to develop a daily schedule for each of the 23 sports. The basic philosophy was to highlight as many final sessions of each sport as possible and at the same time highlight more women's finals than ever before. To accomplish this, it was necessary to move many final competitions to the first week of the Games. Most of the finals in past Games had been contested during the second week of competition.

To coordinate the schedule development, a single resource person was named from the Sports Department. Given information by the IOC and the International Federations regarding the events to be contested and the format used for each, the department determined the day-to-day schedule. This process took approximately one year since many factors had to be considered for each sport.

Each sport had to start at a reasonable time of day in the best interest of the athlete. Each event and round had to be contested so that athletes could compete with proper rest periods between competitions.

Although the daily schedule did not have to be approved by the host broadcaster, the Sports Department worked closely with ABC representatives to format a schedule that would appeal to television viewers. This included advice from foreign broadcasters for start times that would prove beneficial to them. Most of the federations were agreeable because good television coverage was in the best interest of their sport.

After determining if the sport schedule was acceptable for athletes and was appropriate for television, it was determined if the venue could accommodate the proposed schedule. Most of the uncertainties had to do with timing of the sessions within a sport. If there were three sessions of basketball in one day, with different tickets required for each session, the venue had to be able to accommodate parking for each session and the staff had to provide cleaning services and re-stocking of concessions between sessions. These questions had to be answered for each session of each sport.

When determining the schedule of events, the Sports Department looked at the revenue that could be generated by changing the sessions of some of the sports. As an example, both semi-finals of basketball had always been offered on one ticket, but it was determined that many Southern California ticket buyers would probably have interest in each match and the split was made. The same held true for boxing. Usually, all final bouts were held on one ticket but the LAOOC split the finals into two sessions. This split put an extra burden on the venue, however, since it was necessary to move spectators in and out of the first session in a timely manner to prepare for the next session.

Once the initial schedule was drafted, the Sports Department spent the next two and a half years seeking the approvals of the appropriate parties. The refinement in the schedules that occurred during this period usually involved discussion among television broadcasters, the venue staff and the International Federation.

In December 1982, the master schedule for all sports was refined to a point where the Sports Department could begin seeking the approval of each International Federation. The process was slow, however, and it soon became a part of the approval process for each of the explanatory brochures.

The first schedule of events brochure was printed in May 1983 just before the IOC gave its final approval for the explanatory brochures on 14 June 1983. At this time, the schedule information was being readied for publication in the Olympic ticket information and order form booklet issued by the LAOOC Ticketing Department.

With the Games just one year away, changes in the individual sports schedules continued, although the day-to-day schedule of events was set.

Commissioners and sports managers were alerted to notify the vice president/sports regarding all changes to their sport's schedule, regardless of the magnitude. Modifications included variations in starting and ending times, specification of individual events within a session, cancellation of events within a session, splitting of sessions, cancellation of sessions and the addition of pairings for team sports.

In preparation for the second ticket brochure, the Sports Department sought International Federation approval of several amendments in October 1983. Schedule changes were made in basketball, canoeing, cycling, equestrian, gymnastics and weightlifting.

To maintain a current, correct and up-to-date schedule, revised editions were produced by hand on 11 occasions: 5 December 1983; 16 January 1984; 2 February 1984; 30 March 1984; 25 April 1984; 7 May 1984; 16 May 1984; 25 May 1984; 21 June 1984; 29 June 1984 and 9 July 1984.

The 9 July 1984 version was totally redesigned, incorporating pairings for team sports. Approximately 15,000 copies were published.

All qualifying tournaments and the original draws for team competition in baseball, basketball, football, handball, hockey, volleyball and water polo were completed by 25 May 1984. However, due to the non-participation of several countries which had qualified for team competition, new draws were conducted in all team sports except football and hockey. The boycott complicated the selection process, since the International Federations were compelled to meet a second time to determine not only which teams would replace those not participating but also what the draw would be. IF approval was granted late in some sports, thus delaying publication of the revised "Schedule of events" brochure.

Many changes, such as time rearrangements for specific pairings/games, were negotiated by the Sports Department with the IFs to accommodate television broadcasters around the world. A great deal of flexibility was exhibited so that television could present a highly desirable program.

Although the revised "Schedule of Events" brochure was not published until two weeks prior to Opening Ceremonies, changes continued to occur up to the end of competition. During the Games, changes were reported to the Sports Information Offices, Main Press Center, International Broadcast Center and other individuals via the Electronic Messaging System immediately upon confirmation.

30.06 Registration of the athletes

30.06.1 Concept

The Athlete Registration Center (ARC) was developed to accommodate Article 35 of the 1978 provisional edition of the Olympic Charter. It stipulates that, "The list of sports and

the events in which a country shall participate must be submitted to the OCOG at least eight weeks before the date of the opening of the Games. The number of the competitors to take part in the Games which, by Rule 36, must not exceed the number permitted for each event, together with the names of the competitors in each sport and in each event, shall be notified to the OCOG at least ten days before the date on which the Olympic competitions in the relevant sport are due to begin, or by such later date (if any) as may have been previously fixed by the International Federation governing that sport by agreement with the OCOG."

The ARC's objectives were to provide the LAOOC with the entry data pertinent to each sport as soon as possible after the entry deadline and to provide a convenient location for the collection, verification and distribution of entry information. The ARC also served as a center for the effective discussion, clarification and resolution of matters which arose in connection with the information received.

The verification and approval of the entries was based on the participants' compliance with sport-specific rules. It was convenient, therefore, to administer athlete registration out of the Sports Department.

As a general rule, the Athlete Registration Center acted as a clearinghouse for all registration information. It received documentation from the incoming delegations and distributed it to the individual sports. It received approval from each of the sports and then the information was entered into the computerized Games results system.

During the Games, the ARC was located in the LAOOC office building in Westwood. This was adjacent to the UCLA Village and approximately 16 miles from the USC Village.

Shortly after the arrival of the NOCs, the desirability of an area convenient to the NOCs in the USC Village was realized and a room was identified in a building located in the center of the USC campus. (The abbreviation ARC refers to both offices, unless the context makes it clear that one or the other office is specifically referred to.)

The ARC was extremely busy during the period surrounding the two entry deadlines of 14 July and 18 July. Actual processing began on 9 July. Two to three days after the entry deadline, most processing was completed and most problems were resolved.

It should be noted that the LAOOC received approval from the IOC to require entries to be made by 14 July for all sports except athletics. This is in contrast to the Charter-allowed deadline of just ten days prior to the beginning of the sport concerned. The deadline for athletics was extended to 18 July to allow a final weekend of qualifying competitions. The ability to begin processing all entries a full two weeks prior to the Games was of tremendous value, especially in the results-registration process.

30.06.2 General procedures

The registration of athletes, officials and other technical personnel was carried out in two stages: registration by number and registration by name.

The "by number" entry forms were primarily used by the organizer for planning and did not require athletes' or officials' names. Each National Olympic Committee simply projected the number of athletes who intended to participate in each sport and event.

The "by number" entry forms were modeled after the same forms used in the 1976 Olympic Games. These forms were produced by the Sports Department on word processors and sent to each NOC in February 1984.

The "by name" entry forms, however, required the names of competitors and officials for each event in each sport.

The forms also required appropriate qualifying marks, height, weight, sex and birthdate of the competitor. These served as the official entry forms for the Olympic Games.

Intensive development of the "by name" forms started in October 1983. Weekly meetings were held between the LAOOC Technology and Sports Departments to ensure that the computer coding and information layout for the technology systems were properly planned for use during the registration process.

All forms were 8.5 inches by 11 inches with the exception of team sport forms which were 11 inches by 17 inches and were prefolded down to 8.5 inches by 11 inches. All forms were printed on four-part carbonless paper and were distributed as follows:

- Original (white); sports registration office
- First copy (yellow); technology
- Second copy (green); individual sports management

Third copy (blue); remained with NOC
The yellow page, or first copy, contained special computer codes that were not visible on other copies.

Preliminary designs of the forms were sent to the International Federation of each sport for its review during January and February 1984. Upon approval from the federations, the entry forms were printed in March and April 1984 for a 1 May distribution to all National Olympic Committees expected to participate in the Games. Forms were required to be returned to the LAOOC by 14 July 1984 for all sports except athletics, which had a deadline of 18 July 1984.

30.06.3 Organizational structure

The organizational structure was based on the premise that there were two distinct components to the ARC operation. The first component, under the direction of a supervisor, dealt with the processing of entry forms from the time they were received at the ARC. Forms were sorted and checked in conjunction with the representatives of the NOCs. A filing system was developed to store and retrieve many thousands of pages. The second component, under the direction of another supervisor, dealt with the entry information during the time that it was being verified by the representatives of the International Federations to ensure compliance with eligibility rules. Generally, the ARC manager supervised the UCLA operation and the ARC consultant supervised the USC office. Staff members who had well-developed language abilities were of tremendous value.

The staff was trained from 2-6 July in preparation for the opening of the ARC on 9 July.

Work hours were set as follows:

Athlete registration work hours

Date	Hours
Prior to 9 July	0830-1800
9-25 July	Shift 1 0700-1500 Shift 2 1500-2300
After 25 July	0830-1800

The following is a summary of the ARC staff:

Summary of ARC staff

Position	No.	Begin	End	Weeks
Manager	1	1 January	31 August	–
Consultant	1	1 March	31 August	–
Secretary	1	25 May	31 August	14
Supervisor I	1	18 June	15 August	9
Supervisor II	1	18 June	15 August	9
Receptionist *	1	2 July	31 July	7
Checking clerks *	7 per shift	2 July	31 July	5
Phone clerks **	2 per shift	2 July	31 July	7
Meeting clerks **	2 per shift	2 July	31 July	5
Messengers	4 per shift	2 July	31 July	4

*Trained together to enable rotation.
 **Trained together to enable rotation.

Except for deadline dates on 14 and 18 July, the workload of the evening shift rarely lasted until 2300 hours. The USC office closed at 1830 hours and most processing work at Westwood was completed by approximately 2100 hours. Staff who worked at USC were scheduled for the entire day (12 + hours). At Westwood, the two shift system was planned and adjusted slightly so that there was a three hour period at midday when both shifts were working.

On the two deadline days for submission of entries, work continued until about 0200 hours to produce a report. The midnight deadline served no practical use and a deadline earlier in the day could easily have been established, allowing entries made close to the deadline to have been entered in the computer system that day, rather than 24 hours later. In addition, no special staffing arrangements would have been necessary.

30.06.4 Registration

"By number forms" (received by LAOOC by 2359 hours on 2 June 1984)

Each NOC was required to submit a list of the sports and events in which it intended to participate. These were distributed to NOCs on 1 February 1984 and were used to refine projections of likely numbers of participants. The information provided on these forms reflected an over-estimate.

The "by number" forms would have been more useful if they had been more specific in designating male/female officials and participants in mixed sports. A distinction should also have been made between requests for events entered and athletes entered. In athletics, for example, the indication of three entries in the 100 meters and three in the 200 meters could mean as few as three or as many as six actual athletes—a potential 100 percent variation in accuracy.

"By name" and "batch" forms (received by LAOOC by 2359 hours on 14 July 1984, with the exception of athletics, for which the deadline was 18 July 1984).

Each NOC was required to submit a list of the names of each competitor and this information was provided using two distinct documents: "by name" forms and "batch" forms. "By name" forms—except for team sports—required one form for each competitor. There was at least one type of "by name" form per sport and several sports had more than one type.

The "by name" form listed required personal information on each athlete, as well as the information required to properly enter him/her in the competition such as event, category, best performance, etc.

In team sports (baseball, basketball, football, handball, hockey and volleyball), all athletes were listed on one "by name" form.

A batch form was provided for each sport. There was at least one type of batch form per sport and several sports had more than one type.

The batch form listed all athletes in the group to which it applied. It listed very little personal and competition information, but was very useful for reference.

There was no need to have a batch form for the six team sports because all athletes were listed on one "by name" form, replicating the batch format.

Batch forms and "by name" forms were distributed to NOCs on or about 1 May 1984.

Listing of entry forms (excluding "by number" forms)

Sport	Batch forms	"By Name" forms
Archery	One [per delegation (M/F)]	One (M/F)
Athletics	One [relays (M/F)]	Two (M) (F)
Baseball	N/A [see "by name"]	One per team (M)
Basketball	N/A [see "by name"]	One per team (M/F)
Boxing	One [per delegation (M)]	One(M)
Canoeing	Three [canoeing(M)] [kayak (M)] [kayak (F)]	One (M/F)
Cycling	Two [road events (M/F)] [track events(M)]	One (M/F)
Equestrian	Two [jumping (mixed)] [dressage, three-day event (mixed)]	Two (rider-mixed) (horse)
Fencing	Two [foil (M/F)] [epee, sabre (M)]	One (M/F)
Football	N/A [see "by name"]	One per team (M/F)
Gymnastics	One [per delegation (M/F)]	One (M/F)
Handball	N/A [see "by name"]	One per team (M/F)
Hockey	N/A [see "by name"]	One per team (M/F)
Judo	One [per delegation (M)]	One(M)
Modern Pentathlon	One [per delegation(M)]	One(M)
Rowing	One [per delegation (M/F)]	One (M/F)
Shooting	One [per delegation (M/F and mixed)]	One (M/F and mixed)
Swimming	Seven [swimming(M) individual] [swimming(F) individual] [swimming(M) relays] [swimming (F) relays] [diving (M/F)] [synchronized(F)]	Two (M)(F)
Tennis	N/A	One (M/F)
Volleyball	N/A [See "by name"]	One per team (M/F)
Weightlifting	One [per team (M)]	One(M)
Wrestling	One [per team (M)]	One(M)
Yachting	One [per team (mixed)]	Two (competitors—mixed) (boat)

Personal forms

Each competitor was required to complete a declaration that binded him/her to the eligibility code of the International Olympic Committee.

The eligibility code and declaration were distributed to the NOCs on or about 1 May 1984.

It was anticipated that most declarations would be hand delivered with the batch and "by name" forms. Although not needed for structuring the competition, it was necessary to cross-check each with the batch and "by name" forms to ensure that each athlete had completed a declaration.

Officials forms

Each non-competitor accompanying an NOC delegation was required to complete an officials form which was distributed to NOCs on or about 4 May 1984.

It was anticipated that most officials forms would be hand delivered with the batch and "by name" forms. It was necessary to check the allowable ratio between competitors and officials.

The officials forms could have been more useful by designating specific functions and the coaches should have been able to indicate the sport they coached.

30.06.5 Registration processing and distribution of information

Ernst & Whinney was contracted by the LAOOC to provide supervision of computer entry and results systems for the Games. They assisted in design of the forms and throughout the operation of the ARC, Ernst & Whinney personnel entered the information into the computers to ensure the results systems functioned properly.

When the entry forms were received and checked, pages were separated and copies were distributed as follows:

- White (original) copies were kept in the ARC filed by country and then by sport in alphabetical order. They were available for reference and were frequently consulted.
- Yellow copies were arranged by sport and passed to Ernst & Whinney in batches. A tally was kept of the number of forms in each batch and this tally was checked repeatedly; any discrepancies were investigated and resolved on the spot. The yellow copies were pre-coded for input into the computer.
- Green copies were arranged by sport and sent to the registration liaison at each venue daily.
- Blue copies were kept by the NOCs for their records. Any blue copies that mistakenly arrived in the ARC were filed in case the NOC subsequently wanted them.

After 14 July, printouts of the entry material began to arrive from the computer control center. The printouts were sorted, copied and readied for distribution. The printout, listing participants by sport (coded LPBINDE2, known as "Bindy2"), was divided by individual sport and sent to the appropriate venues daily until the entries were finalized. This printout contained the biographical and performance data given on the entry form. The "Bindy 2" printouts were arranged in two groups. The first was arranged by event, in alphabetical order of NOCs with participants listed alphabetically within the NOC. The second part was also arranged by event, but was sorted by best qualifying performance. It was only provided in certain sports where previous performance was a factor in eligibility or seeding. It was known as the sequential performance list.

The sequential performance list could have been more useful for the sports of athletics, swimming and weightlifting if the athletes' personal-best performances could have been sorted. Only the qualifying performance marks could be sorted due to the computer field assigned. Seeding would probably have been aided if the list had been in order of personal best. On two occasions, a special request was received from athletics for a listing of each country's entries in the sports. This enabled the technical delegates to review in a more convenient form each country's observance of the qualifica-

tion regulations. The request required a little preparation within the ARC but it was accommodated because of the clear benefit to the sport.

It was also important for the NOCs to get a chance to review the entries they had submitted. The resulting feedback was seen to be a major factor in ensuring the accuracy of final lists. This was done using a printout listing participants by sport for each country (a printout coded LPBINCN9, known as "CN9") and was distributed on six occasions, on 19, 20, 22, 23, 24 and 28 July. The final printout had not been previously planned, but was deemed desirable because of the number of NOCs arriving at the last minute.

Two copies of each CN9 form were distributed on each occasion, usually with a cover note in English and French. It was hoped that the chef de mission might keep one copy while the other was distributed to the coaches of the various sports. This seemed to work well since only two requests were made for additional copies.

Prior arrangements were made for the ARC to be the distribution point for printouts going to other departments as well. Printouts were regularly channeled to departments requesting them such as Technology, Publications, Press Operations, Health Services and Ceremonies.

Requests were periodically received from other sources and were individually evaluated. The IOC was supplied with both types of printouts on two occasions. Some lists were also supplied to village administration. Requests from NOCs for complete sport listings were not accommodated until the sports' approval for release was obtained. These requests and other isolated personal requests for information on specific teams or individuals were referred to the NOC or the sport concerned.

30.06.6 Procedures for receipt of entries

Specific procedures were developed for receipt of all of the entry forms, including those received before the deadline, by mail and after the deadline. The procedures were as follows:

Hand-delivered forms received before entry deadline

- Forms were delivered to reception desk. A receptionist logged the time, country and identity of the person delivering the forms. A temporary receipt was issued.
- The receptionist handed the forms to the supervisor for preliminary sorting by sport. The NOC contact was asked to wait or return later at an appointed time.
- The supervisor arranged for preliminary sorting by sport. During the sorting, forms were checked for obviously missing or illegible information and names on "by name" forms corresponding to names on "batch" forms. Some sports had specific notations to be made at this stage to ensure consistencies between "batch" and "by name" forms.
- The NOC contact was advised of any problems. Any changes made were initialed.
- Supervisor and NOC contact authorized the preliminary check and the supervisor issued a receipt for entries by sport and number. This was witnessed.
- Forms were then separated into piles for distribution.
- Technology was given their copy without delay in order to begin computer entry. It was understood that any processing was unofficial until approval was received from the IF/sport representatives through the ARC.
- Sport copies were kept for examination by the sport contact and IF representatives. Depending on the arrangement with sport, they were delivered or picked up by the sport staff.
- The sport contact worked with IF representatives to identify sports-specific problems. The ARC was then informed of any problems.
- The sport contact and IF representative solved any problems, and the ARC was informed of the resolution.
- The ARC then arranged for necessary data to be entered into the results computer system.

Forms delivered by mail before the entry deadline

- Forms were delivered by LAOOC interoffice mail to the ARC after the delivery to the LAOOC's main office. A receptionist then logged receipt.

Forms arrived at numerous locations, including the airport, the Accreditation Department, the NOC Relations Department and the president's office. Some surfaced at venues or did not surface at all. It was vital to instruct all LAOOC departments to identify and properly direct entry forms which ended up in other places.

- Contact was made with the accreditation or sport representative in an attempt to resolve any problems. Any changes were initialed by the person making the change and the source of the new information was indicated.
- Other steps numbering 9 to 11 were carried out as above.

Forms delivered after the entry deadline (2359 hours on 14 July for all sports except athletics; 2359 on 18 July for athletics)

- Preliminary steps were carried out as above. While these steps were being carried out, a phone clerk attempted to contact a sport representative to advise of late entries and attempt to secure the IF representative's decision.
- A supervisor issued a receipt of delivery, but advised that IF approval was needed, if not already obtained. Forms were separated into piles for distribution once approval was obtained.
- Upon receipt of approval, normal procedures were carried out. If approval was denied, the ARC reached the NOC contact directly. ARC staff advised the NOC contact that approval for late entry had been denied and to contact the IF representative for any further discussion. This was then dealt with as any other problem.

For many countries, the deadlines preceded the arrival of the delegations. On the other hand, they were too close to the Games to allow for delivery of the forms by most regular channels. To give ample time for delivery would mean an unacceptably early date for final team selections.

The larger, better-organized countries picked their teams and sent the forms with an advance party. The smaller

delegations preferred to bring the forms with them when they arrived, which meant many NOCs were late with their entries.

The Olympic Charter does contain a provision to allow telex entries followed by the submission of the forms. A more satisfactory alternative would have been to follow the lead of the larger countries and require a small advance party to be in attendance in the host city from a certain date.

30.06.7 **Procedures for changes and updates**

The procedure for reporting changes and updates worked well when it was observed. The NOCs reported changes to the ARC who in turn passed them on using the same procedure as the original entry forms. Changes and updates from NOCs came in various forms: simple corrections, additional information, changes in team composition within the rules of the sport and special requests requiring International Federation scrutiny. Changes also came from the registration liaison at each sport.

The number of changes was not large in absolute terms. However, each change was very important to each NOC. In order to ensure adequate attention and follow up, a daily "summit meeting" was instituted, usually at the end of the day. The consultant chaired the meetings, all available supervisors were in attendance to provide advice on each case and two or three clerks were used for research and the completion and delivery of the appropriate paperwork. All changes and updates received from either office during the day were dealt with, channeled appropriately and recorded. It was an excellent process and is highly recommended to keep track of the variety and intricacy of changes and updates.

After Ernst & Whinney moved to its results computer control center on 27 July, the transmission of changes and updates was done by telecopier.

The ARC had anticipated many changes in the names of competitors, but due to the thorough NOC checking procedures established and the accuracy of data entry, only about 100 changes were necessary.

30.06.8 **Information and statistics collected**

From the data received and processed through the Athlete Registration Center, it was possible to provide the following statistical information during the registration process.

Number of entrants:

- Total
- By sport
- By NOC
- By sex
- Athletes/team officials
- Number of horses brought by delegations
- Number of yachts brought by delegations
- Comparison of numbers: "by number" and "by name" forms

It was not possible to provide the number of actual participants as opposed to entrants. This information was kept by the competition management of each sport.

As expected, the Athlete Registration Center received a large number of requests for statistical and personal information on the participating athletes and nations.

The ARC staff was extensively trained and instructed that information was confidential until released by the IFs governing each sport.

The ARC kept in contact with the sports federations to find out when information could be released, as coaches wanted to gather information on their competition. The team sports and the weight class sports were the most strict in this regard and asked that information be withheld the longest. In order to be of some help, the ARC referred inquirers who seemed to have a legitimate need for information to the sport organizers or the NOC delegation itself.

There was often a lag between a team's arrival and the delivery of registration forms, in spite of the best efforts of the ARC and other groups to contact them. It was not, of course, necessary to use ARC figures of actual registration when there were other (more favorable) lists and projections elsewhere. However, the ARC received a number of calls from various sources asking to check its daily report information. Almost invariably, discrepancies occurred because NOCs that had arrived (or were rumored to be arriving) had not yet come in to register. Consequently, they were not listed in the ARC. This led to the

differences in figures and caused some confusion over the accuracy of ARC figures.

Close to the Opening Ceremonies, the ARC received other requests, mostly from the villages. It was necessary to distribute passes for various functions and activities and an accurate count of athletes by NOC was needed. Both village administrations decided that the ARC could provide the count, although it was felt that this information was or should have been available at the village itself from housing records. However, since it was considered that the ARC's count of registrations was the most accurate available, every effort was made to cooperate.

30.06.9 **Entry list publication: 28 July 1984**

One of the requirements of an organizing committee is the publication of a complete list of all participants. The LAOOC set 28 July as the date for publication. The information that was published was compiled from data supplied by the ARC. The copy deadline for the 28 July publication was 25 July. The issuing of the printouts to the NOCs to check information was programmed to correspond with this deadline.

It had been hoped that all NOCs would be in a position to report their changes by this deadline. Many were understandably more concerned about the accuracy of their printouts only as the competition approached and therefore reported their changes after the 25 July deadline. Nevertheless, a participant's list by sport/event and in overall alphabetical order was published on 28 July. Careful attention to entries made near deadline allowed publication of all entries received by 1700 hours on 26 July.

30.06.10 **Competitor's number assignment**

It was agreed that the computerized results system would be used to assign competition numbers and an access number was needed to identify the athlete for the results system. Many sports took the opportunity to use this

number to coincide with the body number worn by the athlete during competition.

It was originally intended that these numbers would be issued after all entrants were approved by each International Federation. Some IFs were extremely efficient in indicating approval. In other sports, usually because of late arrivals of the technical delegates, it was indicated that numbers were needed before approval could be gained.

Chronological analysis of entries by name **(All sports except athletics)**

Date—up to	NOCs received
14 July	95
15 July	2
16 July	4
17 July	11
18 July	5
19 July	4
20 July	2
21–22 July	7
23 July	2
24 July	2
25 July	3
26 July	5

Summary

NOCs received before deadlines	95
NOCs received after deadlines	47
Withdrawals	
Libya—28 July	2
Upper Volta—23 July	
Total NOCs received	140

Chronological analysis of entries by number

Date (up to)	NOCs received
2 June	58
7 June	34
15 June	24
22 June	5
29 June	3
1 August	6
Not submitted	28

Number of NOCs sent entry forms

Total NOCs contacted	158
Withdrawals prior to Games	16
Withdrawals after arrival (Libya, Upper Volta)	2
NOCs participating	140

30.06.11 Recommendations

The Athlete Registration Center successfully accomplished its objectives of collecting, verifying and distributing entry information from the athletes of 140 NOCs. Entry data pertinent to each sport was readily available after the entry deadlines and the ARC was able to accommodate requests from departments other than sports.

Several recommendations for different phases of the operation are as follows:

- The planning for athlete registration operations should be a part of the Sports Department planning. Each sport area manager should have complete knowledge of the functions of athlete registration and how it relates to their sport.
- It should be determined as early as possible what information will be available for other departments through the ARC.
- The "by number" forms should be redesigned and developed in conjunction with other departments who need as much data as possible for effective planning. A questionnaire format incorporating other information may be helpful.
- The "by number" information should incorporate arrival information of teams or team officials.
- The "by name" or "by number" forms should be designed after input from the sports. Development of the forms should start as early as possible.
- The "by name" deadlines should be set after the opening of the Olympic villages.
- Staff should have some multiple language capabilities. A computer system should be planned to accommodate the possibility of any type of data request for registration, i.e. the youngest athlete or the oldest athlete. The software should also be able to handle nicknames, i.e. Catherine/Cathy, Jonathan/Jon, etc.

30.07 Training sites

30.07.1 Concept and general service level

The training sites unit of the Sports Department was responsible for the development of all sites used for training only. Its objectives were to centralize the planning and thus standardize the quality of services offered. The unit had its own budget and staff and managed sites on behalf of each sport while working closely with the respective commissioners and sport managers.

Thirty training sites were selected for 11 of the 23 sports, Athletes in the remaining 12 sports trained solely at the competition venues and the training site unit assisted the sport management staff. Competition venues used as training sites included:

Venues used as training sites

Archery	El Dorado Park
Canoeing/Rowing	Lake Casitas
Cycling	California State University at Dominguez Hills
Equestrian	Santa Anita Park
Fencing	Long Beach Convention Center
Hockey	East Los Angeles College
Judo	California State University at Los Angeles
Modern Pentathlon*	Coto de Caza
Shooting	Prado Recreational Area
Weightlifting	Loyola Marymount University
Yachting	Long Beach Downtown Shoreline Marina

*Also used an off-site swimming pool and was managed by competition staff.

Sites used for training purposes only Athletics

Cromwell/Dedeaux Fields, USC
Los Angeles Southwest College
West Los Angeles College
Birmingham High School
Jackie Robinson Stadium
Occidental College
Drake Stadium, UCLA
California State University at Los Angeles

Baseball

West Los Angeles College
Stengel Field

Sunset Canyon Courts, UCLA

Volleyball

Pacific Palisades High School
Los Angeles Valley College
Los Angeles Trade Technical College
Manual Arts High School

Water Polo

Los Angeles Swim Stadium
Sunset Canyon Pool, UCLA

Wrestling

UCLA Wrestling Compound
USC Wrestling Compound

By having two main Olympic villages, the training site unit had to provide an increased number of sites. For example, only three training sites were needed for 18 volleyball teams but to have enough sites to accommodate the teams housed at each village, four sites were used. Additional sites provided greater flexibility for each team's training time selection.

The ultimate goal was to provide equitable training opportunities for all competitors, regardless of sport and village assignment. Scheduling of practice times was done as fairly as possible. The equipment provided at each site was, wherever possible, identical to that used in competition, and, in all other cases, similar.

30.07.2 Acquisition and development of the sites

The Sports Department sent letters of inquiry in late 1981 to all local high schools, colleges, universities and municipal recreation facilities exploring the possibility of using the sites for training purposes. The positive responses more than covered the number of sites required.

The criteria used for selection of the training sites included the following:

- Proximity to each Olympic village
- Quality of the facility
- Ability to be secured
- Adaptability to certain sports not traditionally contested at the facility
- Cooperation from the venue owner

The first criteria was especially important since a site in close proximity to a village reduced athlete travel time.

Of the 30 sites, 18 (60 percent) were within a distance of 10 miles/16 kilometers from the Olympic villages and 28 (93 percent) were within 20 miles/32 kilometers. A more significant fact, however, was that of the 22 sites which were used for 20 or more days, 16 (73 percent) were within 10 miles/16 kilometers of the Olympic villages.

Many of the facilities had been built within the previous 10 years and were in good condition. New synthetic tracks were built at six athletics training sites, but apart from athletics, there were no other new facilities constructed. Sites older than 10 years were cleaned and repaired by the owners before the LAOOC took possession.

The Sports Department, following consultation with LAOOC Security, chose sites which could be fairly easily secured. Outdoor facilities were secured by fences, some of which were installed on a temporary basis. At indoor facilities, all entrances were staffed by security guards.

Equipment for sports played regularly in the United States such as basketball and volleyball was easily installed. However, sports such as team handball and rhythmic gymnastics required facilities with specifications not usually found in United States gymnasiums. When necessary, the Sports Department worked with the International Federations to negotiate a compromise on required specifications for training facilities. It was found, for example, that all five basketball courts for training were marginally short in length, according to FIBA rules, but no action was taken since all of the courts were short by the same margin.

Lease agreements for all training sites were completed approximately nine months before the Games. The agreements noted use rights such as the ability to control access to the facility and the right to make temporary modifications. As a general rule, however, the venue owner retained the right to enforce its existing policies. The agreements also listed LAOOC responsibilities such as the need to carry liability insurance and the obligation to restore the facility to its original condition following the Games. The facility owners were still required to provide maintenance and facility repairs. In addition to some permanent improvements and equipment that the LAOOC gave to the sites, rental payments were made to the facility owners to help offset operating costs.

10 Competitors work on their boats in the athletes' area at Lake Casitas.

11 Olympic victories are often family affairs

11

30.07.3 Provision of personnel services, sports equipment and scheduling Personnel

Each training site was managed by an on-site director who reported to one of two training site managers. The two managers were responsible for the complete operation of their respective sites which were divided according to their proximity to either USC or UCLA.

The training site directors were responsible for all day-to-day operations including set up and take down. Sites that served more than one sport had a separate supervisor who oversaw the training of each sport. There were equipment supervisors at sites for athletics and boxing who reported to the site directors and were responsible for equipment maintenance and distribution.

Training site managers, directors and supervisors each had an assistant. All were paid, but only the training site managers and their assistants were permanent full-time staff. Directors became full-time on 18 June and the others on 2 July.

The remainder of the work force at each site was volunteer. These positions included team attendants, equipment assistants and clerks. Volunteer staff began work two days before each site was scheduled to open. All staff completed work the day each site closed, with the exception of the site directors who continued until the facilities were completely restored.

The team attendants were responsible for preparing the site for each team and meeting the teams' needs during each training session. This included, but was not limited to, providing towels, setting up equipment, pumping up balls and cleaning playing surfaces. The equipment assistants were responsible for checking out and controlling the inventory of athletics and boxing equipment. The clerks were responsible for answering telephones and completing any necessary paperwork.

Three people were recruited for each volunteer position to allow each staff member one day off every third day. Paid staff members at each site were responsible for working out their own schedules. The majority of the staff at each training site were recruited from existing staff at the facility, the local sporting community and the LAOOC volunteer pool.

The staff training program consisted of three monthly meetings beginning in April. There were also three meetings held at the end of June specifically for the training of site directors. A general orientation was held on 23 June to promote enthusiasm for the Games and boost employee morale. Specific on-the-job training was completed by each training site director immediately prior to the opening of each site.

Services

Training site managers coordinated activities with many other LAOOC departments to prepare the sites for the training needs of the athletes. Those departments were:

- Construction; although no new facilities were built, many modifications, such as the installation of sports equipment, fences and electrical lines were necessary. It was also the responsibility of the Construction Department to remove those modifications following the Games.
- Finance; besides monitoring the budget and generating lease payments and payroll checks, the Finance Department provided petty cash for each site. Since food was not provided for staff, a \$3 meal allowance was provided to each staff member for each shift worked.
- Food Service; the Food Service Department provided isotonic beverages, soft drinks and bottled water for each training site. No food or snacks were provided.
- Language Services; while no interpreters were assigned to the training sites, they were available via telephone from the Olympic villages. The few language problems encountered were easily resolved in this way. Most teams had at least one official who spoke and understood English.
- Health Services; at least one certified athletic trainer (physiotherapist) was assigned to each site. First aid supplies and equipment were available. The trainers were responsible for assisting team doctors in treating injuries on-site. Non-emergency cases were transported to the nearest village polyclinic and emergency cases, if there had been any, were to be taken to the nearest hospital. There were no medical emergencies at the sites.
- Security; since the training sites were closed to the public, security was only responsible for admitting members of the Olympic Family and for protecting the equipment, athletes and staff. Metal detectors and bar code readers were not used at the training sites.

- Technology; the technology equipment at each site was minimal. Each site was provided with two telephones, walkie-talkies and a television. The sites were not included in the EMS network, which was unfortunate since it greatly reduced the capacity to communicate with other sites.
- Transportation; the Transportation Department provided buses based upon the times of the training sessions. The schedule was published weeks before the Games. This type of service had both benefits and drawbacks. Athletes were able to ride whichever scheduled bus best fit their needs, however, many empty buses traveled to training sites (especially during the first week of village operations) since there were times when no teams were scheduled to train. Also, teams did not have the flexibility to leave a site at an unscheduled time.

Equipment

The majority of sports equipment at each training site was provided by official Olympic suppliers and it was usually identical to that used in the competitions. The remaining sports equipment and all office supplies and equipment were purchased from local suppliers. Wherever possible, furniture was borrowed from the facilities to reduce the number of purchases and movement of goods.

In general, each training site was provided with the following:

- Sports equipment
- Medical supplies
- Miscellaneous office supplies
- Signs
- Towels and ice (for medical purposes)
- Beverages (isotonic, soft drinks and water)
- Tables, chairs and a file cabinet

Since ice was required daily at each site and no ice company would deliver the relatively low volume needed, large ice freezers were rented and placed at six central locations. A staff member from each site picked up ice as needed at the nearest location.

Athletics and boxing equipment was checked out to coaches, team officials and athletes in exchange for their accreditation badges. When the equipment was returned to the storage

area, the badges were returned. Very little equipment was lost as a result of this system. The remaining sites did not use a check-out system, because it was easier to control the equipment used in team sports.

Sport equipment was ordered by each sport management staff. A single agreement was usually made with each supplier for competition as well as training equipment. This equipment was delivered to the LAOOC's warehouse prior to the Games and stored until moved to the sites. All other support equipment was ordered by the training site managers and delivered to the warehouse. All equipment and supplies in the warehouse were delivered in one shipment to each training site before it opened. Subsequent deliveries were made as additional equipment arrived.

Scheduling of sites

For the 12 sports that used the competition venues for training purposes, scheduling was done by the sports staff in conjunction with the appropriate International Sports Federation. For the 13 sports listed below, the training site managers scheduled training sessions according to the following criteria:

- Baseball; one (three-hour) session per team per day
- Basketball; one (two-hour) session per team per day
- Boxing; one (1 %-hour) session per team per day
- Football; one (two-hour) session per team per day
- Artistic Gymnastics; one (three-hour) session per team per day and a one (1 %-hour) session per team per day
- Rhythmic Gymnastics; two (1½ hour) sessions per team per day
- Handball; one (two-hour) session per team per day
- Swimming; two (two-hour) sessions per team per day
- Synchronized swimming; one (three-hour) session per team per day
- Tennis; one (one-hour) session per team per day
- Volleyball; one (two-hour) session per team per day
- Water polo; one (1 %-hour) session per team per day
- Wrestling; one (two-hour) session per team per day

Athletics training was not scheduled. The training sites were available on a first-come, first-served basis. In addition to the team training schedules which were developed in conjunction with the International Sports Federations, teams had the opportunity to sign up for additional

training times as available. By providing these additional times, teams were able to customize their training schedules based upon their particular needs. No problems were encountered in accommodating the varied needs of each team.

Close out

Closing the training sites consisted of six basic steps:

- Determining when the site was no longer needed for training
- Stopping bus service
- Releasing staff
- Removing equipment
- Taking down all temporary construction
- Obtaining a release document from the facility owner

Although an attempt was made to predetermine site closing dates, some minor adjustments were made as the Games ended. It was found that some sites were not being used after 3 August, so they were closed on 5 August. When team sports reached the quarterfinal round, only one site for teams housed in each village remained open.

All medical and sport equipment was removed from each site immediately upon closing. Office supplies and equipment were left for the facility and small items were given to staff members. All such gifts were carefully documented for audit purposes and the value of gifts made to the facility was subtracted from the total amount due from the LAOOC.

30.07.4

Sports information centers

The sports information centers in each village provided up-to-date information for coaches and team officials regarding training and competition. Coaches and officials could request changes in their training schedules at one of 12 desks which handled one, two or three sports. The offices were open daily from 0700–2200, 14 July–12 August.

Each office had two supervisors who reported to the appropriate training site manager. The staff for each office consisted of 36 sports information officers (three to a desk) who rotated shifts. One person per desk was on duty at all times during operational hours and 12 computer operators (three per terminal) rotated shifts so that four terminals were staffed at all times. The supervisors were paid and worked from 1 July to 15 August. All other staff members were volunteers and worked from 12 July to 12 August.

A computer system was used to monitor and make changes in the training schedules. With two villages, a system was needed whereby training sites could be scheduled at one village without the possibility of duplication at the other.

The sports information centers also printed reports of training schedules sorted by NOC, sport, site, team or day, which proved to be very valuable to coaches and LAOOC support departments.

The program, although very complex, was simple to use. Volunteer operators were successful in working with coaches to change training schedules. The system provided instant confirmation of changes as well as hard-copy printouts of revised schedules. Six terminals and two printers were used at the USC office and four terminals and one printer were used at UCLA, which was sufficient for even the busiest periods.

In addition to scheduling training sites, the sports information center staff members were responsible for distributing start lists and results and providing information regarding the competition venues, training sites, transportation system and sports equipment. The athletics secretariat also used the sports information center to distribute athlete competition numbers and to collect marathon participant beverages and participation confirmation forms for all events.

The following documents were available:

- The LAOOC sports site guide
- The schedule of events
- The athlete bus schedules
- Various sports' team/participant manuals
- The venue and NOC telephone lists
- Maps of training and competition sites
- The LAOOC media guide
- The sports explanatory brochures

Although these publications were given to all participants, most people preferred to ask questions rather than research the answers in the printed material.

Summary

The training sites ran very well due in large part to training site directors who possessed the proper balance of leadership, technical expertise and flexibility. Some aspects of the operation were overplanned but, as a result, all staff members were totally prepared for the situations they encountered.

Most of the athletes and coaches preferred to train in the villages under crowded conditions rather than at a less crowded outlying site, even if it was only 10 or 15 minutes away.

Fewer athletics and swimming training sites were needed since there were fewer competitors in these sports than planned.

During planning, getting the necessary information from each sport's staff for scheduling purposes was difficult. But, once the information was received, the schedules were prepared quickly and on time.

Having a separate training site management group worked well since specific attention was given to the needs of athletes who trained at sites used for training only.

The following summary provides specific training information for each sport. Also included is a training site usage summary and a facilities summary.

Training facilities summary

Sport	Description
Athletics	5 400 m synthetic tracks 12 shot put rings 3 discus circles 4 javelin runways 5 discus/hammer circles 8 high jump areas 8 long jump/triple jump runways 8 pole vault runways
Baseball	2 diamonds
Basketball	5 courts
Boxing	13 rings
Diving	1 10-meter platform 2 3-meter springboards
Football	4 fields
Artistic Gymnastics	1 men's gymnasium 1 women's gymnasium
Rhythmic Gymnastics	4 training areas
Handball	3 courts
Swimming	7 50-meter pools
Synchronized Swimming	2 pools
Tennis	11 courts
Volleyball	8 courts
Water Polo	2 pools
Wrestling	15 mats

(Note: non-competition venues)

Training information Archery

Dates of operation:
14 July-1 August 1984

Hours of operation:
0900–1800

Services:
Medical facilities

Equipment:
Equipment identical to that utilized in competition.

Allocation:
Open practice, no reserved training

Training site:
El Dorado Park East, area 2 (north of competition area)

Location:
32 miles/51 kilometers from the UCLA Village, 23 miles/37 kilometers from the USC Village

Number of training areas available:
One range with approximately 40 practice targets was available. Targets were established at each of the four FITA distances for men and women.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Athletics

Dates of operation:
14 July-1 August 1984

Hours of operation:
0800–2000

Services:
Medical facilities, restrooms and liquid refreshments

Equipment:
Implements on the IAAF-approved list were provided at each training site. All other training equipment met IAAF specifications.

Allocation:
All sites were available on a first-come, first-served basis to all athletics competitors.

Training site:
Archie Morrison Field, Santa Monica College

Location:
6 miles/10 kilometers from the UCLA Village

Number of training areas available:
An eight-lane, 400-meter synthetic track was available along with the following facilities: one high jump area, one long jump/triple jump runway, one pole vault runway, two shot put circles and one discus circle.

To be used by whom:
Available for use by athletes housed at UCLA and for wheelchair athletes

Wheelchair training:
The track at Santa Monica College was available for wheelchair training 5-10 August between 1200–1500.

Training site:
Cougar Field, Los Angeles Southwest College

Location:
8 miles/13 kilometers from the USC Village

12

12 The athletics competition at the Los Angeles Memorial Coliseum was supported by six training sites, including one in each village.

13 The Coliseum is the first main stadium to be used for two Olympic Games: 1932 and 1984.

13

Number of training areas available:
An eight-lane, 400-meter synthetic track was available along with the following facilities: one high jump area, one long jump/triple jump runway, one pole vault runway, and one shot put circle.

To be used by whom:
Available for use by athletes housed at USC

Training site:
Cromwell Field and Dedeaux Field
University of Southern California

Location:
Within the USC Village

Number of training areas available:
An eight-lane, 400-meter synthetic track was available along with the following facilities: two long jump/triple jump runways, two high jump areas, two pole vault runways and two shot put circles. Javelin, discus and hammer areas were available on nearby Dedeaux Field.

To be used by whom:
Available through 2 August 1984 and on 7 August 1984 for use by athletes housed at USC. This site served as the warm-up area for all athletics competitors prior to competition and was therefore closed for training 3-6 August and 8-11 August.

Training site:
Elvin C. Drake Stadium, University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
A nine-lane, 400-meter synthetic track was available along with the following facilities: two long jump/triple jump runways, two high jump areas, two pole vault runways and

two shot put circles. Javelin and discus areas were available on the adjacent intramural field.

To be used by whom:
Available for use by athletes housed at UCLA

Training site:
Jackie Robinson Stadium, Rancho Cienega Park

Location:
4 miles/7 kilometers from the USC Village

Number of training areas available:
A six-lane, 400-meter synthetic track was available along with the following facilities: two high jump areas, two long jump/triple jump runways, two pole vault runways and two shot put circles. Discus and javelin areas were available on an adjacent field.

To be used by whom:
Available for use by athletes housed at USC

Training site:
West Los Angeles College Fields
West Los Angeles College

Location:
7 miles/12 kilometers from the UCLA Village and 8 miles/13 kilometers from the USC Village

Number of training areas available:
Two fields were available for throwing events with the following facilities: one hammer circle, three hammer/discus circles, one javelin runway and three shot put circles.

To be used by whom:
Available for use by athletes housed at both USC and UCLA

Out-of-stadium events:
The marathon course was unavailable for training, however, marathon competitors and team officials had an opportunity to familiarize themselves with the course. The competition race walking course was partially available for training. Because the training needs of long-distance competitors were so varied, no official long-distance training routes were provided.

Basketball

Dates of operation:
14 July–10 August 1984

Hours of operation:
0900–1900

Services:
Medical facilities and meeting rooms

Equipment:
Identical to that utilized in competition. Twelve balls were provided per team. A wooden floor court which met FIBA minimum side specifications was provided at each site.

Allocation:
Each team was allocated one two-hour training session each day and had the opportunity to request additional open training hours, if desired.

Training site:
Birmingham High School
Gymnasium

Location:
12 miles/20 kilometers from the UCLA Village

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Dorsey High School Gymnasium

Location:
8 miles/13 kilometers from the UCLA Village and 3 miles/5 kilometers from the USC Village

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Garfield High School Gymnasium

Location:
10 miles/16 kilometers from the USC Village

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
University High School Gymnasium

Location:
5 miles/8 kilometers from the UCLA Village

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Wilson High School Gymnasium

Location:
8 miles/13 kilometers from the USC Village

To be used by whom:
Scheduled for use by athletes housed at USC

Boxing

Dates of operation:
14 July–11 August 1984

Hours of operation:
0800–2100

Services:
Locker rooms, showers, medical facilities, conditioning equipment, scales, a sauna and a running track

Equipment:
Equipment was identical to that utilized in competition.

Allocation:
Each team was allocated 1% hours of training each day and had the opportunity to request additional open training hours, if desired.

Training site:
Alexander Hamilton High School

Location:
5 miles/8 kilometers from the UCLA Village and 7 miles/11 kilometers from the USC Village

Number of training areas available:
Thirteen training areas, each equipped with a full-size ring, light and heavy bags and double-connected bags were available. In addition, conditioning equipment, scales, mirrors, jump ropes, a sauna and a running track were available.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Canoeing

Dates of operation:
14 July–11 August 1984

Hours of operation:
0600–1300 and 1600–1900

Services:
Locker tents, showers, medical facilities, athlete lounge, boathouses, repair shop, docking facilities

Allocation:
Open practice, no reserved training

Training site:
Lake Casitas

Location:
30 miles/48 kilometers from the UCSB Village, 70 miles/112 kilometers from the UCLA Village and 85 miles/136 kilometers from the USC Village

Number of training areas available:
In addition to the 2,000-meter competition course, two other courses were shared with rowers during training. The first, which stretched along the northeast shore of the lake, was also 2,000 meters long. During rowing competitions, no training took place on the competition course and the 1,000-meter course was reserved as a warm-up area for the rowers. The 2,000-meter training course was shared with rowers not competing that day who had qualified for the finals.

To be used by whom:
Scheduled for use by athletes housed at UCSB

Cycling—track events

Dates of operation:
14 July–3 August 1984

Hours of operation:
0730–2200

Services:
Locker rooms, medical facilities and shaded athlete lounge

Equipment:
Five motorcycles were available to teams for training purposes at the velodrome. Cycling equipment similar to that utilized in competition was available. Two rollers (one for track training and one for road training) were provided for each team.

Allocation:
Teams were scheduled for training in 1½-hour sessions with a limit of 35 riders per session. Upon arrival at the village, athletes were scheduled for training through the use of a computer. Teams were limited to two sessions per day and all members of a team were required to train at the same time. An open training session was available from 2000–2200.

14

Training site:
Olympic velodrome, California State University at Dominguez Hills

Location:
22 miles/35 kilometers from the UCLA Village and 16 miles/26 kilometers from the USC Village

Number of training areas available:
The competition track was available for training during non-competition hours.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Cycling—road events

Dates of operation:
Suggested training areas: 14 July–5 August 1984; Olympic road course: 26 July 1984; Olympic team time trial course: 28 July 1984; 126 freeway: 26 July and 2 August 1984

Hours of operation:
Suggested training areas: 0830–1730; Olympic road course: 0900–1200; Olympic team time trial course: 0730–0930; 126 freeway: 0900–1200

Services:
Medical facilities and shaded athlete lounge

Equipment:
Support vans and vehicles were available

Allocation:
The length of each long-distance training session varied according to each athlete/team.

Training site:
Olympic road course

Location:
69 miles/110 kilometers from the UCLA Village and 53 miles/85 kilometers from the USC Village. 35 miles/58 kilometers from Olympic velodrome

Number of training areas available:
The competition site for the individual road races was partially closed to traffic and available for training on 26 July 1984, from 0900–1200. Sections of the course were closed and then reopened after the riders passed. Athletes trained on the course (with traffic) at other times, if desired. This was a 15.8 kilometers (9.8 miles) loop course with one moderately steep climb and rolling hills.

14 Boxing training was concentrated at Hamilton High School, where 13 rings are available.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Training site:

Olympic team time trial course
Artesia (91) Freeway

Location:

22 miles/35 kilometers from the UCLA Village, 16 miles/26 kilometers from the USC Village and .5 miles/.8 kilometers from Olympic velodrome

Number of training areas available:

A 6-kilometer (3.7 mile) section of the time trial competition course was closed to traffic and available for training on 28 July 1984 between 0730–0930.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Training site:

126 freeway

Location:

58 miles/93 kilometers from the UCLA Village, 73 miles/117 kilometers from the USC Village and 79 miles/127 kilometers from Olympic velodrome

Number of training areas available:

An 8-kilometer (5-mile) stretch was available for training on 26 July 1984 and 2 August 1984 between 0900–1200.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Suggested Training Site:

UCLA/Pacific Coast Highway/
Trancas Flat

Location:

Began at UCLA Village; 16 miles/26 kilometers from USC Village and 32 miles/52 kilometers from the Olympic velodrome

Number of training areas available:

An out-and-back route, mostly flat, of 41 kilometers (25.5 miles) round-trip. The course was suitable for team time trial and track training.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Training site:

UCLA/Pacific Coast Highway/
Topanga/Mulholland Loop

Location:

Began at the UCLA Village; 16 miles/26 kilometers from USC Village and 32 miles/52 kilometers from the Olympic velodrome

Number of training areas available:

This was an alternate, general training loop-course approximately 126 kilometers long (78 miles); it was very hilly.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Training site:

Santiago Canyon Road

Location:

65 miles/105 kilometers from UCLA; 55 miles/88 kilometers from USC and 40 miles/64 kilometers from the Olympic velodrome.

Number of training areas available:

A general training loop-course of 56.3 kilometers (35 miles) with moderate rolling hills, one medium climb of 1.1 kilometers (0.7 miles) and a very steep climb of 1.3 kilometers (0.8 miles).

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Other:

This site was staffed by LAOOC medical, security and training site personnel.

Training site:

Santa Ana River Trail

Location:

56 miles/90 kilometers from UCLA, 48 miles/77.5 kilometers from USC and 22 miles/35.5 kilometers from the Olympic velodrome.

Number of training areas available:

A 1 g-kilometer (lo-mile) basically flat, narrow (6 feet) road intended for bicycle traffic only; this route did not permit motor traffic at any time.

Equestrian

Dates of operation:

14 July–12 August 1984

Hours of operation:

Sunrise to dusk (approximately 0600–2000)

Services:

Medical facilities, restrooms, showers

Equipment:

Not applicable

Allocation:

Training site and practice area allocations for all teams and individuals were provided at scheduled times by country: Dressage; 2 hours, twice per day
Jumping; 1% hours, twice per day
Cross country galloping track; unscheduled.

Training site:

Santa Anita Park

Location:

30 miles/48 kilometers from UCLA and 19 miles/30 kilometers from USC

Number of training areas available:

The training areas for dressage included 10 practice areas-seven on sand and three on grass. Seven practice areas-including five on sand and two on grass-were available for jumping. One practice area on grass and one galloping track on grass measuring 2,800 meters (1.74 miles) was available for all horses, including the three-day-event horses.

To be used by whom:

Scheduled for use by athletes and horses by country

Training site:

Fairbanks Ranch Country Club

Location:

140 miles/225 kilometers from UCLA, 129 miles/208 kilometers from USC and 110 miles/177 kilometers from Santa Anita Park

Number of training areas available:

Training was permitted on 31 July 1984 on the steeplechase course and roads and tracks. The official course walk (without horses) was held on 26 July 1984. The course was available for competitors only to walk from 27-31 July.

To be used by whom:

Scheduled for use by all accredited equestrian competitors

Fencing

Dates of operation:

14-11 August 1984

Hours of operation:

0700–1900

Services:

Showers, first aid, equipment storage and repair facilities

Equipment:

Equipment identical to that utilized in competition.

Allocation:

Each team was allocated two (two-hour) training sessions each day and had the opportunity to request additional open training hours, if desired.

Training site:

Long Beach Convention Center
Exhibition Hall

Location:

32 miles/51 kilometers from UCLA and 23 miles/37 kilometers from USC

Number of training areas available:

One area equipped with 26 practice pistes, (24 for training, two for warm-ups) within the Exhibition Hall adjacent to the competition site, was available for training.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Football

Dates of operation:

14 July-12 August 1984

Hours of operation:

0900–1800

Services:

Locker rooms, showers and medical facilities

Equipment:

Equipment similar to that utilized in competition. Five balls were provided per team.

Allocation:

Each team was allocated two (two-hour) training sessions each day.

Training site:

Birmingham High School

Location:

12 miles/20 kilometers from UCLA

Number of training areas available:

Two grass fields, each 100.58 meters by 68.58 meters (110 yards by 75 yards), were available.

To be used by whom:

Scheduled for use by athletes housed at UCLA

Training site:

California State University at Dominguez Hills

Location:

16 miles/26 kilometers from USC

Number of training areas available:

Two grass fields, each 105 meters by 68 meters (114.83 yards by 74.37 yards) were available.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Gymnastics

Dates of operation:

14 July–11 August 1984

Hours of operation:

Artistic: 0830–2030; Rhythmic: 0830–2030, training sites open

Services:

Locker rooms, showers and medical facilities

Equipment:

The apparatus and mats were identical to those used in competition. Each rhythmic gymnast brought her own equipment. The necessary audio equipment for musical accompaniment was available.

Allocation:

In accordance with FIG technical rules, all rhythmic teams were allocated two 1½ -hour training sessions per day for a total of three hours of training each day.

Artistic teams were allocated 4½ hours of training per day (one three-hour session and one 1½-hour session). Teams had the opportunity to request additional open training hours, if desired.

Artistic training

Training site:

North Gymnasium University of Southern California

Location:

Within the USC Village.

Number of training areas available:

One 1,030-square-meter (11,100-square-foot) area was equipped for artistic and rhythmic gymnastics. One private set of apparatus, excluding floor exercise, was available for men. One rhythmic area was available for women.

To be used by whom:

Scheduled for use by athletes housed at both USC and UCLA

Training site:
South Gymnasium, University of Southern California

Location:
Within the USC Village

Number of training areas available:
One 720-square-meter (7,750-square-foot) area partitioned into two private areas was available with one floor exercise mat for men and one complete set of apparatus for women.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Wooden Center—Collins Court University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
One 2,134-square-meter (22,968 square-foot) area was available with four private, complete sets of apparatus, three for men and one for women.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Wooden Center—Pardee Gym University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
One 981-square-meter (10,556-square-foot) area with two private, complete sets of apparatus for women, was available.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA.

Training site:
Wooden Center-Yates Gym University of California, Los Angeles

Location:
Within the UCLA village

Number of training areas available:
One 682 square-meter (7,360 square-foot) area with two private, complete sets of apparatus, one set for men and one for women was available for training when the room was not being used as a warm-up facility prior to competition.

To be used by whom:
Available on a sign-up basis only for athletes housed at both USC and UCLA

Rhythmic training

Training site:
Marymount High School Gymnasium

Location:
.5 miles/.8 kilometers from UCLA

Number of training areas available:
The gymnasium was approximately 895 square meters (9,632 square feet). Two sets of two 12-meter by 12-meter (39.37-foot by 39.37-foot) areas were available. One carpeted surface and one hardwood floor surface were provided in each of the two areas.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
North Gymnasium, University of Southern California

Location:
Within the USC Village

Number of training areas available:
The gymnasium is approximately 1,030 square meters (11,100 square feet). Two 12-meter by 12-meter (39.37-foot by 39.37-foot) areas, one with carpeting and one with hardwood flooring, were available. The North Gymnasium was also equipped with one set of men's apparatus, excluding floor exercise mat, for artistic gymnastics.

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
Venice High School Gymnasium

Location:
18 miles/29 kilometers from USC

Number of training areas available:
The gymnasium is approximately 1,106 square meters (11,904 square feet). Two sets of two 12-meter by 12-meter (39.37-foot by 39.37-foot) areas were available. One carpeted surface and one hardwood floor surface were provided in each of the two areas.

To be used by whom:
Scheduled for use by athletes housed at USC

Handball

Dates of operation:
14 July–9 August 1984

Hours of operation:
0800–2000

Services:
Locker rooms, showers and medical facilities

Equipment:
Equipment identical to that utilized in competition. Training balls were provided to each team.

Allocation:
Each team was allocated one two-hour training session each day and had the opportunity to request additional open training hours, if desired.

Training site:
Gymnasium Santa Monica College

Location:
6 miles/10 kilometers from UCLA and 16 miles/26 kilometers from USC

Number of training areas available:
One 20-meter by 40-meter (65.6-foot by 131.2 foot) area equipped with Bat Taraflex synthetic flooring was available.

To be used by whom:
Scheduled for use by athletes housed at both UCLA and USC

Training site:
Gymnasium, California State University at Dominguez Hills

Location:
22 miles/35 kilometers from UCLA and 16 miles/26 kilometers from USC

Number of training areas available:
Two 20-meter by 37-meter (65.6-foot by 121.4 foot) hardwood areas were available for training.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Titan Gymnasium, California State University at Fullerton

Location:
40 miles/64 kilometers from UCLA and 28 miles/45 kilometers from USC

Number of training areas available:
One 20-meter by 40-meter (65.6-foot by 131.2-foot) area with Bat Taraflex synthetic flooring (the competition area) was available for training during non-competition hours.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Hockey

Dates of operation:
14 July–11 August 1984

Hours of operation:
0800–2000

Services:
Locker rooms, showers and medical facilities

Equipment:
Equipment similar to that utilized in competition. Twenty balls were provided per team.

Allocation:
Each team was allocated one two-hour training session each day and had the opportunity to request additional open training hours, if desired.

Training site:
Weingart Stadium, East Los Angeles College

Location:
20 miles/32 kilometers from UCLA and 11 miles/17.6 kilometers from USC

Number of training areas available:
In addition to the competition field, two adjacent natural grass fields were available.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Judo

Dates of operation:
14 July–11 August 1984

Hours of operation:
0830–1730

Services:
Locker rooms, showers, medical facilities, scales and saunas

Equipment:
Equipment identical to that utilized in competition

Allocation:
Each athlete was allocated 1½ hours of training time each day and had the opportunity to request additional open training hours, if desired.

Training site:
Eagles' Nest Arena, California State University at Los Angeles

Location:
21 miles/34 kilometers from UCLA and 9 miles/14 kilometers from USC

Number of training areas available:
Seventeen private, partitioned areas, each equipped with an 8-meter by 8-meter tatami, were available within the gymnasium.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Modern Pentathlon

Dates of operation:
14 July–1 August 1984

Hours of operation:
According to predetermined schedule

Services:
Locker rooms, showers, medical facilities, saunas, whirlpools, scales, Universal gym equipment

Equipment:
Equipment similar to that utilized in competition. All equipment, with the exception of epee(s) and pistols, was provided.

Allocation:
Teams were allocated training as follows: Riding: one hour per day; Fencing: two hours per day; Swimming: two hours per day; Shooting: one hour per day; Running: unscheduled

Training site:
Coto de Caza (for fencing, riding, running, shooting)

Location:
70 miles/112 kilometers from UCLA and 54 miles/87 kilometers from USC

Number of training areas available:
Training facilities were available for fencing, riding, running and shooting.

To be used by whom:
Scheduled for use by athletes housed at USC, UCLA and Coto de Caza

Training site:
Heritage Park Aquatics Complex (for swimming, 23–27 July)

Location:
50 miles/80 kilometers from UCLA, 35 miles/56 kilometers from USC and 20 miles/32 kilometers from Coto de Caza

Number of training areas available:
One pool (50 meters, 8 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA; athletes were transported by bus from Coto de Caza.

Training site:
El Toro High School (for swimming, 14–22 July)

Location:
57 miles/92 kilometers from UCLA, 40 miles/64 kilometers from USC and 13 miles/21 kilometers from Coto de Caza

Number of training areas available:
One pool (50 meters, 8 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA. Athletes were transported by bus from Coto de Caza.

Rowing

Dates of operation:
14 July–5 August 1984

Hours of operation:
0600–1300 and 1600–1900

Services:
Locker tents, showers, medical facilities, athlete lounge, boat-houses, repair shop, docking facilities

Allocation:
Open practice, no reserved training

Training site:
Lake Casitas

Location:
30 miles/48 kilometers from UCSB, 70 miles/12 kilometers from UCLA and 85 miles/136 kilometers from USC

Number of training areas available:
In addition to the 2,000-meter competition course, two other courses were shared with canoeists during training. The first, which stretched along the northeast shore of the lake, was also 2,000-meters. The other was approximately 1,000-meters long. During the rowing competitions, no training took place on the competition course. While the 1,000-meter course was used for warm-up by athletes prior to competition, the 2,000 meter training course was shared by canoeists with rowers not competing that day.

To be used by whom:
Scheduled for use by athletes housed at UCSB

Shooting

Dates of operation:
14 July–4 August 1984

Hours of operation:
0900–1600

Services:
Resting rooms and medical facilities

Equipment:
All installed equipment utilized in competition complied with UIT specifications.

Allocation:
Each team was allocated specific hours of training per day, depending on the number of entries and the discipline involved. Each team had the opportunity to request additional training hours, if desired, subject to availability.

Training site:
Olympic shooting range, Prado Recreational Area

Location:
58 miles/93 kilometers from UCLA Village 42 miles/67 kilometers from USC Village

Number of training areas available:
The entire Olympic range, as mandated by the UIT, was available for training.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Swimming

Dates of operation:
Swimming: 14 July–4 August 1984;
Diving: 14 July–12 August 1984;
Synchronized Swimming: 14 July–12 August 1984; Water Polo: 14 July–10 August 1984

Hours of operation:
0600–2000

Services:
Locker rooms, showers and medical facilities

Equipment:
Equipment identical to that utilized in competition. Twelve water polo balls were provided at each site.

Allocation:
Each team was allocated the appropriate number of hours of training each day and had the opportunity to request additional open training hours, if desired. Swimming: four hours per day (two hours twice per day); Diving: three hours per day (1½ hours twice per day); Synchronized swimming: the allocation of training hours was based on the number of teams participating. The hours were divided proportionately among the teams. Each team was allocated two training sessions per day. (Note: 14–19 July one practice per day). Water polo: two hours per day (1 hour twice per day).

Swimming training

Training site:
Barnes Park

Location:
20 miles/32 kilometers from USC

Number of training areas available:
One pool (50 meters, 6 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
Los Angeles Swim Stadium

Location:
.6 miles/1 kilometer from USC

Number of training areas available:
One pool (50 meters, 8 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
Olympic Swim Stadium, University of Southern California

Location:
16 miles/26 kilometers from UCLA Village; adjacent to the USC Village

Number of training areas available:
Two pools (50-meter, 8-lane competition pool and 50-meter, 6-lane warm-up pool) were available for training during non-competition hours.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Roosevelt High School

Location:
10 miles/16 kilometers from USC

Number of training areas available:
One pool (50 meters, 8 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
Smith Park

Location:
20 miles/32 kilometers from USC

Number of training areas available:
One pool (50 meters, 8 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
Sunset Canyon Recreation Center University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
One pool (50 meters, 8 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Van Nuys/Sherman Oaks Recreation Center

Location:
10 miles/16 kilometers from UCLA

Number of training areas available:
One pool (50 meters, 8 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Verdugo Park Pool

Location:
16 miles/26 kilometers from UCLA

Number of training areas available:
One pool (50 meters, 6 lanes) was available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Synchronized swimming training

Training site:
Cerritos Olympic Swim Center

Location:
35 miles/56 kilometers from UCLA and 20 miles/32 kilometers from USC

Number of training areas available:
One indoor pool (50 meters) was available. The configuration and depth of the Cerritos pool were nearly identical to the competition pool.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Olympic Swim Stadium, University of Southern California

Location:
16 miles/26 kilometers from UCLA and adjacent to the USC Village

Number of training areas available:
One pool (50 meters) was available from 29 July–12 August between 1900–2200 and during non-competition hours.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Sunset Canyon Recreation Center, University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
One pool (50 meters) was available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Dividing training

Training site:
Industry Hills Swim Center

Location:
50 miles/80 kilometers from UCLA and 35 miles/56 kilometers from USC

Number of training areas available:
Springboard and platform diving facilities were available.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Olympic Swim Stadium, University of Southern California

Location:
16 miles/26 kilometers from UCLA and adjacent to the USC Village

Number of training areas available:
The competition diving well was available for training during non-competition hours and swimming preliminary heats.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Water polo training

Training site:
Exposition Park Stadium

Location:
.6 miles/1 kilometer from USC

Number of training areas available:
One pool (50 meters) was available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Raleigh Runnels Memorial Pool Pepperdine University

Location:
16 miles/26 kilometers from UCLA and 32 miles/51 kilometers from USC

Number of training areas available:
The competition pool was available for training during non-competition hours.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
Sunset Canyon Recreation Center University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
One pool (50 meters) was available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Volleyball

Dates of operation:
14 July–11 August, 1984

Hours of operation:
0900–1900

Services:
Locker rooms, showers, medical facilities and beverages

Equipment:
Equipment identical to that utilized in competition was available. Floors were surfaced with Bat Taraflex material and were marked according to FIVB standards.

Allocation:
Each team was allocated two hours of training each day and had the opportunity to request additional shared training hours, if desired.

Training site:
Los Angeles Valley College Gymnasium

Location:
17 miles/27 kilometers from UCLA

Number of training areas available:
Two courts, each 16.35 meters by 32.7 meters (53.64 feet by 107.28 feet), with a ceiling height of 8 meters (26.25 feet), were available. Each inbounds area measured 9 meters by 18 meters (29.53 feet by 59.06 feet).

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Los Angeles Trade Technical College Gymnasium

Location:
.9 miles/1.5 kilometers from USC

Number of training areas available:
Two courts, each 14.1 meters by 28.2 meters (46.26 feet x 92.52 feet), with a ceiling height of 8 meters (26.25 feet) were available. Each inbounds area measured 9 meters by 18 meters (29.53 feet by 59.06 feet).

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
Manual Arts High School Gymnasium

Location:
.6 miles/1 kilometer from USC

Number of training areas available:
Two courts, each 14.1 meters by 28.2 meters (46.26 feet by 92.52 feet), with a ceiling height of 8 meters (26.25 feet), were available. Each inbounds area measured 9 meters by 18 meters (29.53 feet by 59.06 feet).

To be used by whom:
Scheduled for use by athletes housed at USC

Training site:
Pacific Palisades High School Gymnasium

Location:
5 miles/8 kilometers from UCLA

Number of training areas available:
Two courts, each 14.1 meters by 28.2 meters (46.26 feet by 92.52 feet), with a ceiling height of 8 meters (26.25 feet), were available. Each inbounds area measured 9 meters by 18 meters (29.53 feet by 59.06 feet).

To be used by whom:
Scheduled for use by athletes housed at UCLA

Weightlifting

Dates of operation:
14 July–8 August 1984

Hours of operation:
0830–2100

Services:
Locker rooms, showers, medical facilities, saunas, scales and massage tables

Equipment:
Equipment identical to that utilized in competition was available for training.

Allocation:
Each team was allocated 2½ hours of training each day and had the opportunity to request additional open training hours, if desired. Each team was assigned one to four platforms depending on team size.

Training site:
Alumni Memorial Gymnasium Loyola Marymount University

Location:
6 miles/10 kilometers from UCLA and 19 miles/30 kilometers from USC

Number of training areas available:
Twenty-four training platforms, each with a complete set of barbells, squat and lifting blocks, was available.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Wrestling

Dates of operation:
14 July–8 August 1984

Hours of operation:
0800–2000

Services:
Medical facilities and scales

Equipment:
Each team was assigned to one mat. Training dummies of various weights and equipment identical to that utilized in competition were available for training.

Allocation:
Each greco-roman team was allocated two hours of training per day and each freestyle team was assigned two hours of training each day.

Training site:
Sunset Canyon Recreation Center University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
Six private, partitioned training areas, each equipped with a 10-meter by 10-meter (32.81-foot by 32.81-foot) mat, were available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Birnkrant Hall University of Southern California

Location:
Within the USC Village

Number of training areas available:
Nine private, partitioned training areas, each equipped with a 10-meter by 10-meter (32.81-foot by 32.81-foot) mat, were available.

To be used by whom:
Scheduled for use by athletes housed at USC

Yachting

Dates of operation:
14 July–11 August 1984

Hours of operation:
0800–2000

Services:
Lockers, showers and medical facilities

Equipment:
All classes, with the exception of Windgliders and Finns, brought their own equipment. Windgliders similar to those utilized in competition were provided for training.

Allocation:
Open training was available.

Training site:
Olympic Yachting Center at the Long Beach Downtown Shoreline Marina and Harbor.

Location:
33 miles/53 kilometers from UCLA and 24 miles/38 kilometers from USC

Number of training areas available:
Unlimited training was available at Olympic Harbor and offshore beginning 14 July 1984.

To be used by whom:
Scheduled for use by all accredited sailors

Baseball

Dates of operation:
14 July–7 August 1984; West Los Angeles College: 14 July–5 August 1984; Stengel Field: 21 July–7 August 1984

Hours of operation:
0800–1930

Services:
Medical facilities and beverages

Equipment:
Rawlings baseballs were furnished for training.

Allocation:
Each team was allocated 2% hours of training each day and had the opportunity to request additional training hours, if desired.

Training site:
Stengel Field

Location:
11 miles/18 kilometers from USC

Number of training areas available:
One diamond was available. During competition, the diamond was used for pre-game batting practice for those teams who competed in the second game of the doubleheader.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Training site:
West Los Angeles College

Location:
7 miles/12 kilometers from UCLA

Number of training areas available:
One diamond was available. During competition, the diamond was used by non-competing teams.

To be used by whom:
Scheduled for use by athletes housed at both USC and UCLA

Tennis

Dates of operation:
14 July–11 August 1984

Hours of operation:
0700–1900

Services:
Medical facilities

Equipment:
Equipment identical to that utilized in competition was available for training.

Allocation:
Each competitor was allocated one hour of training each day and had the opportunity to request additional open training hours, if desired.

Training site:
Los Angeles Tennis Center
University of California, Los Angeles

Location:
Adjacent to the UCLA Village.

Number of training areas available:
Four hard-surfaced courts were available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

Training site:
Sunset Canyon Recreation Center
University of California, Los Angeles

Location:
Within the UCLA Village

Number of training areas available:
Six hard-surfaced courts were available.

To be used by whom:
Scheduled for use by athletes housed at UCLA

**30.08
Use of pre-Olympic events**

**30.08.1
Concept and goals**

LA83 was the catchword for a series of pre-Olympic test events in 1983 which were organized for the purpose of identifying and training staff, cultivating working relationships among departments and showcasing some of the Olympic facilities in the year preceding the Games.

In the early months of the LAOOC's existence, a decision was made not to stage one major multi-sport event before the Games. Instead, the concept of LA83 was developed since some of the new facilities such as the Olympic Swim Stadium and the velodrome needed testing. At the same time, management wanted to test support operations, including housing, food services, security and transportation over a series of major events.

LA83 events were held at selected venues, depending on the availability of major international events and the need to test a facility or venue. Nearly every venue hosted some kind of major regional or international event in the 18 months prior to the Games, though most were only partially LAOOC managed or sponsored.

The III FINA World Water Polo Cup held from 7–14 May at Pepperdine University was the LAOOC's first LA83 event. Although planning of the Look and design of the Games was still in its very early stages, the venue was in readiness for the week-long round-robin tournament. While the event was technically a success and proved the LAOOC's ability to organize and run an international-class pre-Olympic sporting event, many of the support departments uncovered imperfections in their planning and services and made plans for improvements at the later LA83 events.

Cycling, swimming, synchronized swimming and diving events were scheduled to test new facilities. A gymnastics event was planned to examine the organization of a major indoor event. A rowing and canoeing regatta was organized to test the newly designed race course at Lake Casitas. An LA83 archery event was the last of the pre-Olympic events in 1983. In 1984, upon completion of the Olympic Shooting Ranges at the Prado Recreational Area, an invitational was held to provide a test of the new shooting facilities.

Other (non-LAOOC sponsored) events held at the Olympic venues in 1983

Date	Event	Olympic venue
23 Jun–4 Jul	Santa Anita National Horse Show	Santa Anita Park
23 Jun–26 Jul	International Athletics All-Comers	Coliseum
25 Jun–26 Jul	USA-GDR athletics dual meet	Coliseum
1 Jul–2 Jul	7-Eleven/Bicycling Magazine Grand Prix	CSUDH Velodrome
29 Jul–6 Aug	Olympic Classes Regatta (OCROC)	Long Beach Marina
2 Aug–5 Aug	U.S. National Archery Championships	El Dorado Park
9 Aug–14 Aug	International Men's Volleyball Tournament	Long Beach Arena
11 Aug–13 Aug	World Junior Wrestling Championships	Anaheim Convention Center
13 Oct–16 Oct	International Women's Volleyball Tournament	Long Beach Arena
15 Oct–19 Oct	World Junior Modern Pentathlon Championships	Coto de Caza
9 Dec–11 Dec	International Hockey Invitational	East Los Angeles College

Other unofficial LAOOC events held at the venues in 1984 included a world challenge boxing event in early 1984, the Junior Olympic Regional Boxing Championships at the Sports Arena in June 1984 and the U.S. Olympic Track and Field Trials at the Coliseum in June 1984.

The LAOOC's involvement in these unofficial events ranged from that of a casual observer to more in-depth involvement of competition staff and some support departments.

For the LA83 events, the LAOOC made an all-out effort to house and feed athletes, train staff and integrate support departments. Some uniforming of staff was done, press kits were distributed, programs printed, lunches served and most importantly the organization of all field of play and competition activities was tested.

**30.08.2
Review of the events
III FINA World Water Polo Cup
Pepperdine University, 7–14 May**

The Federation Internationale de Natation Amateur (FINA) stages a World Water Polo Cup every two years and the LAOOC's bid to host the III FINA Cup at the Olympic site was accepted, making it the LAOOC's first LA83 event.

Carefully planned operating scenarios for all departments from Accreditation to Press Operations were developed. Some of the planning included definition of job descriptions and staffing requirements; information exchange with the federation; organization of ceremonies; housing arrangements (officials, athletes and some LAOOC staff); development of accreditation lists; arrangements for medical needs and acquisition of technology equipment and services.

Field of play requirements at the Raleigh Runnels Memorial Pool at Pepperdine were carefully examined and tested. Because of FINA requirements for pool depth, the LAOOC successfully raised the water in the pool to near deck level by plugging

the drains. Since the Olympic water polo competition would not be held at the same venue as swimming, diving and synchronized swimming, the III FINA Cup provided a good, close look at the Pepperdine facilities and venue staff.

Eight teams participated in the round-robin tournament with the U.S.S.R. finishing with a record of five wins, one loss and one tie to take first place. A sell-out crowd of 3,000 watched the U.S.S.R. defeat the United States, 7–6. The Federal Republic of Germany finished second in the tournament, followed by Italy in third and the United States, fourth. Spain, Holland, Hungary and Cuba placed fifth through eighth in the standings, respectively.

The overall success of the event was measured by the fact that lessons learned gave great impetus to the planning for all of the venues and the various sports competitions held that summer.

**Murray/7-Eleven International
Cycling Invitational
California State University at
Dominguez Hills, 8–9 July**

This event gave the LAOOC its first test of the Olympic Velodrome. World class times were recorded on the fast track. Team facilities, both on the field of play and in the team cabin area, worked exceptionally well. The organizers thought one of their most valuable lessons came from making the transition from planning to operations. The identification and training of key competition and venue staff were invaluable. Areas of concern were identified and later resolved, including the use of shade structures; excess staff on the infield; placement of and supplies for the doping control area; identification of venue materials;

Fourteen countries participated in five major events at the velodrome. Riders from the German Democratic Republic captured three races and the GDR's Lutz Hesslich was named the invitational's top performer.

McDonald's International Swim Meet University of Southern California, 14-17 July

Approximately 330 swimmers from 20 countries came to Los Angeles to test the waters in the new Olympic Swim Stadium on the USC campus. The new pool passed its first test when Vladmir Salnikov of the U.S.S.R. swam to a world record time in the 800-meter freestyle. The U.S.S.R.'s squad of 11 Olympic veterans dominated the 34-event meet, winning 12 of the 17 men's events. The German Democratic Republic, led by Petra Schneider, won seven of the women's races. Tiffany Cohen of the United States won four gold medals. More than 400 members of the media covered the meet, which was run concurrently with the McDonald's International Diving Invitational 16-17 July. More than 750 volunteers assisted the LAOC staff in staging the two events.

Key elements in the design of the temporary facilities at the swim stadium were developed for the 1983 events and modified for 1984. The orientation of the competition pools had been dictated by limited space and existing structures at USC. Temporary bleachers were erected for the 1983 event, removed, and then increased for 1984. Athlete preparation and holding areas were established and staff duties such as those of the deck marshals were defined.

McDonald's international Diving Invitational University of Southern California, 16-17 July

United States divers won all the events at the McDonald's International Diving Invitational, run concurrently with the McDonald's swim meet. Greg Louganis won the three-meter springboard event while teammate Bruce Kimball won the platform diving event for men. Megan Neyer won the women's three-meter springboard and Wendy Wyland won the platform diving event.

Sunkist American Cup II Synchronized Swimming University of Southern California, 5-7 August

The Sunkist American Cup completed the test sweep of the facilities for the four aquatic sports. Moveable bulkheads in the new Olympic Swim Stadium, which formed the 30-meter competition area, were tested.

Fifteen nations were represented in the event, with Tracie Ruiz of the United States winning the gold medal in the solo competition; Ruiz and Candie Costie winning the duet competition and Canada winning the team competition.

McDonald's International Gymnastics Championships University of California, Los Angeles, 27-28 August

This event was the LAOC's first test of an indoor event, and UCLA's Pauley Pavilion was the perfect choice from both a spectator interest and an operational standpoint. The first question that was resolved was whether or not the competition podium from the Montreal Games would fit in Pauley. Other issues ranging from press access to the acquisition of a piano for rhythmic gymnastics, were resolved during the event.

Athletes from 14 nations competed in the men's and women's events, with the United States' Diane Durham winning the women's all-around and Mary Lou Retton capturing the vault, uneven bars and floor exercise. Alena Drevjana of Czechoslovakia won the

balance beam. Peter Vidmar of the U.S. won the men's all-around and individual event winners were as follows: Mitsuki Watanabe of Japan, horizontal bar; Valentin Pintea of Romania, floor exercise; Jens Fischer of the GDR, rings and vault; Vidmar, parallel bars; and Tim Daggett of the U.S., pommel horse.

Foster Farms Lake Casitas International Regatta Lake Casitas, 22-25 September

Mild weather, still winds and a large public turnout contributed to a successful regatta at Lake Casitas. A lake had not been used for Olympic rowing and canoeing since 1960 and the LAOC wanted to test its course layout and athlete facilities. Additionally, hundreds of volunteers and staff were trained in the complex operations of a major regatta. Construction needs were examined and some preliminary Games construction was done at this time. More than 100 arrowhead anchors were driven into the lake bottom for the course installation and left in place for 1984. Some dock ramps were left in place, some grading of land was done, irrigation and landscaping was started and some portions of the finish tower were constructed.

The LAOOC purchased 90 canoes and kayaks for the event with the hope of attracting a greater number of nations. The LAOOC had originally planned to host only a rowing event, but since the two sports would share a venue during the Games, organizers thought the 1983 regatta should simulate Games-time operations as much as possible. More than 400 athletes from 26 nations competed in the 12 canoeing and eight rowing events. The boats that were purchased in 1983 were available for rental or sale to teams in 1984.

Ten-time world champion Rudiger Helm of the GDR claimed the 1,000-meter kayak title, one of two gold medals won by the GDR in the kayaking and canoeing competition. Sweden took three gold medals. A crowd of 2,374 witnessed the final day of rowing activities as gold medals were distributed among eight countries. Romania and Norway each won two golds, while the GDR, Canada, Belgium, Argentina, Puerto Rico, Italy and the United States each claimed one.

XXXIInd World Archery Championships El Dorado Park, 19-22 October

More than 200 athletes from 43 countries took part in the XXXIInd World Archery Championships and after four days of competition, the men's title was not decided until the final arrow was shot. American Rich McKinney edged teammate Darrell Pace for the gold medal. The U.S. also won the team gold medal. In the women's competition, Jin Ho Kim of South Korea won the women's competition and Korea won the team gold as well. Eleven of 12 world records were broken and the twelfth record tied.

This event was the only 1983 world championship hosted by the LAOOC. During the event, a number of problems were identified and later resolved while the Southern California community and media were introduced to world class archery. Nearly 85 percent of the Games staff and volunteers were identified; scoring systems were tested; facilities at El Dorado Park were examined and physical venue needs such as office space were recognized. As a result, the entire computer program for the scoring system was modified, security needs were identified and preliminary architecture plans were revised to add more office space.

The Inaugural Championships of the Olympic Shooting Ranges Prado Recreational Area 9-16 April 1984

Difficulty in selecting a venue site meant construction could not start on the ranges until August 1983. The ranges were complete for the April 1984 event, though numerous venue improvements and construction of temporary venue facilities still needed to be finished before the Olympic competition.

More than 500 competitors from 50 nations were represented in 11 Olympic events.

Shooting organizers felt the event was essential to the successful operation of the venue during the Games, but suggested that had it been possible, an event at least 12 months in advance of the Games would have been more helpful.

30.08.3 Value of the pre-Olympic program

Without exception, each of the LA83 events (including shooting in 1984) contributed immensely to the successful staging of the Olympic Games. Every event was approached as a learning experience, yet it was important to present well-run international events for the athletes, media and the public.

Eight of the nine events were held within a six-month timeframe, a schedule that was demanding for departments that were involved in every event. Yet the schedule allowed time for in-house improvements to be made between events. In the meantime, the world had the opportunity to judge the LAOOC on its ability to stage international-class sporting events.

Most of the individual sport organizers wanted their own LA83 event but the LAOOC decided early to showcase certain sports and use the experience as an aid for all the venues. Still, many unofficial events were held at the venues in the 18 months prior to the Games and they proved valuable since the LAOOC could observe or allow several support departments to become involved.

Whether the LA83 events were considered dress rehearsals for individual venues, or a reflection to the world of the LAOOC's overall level of readiness, they were successful in assisting the sports and support departments in their ongoing organizational phase in the year prior to the Games. Mistakes made and lessons learned were equally important as the impressions provided to those on the exterior.

15

30.09
Review of the sports

30.09.1
Archery

At archery, the LAOOC was charged with converting a public park with an existing recreational archery range into an Olympic venue that would accommodate a record 109 archers from 35 countries, 478 staff and volunteers and temporary bleacher seating for 4,000 spectators. Long Beach's El Dorado Park provided a beautiful setting for the four days of Olympic competition, but there were no existing structures that could be adapted to provide office space and support operations for venue staff and Fédération Internationale de Tir à l'Arc (FITA) officials as well as working space for journalists and eating facilities for staff and spectators. Therefore, 27 tents and 12 trailers were assembled at the site.

El Dorado Park was built in 1972 and its archery range is unique to Southern California. The 275-meter-wide competition range saw two major events in 1983—the United States Archery Championships and the XXXIInd World Target Archery Championships, and was more than adequate in size to play host to the Olympic Games.

Construction of the temporary Olympic facilities was begun 28 May 1984 by a local contractor. Work was completed on time on 7 August 1984, with only last-minute details like flower planting taking place the last two days. The LAOOC provided on-site supervision and pre-construction planning.

Competition for 47 women and 62 men began 8 August and Olympic records were set at every distance. Darrell Pace of the United States, the 1976 Olympic gold medalist, dominated the men's competition by shooting FITA rounds of 1,317 and 1,299 to post an Olympic record total of 2,616. Teammate Rich McKinney followed with a 2,564 total, just edging out Japan's Hiroshi Yamamoto who posted a 2,563. Korea's Hyang-Soon Seo earned the gold medal for the women with an Olympic record total 2,568, including a second FITA round of 1,293. Lingjuan Li of China took home the silver medal, scoring a 2,559, and Korea's Jin-Ho Kim won the bronze medal with a 2,555.

16

15 Scientific precision is the key element for modern competitors in the ancient sport of archery.

16 El Dorado Park is colorfully dressed for use as the archery venue during the Games.

Sports Administration and Competition Management

Field of play

The athletes found a nearly perfectly measured field sporting 22 men's targets and 16 women's targets. Although a tolerance for a Small amount of error in measuring the field is allowed by FITA, the Olympic archery range at El Dorado was well within those allowances. A survey of the range showed the measurements were within ± 1 centimeter at 90 meters and less at the shorter distances. Lanes were provided every six meters with two targets per lane, allowing comfortable spacing for the athletes. Lanes were painted three days before the event with a striping device which lined the field with floor striping paint. The paint lasted throughout the entire event with little fading due to foot traffic or watering of the field, and only the shooting line and television lines needed a second painting. Three lines were painted behind the shooting line at a 90-degree angle to the target lanes. These formed the television lane and the waiting lane. The television lane was two meters wide and lined in yellow and the athletes' waiting lane was painted in white, two meters behind the television lane.

Southern California's hot summer weather necessitated regular watering of the field. A staggered watering system was used: the front half of the field was watered when the targets were placed at the long distances while the back of the field was watered when the targets were at the close distances. The result was a lush, green competition field. Shade for the competitors, scorers and judges also became important. Canopy-type sun shelters measuring 8 feet by 8 feet by 7 feet in height were a tremendous improvement over more commonly used umbrellas. There were 48 connected shelter sections (27 for the men and 21 for the women) providing ample shade for the athletes at the field of play. One section on the women's side was used for the announcer's booth. Every other section of the open-sided shelters was roofed with a 70 percent screened material to allow air flow and reduce heat inside the shelter. The valance on the south side of the shelter was positioned at an angle of approximately 45 degrees. Several 10-foot by 10-foot tents provided more than adequate space for 20 to 25 scorers. These tents were placed 40 meters from the shooting line and 20 meters off the field (measured from the last shooting lane). Tents were also positioned 20 meters from the last shooting lane and 20 meters from the shooting line for use at the shorter distances. This enabled the scorers to monitor competition and meant a shorter walk to meet the archers at the target for scoring. Two 20-foot by 20-foot tents were set up north of the scoreboards for the computer scoring which was located on each side of the field.

The Saunders Archery Company of the United States made the target mats specially to 52-inch-diameter specification, slightly larger in diameter than the standard 48-inch (122-centimeter) targets. The flat-faced target mats were covered in green burlap to match the target standards and tied with sisal cord (rather than polyethylene) with all knots on the back of the mat. With 3 1,392 arrows shot during the competition, no pass-throughs and only three bounce-outs occurred, two on one mat which was quickly replaced. The mats were extra-firm and did not oval or lose concentricity. The Björn Bengtson Archery Company of Sweden supplied the target faces at no cost to the LAOOC.

A key service to the athletes during both the practice sessions and actual competition was an equipment repair trailer. From 14 July to 6 August the trailer was stationed at the practice field. On the evening of 6 August it was easily moved to the athlete preparation area. The Hoyt/Easton Company provided all of the equipment and personnel to operate this service at no cost to the Organizing Committee. The LAOOC rented the trailer, but all internal trailer modifications were provided by Hoyt/Easton. Nearly every competitor utilized the equipment repair service and the trailer was equipped to handle any problem from straightening arrows to repairing shoes. This service was valuable in that there was not a single equipment failure on the first day of competition and only three equipment failures during the entire tournament. Generally, two to three times that number of equipment failures and subsequent delays are experienced at major events of this type.

A practice range with 46 targets was ready for use on 12 July. Targets were placed at the following distances:

- 9 targets at 90 meters
- 9 targets at 70 meters
- 6 targets at 60 meters
- 10 targets at 50 meters
- 10 targets at 30 meters
- 2 targets at 10 meters

The practice field faced northeast, so as to conform to the unwritten rule that the practice range should not face in the same direction as the competition field. The entire practice field was enclosed with an 8-foot chain-link fence to prevent vandalism and keep out wandering park pedestrians. Chairs and tables were provided to form a small rest area; box lunches were made available to the athletes. Because of the many trees located throughout El Dorado Park, only one extra shade structure was provided for the soft

17

18

drink and water dispensers. The location provided adequate shade for all athletes. Practice was open to all competitors from 0900 to 1800 hours and the use of an open practice schedule worked well. Services at the practice field included equipment repair and athlete information. A transportation liaison person and a general troubleshooter were also available.

Sports administration and competition management

Hosting the World Championship event at El Dorado Park in October, 1983, helped the LAOOC to identify and train 85 percent of the staff and volunteers who would work the Olympic Games. Very little attrition occurred either before or during the Games, contributing to a smooth running venue. LAOOC staff at the venue numbered 370. An additional 65

17 Shade structures provide good rest areas for competitors during the competition.

18 A special tent is present for the director of shooting and other support officials.

19 Archers hit the "bull's-eye" with remarkable frequency.

19

maintenance, food concessionaire, security and city employees were contracted. Contractors working solely in the public area numbered 34 to bring the venue total to 469.

Several 10-foot by 44-foot trailers housed the FITA offices, judges and officials, the commissioner and his staff and the venue operations offices. Tents were more suitable for such services as spectator first aid, the athlete lounge and public information. FITA officials were assigned their own trailer and judges and officials were accommodated separately. Officials for the event consisted of seven judges, three members of the Jury of Appeals, two Technical Delegates and three Directors of Shooting as well as the President and Secretary-General of FITA. A 12-foot by 12-foot elevated platform was built for the Director of Shooting, with a roof with an 18-inch valance for sunshade. The announcers (English and French) and sound engineer were moved from behind the Director of Shooting platform into a separate area to reduce confusion and unnecessary activity around the platform during competition.

Scorers worked in tented areas adjacent to the competition field. Results management was also provided with tents in this area. For the first time at an Olympic Games, compilation of scores was done on a small computer. Scorers manually marked the official FITA scorecards and then immediately transferred the data to computer cards. The cards were

then fed into a Chatsworth Data System card reader which read the individual arrow scores and fed the data to the computer. The system had been tried at the World Championships in 1983 but the computer program had to be completely rewritten before the Games. However, the scoring system worked almost flawlessly during the Olympics and results were produced approximately six minutes following each scoring end. Results were hand-carried to the nearby scoreboard operators after each end of arrows was shot. The computer was also used to pre-print the computer cards in advance of the competition. While the scoring system worked well, a problem existed in coordinating the on-site computer-generated results with Ernst & Whinney's results distribution system. Venue management pinpointed the problem as a lack of pre-Games test runs and a non-sport-specific program. The result was an extremely slow production of results for distribution. After the first computer printout of results was received, it took four hours for the results system operators to re-enter and duplicate hard copy on the first day of competition. The results system was then moved from the scoring tents to the management compound in an attempt to speed up production. By the end of the Games, the turn-around time had been gradually reduced to approximately two hours, but before then venue management had decided to reproduce copies of the on-site computer printout for quick distribution to the media and other groups which needed immediate results.

Summary

Perhaps the biggest single contribution to the success of the 1984 Olympic archery competition was the XXXIInd World Archery Championships 18-22 October 1983. The event was part of the LAOOC's plan to utilize many Olympic sites during 1983 to help venue staff prepare for the Games and was the only world championship to be hosted by the LAOOC in 1983. The event identified a number of problems that were later resolved and also introduced world-class archery to the

Southern California community and media. Games staff and volunteers were identified; scoring systems were tested; facilities at El Dorado Park were examined; and physical venue needs like office space were recognized. As a result, the entire computer program for the scoring system was modified; security needs were identified and preliminary architecture plans were revised to add more office space. Most importantly, world-class athletes took part in a successful competition where 11 of 12 world records were broken and the twelfth record tied.

When the Olympic Games began, the archery venue was ready and the weather was perfect. The temporary facilities (tents and trailers) proved adequate for a variety of uses from shaded areas for athletes to office space for FITA officials. An innovative equipment repair trailer that could be moved from the practice field to the competition range saw heavy use and Olympic archery officials highly recommended such an operation for future archery championships. The competition field was measured to near-perfection and target equipment provided by Saunders Archery Company and the Björn Bengtson Archery Company of Sweden was excellent.

Though the computer scoring system worked almost flawlessly, the results management system was extremely slow. A better understanding of archery and more pre-Games planning by the results management company could have speeded up the official post-competition results distribution. Unofficial results were available within minutes after the end of competition.

20

30.09.2 Athletics

When the Games returned to Los Angeles in 1984, they also returned to the Los Angeles Memorial Coliseum. Athletics competition and Opening and Closing Ceremonies had been staged there in 1932 and the historic Coliseum was an obvious and fitting choice for those same events in 1984. Never before had an Olympic main stadium been used twice.

The 63-year-old structure was magnificently decorated for the 1984 Games, but it took approximately \$5 million and several years to upgrade the aging facility. Another \$2 million was spent in permanent improvements in Exposition Park, a public area surrounding the Coliseum. Temporary decorative elements were added by the LAOOC to embellish the Coliseum both for athletics and ceremonies. Because the Coliseum had been the central site of the 1932 Games, the LAOOC attempted to respect tradition in its design efforts at the stadium for 1984.

A giant Olympic torch sits 45.72 meters (150 feet) above the ground on the peristyle (east) end of the stadium and was placed there for the 1932 Games. Construction of the Coliseum was completed in 1923 at a cost of \$954,872.98. The original 75,000-seat capacity of the stadium was enlarged to 101,574 in 1931 at a cost of \$950,293.88. A later conversion of seats to theatre-type reduced the capacity to 92,516, with 73,929 permanent chairs now in place and only 18,587 covered bench seats remaining. There are 90 entrances and 74 turnstiles.

The Coliseum's track and field facilities were totally redesigned with construction focusing on the installation of a new world-class synthetic "Rekortan" track. All possible factors affecting the competitors were taken into account in the planning of the total athletics

facilities. The track was designed with the widest turns possible to give all competitors the best running conditions in the 200 meters, 400 meters, 400-meter hurdles and 400-meter relay events, where sharp turns affect some lanes more than others. The field events areas were constructed to provide the best possible running, jumping and throwing surfaces. The orientation of the field events took into consideration weather and background conditions and the longest possible runways were installed. Training tracks were built or refurbished at nine other sites, including seven funded by ARCO. Two of these tracks were located within the two main Olympic villages.

Every athletics event finished in the Coliseum and every event, except the men's and women's marathons, started at the Coliseum. The marathons began at Santa Monica College. The women's marathon was one of four women's events added to the schedule for the first time. The others were the 400-meter hurdles, the 3,000-meter run and the heptathlon,

which replaced the pentathlon. The athletics competition began on 3 August, the sixth day of the Games, and continued with two sessions per day through 11 August except for a rest day on 7 August. One day-long session was set for 9 August. A departure from the traditional eight-day athletics schedule was arranged so that the men's marathon would finish during the Closing Ceremonies on 12 August. Morning sessions began at 0930 and generally included preliminary heats and qualifying rounds. Except on 9 August, the Coliseum was cleared and cleaned before the afternoon session which began at 1600 hours. On 11 August, the start of the 50-kilometer walk opened that day's morning session at 0800. The women's marathon began at 0800 on 5 August and the men's marathon commenced at 1715 on 12 August.

Each participating nation was allowed to enter up to three athletes in each individual event, but entry standards were required in all events except the marathons and walks if an NOC wished to enter more than one competitor. Each NOC could enter one team in each relay event.

One world record was set in athletics (men's 4 x 100 relay) while Olympic records were surpassed 28 times. Olympic bests were recorded in the men's 20 and 50 kilometer walks and men's marathon and an Olympic best was established in the women's marathon. A record 411 women participated in athletics while 973 men competed. A record number of nations, 124, were represented. Out of the 304 different heats, flights and sections of the competition, 21 protests were lodged and four were sustained. The first race of every session started on time.

Twenty-four events were held for men with the following gold medal results: 100 meters, Carl Lewis (USA), 9.99; 200 meters, Lewis (USA), 19.80; 400 meters, Alonzo Babers (USA), 44.27; 800 meters, Joaquim Cruz (BRA), 1:43.00; 1,500 meters, Sebastian Coe (GBR), 3:32.53; 3,000-meter steeplechase, Julius Korir (KEN), 8: 11.80; 5,000 meters, Said Aouita (MAR), 13:05.59; 10,000 meters, Alberto Cova (ITA), 27:47.54; marathon, Carlos Lopes (POR), 2:09:21; 110-meter hurdles, Roger Kingdom (USA), 13.20; 400-meter hurdles, Edwin Moses (USA), 47.75; 20-kilometer walk, Ernesto Canto (MEX), 1:23:13; 50-kilometer walk, Raul Gonzalez (MEX), 3:47:26; 4 x 100 meters, United States, 37.83; 4 x 400 meters, United States, 2:57.91; high jump, Dietmar Moegenburg (FRG), 2.35; pole vault, Pierre Quinon (FRA), 5.75; long jump, Lewis (USA), 8.54; triple jump, Al Joyner (USA), 17.26; shot put, Alessandro Andrei (ITA), 21.26; discus, Rolf Danneberg (FRG), 66.60; hammer, Juha Tiainen (FIN), 78.08; javelin, Arto Haerkoenen (FIN), 86.76; decathlon, Daley Thompson (GBR), 8,797.

Gold medal results in the 17 women's events were: 100 meters, Evelyn Ashford (USA), 10.97; 200 meters, Valerie Brisco-Hooks (USA), 21.81; 400 meters, Brisco-Hooks (USA), 48.83; 800 meters, Doina Melinte (ROM), 1:57.60; 1,500 meters, Gabriella Dorio (ITA), 4:03.25; 3,000 meters, Maricica Puica (ROM), 8:35.96; marathon, Joan Benoit (USA), 2:24:52; 100-meter hurdles, Benita Fitzgerald-Brown (USA), 12.84; 400-meter hurdles, Nawal El Moutawakel (MAR), 54.61; 4 x 100 meters, United States, 41.61; 4 x 400 meters, United States, 3: 18.29; high jump, Ulrike Meyfarth (FRG), 2.02; long

jump, Anisoara Stanciu (ROM), 6.96; shot put, Claudia Losch (FRG), 20.48; discus, Ria Stalman (HOL), 65.36; javelin, Tessa Sanderson (GBR), 69.56; heptathlon, Glynis Nunn (AUS), 6,390.

Athletics competition in the 1984 Games added a new dimension when two wheelchair exhibition races were held at the Coliseum on the morning of 11 August. Sharon Hedrick of the United States won an 800-meter race for women in 2:15.73 and Paul Van Winkel of Belgium won the 1500-meter wheelchair exhibition for men in 3:58.50. The IOC granted permission late in 1983 to stage a wheelchair event and the International Amateur Athletics Foundation (IAAF) agreed in January of 1984 to allow the two wheelchair events on the athletics schedule. Trials for the event were held in New York in June 1984 and the field was narrowed to eight competitors and two alternates in each race.

Existing athletics officials, plus a specially appointed head referee and a head starter, officiated the two races. The athletes were allowed to stay in the USC Village where they could use the Cromwell Field training track during specific evening hours. A separate training track and facilities were available at Los Angeles Southwest College.

Field of play The Coliseum

A little more than a year before the Games, a new synthetic 400-meter track made of Rekortan Sports Corporation/C. Voigt Sohne GmbH's "Rekortan" was installed on the Coliseum floor. It was the same surface that was used at Munich's Olympiastadion for the 1972 Olympic Games. The eight-lane track had a 36.8-meter turn radius, requiring the LAOOC to modify some of the seating in the Coliseum to accommodate the wider track. Additionally, an American football field which lies inside the track, had to be moved five yards to the east. A new Hi-Play systems grass infield was installed which allowed the mid-field crown to be eliminated. Although the new Coliseum floor was completely flat, drainage capabilities were improved. The stadium infield was set up with two long jump/triple jump runways on the south side; two pole-vault runways on the north side; three high-jump areas on the east end; two shot put circles on the west side and one circle in the center of the stadium (for finals); a discus and hammer circle in the northeast corner and a javelin runway in the east end. The decision to install two parallel pole vault runways along the north side of the infield, with provision for landing pads at either end, allowed the LAOOC to make the runways longer. This also presented less of a hindrance to the hammer and discus throwers and any runners that might be on the northwest turn of the track. The field event placements took into consideration sun, wind, background, crowding and scheduling problems.

Sports Administration and Competition Management

IAAF regulations require that all of the implements used in the throwing events be furnished by the Organizing Committee and competitors must select from those implements both for training and competition. In an attempt to coordinate the gathering of hundreds of these implements from a variety of manufacturers, the LAOOC contracted with UCS Incorporated of New Jersey to order, store and ship the implements. Additionally, UCS supplied pole vault and high jump pits and standards, hurdles, steeplechase barriers and water jumps, the long jump take-off board system, lane marker boxes, shot put toe-boards and rings, discus and hammer rings and cages, implement carts and platform carrier carts, sector line marking tape, distance markers and a one-meter-high protective mesh barrier to surround the throwing sectors. UCS technicians set up and dismantled their equipment at the Coliseum and training sites and kept in daily contact with the training sites during the Games for equipment maintenance. Other equipment gathered by UCS included Berg relay batons, Cantabrian and Berg hammer handles and cables, Pacer pole vault and high jump standards and cross bars and Cantabrian pole vault boxes. Other miscellaneous equipment ordered locally included 48 clothing baskets, two pole vault wind socks, four sets of step markers for long jump runways, 21 spools for reusable plastic arc and sector tapes, two heavy pit smoothers, 90 metal numbers, 52 arc distance signs and various officials flags.

The process of gathering the equipment began once the IAAF released its list of required equipment standards, manufacturers and model numbers. UCS began shipping the equipment to the LAOOC warehouse in March 1984 and continued gathering and shipping equipment through the start of the Games. An equivalent of more than 40 trailers (42-foot) of equipment were shipped between March and the end of the Games. Original equipment quantities were increased just before the Games when athletics organizers realized the track at USC served not only as a training site, but also as a warm-up site. The amount of equipment ordered proved to be more than adequate.

The only personal competition equipment allowed in Olympic athletics is vaulting poles. They must be of a type which has been generally available for at least two years prior to the Olympic competition. Pole vaulters were asked to bring all competition poles to the training site office in their village of residence on 5 August, the day before the pole vault qualifying rounds. The LAOOC delivered the poles by truck to the equipment storage building at the Coliseum and checked to insure all poles conformed to the IAAF approved list. All approved poles were delivered directly to the pole vault competition area prior to the athletes' entrance into the Coliseum. At the conclusion of the competition, all poles

were transported back to the proper village. Athletes were provided with a tag which was attached to the poles and indicated name, competitor number and village of residence. The same procedure was in effect for the final round of competition and for decathletes.

The LAOOC utilized an electronic starting block system by Swiss Timing and Berg of the Federal Republic of Germany that was very accurate in indicating false starts. Loudspeakers built into the rear of each starting block gave athletes in each lane an equal opportunity to hear the starting commands and gun. Two sets of eight blocks were available at the Coliseum.

Swiss Timing provided three electronic finish cameras; two located on the south Coliseum rim and one on the field. No failures were reported, but back-up power was included with the devices and four hand-timers were also provided to back up the three electronic systems. The hand timers were not needed. Zeiss-Jena of the German Democratic Republic provided an optical measuring system for all field events except the high jump. The opening height of the pole vault was optically measured and the standards calibrated so that every height did not need to be measured. Previously, the system had only been used in measuring the long throws. The system provided quick, exact measurements and required fewer people on the field of play than traditional measuring systems. Steel tapes were available as a back-up system.

Training information

Training opportunities were more than adequate for athletics competitors. Each village offered complete facilities except UCLA, where no hammer throw area was available. Four other training tracks were fully equipped with all necessary equipment and implements, a check-in area and information board, a tented rest and massage area, refreshments, toilets and medical facilities. All training areas were fully secured. No showers, saunas or any type of indoor facilities were provided. The tracks were available for training between 0800 and 2000, while throwing areas were available at more specific hours. For example, at UCLA, one discus training area was available between 1100 and 1400 and 1700 and 2000, while the javelin throw training area was open between 0800 and 1100 and 1400 to 1700.

Though no training was allowed in the Coliseum, NOCs were assigned dates for an orientation tour between 17 and 30 July. Athletes were allowed orientation on an open basis as well, though only a few made use of this service. For marathoners, the course could not be closed for training prior to competition. All competitors and team officials had an opportunity to take guided tours between 2 and 9 August. The racewalk competition course also was not closed for training.

23 Start of the first semi-final of the men's 200 meters.

24 This special starter's pistol activated not only the runners, but the multiple timing systems used at the Games

Training sites

Drake Stadium, UCLA Village; available 14 July to 15 August

- Nine-lane, 400-meter Voigt Rekortan track
- Two long jump/triple jump runways
- Two high jump areas
- Two pole vault runways
- Two shot put circles
- Hurdles and steeplechase barriers
- One discus and one javelin area at adjacent field

Cromwell and Dedeaux Fields, USC Village; available 14 July to 2 August, 7 August, 12 August

- Right-lane, 400-meter Voigt Rekortan track
- Two long jump/triple jump runways
- Two high jump areas
- Two pole vault runways
- Two shot put circles
- Hurdles and steeplechase barriers
- One javelin runway (1400 to 1700)
- One discus/hammer circle

West Los Angeles College; 12 km from UCLA, 13 km from USC; available from 15 July to 12 August

- Three discus/hammer throw circles
- One javelin runway
- Three shot put circles

Jackie Robinson Stadium; 7 km from USC Village; available 15 July to 11 August

- Six-lane, 400-meter Berleburger Schaumstoffwerk Regupol track
- Two shot put circles
- One discus circle
- One javelin runway
- Two high jump areas
- Two pole vault runways
- Two long jump/triple jump runways
- Hurdles

Corsair Stadium, Santa Monica College; 7 km from UCLA Village; available 14 July to 11 August, except for between 0800 and 1000 on 5 August

- Eight-lane, 400-meter Mondo Sportflex Super-X track
- One high jump area
- Two long jump/triple jump areas
- One pole vault runway
- Two shot put areas
- One discus area
- Hurdles

Cougar Stadium, Los Angeles Southwest College; 13 km from USC Village; available 25 July to 11 August

- Eight-lane, 400-meter Mondo Sportflex Super-X track

25 The training track at UCLA's Drake Stadium. Press interview tents for the UCLA Village are in the background.

Sports Administration and Competition Management

- One high jump area
- One long jump/triple jump runway
- One pole vault runway
- One shot put circle
- Hurdles, steeplechase barriers

Other suggested training sites were:

- Birmingham High School, Voigt "Recaflex S" track
- California State University at Los Angeles, Voigt "Recaflex S" track
- East Los Angeles College, Berleburger Schaumstoffwerk GmbH "Regupol"
- Occidental College, Voigt "Rekortan" track

The road events

In a unique attempt to close the Olympic Games with the finish of an Olympic event, the LAOOC scheduled the men's marathon to conclude in the Coliseum just prior to the start of Closing Ceremonies. Another Olympic first was the scheduling of a women's marathon event. Both marathons began at Santa Monica College and finished in the Coliseum. The two racewalk events began and ended at the Coliseum and were held on a 2.5-kilometer loop course near the stadium.

Four priorities were established during the preliminary mapping stages of the marathon course. First and foremost was the desire to finish the marathon in the Coliseum. The second and third priorities were to select a somewhat flat course along a scenic and

comfortable route. Finally, the LAOOC endeavored to select streets that were wide enough to accommodate the runners and necessary accompanying vehicles. An obstacle in mapping the final course was gaining the cooperation of the five local governmental jurisdictions through which the race passed, since streets had to be temporarily closed during the race. In the end, the roads that the course followed were shut down for just a few hours. A "rolling closure" system meant main cross streets were closed briefly just before the runners passed and reopened as soon as the last runner passed. Climatic conditions were also a factor in mapping the course and, in the end, two-thirds of the course was located within four miles of the Pacific Ocean to take advantage of the prevailing ocean breeze.

Santa Monica College served not only as the starting point for the marathons, but also as a training site for athletics and handball. Therefore, security fences and some athlete services were already in place. A marathon venue management staff worked independently of the Coliseum staff. A minimum amount of design changes were required to accommodate the

start of the marathons. Alterations specific to the marathon were the addition of temporary toilet facilities for spectator use, the placement of protective padding on the walls and fences and the athlete exit from the track, decoration of the stadium, the building of platforms on the existing bleachers for television cameras and the removal of existing goal posts and approximately 65 feet of fences and gates. Television cameras were positioned in the west bleachers, along with the Olympic Family, including the IAAF. Athletes arrived by bus and entered a gymnasium east of the stadium, where they went through the Athlete Control Center. A band entertained spectators prior to both races. Tickets for the start of the marathons were sold on site.

The earliest the IAAF would allow the women's marathon to start was 0800, which meant the race would finish in the Coliseum at approximately 1030, as a part of the morning session on 5 August. A consistent afternoon breeze off the Pacific Ocean allowed the LAOOC to schedule the start of the men's marathon for 1715 hours in order to finish just before ceremonies began. An equestrian event, men's platform diving and a synchronized swimming event were the only other competitive events scheduled for 12 August making the men's marathon the last event of the Games. The first runner entered the Coliseum after 1930

to a cheering crowd of more than 92,500 spectators. Because it was feared that stragglers would hold up the start of the Closing Ceremonies, the LAOOC prepared a finish area just outside of the Coliseum for any runners that finished more than three hours after the start of the race. This contingency plan was not used. The victory ceremony for the marathon, as well as that for the equestrian individual jumping event were held just as the Games' closing festivities began.

The shortest route of the marathon course was marked with a broken line on the route surface and each kilometer was marked along the route. The runners entered the Coliseum from Menlo Street, passing down through the main tunnel and running 1.25 laps on the Coliseum track. The runners ran 140 meters in lanes four and five past the finish line, then finished the final 400 meters in lane one.

Racewalkers toured the Coliseum track five times before departing on the 2.5-kilometer course. After six laps for the 20-kilometer race and 18 laps for the 50-kilometer race, the athletes returned to the Coliseum through the main tunnel. A digital clock was available to show the intermediate time at five kilometers and every 2.5 kilometers after that.

26 Rosa Mota of Portugal leads the pack midway through the women's marathon.

27 Aid stations like this one at the 28 kilometer mark are available to marathoners at various points during the race.

26

27

Three-thousand race course marshals were recruited to work the marathons and race walks. Most worked both marathons and about 100 worked the race walks as well. Instead of relying on the LAOOC Games Staffing process, athletics organizers appealed to service clubs and churches that were located along the course and asked local running clubs to supply volunteers. Just prior to the Games, a five-day training session was held and all marshals were required to attend a three-hour session on one of the five days. On race day, the marshals met at three locations for orientation prior to being transported to their respective work stations. Mile chiefs were located on each side of the course and coordinated the efforts of the marshals, whose primary task was to assure a clean and clear path along the competition route. No incidents of spectator interference were reported for any of the road events. Another duty of the marshals was to help rope off the course prior to the race. As a truck dropped the nylon rope along the side of the road, the marshals affixed the rope to trees, posts or LAOOC-provided barriers.

Thirteen spray and sponge stations were set up along the marathon course. While on-course pass-through shower stations had not previously been attempted in the Games, this service was well received and used by the athletes. One shower station was also set up on the racewalk course. These stations consisted of a shower spray device on the right side of the course at the beginning of the station and the runner had the choice of running to the right under the spray or to the left to avoid it. Both alternatives covered the same distance. On each side of the course just after the spray area were three tables spaced 20 meters apart. Wet sponges were available on two of the tables and cups of water on the third. The refreshment tables, sponging/spray stations and toilets were indicated with signs 100 meters in advance.

Eight refreshment stations were spaced every five kilometers along the marathon course. Each station consisted of nine tables spaced 20 meters apart. The first seven tables were numbered and labeled by country for individual drinks. The eighth table was supplied with an electrolyte drink and the ninth table had cups of water on it. Athletes who wanted personal beverages left at the tables were instructed to leave them at the athletics desk at the Sports Information Center in the Olympic villages by 2000 hours on 4 August for the women's marathon and before 1100 hours on 12 August for the men. Athletes not living in the villages could leave their beverages at the Santa Monica College Gymnasium. A medical

aid tent and a portable toilet were placed at the beginning of each refreshment station, but competition management reported little use of the medical tent. Roving Red Cross aides walked the entire route to offer first aid for spectators.

The IAAF decreed that all vehicles preceding the marathon had to be electrically powered. The host broadcaster created a vehicle that carried cameras and commentators and supplemented it with three electric motorcycles. Six electric trucks provided transportation for security and support personnel as well as a digital timing readout. The running time could be seen on top of the lead vehicle and on digital clocks located every five kilometers on the course. Approximately 200 meters ahead of the race, a phalanx of police personnel escorted the race.

More than 150 hand-held radios provided the essential communications link between course officials and competition management at the Coliseum. Even the starter's signal was radioed back to the Coliseum to set the Swiss Timing clock in motion. Closing Ceremonies spectators viewed much of the race on the giant video screen in the Coliseum.

Sports administration and competition management

Co-commissioners provided the leadership for athletics, supervising a paid and volunteer staff of approximately 6,600. One commissioner planned and managed the track and field events at the Coliseum and training sites while the other was in charge of the road events, receptions and hospitality. Both commissioners shared responsibilities for the general operation of the Coliseum venue, although once a venue director was appointed, he directly supervised all of the general venue services. Other key management figures included a competition director, a pre-competition director, a competition secretariat director, a spectator information director, a marathons technical director, a marathons support director, a race walks director and a protocol director. Under the direct supervision of the competition director were several key managers, including four assistant competition directors, a competition equipment manager, a combined competition manager, a competition facilities manager, an officials support manager, a video race monitoring manager, a chief steward and a venue ceremonies manager. Regular meetings of all competition managers were held starting in September 1983 and increased from monthly to bimonthly and eventually weekly. Managers of the stadium departments began meeting in spring 1984. Many managers were not employed on a full-time paid status until June 1984 and volunteered their time during the planning stages. It should be noted,

however, that the LAOOC assigned many of its top personnel in various departments to the athletics venue.

Several athletics events held in the Coliseum prior to the Games helped management staff and volunteers observe or become involved in activities that were beneficial during the Games. In June 1983, an all-comers meet and a United States-German Democratic Republic dual meet were held to test the new facilities. In June 1984, the California State High School Track and Field Championships and the U.S. Olympic Track and Field Trials were held in the Coliseum. The U.S. trials, though not sponsored by the LAOOC, gave numerous departments the chance to gain operating experience with an almost identical time schedule and an identical program of events. Many key managers also had the opportunity to attend and closely observe the 1983 World Track and Field Championships in Helsinki, Finland.

Existing athlete and officials' facilities in the stadium were augmented by use of trailers and tents, with all venue operation facilities housed in trailers. Because the Coliseum was in close proximity to the Sports Arena (boxing), facilities for Olympic Family hosting and some parking and press facilities were shared.

Construction at the venue included the installation by the venue owners of three permanent alphanumeric video scoreboards in 1983 for the transmission of start lists, results, records, running times and video reruns. A 36-foot-high by 48-foot-wide (11-meter by 14.6-meter) full-color video system board showed full speed and slow motion reruns of races and field events when possible and was located at the south end of the peristyle. A second board at the north end of the peristyle displayed all start lists, official results and interim field events standings. The third board, located in the center of the peristyle, showed running times, interim times, final unofficial times, final official times and world and Olympic records. Additionally, a 165-foot-high (50.3-meter) freestanding, full lamp, matrix display was erected facing the Harbor Freeway outside the venue. The \$12.5 million project was arranged through private sponsorship and the installations were made by the American Sign and Indicator Corporation of Spokane, Washington. In addition, a temporary 10-line alphanumeric board was installed over the west-end tunnel by Swiss Timing. There were also five rotating scoreboards on the field showing the results of each attempt in the jumping and throwing events. Scoreboard distances were shown in both meters and feet.

Other construction at the Coliseum included the following permanent rehabilitation work:

- Installation of new field turf with drainage and irrigation
- Addition of new field events areas
- Enlargement of existing sewer line
- Installation of air-conditioning in existing dressing rooms
- Addition of an electrical supply for new scoreboards
- Renovation of concourse first aid room
- Construction of a new 6,000-square-foot storage building
- Replacement of 1,500 seats
- Upgrade of concourse rest rooms
- Installation of new emergency electrical system
- Installation of new electrical service at field level
- Upgrade of field lighting
- Excavation and extension of tunnel six (athlete exit)
- Installation of a new public address system
- Construction of 11 new perimeter concession stands
- Repair and painting of concourse floor
- Repaving of perimeter area
- Replacement of peristyle fence
- Repair of the press box elevator
- Installation of a new gas line to the torch
- Installation of a grade-level conduit chase across the perimeter area for use mainly by the host broadcaster
- Replacement of the fence on top of the stadium rim
- Replacement of the concrete at the peristyle between the seats and the perimeter fence
- Painting of peristyle seats and ceiling

The warm-up areas for use before competition were located away from all press, public and non-essential officials, allowing total isolation and concentration for the athletes. Athletes who were not warming up for immediate competition were not allowed to use the warm-up facilities at Cromwell and Dedeaux fields where the pre-competition warm-ups were being held. Because of the 900-meter distance from Cromwell and Dedeaux fields to the Coliseum and because it was impossible to build a complete training track and field immediately adjacent to the Coliseum, a frequent shuttle bus service was arranged to quickly transport the athletes to the check-in area and final warm-up area just outside the Coliseum. No athletes missed the start of a race or event, thanks to carefully planned athlete warm-up, transportation and check-in systems.

The scenario for an athlete competing in a 1005 event was as follows: an athlete living at UCLA took the athlete shuttle to USC at 0730 hours; by 0815, the bus arrived at the USC Village; at 0820, the athlete walked to Cromwell or Dedeaux field where he or she warmed up for approximately 45 minutes; at 0915, the athlete got on a shuttle bus for the Coliseum, a 900-

Sports Administration and Competition Management

meter trip through a secured area; at 0930, the athlete entered the Athlete Control Center where warm-up on a six-lane, 55-meter track was available; by 0940 the athlete was required to check in at the call room and waited until his or her event was called; at 0950, stewards took the athletes in lane or competition order through a tunnel into the west end of the Coliseum floor to await competition.

Facilities at the Athlete Control Center were well isolated, sheltered and shaded for the athlete's final few minutes of limbering up before checking in at the call room, which was quiet and again designed to prevent interruptions in the athlete's concentration. While in the call room, the athletes' competition numbers, including hip numbers, were checked, the make of shoes, their design and number of spikes were analyzed and commercial advertising and equipment were examined for compliance with IOC and IAAF rules. Thirty-seven different language capabilities were available during these procedures to avoid any misunderstanding or lack of information. After completing the check in procedures, the stewards escorted the athletes in lane or field competition order through the large tunnel at the

west end of the Coliseum, onto the field and to the competition area.

Each track competitor was provided with a basket for his or her clothes. The warm-up suit was placed on top with the athlete number showing. In addition, a lane number was marked on the side of each basket in order to help the aides and athletes locate the baskets after the event. Competition aides were secondary school-aged youths who contributed enthusiastically to the pre-competition and post-competition procedures.

After competition, stewards escorted athletes through tunnel 6, which was located under the stands, to the outside of the Coliseum, through the press mixed zone and to the bus pickup point. After finals, medal winners were taken to the awards ceremonies area and then to the press interview area and doping control.

The athletics competition secretariat coordinated preliminary and final entry lists and assisted in the preparation of start lists. All entries were due in the LAOOC registration office by 18 July 1984 and were entered into a small computer, along with qualification

results in preparation for approval by the technical delegates on 22 July. Once verified lists were prepared by the secretariat, they were distributed to Ernst & Whinney (results system managers) for the assignment of competition numbers. The LAOOC also provided a nation-by-nation list of participants that included name of competitor, date of birth, height, weight, event, qualifying result and personal record. This information was prepared for distribution to teams and the media.

The secretariat staffed sports information offices in each of the villages and was headquartered in the Coliseum. Three days prior to the start of the first competition in a given event, an official representative of the NOC was required to confirm participation of those competitors entered. The names were written on an LAOOC-provided form and submitted to the secretariat or village sports information offices before 0900 on the confirmation day. The sports information centers were open daily from 0700 to 2300 while the secretariat in the Coliseum was open from 0800 to 2200. The LAOOC coordinated the confirmation of participation and prepared a list for the technical delegates after 1000. Seeding cards for each individual were

prepared in advance, including best performance and qualifying performance, and were finalized by the technical delegates once entries were confirmed. Result cards were then prepared with the following information: event, round, heat or group, lane order, athlete number and athlete name competition number. Copies of the result cards were telecopied to the results management team for preparation of the unofficial start list which was approved for distribution between 1400 and 1800. The original results cards were filed with the secretariat after shoe codes were marked and two copies were sent to the Athlete Control Center one hour before each session. The steward who escorted the athletes to the field for a particular heat or final took the results cards to the head judge for field events or the starters' assistant for running events.

The secretariat also coordinated scratches, cancellations and protests. Team leaders were required to file their protests in writing with the secretariat. To aid the jury of appeal in protest decisions, a race monitoring system of six video cameras was set up at various points around the Coliseum.

Summary

The historic Los Angeles Memorial Coliseum was the site of the Olympic athletics competition for the second time-the first being the 1932 Games. The aging facility was refurbished and

brightly decorated for the 1984 Games and construction included total redesign of the track and field facilities.

A new world-class synthetic "Rekortan" eight-lane track with wide turns was installed in 1983 and field event runways and throwing sectors were placed with the best possible orientation, taking into account weather, background conditions and scheduling problems.

Every athletic event finished in the Coliseum, including the race walks and marathons, though the marathons began at Santa Monica College. The women's marathon was an Olympic first as was the finish of the men's marathon at the Coliseum just prior to the start of Closing Ceremonies. Other new women's events were the 3,000 meters, the 400-meter hurdles and the heptathlon. Twenty-four events for men and 17 for women attracted 973 male and 411 female competitors, representing a total of 124 NOCs. A total of 304 different heats, qualifying rounds and finals were successfully run.

UCS Inc. of New Jersey coordinated the ordering and shipping of all competition implements. The concept of using one dealer to organize the collection of all the competition equipment had not been tried before and worked extremely well. UCS manufactured some of the athletic equipment itself, including high jump and pole vault pits, hurdles and discus and hammer cages.

An electronic starting block system by Swiss Timing and Berg of the Federal Republic of Germany was very accurate in indicating false starts.

Swiss Timing provided the electronic finish cameras as well. Zeiss-Jena of the German Democratic Republic provided an optical measuring system for all field events except high jump. The system provided quick, accurate measurements and required fewer people on the field of play.

Training sites were located within the UCLA and USC Villages and at several other sites, offering athletes more than adequate space and equipment needs. No training was allowed in the Coliseum, though orientation tours were provided. Tours of the marathon and race walks courses were offered as well.

Three thousand course marshals were recruited to assure a clean, clear path along the marathon and race walk courses. Shower stations were planned along the courses for the first time in an Olympics and were well-received by the athletes.

The organization and staging of the athletics competitions was a monumental task and two commissioners were selected to provide supervision of the events. More than 6,600 paid and volunteer LAOOC staff worked the Coliseum and road events during the Games. Planning began as soon as the Coliseum was announced as the competition site. Key managers were selected and participated in regular meetings two years prior to the Games and planned services such as the competition secretariat, Athlete Control Center and training sites. Some of those services were tested at an international meet held at the Coliseum's newly installed athletics facilities in 1983 and again in June 1984 at the U.S. Olympic Track and Field Trials.

The goals of the athletics organizers were to provide the finest and fairest possible physical and mental environment for the competing athletes, and to provide all of the spectators of those competitions-the stadium ticket holders, the media representatives and the television audiences-with the best possible viewing and information arrangements to maximize their understanding and enjoyment of the competitions. The facilities were designed to give the public unimpeded views of all competition facilities from every seat and camera position within the Coliseum. The schedule was published well in advance of the Games and was designed to give the public a minimum of conflicting competition on the field at any one time during the eight days of track and field competition. The scoreboards, both around the stadium and on the infield, were designed to provide the maximum amount of information to the spectators and athletes and included video replays of most of the events.

More than 1.1 million spectators viewed the 15 sessions of competition and an additional 92,500 saw the finish of the marathon at Closing Ceremonies. One world record was set and Olympic marks were surpassed 28 times. Those who viewed the competition will not soon forget the outstanding performances. They will also remember the magnificent Coliseum, decorated with the festive Look of the 1984 Games, but respecting the tradition that began with the 1932 Games.

29 Giant umbrellas are used for shade for athletes competing in such lengthy events as the pole vault or decathlon.

30

30.09.3 Baseball

More than 385,000 spectators attended eight days of Olympic baseball competition at Dodger Stadium in Los Angeles, giving the demonstration sport the third highest attendance of the Games behind football and athletics.

The long-standing and constant support of the Los Angeles Dodger professional baseball organization contributed immeasurably to the success of the event. Not only did the Dodgers offer use of their 56,000 capacity facility in the middle of their own regular season, but they also assisted greatly in the planning stage and provided the majority of the staff necessary to operate the venue.

The initial push for the inclusion of baseball in the 1984 Games began in 1979 when the Extraordinary Congress of the International Amateur Baseball Association (AINBA) was held in Los Angeles. AINBA made a presentation to the LAOOC's Demonstration Sports Commission, which recommended

baseball and tennis as its choices for demonstration status in the 1984 Games. When the IOC gave its approval for the two demonstration sports on 10 April 1981, a four-team, six-day tournament format was dictated. Included in this original plan was the stipulation that medals would not be presented to the winners, athletes could not march in Opening or Closing Ceremonies and teams would not be able to stay in the Olympic villages. The LAOOC continued to lobby for inclusion of baseball as a full medal sport. At the 1983 IOC Session in New Delhi, the number of teams was expanded to six and permission to conduct awards ceremonies and present special gold, silver and bronze medals similar to those awarded in official Olympic sports was granted. By May 1984, many of the LAOOC's original demands were met as the IOC approved an increase in the number of participating

30 Dodger Stadium in full Olympic dress.

31 The demonstration sport of baseball showcases some of the finest teams in the world, including Chinese Taipei, (in blue) and Korea.

31

teams to eight and allowed baseball players to stay in the Olympic villages and to march in Opening and Closing Ceremonies.

Although baseball had been a demonstration sport in six other Olympic Games, previous formats consisted mainly of one-game exhibitions played in makeshift ballparks. The inclusion of an eight-team, eight-day tournament for baseball in the 1984 Games and the tremendous spectator interest was seen by the AINBA as a major step forward for international amateur baseball.

The LAOOC executed an agreement in principle with the Dodgers in September 1981, calling for the Dodgers to provide Dodger Stadium as the site for the baseball demonstration and act as a managing partner with the LAOOC in assuming responsibility for the housing, feeding, transportation, security, entertainment and training of the athletes during the Games. In return, the Dodgers would receive a percentage of the gross receipts derived from baseball ticket sales and reimbursement for day-of-game expenses. The Dodgers were entitled to offer their season ticket holders right of first refusal to purchase tickets to their regular seats during the Games. In late 1983, the LAOOC was able to revise downward its village housing estimates allowing baseball athletes village privileges under the following conditions: a maximum of 20 athletes and five officials per team were permitted; the needs of each team would be administered by its own NOC without an increase in the size of the NOC staff; and the cost for each athlete would be \$100 per night (compared to \$35 per night for athletes in medal sports). The contract with the Dodgers was then amended and the LAOOC reassumed responsibility for athlete housing, feeding, entertainment, security, transportation and training in return for the Dodgers' paying two-thirds of the housing costs for the athletes by 1 March 1984. The Dodgers were responsible for operating the stadium during the Games, while the LAOOC managed key departments such as Technology, Language Services and Accreditation, necessary for the Olympic Games functions but not within the scope of the Dodgers' usual operation.

Selection criteria for the six teams originally planned for the tournament called for automatic berths for the defending world champion (Korea) and the host country as well as one berth each for European and Asian entries and two for the Americas exclusive of the United States. Several alternates which had been selected as reserves against non-participation provided additional choices when the

tournament was increased to eight teams. When a final schedule was determined, the eight teams were divided into two groups for divisional round-robin play. Two games were played each day with the top two teams in each division after round-robin play advancing into semi-final games. Japan outscored the United States, 6-3, in the championship game, while Chinese Taipei shut out Korea, 3-0, for third place.

Field of play

Utilizing one of the world's finest and most beautiful baseball stadiums meant the LAOOC had very little construction work to do at Dodger Stadium. LAOOC Look items decorated the stadium and two existing locker rooms were modified to accommodate four teams a day, but the field of play needed no alterations. The Dodgers supplied any competition equipment needed with the exception of game balls, which were supplied by Rawlings Sporting Goods. One hundred and fifty dozen baseballs with the *Star in Motion* printed on them were provided, with one-half used at the training sites and the other half at the competition site. Rawlings also set up an equipment repair facility at Dodger Stadium during the Games.

Two training sites were made available to the eight teams and proved adequate for all training needs. One diamond was available at West Los Angeles College, seven miles (12 kilometers) from the UCLA Village. A second diamond was available at Stengel Field, 11 miles (18 kilometers) from the USC Village. Each team was allocated two-and-one-half hours of training time each day but generally was able to get three hours if needed. To prevent long delays between games, teams playing in the second half of each day's doubleheader were allowed 60 minutes of batting practice at Stengel Field before traveling the short distance to Dodger Stadium for competition. Each team was given 10 minutes of infield practice on the competition field just prior to game time. Teams competing in the first game of the doubleheader each received 50 minutes of batting practice at Dodger Stadium. The ground crew then groomed the field for 10 minutes before each team received 10 additional minutes of batting practice.

Sports administration and competition management

The Dodger organization employees were already experts at running a large-scale baseball event so one of the LAOOC's primary tasks was supplementing the Dodger services with access control, language services, medical services, protocol,

32

security, technology, transportation and some venue management personnel. Another priority was orienting the Dodger organization to LAOOC policy. In 1983, the Dodgers assigned their ticket and marketing manager the responsibility of coordinating day-to-day Olympic planning with the LAOOC. During the Games he served as competition director. The LAOOC named its own commissioner for baseball, but he worked closely with the Dodger organization.

Most LAOOC-provided services were housed in tents and trailers in one of the stadium parking lots. Material Logistics, AINBA, venue operations, a post office and some novelty stands utilized trailers, while tents were set up for staff entry, language services, athlete check in and public information. Other LAOOC service departments utilized existing Dodger office space.

While the LAOOC provided technology and a results distribution service, the regular Dodger statistical crew worked all the Olympic games and produced a quick, unofficial box score, game notes, tournament statistics, notes and quotes and an inning-by-inning play-by-play at the end of each game. The LAOOC's results management team provided start lists and the official box scores.

Sell-outs occurred the last two days of Olympic competition while spectator attendance averaged 48,000 for the eight days of the tournament. Parking was available for 16,000 automobiles on 21 terraced lots surrounding the stadium. All spectator services were provided by the Dodgers. To promote the sale of tickets, the Dodgers mailed information to their regular season ticket holders and received about 20,000 positive responses for Olympic series tickets.

32 The victorious Japanese team is presented with their medals by IOC President Juan Antonio Samaranch and applauded by LAOOC President Peter V. Ueberroth.

Summary

Despite its exhibition status, baseball was popular with Olympic spectators as daily crowds averaged 48,000 and gave baseball the third highest attendance figures at the 1984 Games. But the sport may never have been a part of the Games at all without the diligent efforts of the Los Angeles Dodger organization, LAOOC management and AINBA officials.

Stadium management during the Games was provided by the Dodgers with the LAOOC supplementing the venue staff with certain service

departments. Experienced Dodger ushers, ticket takers, media services personnel, maintenance crews, concessionaires and others contributed to a smoothly-run venue operation. It should be noted that cooperation between the LAOOC and the Dodgers was extremely important to the success of the tournament. In any case, where the site owner provides such extensive management and staffing for an Olympic venue, great attention should be paid to the sharing of information and policies.

Dodger Stadium is a world-class facility and was ready-made for Olympic baseball. The tremendous turn-out of spectators for the latter part of the eight-day event indicated that even a stadium with a greater seating capacity than the Dodgers' may well have been filled.

33

33 Huge crowds turn out to view the baseball games at Dodger Stadium.

34

30.09.4 Basketball

An extremely short move in schedule created a tremendous challenge for the basketball venue staff. Fortunately for the LAOOC, the existing facilities at The Forum in Inglewood were well-suited for Olympic basketball competition and very little construction took place other than installation of the Olympic basketball court, decoration of the arena and creation of office space for venue personnel.

Because The Forum management had previously scheduled other events in the multi-purpose facility, the LAOOC was not able to officially move into The Forum until 0800 on 16 July. Since the Olympic villages had opened on 14 July, venue management had to rush to prepare the arena not only for the competition which began on 29 July but also for a full practice schedule which began 23 July.

Planning for the basketball competition began 30 April 1980 when the LAOOC signed an agreement in principle with California Sports, Inc., owner of The Forum, though the final contract was not signed until July 1984. The agreement was the LAOOC's first site arrangement and the basic cost-recovery format set the framework for many of the LAOOC's negotiations with venue owners (including training sites). The LAOOC did not want venue owners to lose money so revenue from services like parking and concessions were often shared, but negotiations varied from venue to venue. At some sites, the LAOOC improved facilities to help cover the cost of rent.

In spite of a short move in schedule, a successful Olympic basketball tournament was held, involving 18 teams (12 men's and 6 women's) in 63 games. For the first time in history, men's and women's teams from the same country took the gold medals. The United States women got by Korea, 85-55, in the final game while China captured the bronze medal, beating Canada, 63-57. Korea's Hwa-Soon Kim accumulated 101 points in 16 games to lead all individual women's scorers, while Cheryl Miller had 99 points for the U.S. squad. In men's action, the United States defeated Spain 96-65 for the gold while Yugoslavia beat Canada 88-82 for third place. Egypt's Mohamed Soliman took scoring honors with 179 points in seven games, averaging 25.6 points per game.

34 *The Forum provides a colorful backdrop for the basketball competition.*

35

36

35 Australia defeated the Federal Republic of Germany, 83-78 in the final for 7th place in the men's basketball tournament.

36 The specially-made basketball court for the Games is installed in sections.

Field of play

One of the LAOOC's first responsibilities upon move-in was the installation of a playing court made to Federation Internationale de Basketball Amateur (FIBA) specifications, which was loaned to the Organizing Committee by the Horner Flooring Company of the United States. Although The Forum owns a basketball court that the Los Angeles Lakers, a professional basketball team, play on, court size and striping specifications required by FIBA caused the LAOOC to seek another floor. The 37,800-pound Hornerfloor was delivered to an LAOOC warehouse prior to the Games in 210 four-foot by eight-foot sections. The Forum work crew spent one working day installing the court which was 60 feet by 112 feet (18.29 meters by 34.14 meters) in total size. The playing surface measured 15 meters by 28 meters (49 feet two-and-one-half inches by 91 feet 10-and-one-half inches) A large *Star in Motion* and the Olympic rings were painted on the court. Two hundred basketballs were provided by the Molten Corporation of Japan; 100 were used at The Forum and 20 were used at each training site. Rims made by the Porter Equipment Company of Chicago, Illinois, were installed at The Forum and at the five training sites. Some existing equipment at The Forum, like Porter glass backboards and standards and the scoreboard and scoring tables, was used by the LAOOC as a part of its arrangement with California Sports. Even though practices in The Forum did not begin until 23 July, training schedules at five local secondary schools began 14 July 1984. Each team was assigned one two-hour practice session per day through 27 July. Additional training sessions were granted subject to availability. From 23-27 July each team was assigned one two-hour practice session at the competition site. Training on 28 July involved only those teams scheduled to compete the next day. After 28 July, teams were able to request one or two-hour practice sessions through village sports information office computers. No shower facilities were made available at any of the training sites, including The Forum, although four Forum locker rooms were utilized during competition. Basketballs and all other necessary equipment, including medical training supplies, were available at each site. Each was staffed with a site director, a team attendant, a

clerk and a certified athletic trainer. Two training sites were assigned to teams staying at the USC Village, two assigned to teams at the UCLA Village and one, located between the two villages, to teams from both villages.

Training sites	Distance from USC/UCLA Village
Birmingham High School	12 miles (20 km) from UCLA
Dorsey High School	3 miles (5 km) from USC 8 miles (13 km) from UCLA
Garfield High School	10 miles (16 km) from USC
University High School	5 miles (8 km) from UCLA
Wilson High School	8 miles (13 km) from USC
The Forum	10 miles (16 km) from USC 13 miles (21 km) from UCLA

Sports administration and competition management

Because the LAOOC was utilizing an existing facility, it had to improvise to provide adequate office space. The Laker warehouse in The Forum had to be quickly emptied of such items as the Laker basketball floor and an indoor track and tennis courts, all of which had to be moved to a remote warehouse. Temporary office space for venue management was thus created in the 28-foot by 80-foot warehouse. Telephone lines and electrical hookups had to be installed and office equipment moved in. Some existing office space within The Forum was utilized for sports medicine, Olympic Family services, security and the commissioners' office. A 2,500-square-foot storage area under the arena stands was converted into a press sub-center. Local media used the existing press room as a second sub-center because many of them already had permanent phone lines installed there. To accommodate FIBA officials, two trailers were installed in The Forum parking lot. Other temporary outdoor structures such as tents and fencing served a variety of needs, including areas for accreditation, transportation, trash storage, food service and public information.

After working overtime to settle into The Forum, the venue staff faced a demanding competition schedule with six games played each day from 29 July through 5 August. The first game of the day started at 0900 while the last game was scheduled at 2200. Men's quarter-final games were played on 6 August and women's medal games were held 7 August. Four more men's games were played on 8 August, three on 9 August, including the bronze medal game; and the gold medal game and two consolation

games were played 10 August. Immediately after the grueling schedule was finished, the Olympic floor had to be removed and venue staff moved from their offices to make room for the Olympic handball finals which were played in The Forum on 11 August. The LAOOC had to be out of the venue by 15 August.

Competition days were divided into three working shifts for most of the venue personnel, meaning most staff and volunteers worked two games each day. Some upper management staff worked shifts of three games per day and a few worked the entire day. The LAOOC work force of 659 volunteers and paid staff was supplemented by The Forum ticket takers, ushers and concession personnel who were already familiar with operations at the arena.

Three statistical crews were utilized on a rotating basis to provide immediate statistics following each game. Once that information was provided in the form of a handwritten box score, it was copied and quickly distributed to the media. Then, within 10 to 15 minutes, the LAOOC's results management team produced a final

box score by encoding the information into the results system for further distribution. First and second half play-by-play summaries and game results were also included in the final results package. At the end of each afternoon and evening session, members of the statistical crew updated individual scoring leaders and team statistics with the aid of a small computer. That information, along with pool and team standings, was then sent to the results management team for encoding and distribution. The 10-member statistical crews were composed of the following positions: crew chief; shot and free throw recorder; caller; rebound and foul recorder; three recorders for assists, turnovers, blocked shots, steals and minutes; play-by-play typist; caller for play-by-play and one alternate per shift.

The statistical crew sat at floor level, opposite the official scorer's table and team benches. Seated at the officials' table were the public address announcer, the 30-second clock operator, two FIBA delegates, the scoreboard operator, the timer, the official scorer and an assistant scorer.

Event crews of eight people each worked shifts of two games a day and performed such tasks as escorting competing teams, servicing teams at their benches and providing locker-room and equipment-room services. Ballgirls and ballboys (minimum age 12 years) worked each game in groups

of six. Competing teams were allowed a 20-minute warm-up period prior to each game. Game officials were selected from a pool of 28 by the federation and each official worked no more than one game per day.

Summary

The Forum proved an excellent choice for Olympic basketball. Its reputation as world-class basketball facility is well known and it was able to provide seating for more than 17,000 spectators, media and Olympic Family. The LAOOC had to provide its own playing court but was able to easily adapt most of its other venue needs to existing facility space and services. The Forum employees, who already had a working knowledge of the arena, served as ticket takers and ushers as part of the California Sports agreement. Adequate parking within walking distance was available for spectators and staff and the site was relatively close to both athlete villages (10 miles from USC and 13 miles from UCLA).

The basketball venue staff overcame a very late move-in date (16 July) to prepare the venue for training which began there on 23 July and competition which began on 29 July. But outside of installing the 37,800-pound wooden basketball floor, construction needs were few.

Once competition began, six games were played each day until 5 August. Most of the venue staff worked two-game shifts while upper-level management worked either three games or the whole day. It was a hectic schedule but the LAOOC staff of 659 ran a first-rate tournament which attracted 363,093 spectators in 13 days.

37 The USA men's team on the way to a 104-68 victory over Uruguay in preliminary pool play.

30.09.5 Boxing

Olympic boxing in 1984 had many firsts. A super-heavyweight category was added to the schedule and the mandatory use of 10-ounce headguards was introduced. Two different glove weights were used for the first time in the Olympics. Boxers in the 67-kilogram-and-under weight classes used eight-ounce gloves while boxers weighing more than 67 kilograms fought with 10-ounce gloves. Mandatory replacement of mouthguards during rounds was a first in 1984 as was the use of an instantaneous video review process for protests. For the first time, a jury system of overruling the judges in 3-2 decisions was used.

The 13 days of boxing competition took place at the Los Angeles Memorial Sports Arena, well known for its championship boxing events. The Sports Arena, along with the Los Angeles Memorial Coliseum, was located in Exposition Park. The athlete village at the University of Southern California (USC) was a short walk away. Although the Coliseum was adjacent to the Sports Arena, only a few services such as staff transportation, Olympic Family services, some press facilities and spectator parking were shared between the two venues. Use of the Sports Arena for the staging of athletes and performers during the Opening and Closing Ceremonies called for cooperation between personnel from both venues.

Three hundred fifty-six athletes from a record 82 nations fought 345 bouts during the Games. The average length of a bout was 15 minutes and nearly 50 percent of the bouts were decided 5-0 by the judges. Eleven decisions were overturned by the jury. The following is a list of gold medal winners in their respective weight classes: 48 kg, Paul Gonzales (USA); 51 kg, Steven McCrory (USA); 54 kg, Maurizio Stecca (ITA); 57 kg, Meldrick Taylor (USA); 61 kg, Pernell Whitaker (USA); 63.5 kg, Jerry Page (USA); 67 kg, Mark Breland (USA); 71 kg, Frank Tate (USA); 75 kg, Joon-Sup Shin (KOR); 81 kg, Anton Josipovic (YUG); 91 kg, Henry Tillman (USA); 91+ kg, Tyrell Biggs (USA). The United States won a record nine gold medals. However, the absence of a strong Cuban team because of the boycott was significantly felt.

Field of play

The Everlast Sporting Goods Manufacturing Co. Ltd. of the Bronx, New York, supplied all of the boxing equipment used at the venue and training site, including the specially designed 26-foot by 26-foot competition ring. The ring had some new features, including increased corner pads, swing-away seats for the corners and a special apron with the Star in Motion painted on it. Though the concept of swing-away seats was not new since they are required in international amateur bouts, the Everlast design was new, preventing the seats from accidentally swinging into the ring during a round. The boxing surface (under the apron) was made of a special protective insulate foam. Inside the ropes, the ring measured the standard 20 feet by 20 feet but Everlast added an extra foot to the usual two-foot-wide outer edge as a safety factor. This caused some confusion initially because the host broadcaster had allowed for a total ring size of 24 feet by 24 feet. Everlast provided a trained supervisor who set up much of the ring himself in a day-and-a-half. Three additional Everlast technicians helped coordinate equipment needs between the competition and training sites.

Everlast also provided the following equipment:

Training site

- 40 pairs of 12-ounce boxing gloves
- 100 pairs of 14-ounce boxing gloves
- 80 pairs of 16-ounce boxing gloves
- 56 training headgear
- 16 heavy bags
- 14 double ended bags
- 16 light bags and platforms
- 150 jumping ropes
- 60 protective cups
- 104 pairs training mitts
- 100 pairs of bag gloves
- 400 pairs of hand wraps
- 50 mouthpieces
- 26 stools
- 400 pairs of shoes
- 30 buckets
- 13 timers
- 12 whistles
- 13 boxing rings (20 ft by 20 ft)

Competition site

- 90 competition headgear
- 120 pairs 8-ounce competition gloves
- 80 pairs of 10-ounce competition gloves
- 350 mouthpieces
- 288 trunks
- 20 buckets

More equipment items came from local suppliers. These included 400 water bottles, four stopwatches, two drying racks and 13 mirrors for the training site, 140 rolls of one-inch adhesive tape and 1,000 rolls of gauze wrap.

Quantities of most of the equipment were sufficient. However, Everlast supplied more than enough shoes to outfit all the boxers and nearly enough trunks for all the boxers. Many boxers elected not to use the shoes and trunks that were provided so there was a surplus of these items.

The boxing training site was set up at Alexander Hamilton High School, five miles (eight kilometers) from the UCLA Village and seven miles (11 kilometers) from the USC Village. The 13 private training areas were separated by curtains and each included a 20-foot by 20-foot ring, light and heavy bags and double-connected bags. Additional conditioning equipment and scales, mirrors, jump ropes, a sauna and a running track were available at the site. If requested, headgear, gloves, shorts and shoes were also provided to the boxers at the training site. No training took place at the competition ring.

For the first time in an Olympic Games, a digital read-out of the boxer's weight was produced and attached to his medical card during the initial and daily weigh-ins. Broadcasters were also provided with a copy of the weight read-out, giving them exact weights for the first time, rather than just a

confirmation of a boxer's weight class. This was especially beneficial for identifying a boxer's exact weight in the new 91 kilogram-plus (super-heavyweight) class.

After the weigh-in, boxers were offered fruit and beverages at a special athlete lounge. Youths from amateur boxing groups in the Southern California area assisted at the team rest areas, helped during the gloving procedure and acted as escorts for each team. Each team was provided with its own eight-foot by ten-foot rest cubicle with a cot and chair in each.

When boxers were ready to enter the competition ring, they walked through a 120-foot public area between the preparation area and the ring. Once a fight was concluded, boxers again had to walk through a public area to get to the press interview room.

Sports administration and competition management

Existing rooms at the Sports Arena provided the LAOOC with all the office space it needed. Although the arena was very close to the Coliseum, only a few staff and services were shared. The entire boxing staff did face a unique sharing situation when athletes and performers for the Opening and Closing Ceremonies were staged inside the arena. Boxing venue staff provided many support services for these groups, including food service and maintenance. This was a challenge for the staff, especially after Opening

39 Rings such as this are used for training at Hamilton High school.

39

Ceremonies, because boxing competition began the next morning. An outdoor Olympic Family lounge served both athletics and boxing but a lack of communication regarding which accredited officials should be allowed inside took several days to resolve.

On the competition side, a small computer aided officials in a number of areas. A program was written to allow the competition draw to be done on the computer. The result was a quick, efficient draw. The computer also assisted in producing the round-by-round point summaries. New scoring forms were designed by the LAOOC for use in conjunction with the computer. Once a bout was concluded, the Jury de Appeal provided official certification of the bout. Then, the scoring jury, made up of three Association Internationale de Boxe Amateur (AIBA) officials, added up the points. An announcer's sheet was prepared and results announced in English, French and Spanish before the competition director prepared a summary tally form. This was given to a scoreboard operator and an electronic scoreboard flashed the final points total. The computer operator then input a round-by-round point summary. Results management personnel sitting with the computer operator instantly received the summary for copying and distribution.

The participation by Ernst & Whinney, the results management team, in two Sports Arena boxing events prior to the Games was a key factor in the smooth operation of the results systems during the Olympics. A world challenge boxing event was held in early 1984 and the Southern California Junior Olympic Regional Boxing Championships were held in June 1984. Neither was an LAOOC-sponsored event but numerous LAOOC departments were involved and management of the Junior Olympic event came primarily from LAOOC boxing staffers. At the world challenge event, technical delegates from AIBA approved the use of the computer for the draw and Toledo Scales for the weigh-in. At the Junior Olympic competition, transportation, food services, access control, medical and security procedures were rehearsed. Final rehearsals of the draw, weigh-in, opening and award ceremonies and competition helped many LAOOC volunteers gain valuable experience and contributed to the success of the boxing venue.

A five-member jury was used for the first time in 1984 to decide bouts where the judges' score was 3-2. This jury was separate from the Jury de Appeal and scoring jury. The five-member jury voted on every contest

but its decision was only used when the judges voted 3-2. If the jury voted 5-0 or 4-1 in favor of the boxer whom the judges had deemed the loser, the decision was overturned and the jury's score (5-0 or 4-1) became the decision of record.

A new video tape review process provided the protest committee with an instant review of competition for the first time in an Olympic Games. All bouts were recorded and tapes were indexed and made available to teams for review. Thirteen official protests were lodged by teams but none were upheld.

A boxing operations center was developed to improve communication throughout the venue. Staff needing to communicate quickly with other staff members on different radio frequencies or without radios could contact the boxing operations center for help. A situation board was maintained, showing the location and nature of significant events and the location of key personnel. This internal communications center was planned in advance and was not part of the telecommunications center which handled calls coming into or going out of the venue.

Summary

The choice of the Los Angeles Memorial Sports Arena was an excellent one for the boxing venue. Boxing proved to be an extremely popular spectator sport for the 1984 Games, attracting more than 230,000 spectators over the 13 days of the event. A capacity crowd of 16,353 was in attendance for the finals on 11 August. Boxing spectators witnessed 345 bouts and saw many features new to the Olympics, including the addition of the super-heavyweight category. Headguards were mandatory for the first time and the LAOOC provided these and a

40

number of other equipment needs such as gloves, trunks and shoes at no cost to the participants.

An instantaneous video review service was well received as was a new digital weigh-in procedure. A computer-aided draw provided instant information and worked extremely well.

For the athletes, a training site with 13 private training rings and a variety of equipment services gave the competitors everything they needed to prepare for Olympic competition.

40 Colorful banners decorate the Sports Arena utilizing the Festive Federalism color palette.

**30.09.6
Canoeing/Rowing**

Scenic Lake Casitas provided the LAOOC with nearly everything it was looking for in an Olympic rowing and canoeing venue, but it took an exhaustive search as the Organizing Committee members analyzed more than 60 sites in an 800-mile radius of Los Angeles before Casitas was named the Olympic site in June 1981. The search epitomized the LAOOC's intention to use existing sites rather than build new ones. Many past Olympic race courses had been built at great cost on artificial bodies of water, often creating favored lanes, limiting training areas, causing traffic pattern problems and limiting scheduling flexibility. The open water at Lake Casitas eliminated the problem of favored lanes. Lake Casitas also provided three times the water surface of any previous rowing and canoeing venue, allowing a 2,000-meter race course, a 2,000-meter training course with two 45-meter-wide lanes and a 1,000-meter training course with two 45-meter-wide lanes. Mid-day wind on

the lake necessitated early morning training and competition schedules, but the two training courses provided training areas during the rowing and canoeing competitions.

The 1984 Games marked the first time since 1964 that a lake was used for the canoeing competition and the first time since 1960 for rowing. The race course stretched west to east on the northern shore of the lake and was designed specifically so that the course could quickly be converted during the Games from an eight-lane rowing course (six racing and two auxiliary lanes) to an 11-lane canoeing course (nine racing and two auxiliary lanes). The lake measures 1,080 hectares (2,669 acres) in area and is situated in a 2,713 hectares (6,700 acre) park. While more than one-fourth of the lake's usable surface was devoted to the LAOOC's competition and training courses, much of the lake was left to the public for recreational uses while the Games were taking place.

42

43

While Lake Casitas gave the LAOOC plenty of water surface, no race course or spectator facilities had ever existed at the site. The LAOOC was charged with creating temporary facilities at an environmentally sensitive site and then restoring the lake and shoreline to its original state. In addition to its recreational uses, the lake serves as a reservoir and no impact on water quality for human consumption could result from Olympic events. This meant the LAOOC had to pay close attention to every construction and operational detail. For example, water runoff from the boat wash-down area and showers could not be allowed to reach the lake.

Because Lake Casitas was 85 miles (136 kilometers) from the USC Village and 70 miles (112 kilometers) from the UCLA Village, a satellite village was established 30 miles (48 kilometers) from the lake at the University of California, Santa Barbara (UCSB). The

UCSB Village offered the nearly 1,000 rowing and canoeing participants the same services as USC and UCLA (see Chapter 15, Housing of Olympic Athletes and Team Officials). A day village was constructed at the venue and was met with great success because it provided the athletes with a secluded area to relax and eat during training and racing days at the lake.

Rowing

Eight 2,000-meter men's events and six 1,000-meter women's events made up the 1984 Olympic rowing regatta, with elimination heats beginning 30 July. Three days of finals began 3 August after two days of elimination heats and two days of repechage. Each rowing lane was 13.5 meters wide

(44.29 feet) and 2,000 meters (1.24 miles) long. Buoys were set every 10 meters while distance markers were set every 250 meters. Women's gold medal winners were as follows: Valeria Racila (ROM), single sculls, 3:40.68; Romania, double sculls, 3:26.75; Romania, pair-oars without coxswain, 3:32.60; Romania, quadruple sculls with coxswain, 3:14.11; and the United States, eight-oars with coxswain, 2:59.80. Men's gold medal winners in the eight rowing events were as follows: Pertti Karppinen (FIN), single sculls, 7:00.24; United States, double sculls, 6:36.87; Romania, pair-oars without coxswain, 6:45.39; Italy, pair-oars with coxswain, 7:05.99; Federal Republic of Germany, quadruple sculls without coxswain, 5:57.55; New Zealand, four-oars without coxswain, 6:03.48; Great Britain, four-oars with coxswain, 6:20.28; and Canada, eight-oars with coxswain, 5:41.32.

Canoeing

For the first time in women's Olympic canoeing competition, a kayak fours race was included but only eight teams were entered. The three events for women were all 500 meters. For men, five 1,000-meter events and four 500-meter events were held. Canoeing competition began the day after rowing finished so the 2,000-meter six-lane rowing race course had to be transformed into a 1,000-meter nine-lane canoeing course overnight. The canoeing lanes were nine meters (29.5 feet) wide and either 500 meters (546.8 yards) long or 1,000 meters (1,093.6 yards) long, depending upon the event. Distance markers were provided every

45 A close-up view of the composition of the Jet Float bridge.

250 meters. Heats and repechage were held 6-7 August, with semi-finals on 8-9 August and finals on 10-11 August. Women's gold medal winners were as follows: Agneta Andersson (SWE), kayak singles (K-1), 1:58.72; Sweden, kayak pairs (K-2), 1:45.25; and Romania, kayak fours (K-4), 1:38.34. The gold medal winners for men in the canoeing and kayaking events were as follows: Ian Ferguson (NZL), kayak singles (K-1), 1:47.84; New Zealand, kayak pairs (K-2), 1:34.21; Larry Cain (CAN), Canadian singles (C-1), 500 meters, 1:57.01; Yugoslavia, Canadian pairs (C-2), 500 meters, 1:43.67; Alan Thompson (NZL), K-1, 1,000 meters, 3:45.73; Canada, K-2, 1,000 meters, 3:24.22; New Zealand, K-4, 1,000 meters, 3:02.28; Ulrich Eicke (FRG), C-1, 1,000 meters, 4:06.32; and Romania, C-2, 1,000 meters, 3:40.60.

Field of play

Nothing could have helped LAOOC rowing and canoeing planners more than a pre-Olympic dress rehearsal. The Foster Farms Lake Casitas International Regatta on 22-25 September 1983 attracted more than 400 athletes from 26 nations for 12 canoeing and eight rowing events, the largest regatta ever held for rowing or canoeing in the United States. Besides proving that Lake Casitas would serve well as the Olympic rowing and canoeing venue, the regatta highlighted LAOOC construction needs and oriented staff and volunteers to the venue. Staff received critical training in boat launching and retrieval. Some of

the construction that was done for the 1983 event was left intact for 1984. This included grading, irrigation and landscaping, and some portions of the finish tower, ramps and course. The LAOOC rented reusable portions of the course, such as lane cables, buoys and start platforms from Kayak Specialties Inc., and purchased other materials such as the cross lateral cables for underwater course construction. The rowing course was designed and engineered by the rowing commissioner and adapted for use as a canoeing course. He also did the master planning for the entire venue facility. Kayak Specialties Inc. did much of the course installation, using pneumatic hammers to drive more than 100 arrowhead anchors into the lake bottom to hold 35 miles of underwater steel cable in place. An uneven lake bottom and some soil problems created a challenge for divers who had

Sports Administration and Competition Management

to work at depths of up to 100 feet to install the anchors. The anchors were left in place after the 1983 event, but the starting bridges, underwater cables, lane buoys and most of the platforms were stored locally until the Games. Three ramps were left in place from the 1983 event and two more were added for the Games. The ramps to the docks were eight-foot-wide wooden units varying in length that were mounted on steel piles to provide a bridge from land to water. Hand railings were mounted on each unit. Hinged to these units were several eight-foot by 12-foot wooden units with varying thicknesses of foam for flotation. At the end of the last unit, modular Jet Float units made of high density polyethylene were attached. The 19.75-inch by 19.75-inch Jet Float units were joined at their four corners with a removable slotted pin. During the Games, Jet Float was used for all athletes' docks, the floating bridge that connected the athlete and spectator areas, the host broadcaster's dock, the support craft dock and the awards platform. The Jet Float material, made by the Jet Float company of Canada, was made in a special gray color to eliminate heat on the surface and was specially embossed with the LAOOC *Star in Motion* on each unit.

Much of the work on the judges' (finish) tower was completed for the 1983 event. The tower was set on steel piles 60 feet off shore in line with the finish line. A modular steel scaffold structure with plywood decks was used to create a four-story, 48-foot-high

structure. Steel angle braces and beams stabilized the tower to keep it from swaying in the wind. Chairs for the judges were anchored to prevent any movement when these officials were sighting the finish line during races. Swiss Timing, computer results operations, announcers and federation race officials were located in the tower.

Cables for the host broadcaster (ABC) and Swiss Timing were installed along with the underwater course cables. Floating telephone poles (40 feet long) were connected end-to-end and anchored as barriers (log booms) to keep fishermen away from the course cables and to protect the course from wake. The Albano (named for Rome's Lake Albano) system of horizontal and vertical cables and buoys was developed prior to the 1983 event for the race course. The course was easily changed from rowing to canoeing with the help of scuba divers. Two starting bridges eliminated any need for having to move one between the two start positions. Aligners' huts, ABC camera rafts, Swiss Timing rafts and other rafts were located at the 1,000-and 2,000-meter starting points and intermediate points along the race course.

Every effort was made to make the rowing and canoeing participants comfortable during their long training and competition days at Lake Casitas. On a hill overlooking the course and spectator areas, a fully-secured day village was constructed, providing a small swimming pool, rest tents, an entertainment area, showers, sports medicine facilities, coaches' meeting tents and meal tents. Boat storage tents, five boat docks and repair

facilities were also situated there. A floating bridge constructed of Jet Float was installed between the day village and the spectator and venue management area because a small inlet and marsh separated the two. The Lake Casitas venue was one of only a few venues to provide complete meals (that were more than just box lunches) for the athletes. Breakfasts and lunches were provided daily at the lake. Initially, hot soups and stews supplemented the large, box lunch but lack of interest in these hot food items forced an alteration in the menu to include yogurt, cheeses, milk, juice, fresh fruits, croissants, sandwiches and soft drinks. The 20-foot-diameter circular pool that was built in the athlete area was extremely popular because of the hot, dry conditions at the lake and because no swimming or bathing was allowed in the lake. Shower facilities were built in tent structures with prefabricated panel walls on a concrete slab. Men and women were provided with separate community showers. All water at the site was stored or collected in 4,000 or 15,000 gallon tanks. This included water for fire fighting, shower supply and runoff, and water for the boat-washing area.

Rest areas for the athletes were provided at the day village in 43 tents (20-foot by 20-foot). Each was equipped with a locking storage compartment, a folding table, chairs and four to six cots. The tent floors were covered with an artificial turf

surface which could be swept or vacuumed each day. Each NOC was assigned to a tent, or tents, depending upon the size of the rowing and canoeing delegation. Some small teams shared tents with other teams. A 30-foot by 30-foot tent was initially set up to accommodate team leaders' meetings and later served as a press interview area. A team information kiosk was very popular with the athletes for distributing written information, announcements and messages to the teams through the use of message boards and mail boxes assigned to each NOC.

Boat repair was a key service to athletes in the day village. Two rowing boat builders, Stampfli and Empacher, did minor repairs and rigging and assisted with boat rental and transport. The LAOOC's larger boat repair shop was equipped with supplies and tools to make a variety of repairs on wood and plastic boats and oars. The staff assisted the smaller rowing teams with rigging and managed the rental of LAOOC-owned rowing shells. All services were free and most repairs were made before competition began. The shop was planned for rowing and canoeing, but LAOOC equipment specialists for canoeing, who required less extensive facilities, set up their own shop in one of the canoe tents. The LAOOC had purchased rowing shells, canoes and kayaks in order to attract teams to the 1983 regatta. The canoes and kayaks (90), made in Struer, Denmark, were available for rental or sale to teams during the Olympics and 35 boats were rented while 43 were sold. LAOOC canoeing officials thought they should have

46 Athlete at work in the boat repair area.

46

ordered fewer K-4 and C-2 boats and more K-1s. Twenty rowing shells were available for rental during the Games and seven were rented. Twenty sweep blades and two pairs of sculls were loaned to NOCs.

The most significant problem affecting the planning of facilities and transport of boats to Lake Casitas was getting advance information from the NOCs. Only 25 percent of the NOCs returned a pre-Games questionnaire which asked for information on the number and category of boats the teams were bringing, arrival dates, method of shipment and any special handling requirements. The LAOOC was prepared to pick up boats at the Port of Entry whether they arrived on trailers, in crates or on racks, but with little or no information available as to when or how teams were arriving, the LAOOC had a difficult time coordinating delivery of equipment to the venue. The competition and material supply staff were persistent in their efforts to transport boats, however, and managed to carry out the operation through numerous trips to and from the Los Angeles airport. This task was made easier because of the use of a special canoe-kayak trailer provided by the local Ventura County canoe/kayak club.

Boat storage at the lake posed no problem. Located near the five launch docks in the athletes' day village, eight tents were used to store all boats. Rowing assignments were made as follows:

Rowing assignments

Tent 1	22 quads, 33 fours
Tent 2	15 eights
Tent 3	36 singles
Tents 4 and 5	20 doubles, 37 pairs

Three additional tents housed all canoes and kayaks. These tents had a total of 17 bays (20-foot by 40-foot) and each bay had a capacity of 14 to 16 boats. As rowing and canoeing equipment arrived, competition staff assigned and labeled racks for each national team. All boat racks were tubular, steel frames with foam covers on the arms. Oar racks were constructed so that the top was supported from the tent frame. Horizontal floor racks were built to hold oars in the eights tent. Canoe teams transported their own paddles between the village and the venue each day so paddle storage was not needed. Teams were provided with their own locking trunks to store tools and spare parts in the boat tents or in their rest tents. For rowing, a dockmaster with a staff of 95 was located in a tent near the boat docks and the tent became an information point for team officials and

athletes with questions about course traffic rules, competition rules and equipment problems. Duties of the dock staff included logging crews in and out as they launched, carrying oars and bagging shoes for the crews, cleaning docks and boat ramps and directing boat traffic. The boat tent staff assigned boats and oar racks, monitored activity in the boat tent area and cleaned the boat tents. A staff of 70 provided similar services for the canoeing competitors. In addition, 22 boatholders were available at the 1,000-meter and 500-meter starting positions for the canoeing competition.

Use of the five launch docks was specifically planned. Dock 1 was for rowing quads and fours, dock 2 was for eights and dock 3 for singles, pairs and doubles. Docks 4 and 5 were used for canoes and kayaks.

A course control tower was located at the highest point of the athletes' day village and was always staffed during operational hours (0500 to 1900). The entire water area and athlete area could be observed from this point and the tower became a key communication point, linking water operation with the athlete area. A course control manager was responsible for all activity on the water for rowing and canoeing. His staff of 25 launch drivers, all well trained coaches or athletes, drove the officials' launches, observed and directed boat traffic, assisted in rescues and transported coaches to observation platforms. The launch drivers used 15 Carib Dorries (work boats with 40 horsepower engines), five inflatable rescue boats (with 30 horsepower engines) and six nacra-hull catamaran-type boats for the umpires (with 25 horsepower engines). During training, four inflatable boats and up to seven Carib Dorries carrying drivers and emergency medical technicians were on the water. During competition, the medical technicians were positioned on the inflatable boats along the side of the course. The Dorries patrolled the other two training courses.

In accordance with Federation Internationale des Societes d'Aviron (FISA) regulations, the LAOOC provided eight volunteers to assist the FISA Control Commission in the weighing of the coxswains and boats and for the inspection of competitors prior to and following each race to ensure that crews had met the FISA regulations. The LAOOC volunteers encountered some problems with FISA officials because there was incomplete information regarding dock operations and Control Commission procedures. The International Canoe Federation (ICF) required that canoes and kayaks be weighed prior to competition and

again after each race. The LAOOC provided 10 volunteers to assist three ICF officials with weighing during competition and four volunteers for the pre-competition weighing. All canoe and kayak boat control was carried out to the complete satisfaction of the ICF.

From 14-29 July, all three courses were available for rowing and canoeing training and were open from 0600 to 1300 and again from 1600 to 1900 hours. During the competition period from 30 July until the end of the Games, all crews could practice on the race course until 30 minutes before the first race of the day and then could continue their normal training schedule 30 minutes following the last race. While competition was taking place, training was allowed on the two training courses. Most teams trained twice in the morning and the heaviest use of the course was between 0700 and 1000. Nearly every team was on the water during this time period for sessions averaging about 60 minutes each. The courses were relatively empty by 1045 but training increased again between 1100 and 1200, with several crews training until 1300 hours. About 10 to 15 percent of the rowers and up to 25 percent of the canoeists used the courses in the afternoon from 1630 until 1830 hours.

Sports administration and competition management

Except for sport-specific competition jobs, venue staff for rowing and canoeing were almost entirely shared. The management hierarchy varied slightly from that of other venues in that three commissioners were named to govern the two sports. In 1982, co-commissioners were named for canoeing and one commissioner was named for rowing. Eventually, the rowing commissioner was named as the lead commissioner at the venue and was given the responsibility for both the overall venue design and for the administration of the rowing competition. One canoeing co-commissioner directed all venue construction and the other was responsible for the canoeing competition. Each sport had its own competition director who reported to the rowing or canoeing commissioners. Both rowing and canoeing were represented in the pre-Games period by a single sports manager. During the Games, a single venue manager coordinated all venue needs and services.

The Lake Casitas venue was divided into three areas: the race course, the athletes' area and the spectator and venue management area. In this third area, federation and venue operations were set up in tents and trailers. FISA and ICF officials and their respective commissioners shared two 12-foot by 56-foot trailers located adjacent to the spectator seating area. Other trailers in the area housed the Venue Management, Technology, Results Operations,

Security, Construction, Materiel and Supply and Access Control departments and a press photo lab. Other departments such as Food Services, Olympic Family Services, Press Operations and Ticketing utilized tents.

While most of the technology and results staff members worked in trailers on land, the results management team and Swiss Timing were also located in the finish tower, just off shore. Results information was produced there, but copying for distribution took place at the results trailer. At the beginning of each competition day, federation officials conducted a draw after registration to determine heat and lane assignments. An LAOOC volunteer then entered the information into a small computer and produced an unofficial start list. After it was approved by the federation, the results team entered the information into its own computer system to produce the official start list. After each race was concluded, Swiss Timing passed finish times and photos from the top floor of the finish tower down to federation officials on the floor below. The results management team then entered the split times and finish times into their computer to produce hard copy for copying and distribution.

The LAOOC computer was programmed to compute information for the next level of races, but the federations were reluctant to use the computer and chose to manually set up the draw for repechage and finals. For rowing, a private draw for the next level of races was done in the FISA trailer. That information was then given to the LAOOC computer operator to produce an unofficial start list. That list was then taken to the team leaders' meeting that was held at the end of each day. Later, after FISA approved the unofficial list, the results management team entered the new official start list. This operation was similar for canoeing, a draw for the next level of races took place at the team leaders' meeting instead of at the ICF trailer. Because some events had heats and repechage on the same day, the competition officials held a private draw and unofficial start lists were quickly produced by the LAOOC to speed the process. Overall, cooperation between the LAOOC and the two federations was excellent; races were run on a tight schedule and results were produced quickly and efficiently.

The LAOOC attempted to create a festive, fair-like atmosphere at the venue in an attempt to attract spectators for the early morning competition. The spectator area was decorated with colorful banners,

47

48

47 Romanian athletes moving their shell toward the launching area.

48 The construction of the docking and launch areas requires substantial work in the days just prior to the opening of the villages.

kiosks and tents and contained much more than just the required necessities of bleachers, toilets, refreshment stands and first aid service. A large area adjacent to the refreshment and souvenir stands had 150 chairs at shaded tables, while lawn seating accommodated picnickers. Entertainment featuring jazz musicians, jugglers, magicians, mimes and bands began at 0530 each morning outside the park gates and was also provided up until race time inside the venue and again after competition was completed for the day. The entertainment program also helped alleviate traffic jams on the one road servicing the venue since many spectators delayed their departure to enjoy the entertainment and departed at various intervals after competition ended. Temporary grandstand seating for 4,680 was built and provided a good view of the finish. Twenty television monitors were set up in the spectator area to offer spectators the chance to watch portions of the race they could not see live. These monitors were set up under shade structures, but the shade was not enough to block the intense sun at the venue. Ten toilets for handicapped spectators using wheelchairs and 105 temporary toilet facilities and handwash facilities were provided in a shaded area for other spectators.

Summary

The LAOOC successfully created a festive and vivid atmosphere for spectators and athletes alike at Lake Casitas and at the same time recognized the special needs of the competing teams and of the environmentally sensitive site. The lake is a reservoir and public park and had never before hosted any kind of rowing or canoeing race. The LAOOC faced the challenge of building a race course, two training courses, a day village for the athletes, spectator facilities and venue management facilities, all on a temporary basis, and then successfully running two major international regattas in the 1983 pre-Olympic event and the 1984 Olympic Games. The site was then restored to its natural state when these competitions were over.

All venue services, including on-water race course control and officials' launches, were shared. Each sport had separate competition staff. The sharing of all other departments such as Food Services, Medical Services, venue management and Technology, worked extremely well.

Winds on the lake beginning between 1100 and 1200 necessitated morning competitions and training and spread the competitions out over 13 of the 14 days of the Games. But the size of the lake and the constant wind direction allowed the LAOOC to build two training courses which allowed canoeing athletes to train while rowing competition was taking place. Rowing competition ran from 30 July to 5 August and canoeing followed from 6-11 August. The 2,000-meter six-lane rowing course (with two auxiliary lanes) had to be converted to a 1,000-meter canoeing course with nine lanes (also with two auxiliary lanes) overnight. An Albano system of cables and buoys anchored to the bottom of the lake was set for the race course.

Because Lake Casitas is 85 miles from the USC Village and 70 miles from the UCLA Village, the LAOOC planned a village at the University of California, Santa Barbara, with the same services afforded to athletes at the other two villages. Air-conditioned buses shuttled the athletes between UCSB and the lake. A day village at the lake offered the athletes a quiet rest area where they could swim, eat or relax. Boat repair facilities and boat storage were also located at the lake adjacent to the day village.

49

49 Bicycles provided by the LAOOC's official supplier, the Murray Ohio Manufacturing Company.

50 Individual road race action at Mission Viejo included motorcycle-mounted host broadcaster personnel (in red).

50

30.09.7 Cycling

Two new events, a change from cycling's customary order of competition and an increase in the number of athletes allowed per team, provided some unique features for the 1984 Olympic cycling event. Traditionally, the order of events is the 100-kilometer team time trial followed by velodrome competition and then the individual road race. The LAOOC proposed reversing the order to provide the opportunity for increased live television coverage and to highlight the road race on the first day of overall Olympic competition 29 July. For the first time in the Olympic Games, an individual road race was conducted for women at the Olympic road course in Mission Viejo, California, and a 50-kilometer points race was added for the men. The increase in the number of competitors per nation in several events was approved after a number of countries announced in June they would not attend the Games. In the sprint, individual pursuit and the points race, the number of competitors allowed per team was increased to two. A fourth rider was added to both the men's and women's road races and an alternate was added to the 100-kilometer four-man teams.

The 79-kilometer women's individual road race began at 0930 on 29 July and a little over two hours later, the second gold medal of the 1984 Games was awarded (the first medal was awarded at shooting). The men's 190-kilometer individual road race began shortly after the women's race ended at the same 1 O-mile loop in Mission Viejo. An estimated 275,000 spectators looked on during both road races as 45 female athletes representing 16 nations and 137 male athletes representing 44 nations competed. A thrilling finish where the women's medal winners were separated by inches ended when Connie Carpenter-Phinney and Rebecca Twigg of the United States took the gold and silver, respectively, and Sandra Schumacher of the Federal Republic of Germany earned the bronze. All three were clocked at 2:11:14. Alexi Grewal of the United States won the men's road race in 4:59:57, with Steve Bauer of Canada second in the same time and Dag Otto Lauritzen of Norway third in 5:00:18.

The other Olympic road event was the men's 100-kilometer team time trial on

the Artesia Freeway near the velodrome. Auxiliary facilities at both road venues were constructed and torn down for one-day competitions. The team time trial on 5 August wrapped up the Olympic cycling competition. Italy won the gold in 1:58:28, with Switzerland second at 2:02:38 and the United States third at 2:02:46.

Events at the new Olympic Velodrome, built specifically for the Games at California State University at Dominguez Hills, were conducted 30 July through 3 August. The first world-class cycling track in the western United States, the velodrome was funded by the Southland Corporation and was constructed by Stolte Inc., a Los Angeles developer and contractor. Five events for men were held with the following gold medal results: 1000-meter time trial, Fredy Schmidtke (FRG) 1:06.10; individual sprint, Mark Gorski (USA); 4000-meter individual pursuit, Steve Hegg (USA), 4:39.35; individual points race, Roger Ilegems (BEL); and the 4000-meter team pursuit, Australia, 4:25.99. Attempts were made by the LAOOC to include women's sprint and pursuit events on the track, but the requests were denied by the International Olympic Committee.

Velodrome field of play

The Olympic Velodrome, which served as headquarters for all the 1984 Games cycling events, was dedicated in 1982 and has played host to a number of world-class cycling events. One of them, the 1983 Murray/7-Eleven International Cycling Invitational, was partially funded and completely managed by the LAOOC and proved a valuable learning experience for both the LAOOC paid staff and volunteers. Shortly after the 1983 event concluded, some concern was raised when approximately 30 hairline cracks in the concrete track were discovered. Most were vertically oriented and extended the full width of the track. No detriment to track rideability was associated with the cracks at the time, but it was necessary to determine the long-term effects of such a condition. Research conducted by Stolte Inc. concluded the situation to be the norm among chemically compensated concrete velodromes and not a unique problem. An epoxy injection system was incorporated to fill and seal the cracks. At the same time, it was determined that a grinding system would be employed to eliminate some of the bumps common to concrete-banked velodromes. Once the cracks were filled and the grinding completed, the entire track surface was coated with polyurethane to seal the concrete and afford the cyclists the fastest riding surface possible for a concrete track.

The Chemcomp concrete track in the open-air velodrome is 333.33 meters in circumference with a six-meter-wide riding surface. The gradient of the curves is 33 degrees and the straights are 9 degrees, allowing cyclists to attain speeds of up to 75 km/h.

On the track infield, 52 private 10-foot by 10-foot shaded team boxes provided athletes with a between-race holding area. Spectators and officials had an unobstructed view of the races since the boxes were sunk four feet into the ground. The athletes also were afforded a fenced area outside the velodrome with rest, eating and preparation facilities. An equipment repair tent offered lockable storage, several work benches, bike racks and an air compressor. Forty-five individual team tents each housed lockable storage bins, massage tables, folding cots, work benches, bike racks, water dispensers and chairs.

Technical assistance was provided by Campagnolo, U.S.A., and was based at the velodrome, but included support at the road races through a mobile unit. Campagnolo also offered technical support during training at the track and on the road. The LAOOC supplied air compressors while Campagnolo provided trained mechanics and a full range of spare parts and tools.

Training in the velodrome was available beginning 14 July but the training schedule was not heavily booked until five days prior to competition. Groups of up to 30 riders (four to six countries) were allowed one-and-one-half hour training segments per day between 0730 and 1930. Regular daily rotations were made to allow groups to train in different time segments on successive days. Training periods were also available before and after competition each day.

Mission Viejo

The Olympic road course in Mission Viejo, California, was a 15.85-kilometer asphalt loop with varying widths. The home stretch was 260 meters long and eight meters wide. Since the race course was located in a residential community on a public roadway, all spectator, venue management and athlete facilities were established on a temporary basis. Platforms were built for judges and commissaires, while temporary team meeting rooms, showers and toilets, and equipment repair and storage areas for the athletes were constructed in a four-day span. Sixty sets of cycling rollers for warm-up were set between team cabins. A banner and cables for timing devices and ABC cameras were strung across the road course at the start/finish line. The course was lined with 10,000 delineators (crowd barriers), 4,000 cones to separate bike lanes, 20 miles of yellow barrier tape for

spectator control and heavy-duty plastic bags stuffed with foam rubber to pad dangerous corners. Key intersections and team cabin eating areas were enclosed with plastic fence held in place by hay bales. During competition, 49 specific pedestrian crossings were controlled by course marshals and a 12-foot-wide emergency lane ran adjacent to the entire course. The course marshals blew whistles to announce the approach of riders or vehicles and 40 bullhorns were used by supervisors of key areas to communicate to spectators. Fifty team support cabins were situated just after the first turn on the right side of the course, along with technical support, sports medicine and language services cabins in the middle. Portions of peripheral roads were utilized as warm-up areas.

One official training day in Mission Viejo was conducted 26 July and was the only day the route was even partially closed to traffic. Sections of the course were closed and then reopened as the riders passed. Athletes were allowed to train on the course roads on other days but had to obey normal traffic laws. On the official training day, the LAOOC staff, including 1,000 course marshals, was on duty. Three other nearby road training areas

51

51 The Velodrome at California State University at Dominguez Hills was one of only three sites newly-constructed for the Games.

52

52 The results and scoring area at Mission Viejo.

were detailed in maps that were available to athletes as they arrived in Los Angeles. One of the areas was patrolled by LAOOC competition staff on motorcycles and had athlete refreshment stations, but was not heavily used by the athletes. LAOOC cycling officials felt they had difficulty getting informational materials to the athletes, since many teams were staying in the Mission Viejo area while others were split between the USC and UCLA Villages. The Olympic road course was 69 miles (110 kilometers) from UCLA, 53 miles (85 kilometers) from USC and 35 miles (58 kilometers) from the Olympic Velodrome.

On race day, both events started on time. Two law enforcement motorcycles and two competition motorcycles (1100 cubic centimeters) led off the race. Support vehicles included three commissaires cars, four technical support station wagons, one press car, one medical car and one LAOOC official car. Five ambulances were strategically located along the course and were replaced if needed. Two additional motorcycles were staged at the start/finish for use by the competition management to handle course management issues. Two motorcycles, specially prepared by the host broadcaster, ABC, carried camera equipment and cameramen and were permitted to ride with the race. Another ABC motorcycle occasionally brought a commentator on the course. After the morning race, some difficulty in awarding the women's medals occurred because the men's race was being staged at the same time.

A great aid to competition management was a set of plans which divided the course into 50 detailed segments. It helped the staff design the course, train staff and communicate with the Architecture and Construction Department.

Artesia Freeway

One of the cycling staff's biggest challenges was having less than one day to prepare and only one-and-a-half hours to tear down the course facilities for the 100-kilometer team time trial on the Artesia Freeway on 5 August. Twenty-five kilometers of heavily-used freeway had to be closed in both directions, though only the four eastbound lanes were utilized during the race. Raised reflector/warning dots were removed from the turn-around areas to permit smoothest possible conditions on the asphalt-concrete surface. Some preparatory staging of equipment for the course was done at off-ramp areas along the course. But the majority of move-in began after 0500 hours on race day. Move-in was completed at 0815, 15 minutes before the race began. The California Department of Transportation

53

(CalTrans) and the California Highway Patrol decided the 20-minute task of closing the freeway could not begin until dawn. Construction needs were similar to that at Mission Viejo although the LAOOC had less time to perform the setup. The awards ceremonies concluded at 1210 and the LAOOC staff had until 1315 to clear the freeway for reopening, since CalTrans was anxious to reopen it for traffic to other Olympic events taking place in the area that day. The LAOOC's last piece of equipment rolled off the freeway at 1259, only 49 minutes after commencing tear down and 16 minutes before contract deadline.

A 1.3-kilometer stretch of highway adjacent to the freeway, as well as a section of the Artesia Freeway before the start/finish line, were available as warm-up areas. The only pre-event training available on the actual course was 22 July between 0900 and 1100 hours when a six-kilometer section of the competition course was opened to the cyclists. Two other special training opportunities on a freeway similar in surface and terrain were made available on 26 July and 2 August but both sessions were poorly attended.

Staging the race was difficult as most teams came to the area with several cars. The 27 teams of four that competed were staged on an on-ramp to the freeway. The start/finish line was adjacent to the turn-around point. Each team was provided with a support station wagon and driver, if requested.

54

53 Cycling road and team time trial events require completely temporary facilities, which can be easily installed and removed.

55 Road racers on the course at Mission Viejo; note the crane which is used for host broadcaster television positions in the background.

56 A team support vehicle carrying team bicycles on the roof.

56 All the cycling events were officiated by 28 international officials, assisted by 15 national United States commissaires. LAOOC officials thought that the cycling federations, Union Cycliste Internationale (UCI) and Federation Internationale de Cyclisme Amateur (FIAC) had requested too many officials for the event. The LAOOC also recommended that specific job titles and functions be outlined. LAOOC officials suggested the commissaires should arrive at least two hours prior to competition to meet with the competition staff and properly inspect the course, after a late arrival by this group caused a rushed race preparation.

Sports administration and competition management

Over 1,600 LAOOC paid staff and volunteers, including over a thousand course marshals, staffed the two cycling road sites. A smaller core staff of over 400 was headquartered at the velodrome. There, tents and trailers provided all office and storage space for both LAOOC and FIAC officials.

Permanent spectator seating existed for 2,000, and 6,750 temporary seats were erected for the Games. Paid attendance for each day of velodrome competition was near capacity. A tremendous spectator turnout occurred for the road events as an estimated 275,000 spectators lined the Mission Viejo race course and 75,000 attended the competition at the Artesia Freeway, despite discouragement from law enforcement agencies and the LAOOC. As previously mentioned, facilities for both athletes and staff were needed for only one day at the road events so a minimal amount of construction took place outside of necessary athlete services and course preparation. Still, tents and trailers for technology, venue operations, food services and sports medicine had to be brought in at both road sites.

Careful planning was a key to a smooth operation at the road events and the coordination of services for all three venues was crucial. For the most part, every event went off on schedule and without problems. The results management team was well prepared to produce results for distribution 10 minutes after each event, however, a decision by the commissaire in charge not to use previously agreed upon scoring forms wasted an approved computer system designed to meet contractual agreements for distribution time. Instead, a written/typed version of the results was prepared.

Communication between the LAOOC and the athletes was sometimes a problem because of the distance between the villages, the velodrome, the road sites, training sites and housing locations of the athletes not living in the villages. Use of the Electronic Messaging System (EMS) helped coordinate scheduling of meals and transportation but it couldn't help those teams who were staying where EMS terminals weren't available. Transportation between the villages and the velodrome worked well and for athletes training on the road, station wagons equipped with racks to carry up to six bicycles and extra wheels were made available. Seventy-seven station wagons were assigned to cycling. Another important issue unique to cycling was the need for bicycle and equipment storage in the villages. This service was provided and well received, though the vehicle access point could have been closer to the storage area.

Summary

Women competed in Olympic cycling for the first time in 1984 as an individual road race was held on the first day of the Games. A 50-kilometer points race was added for men and the order of cycling events was changed to give Olympic cycling a new look in 1984. The LAOOC did a remarkable job of organizing and constructing three separate venues for the Olympic cycling road and track events. An outdoor Olympic Velodrome was built at California State University at Dominguez Hills with funding from the Southland Corporation. Then, two road courses were selected and planned. The Artesia Freeway, a heavily traveled roadway, served as the site for the 100-kilometer team time trial and Mission Viejo hosted the individual road races. At the Artesia Freeway, the LAOOC had less than eight hours to build the venue, conduct the race, hold ceremonies and tear down the venue. All of this was achieved within contracted time constraints. Mission Viejo officials allowed four days to construct the venue for the one-day individual road race competition.

The LAOOC provided road training facilities but these sessions were not well attended. Detailed maps were provided to the athletes, carefully outlining suggested training areas, but the distance between the venues and athlete housing areas created unavoidable communication difficulties.

A core staff of about 400 was headquartered at the velodrome, but staff for all three venues totaled 1,527. One thousand course marshals supervised the road courses and competition went extremely smoothly.

57

30.09.8 Equestrian

A unique joint venture to stage the equestrian events was formed three years before the Games and greatly benefited the LAOOC. The Joint Venture Memorandum of Understanding between the LAOOC and the Los Angeles Turf Club, Inc. (LATC), owners of Santa Anita Race Course, called for Santa Anita staff to manage the equestrian events at its race track in Arcadia, California, as well as at Fairbanks Ranch Country Club, site of the speed and endurance portion of the three-day event. Provided in the contract was a 50–50 sharing of all revenues and expenses.

The wisdom in selecting Santa Anita as the equestrian venue was evident, since Santa Anita's existing facilities required little construction to meet federation specifications. Permanent stalls for more than 2,000 horses, and quarters for more than 200 grooms were already in place; parking was available for 20,000 automobiles; more than adequate training and spectator facilities were provided at the 330-acre site; and an on-site catering company existed that had the capability to feed crowds of up to 50,000 people.

Another advantage derived from the joint venture was a professional management team, skilled in operating one of the leading race tracks in the country, already in place at Santa Anita. Of the 806 staff needed to operate the venue at the time of the Games, approximately 95 percent were Santa Anita permanent staff members, or volunteers recruited by Santa Anita. By using the existing employees at Santa Anita, the LAOOC did not need to build up a temporary management staff prior to the Games. It was only after the stable area opened two weeks before the first event that LAOOC staff members arrived at the venue. The entire venue staff was

57 50,000 fans crowd into Fairbanks Ranch to watch the endurance portion of the 3-day event in equestrian.

uniformed and accredited through the LAOOC Games Staffing system, and Santa Anita employees who were to serve as key managers in technology, press operations and transportation areas, received advanced training in LAOOC procedures. A Federation Equestre Internationale (FEI) sanctioned dressage and jumping show held at Santa Anita three weeks before the Games allowed the LATC and the LAOOC the opportunity to test all the Olympic systems and personnel.

All dressage and jumping events were held at Santa Anita in a temporarily constructed main arena that had a seating capacity of 33,500. Two hundred and fifty-four horses were stabled at Santa Anita, 49 of which were transported to Fairbanks Ranch in San Diego County, California, for the speed and endurance portion of the three-day event.

The three-day event

The dressage test of the three-day event opened the Olympic equestrian competition 29–30 July at Santa Anita.

A travel/rest day was scheduled for 31 July at Fairbanks Ranch, followed by the endurance test 1 August and another travel/rest day on 2 August.

The endurance test consisted of a roads and track test at a light trot, followed by a steeplechase test over a two-and-a-half mile course. Then there was a second roads and track event and a cross country test over a four-and-a-half mile course on the Fairbanks Ranch golf course. The jumping test of the three-day event returned to Santa Anita on 3 August. Mark Todd of New Zealand aboard Charisma emerged as the individual gold medal winner, scoring 51.60 for the three-day event. Karen Stives of the United States, aboard Ben Arthur, was second with a score of 54.20, and the bronze medal winner was Virginia Holgate of Great Britain aboard Priceless (56.80). The United States captured the gold medal in the team three-day event with a score of 186.00, followed by Great Britain (189.00) and the Federal Republic of Germany (234.00).

Jumping

A jumping training exercise or “friendly competition” was held on 4 August and gave all riders and horses entered in the competition a chance to familiarize themselves with the arena. The exercise did not count towards a final jumping score, but served as a dress rehearsal for staff, judges, officials, athletes and horses. In the individual competition, each country was allowed to enter a maximum of five competitors and eight horses and could start three competitors and three horses. In the team competition, a maximum of four competitors and four horses per country were allowed to be entered while only three athletes and

58

three horses could start. Fifteen teams took part in the first round of team jumping on 7 August, beginning at 1000 hours, and the 12 best teams advanced to the second round that same day. The United States finished with a score of 12.00 to win the gold medal. Great Britain was second at 36.75 and the Federal Republic of Germany was third at 39.25. One of the last events of the Games was the individual jumping competition on 12 August. It was arranged that medal ceremonies would be repeated that evening at the Coliseum just prior to Closing Ceremonies. Forty-seven riders and horses completed the first round that began at 0800 hours. Twenty-seven competitors advanced to round two, as a three-way tie existed for 25th place. The second round resulted in ties for first and third places, forcing a jump-off to determine the final medal standings. Joe Fargis of the United States aboard Touch of Class captured the gold medal in the jump-off, followed by Conrad Homfeld of the United States aboard Abdullah and Heidi Robbiani of Switzerland aboard Jessica V.

Dressage

Team competition in dressage was held 8-9 August and the individual competition took place on 10 August. Twelve three-person teams and seven individuals started the Grand Prix competition at 1400 on 8 August. The top twelve athletes qualified for the Grand Prix special to determine the individual dressage medalists. The Federal Republic of Germany totaled 4,955 points to win the team gold medal, with Switzerland taking home the silver medal and Sweden capturing the bronze medal. Dr. Reiner Klimke of the Federal Republic of Germany aboard Ahlerich won the individual gold medal, scoring 1,504 points. Anne Grethe Jensen of Denmark aboard Marzog finished second with 1,442 points and Otto J. Hofer of Switzerland aboard Limandus placed third with 1,364 points.

Field of play

Approximately 10,000 cubic yards of specially selected sand was brought in to cover the arena floor at Santa Anita. The 62-meter by 174-meter (205-foot by 570-foot) arena, which overlapped the southwest section of the existing oval race track, was located in front of the permanent main grandstand. Temporary bleachers were added on the other three sides. The 20-meter by

58 Vast Fairbanks Ranch is the site of the middle day of the 3-day event.

60-meter dressage ring was placed in the center of the main arena and a 3.5-foot-high wooden fence of four-inch by four-inch posts with cross bracing was built around the arena. Other construction projects included: five standard dressage booths around the ring; a shaded booth for the president of FEI; a 100-foot by 300-foot holding ring for the jumping competition directly to the west of the arena; and a 17-foot by 100-foot dressage holding area directly to the east. Grass and sand lungeing areas were set on the northwest curve of the track oval. Several sand schooling areas for jumping were spread along the north side of the race track and dressage schooling areas made of sand and grass were located on the northeast and east areas of the track.

Santa Anita, with more than 2,000 stalls, had sufficient space for the care and feeding of 254 horses involved in competition. Horses were stabled in 12-foot by 12-foot stalls, and Santa Anita personnel handled all feed delivery, manure pick-up, watering and road maintenance.

A total of 205 team grooms, veterinarians and farriers were housed in the permanent grooms' quarters at Santa Anita, most of which were located above or immediately adjacent to the horse stalls. Two grooms were assigned per room. Beds, bureaus and chairs were rented for a five-week duration and shower and toilet facilities were located within the stable area nearby.

At Fairbanks Ranch, horses and grooms were housed in 100 temporarily constructed wooden stalls, while athletes and officials stayed at a nearby hotel at no cost to the NOCs or FEI. The horses, athletes and officials were transported to Fairbanks Ranch from Santa Anita in a convoy, beginning at 2000 hours on 30 July. They returned by convoy at 1000 on 2 August. Approximately 10 percent of the key staff from the Santa Anita venue were transported by buses to the site and joined more than a thousand other staffers, mostly from the San Diego County area.

Some logistical problems were caused by of the distance—110 miles—between the two venues. While several other sites had been examined by the LAOOC, the excellent climatic conditions at Fairbanks Ranch made it an attractive venue for the three-day event. It was approximately two miles from the Pacific ocean in a valley where a cooling sea breeze kept temperatures at a comfortable level throughout the day.

The cross-country portion of the three-day event endurance test was laid out over a new golf course at Fairbanks Ranch. Designers of the 35-jump, 4.5-

mile course worked closely with Fairbanks Ranch personnel while the golf course was being built. Construction of the permanent course took place over a six-month period prior to the Games. The steeplechase course and the roads and track events were held on property adjacent to the golf course. The total area used for the cross-country, road and track, and steeplechase events was about 243 hectares (600 acres). The golf course accommodated 50,000 spectators for the event. Rope barriers were placed along the course, but spectators were free to move from jump to jump outside the constraints of the ropes.

Training for the event at Fairbanks Ranch took place on the steeplechase course and on the roads and track on 31 July. An official walk of all the courses (without horses) occurred 26 July, and the courses were available for competitors to walk only, 27-31 July. Training at Santa Anita was available every day from 14 July through 12 August and training site and practice area allocations for all teams and individuals was pre-scheduled by the organizers. Minimum training times were two hours, twice-a-day for dressage and one-and-a-half hours twice-a-day for jumping. A 2,800-meter (1.74-mile) cross country galloping track was available only to the three-day event horses at any time between sunrise and dusk. For dressage, 10 practice areas, including seven on sand and three on grass, were provided. Five sand practice areas and two on grass were available for jumping.

Sports administration and competition management

Virtually all venue space needs were filled by existing office space at Santa Anita. Two trailers and two tents were utilized for some spectator services while some medical facilities, specifically doping control, spectator first aid and sports medicine, were housed in tents and trailers. Doping control for the horses took place in an existing 4,000-square-foot facility with 25 stalls and a laboratory. An existing equine hospital complete with animal hoist, operating room, laboratory and treatment room was also on-site.

Doping control testing for the horses was administered by Santa Anita staff, since the LATC organization had vast experience in testing horses on a daily basis. Many teams brought their own veterinarians, though a three-member Olympic veterinary commission was present from the time the horses arrived at the airport, through the quarantine period and until the horses

59

60

59 The jumps at Fairbanks Ranch included this "Western town."

60 A jump at Fairbanks Ranch just prior to the Games.

61

left Los Angeles. One of the duties of the commission was to administer "vet checks". For the three-day event, the horses were checked on 28 July prior to the start of competition. A 10-minute check was performed at Fairbanks Ranch after the second roads and track event. A final check was conducted on the morning of 2 August, before the horses were transported to Santa Anita. The LAOOC competition staff recommended that the president of the veterinary commission be the person who is the local or resident member of the commission.

A United States Department of Agriculture (USDA)-approved quarantine area was utilized at Santa Anita, eliminating the need for horses to be transported to and held at an intermediate stop between the airport and the competition site. The size of the stable area at Santa Anita allowed the LAOOC to construct the special quarantine area far enough away from the area where the horses would be stabled. Special fencing and double-

screening had to be built around the quarantine area. A three-day quarantine was required for most horses and the rest were quarantined at the airport. A great deal of effort went into planning charter flights to ship the horses to the United States in groups. The largest charter contained 34 horses.

Summary

The LAOOC may have set a new standard for Olympic equestrian events by utilizing an existing race track facility and its staff in 1984. This highly successful decision was made three years before the Games when a joint venture was formed between the Los Angeles Turf Club, owners of Santa Anita Race Course, and the LAOOC. Not only would Santa Anita serve as the primary site of the equestrian events, but the agreement stated that the LATC would also provide management of the event. In the end, approximately 95 percent of the staff needed to operate the venue

consisted of Santa Anita employees or volunteers that Santa Anita recruited.

Extensive stabling facilities existed at the site and the only major construction task at Santa Anita was setting up the arena and adding some temporary grandstands and fencing.

All jumping and dressage events were held at Santa Anita while the endurance portion of the three-day event was held 110 miles to the south at Fairbanks Ranch Country Club. Though the three-day event generally takes four days to complete, it took six days in 1984 because the distance between Santa Anita and Fairbanks Ranch required two travel/rest days. But the advantages of the climate at Fairbanks Ranch far outweighed any negatives. A large volunteer staff from the area was recruited to work the one day of competition at Fairbanks Ranch and approximately 50,000 spectators watched the events.

Facilities at Santa Anita were more than adequate for the stabling of horses and grooms. Space was so plentiful that the LAOOC was able to construct its quarantine facility there, a great convenience for the NOCs.

A large spectator capacity of 33,500 was another advantage at Santa Anita, as was a 20,000-space parking facility and an on-site catering facility. Attendance at Santa Anita averaged 26,000 per day for nine sessions, including the jumping-training competition day on 4 August.

The LAOOC management staff had several recommendations to make for future organizers. Most important was to emphasize good communication with the national federations as well as NOCs, well in advance of the Games, especially to familiarize them with the logistics of the chosen facilities. Another recommendation was to make sure that the duties of the course designer and event director for the three-day event are handled by two different persons. Though part of the three-day event was successfully staged at a remote site, the LAOOC still believes it is best to hold the event at one site. At Santa Anita, the LAOOC encountered no problems with using a single arena for dressage and jumping and would recommend this arrangement for the future.

63

30.09.9 Fencing

The 1984 Olympic fencers were literally in the spotlight when the four team and four individual final events were held on the stage of the Terrace Theater in the Long Beach Convention and Entertainment Center. While preliminary bouts were held in the Convention Center's huge Exhibition Hall during the day, evening finals were featured in a more intimate, formal atmosphere. Officials and even ABC cameramen wore black tuxedos and the white-clad competitors contrasted with the black stage curtains.

Another unique aspect of the 1984 Olympic fencing competition was the sharing of facilities and staff with volleyball. Volleyball matches were

held separately in the center's main arena but most support departments were shared with fencing, including venue management. The majority of public entry points for the two sports were the same, so it was logical to share functions such as spectator services and access control. Arranging deliveries, construction and telecommunications for the entire complex required one central venue management group to coordinate activities of all the shared individual departments such as Material Logistics, Technology and Food Services. In addition, the Exhibition Hall, which measured 440 feet by 300 feet, provided space for the fencing preliminary competition area, the fencing training and warm-up area and the warm-up area for volleyball. Temporary walls were built around the volleyball courts but the noise from the courts could not be completely shut out.

Preliminaries for fencing began at 0900 hours on 1 August and continued every day through 11 August, except 6 August. Finals were held from 2000 to 2300 on eight evenings. For the first time in an Olympic Games, the fencing portion of the modern pentathlon event was not held at the fencing venue because the LAOOC wanted to hold all five modern pentathlon events at one site, Coto de Caza.

Gold medal winners were Jujie Luan (CHN), women's individual foil; the Federal Republic of Germany, women's team foil; Mauro Numa (ITA), men's individual foil; Jean Francois Lamour (FRA), men's individual sabre; Philippe Boisse (FRA) men's individual epee; Italy, men's team foil; Italy, men's team sabre; and the Federal Republic of Germany, men's team epee.

Field of play

Sixteen pistes were initially set up on the field of play area for the preliminary fencing sessions but the number was later reduced to 14. The Directoire Technique podium with space for 15 was situated at the center. Within the Exhibition Hall, 18 additional pistes were available for warm-up and training. Portable bleachers for spectator seating were set up on the east and west sides of the field of play, while temporary team meeting rooms, competition management offices and sports medicine facilities were constructed on the north wall. The training pistes and the volleyball warm-up area were located on the far east side of the hall, beyond the spectator seating.

Although the Exhibition Hall can only be described as gigantic, it worked extremely well for the preliminary competition. Theater lights were

added to bring light up to a minimum 750 lux one meter above each piste, a Federation Internationale de Escrime (FIE) requirement. All wiring in the field of play area was concealed under a gray carpet while a blue carpet covered the spectator area in the Exhibition Hall. The same bright blue covering was used with great success in the Terrace Theater since the gray pistes contrasted with the blue carpet.

A problem developed on the first day of preliminary competition when the two-foot-high foam rubber barriers around the field of play failed to keep spectators, the media and non-competing athletes away from the pistes. The problem was corrected when a five-foot metal barrier was installed, greatly improving the LAOOC's crowd control efforts. Several factors caused media and spectators to want to get closer to the field of play. Information on the individual scoreboards at each piste was not big enough to be clearly seen from the seating area. The information included the fencer's name, bout score and tournament record and may have been adequate if the letters had been larger and the boards had been placed at a greater height. However, the addition of a large, composite, centrally located scoreboard could have provided athletes, spectators and the media with a central information point to display round-by-round scoring. Another problem was that the bleachers were at ground level and those people sitting in the first few rows could not see the entire field of play. Elevated bleachers would have

helped and placing them on four sides of the field of play rather than two would have brought more spectators closer to the pistes.

When the Long Beach Convention and Entertainment Center was selected as the site for Olympic fencing and volleyball, LAOOC officials knew the Exhibition Hall alone would provide plenty of space for the preliminaries. But when the LAOOC fencing commissioner saw the Terrace Theater, she immediately proposed holding the fencing finals on a stage for the first time ever in the Olympics; eventually the site contract included use of the Terrace Theater by the LAOOC. A special piste, 21 centimeters high (approximately eight inches), was set up on the stage in front of a platform of officials. Seated on the official platform was the Directoire Technique, 50 dignitaries and FIE officials. Seating in the wings of the stage was also available for an LAOOC or NOC armorer, coaches and fencing finalists. Two warm-up pistes were located just off-stage as well. The effect of competition taking place on a stage was dramatic for the spectators and most of the theater seats provided an excellent view of the stage, however, seating for the media was located too far from the stage. Swiss Timing provided a scoreboard at the finals which was not adequate for compiling both individual and team information, though it had been approved by the FIE.

Each evening before final competition began, an exhibition in the Terrace Theater lobby proved extremely popular with spectators who were unfamiliar with the sport of fencing. All three weapons were demonstrated and the exhibition included an explanation of the electronic equipment and scoring system.

Scoring equipment for fencing was provided by the Uhlmann Company of the Federal Republic of Germany, but acquisition of the 33 electronic scoring devices came very late because the LAOOC had originally contracted with a company from the Soviet Union to provide the equipment. The Soviet equipment had already arrived in the LAOOC warehouses four months before the Games but because 10 Soviet technicians were required to operate and service the equipment and the LAOOC armorers and technicians were not familiar with the equipment, the LAOOC decided to seek its equipment elsewhere after the Eastern Bloc nations announced their boycott. Uhlmann's scoring devices were all equipped with a blocking system and built-in chronometers required by the FIE. All pistes were manufactured by International Sports Equipment Inc. of Southern California. Pistes for preliminary competition were five centimeters thick while the piste for the finals was 20 centimeters thick in order to elevate the fencers for better viewing by the spectators, officials and judges. The LAOOC utilized a new concept in piste construction with great success. The pistes were made up of 1.2-meter by 2-meter aluminum

sections instead of the traditional heavy, copper material. Each piste contained 15 sections that could be individually replaced if damaged. An entire piste could be set up in just 20 minutes by an experienced crew which was considerably faster than set-up for copper pistes. Equipment at each piste included: an electric scoring box; two reels; two connecting cables; a six-foot table and six chairs; two scoring standards; two 12-volt batteries; a strip signal; Rules of Competition book (FIE); two tie-in cables; an LAOOC-provided scoreboard; 150 and 500 gram weights; a weapon thickness gauge; visible chronometers at each end of the piste; two timers and team seating. Additional equipment was also provided, depending upon the weapon.

Sixteen piste crews, consisting of a piste captain, scoreboard keeper, scorer, timer and two hook-up staffers, were rotated each round. Each crew was kept together for the duration of the Games to develop a team spirit. Since no more than 12 pistes were ever in operation on a given day, crews were able to get time off. An alternate piste crew was always available at the finals but was never needed. Piste crew members also helped with other competition duties.

A weapon control area in the Exhibition Hall, equipped with Uhlmann gauges and two electric apparatus for the control of weapons and body cords,

66 One of the 14 pistes located in the Exhibition Hall of the Long Beach Convention Center complex for preliminary fencing bouts.

66

was staffed by LAOOC armorers. In addition, temporary structures were built to house an armory and repair station and an equipment self-help station. An equipment vendor was available for clothing and equipment sales and three sewing machines were located there for uniform repair. Armories were also available in the USC and UCLA Villages but did not receive heavy use since there were no training facilities in the villages. A storage area for 70 athletes' bags was built at the venue entry, but most athletes were reluctant to leave personal items and equipment there.

The LAOOC built temporary facilities with 10 showers and 30 individual lockers for women and 10 showers and 50 individual lockers for men at the Exhibition Hall. Similar facilities already were in place at the Terrace Theater.

Sports administration and competition management

LAOOC construction crews erected more than 260 feet of hard wall and more than 1,500 feet of temporary partitions to create offices, work spaces and practice facilities for volleyball and fencing in the Exhibition Hall. The venue management staff and support departments, most of which were shared with volleyball, occupied existing offices in the facility's convention meeting room area underneath the Terrace Theater.

In theory, the idea of shared staff was perfect. Operationally, conflicts occasionally arose when sport-specific needs developed. Competition staff for the two sports were completely separate, keeping field of play issues specific to each sport. One venue director and two assistants governed the support departments for both sports. Each sport had its own commissioner. Schedules for volleyball and fencing occasionally overlapped but large pictograms and careful ticket takers helped point spectators in the right direction. Facility Management Incorporated, the organization that manages the Long Beach Convention and Entertainment Center, provided ticket takers, ushers, concession and maintenance personnel under contract.

Technology was no different than the other support departments and was shared between the two sports. The results production facility handled copying and distribution needs for both sports, but each sport had specific needs and problems. At fencing, the computer scoring system used in Montreal was not adequate for 1984 needs. As the Directoire Technique compiled scores from individual bouts, LAOOC scorers transferred the information manually to score cards for compilation by the results management team. This was a slow process and the LAOOC recommends updating the computer software for the next Olympic Games.

Summary

The concept of using a theater setting with fencers competing on a stage was new to the Olympics and created a dramatic atmosphere for the final events. Very little construction was needed in the Long Beach Convention and Entertainment Center's Terrace Theater for the finals, since spectator seating already existed and little had to be done to set the stage except erecting the competition and warm-up pistes and officials' platform. Spectator sight lines were good, but the press and spectators seated in the back of the theater were too far from the stage. The Convention and Entertainment Center's giant Exhibition Hall easily accommodated all preliminary bouts and allowed the LAOOC to be more lenient in meeting venue space needs.

Fencing was not the only Olympic sport located at the Long Beach facility. Volleyball utilized the center's main arena. Venue management and support departments were completely shared between the two sports and though the sharing created some operational problems, the shared staff was necessary to resolve situations such as move-in of equipment into the Long Beach Convention and Entertainment Center. The venue staff recommends that if a similar shared facility situation occurs again, certain

departments should be sport-specific. Fencing and volleyball did have their own Protocol and Language Services departments at the Long Beach Complex.

For the first time, aluminum pistes made in detachable sections were used instead of the traditional copper pistes. The lightweight aluminum pistes were highly acclaimed by fencers and venue staff. Fencers were provided with more than adequate training pistes at the Exhibition Hall and a full range of armory needs were met by a highly trained armorer at the competition site. Additional armories were available at the athlete villages.

30.09.10 Football

More spectators turned out for the 1984 Olympic football tournament than any other Olympic sport as 1,422,605 fans attended 32 matches at four competition sites. First-round football matches were played at two East Coast sites and two West Coast sites, giving Olympic fans living as far as 3,000 miles from Los Angeles the opportunity to witness an Olympic event first-hand. The host cities took on the festive Olympic Look and residents welcomed the football participants by attending the matches in far greater numbers than the LAOOC and the Federation Internationale de Football Association (FIFA) expected.

The huge, 103,300-seat Rose Bowl in Pasadena served as the tournament's main stadium and was the site of six first-round matches, two quarter-final

matches, one semi-final and the two medal games. A North American record crowd of 101,799 attended the final on 11 August. The Rose Bowl was a home field for the North American Soccer League from 1978–1980 and countless American football games have been played there. It was the cycling venue in the 1932 Olympic Games. A mile-long fence surrounds the Bowl and more than 3,000 rose bushes of 100 different varieties decorate the stadium grounds. The 105-meter by 68-meter (114.83-yard by 74.37-yard) natural grass playing field met FIFA regulations but the process of selecting the Rose Bowl and the three outlying sites was no simple task. FIFA specified that four fields must be utilized for the 16-team tournament and LAOOC officials conducted an extensive search of the Southern California area to find adequate playing surfaces. Early in the search, two professional baseball stadiums were

considered as potential football sites, but scheduling difficulties and construction costs eliminated those choices. Many other sites were looked at but were turned down because they didn't meet FIFA field width requirements, had artificial turf or lacked adequate spectator seating.

When it became apparent that four suitable stadiums were not available in Southern California, the LAOOC decided to make the tournament a national event by conducting the first-round games at paired sites—two on the East Coast and two on the West Coast. In the East, Harvard Stadium in Cambridge, Massachusetts, and the Navy-Marine Corps Stadium in Annapolis, Maryland, each played host to six first-round matches while the Rose Bowl and Stanford Stadium in Stanford, California, hosted the other

67 The massive Rose Bowl in Pasadena seats more than 100,000 spectators during the Olympic Football Tournament.

69

68 France wins the first football semi-final, 4-2, in overtime at the Rose Bowl.

69 This semi-final between France and Yugoslavia drew 97,451 to the Rose Bowl.

first-round matches in the West. The 16 teams were divided by draw into four groups and the top seed in each group did not have to travel during the preliminary round. Every other team traveled once within its first three games, playing each of the other teams within its group once. To minimize travel fatigue, the teams located on the East Coast traveled only between Annapolis and Cambridge while the West Coast teams traveled between Stanford and Pasadena. This travel arrangement allowed spectators at each venue an opportunity to see seven of eight teams located on their respective coasts, a decision which helped boost attendance figures. The top two teams from each pool met on the West Coast for quarter-final and semi-final play at Stanford and the Rose Bowl. Rest days after the preliminary, quarter-final and semi-final rounds gave teams a chance to travel and settle into new lodgings. Team members were initially disturbed to learn they had to travel on game day when facing the first-seeded team in their group during preliminaries. But transportation was by charter airline and never exceeded two hours. Hot meals were provided and plane-side boarding via police-escorted buses was arranged. Coaches eventually realized that this day-of-game travel would not detract from the players' performances, because it enabled the players to sleep in a familiar place the night before a game and avoided the frustrations often associated with normal bus and airport travel. Throughout the tournament, the LAOOC paid for all travel costs and subsidized any room and board costs beyond normal Olympic village charges. The LAOOC provided two full-time staff members to make all travel arrangements with United Airlines.

Attendance at Olympic football reached its peak on 11 August when France won its first-ever football gold medal by shutting out Brazil, 2-0, before a sold-out crowd at the Rose Bowl. Yugoslavia edged Italy, 2-1, for third place.

Field of play

In order to meet FIFA standards, some resodding was needed at each of the four grass fields, in addition to lining the fields and installing goals. Beyond those needs, only minor construction was necessary on the fields of play. At the Rose Rowl, an unplanned resodding of the field was necessary following a moto-cross competition that damaged the field extensively six weeks before the Games. New sod was laid under the direction of experts flown in by the LAOOC, and the field held up very well through 11 matches in 14 days. The Harvard field needed only minor resodding while Annapolis and

Stanford were totally resodded. Traditional American football goal posts at Stanford and Annapolis had to be removed and were later replaced by the LAOOC. Because of the narrowness of the Harvard field, a protective wall covering was installed. The Rose Bowl also received some wall padding. At Stanford, a new locker room was built, the press box was completely renovated and a shot put ring and pole vault pit had to be removed from the playing field.

The Porter Equipment Company of Chicago, Illinois, provided three goals and nets at each competition site and three pairs of goals and nets plus one extra goal for each training site. Adidas supplied 200 game balls for practice and competition.

Two natural grass training fields were required for each site and, with the exception of the Rose Bowl, were available within a short walk of the stadium. Teams playing at the Rose Bowl could train either at Birmingham High School in Van Nuys, California, or California State University at Dominguez Hills. Two fields were available at each of those sites. Locker rooms, showers and medical facilities were provided at each site and each team was allocated two, two-hour training sessions per day. In all cases, the competition field was not used for training, with the exception of a one-time light workout for each team. Teams were allowed a 15-minute warm-up on the competition field on game days, and a small space inside each dressing room was available for pre-game warm-ups.

The LAOOC assigned each team a coordinator to serve the team's best interests in dealing with the LAOOC and FIFA. The coordinator was especially useful in arranging transportation, training and village activities and traveled with the team at all times. Considering the amount of travel required for each team, the coordinators' ability to sort out information for the teams was a great aid to the coaches.

Even though most of the participating football teams did not have the benefit of staying in the Olympic villages in Los Angeles, the LAOOC set up full service temporary villages at each of the the outlying sites. Security, meals, entertainment, meeting rooms and athlete services were provided at each site. Athletes were housed in dormitories at Stanford and Harvard universities while a hotel was utilized at Annapolis.

Sports administration and competition management

Colorful banners were hung in the host cities and the stadiums were brightly decorated to create an Olympic atmosphere. To make the athletes feel even more welcome, special football Opening Ceremonies were held at Stanford, Annapolis and Harvard on the first day of preliminary competition. Because of the length of the ceremonies, the LAOOC had to petition FIFA and each delegation to delay the start time of the first match at each site. This was acceptable to all concerned and starting times were delayed a maximum of 45 minutes. Skydivers carrying the Olympic flag and the participating nations' flags opened the ceremonies by landing in a cluster of balloons shaped into the Olympic rings at mid-field. Area youth soccer teams dressed in the uniforms of the 16 participating football teams marched at each of the ceremonies. Former Olympic competitors carried torches into the stadiums and a torchlighting ceremony was held at each site.

The LAOOC faced a unique and monumental challenge in organizing and managing a tournament played at four sites, thousands of miles apart. In an attempt to maintain uniformity, one commissioner and two sports managers managed the entire football operation, while competition and venue directors worked on-site. The venue director supervised overall venue needs while the competition director supervised competition needs, and provided a special secretariat for FIFA.

Construction at the four football venues consisted primarily of setting up security fencing, fulfilling temporary electrical needs, erecting tents and setting up trailers, installing scoreboards and generally decorating the stadiums with the Olympic Look, to include installation of flag poles and hanging flags of the 16 participating nations. Scoreboards had to be modified at each site to include a 45-minute clock.

Establishing communications among the sites was a challenge. The Electronic Messaging System that connected each of the other Olympic venues was not set up at the outlying football sites. The exchange of security, ticketing, accreditation and results information was difficult. An open telephone line between Los Angeles and the outlying sites was set up to allow ticketing representatives to communicate freely with ticketing headquarters. On the results side, statisticians at each site recorded match statistics and sent them via telecopier to the Rose Bowl, where LAOOC statisticians organized the

statistics into the results format for FIFA approval. The results management team entered the information into its Games-wide distribution system and produced hard copy for copying and distribution at the Rose Bowl and at each remote site. Six statisticians were used at the Rose Bowl. Two arrived at the Rose Bowl early during the first-round games to gather statistics from the three outlying sites. The other four statisticians recorded local statistics; two recorded team match statistics for immediate half-time and post-game media distribution, and two recorded match progress statistics and operated the press box public address system and telephone link with the host broadcaster. A small computer assisted the statisticians in sorting the match statistics information to meet the results team's input format.

Summary

The difficult task of simultaneously operating four football venues, two of them 3,000 miles from Los Angeles, was successfully carried out for the 1984 Games. Great attention was paid to the smallest details to make the participants at the venues feel welcome and comfortable. Elaborate opening ceremonies were held at each of the outlying sites, athlete mini-villages were set up and the host cities were decorated with the Olympic Look. The end result was not only an exciting tournament but also the largest spectator turnout for any Olympic sport in 1984. Nearly 1.5 million fans turned out at the four sites, with the largest crowd being 101,799 at the finals at the Rose Bowl in Pasadena, the main stadium for football.

FIFA field requirements meant the LAOOC had to go to great lengths to find four stadiums with adequate seating and field of play standards. Because four such fields did not exist in Southern California, the concept of utilizing two paired sites on the East Coast and two on the West Coast was developed for first-round matches. All travel costs and arrangements were paid by the LAOOC. The LAOOC also covered all room and board costs above those normally charged at the Olympic villages.

Although LAOOC football organizers faced a tremendous challenge, the concept of the East Coast competition sites brought the Olympics to thousands of fans who otherwise would not have been able to witness an Olympic event.

**30.09.11
Gymnastics**

Knowing that the attention of the world would focus on the popular sport of gymnastics early in the 1984 Games, the LAOOC set the stage for a successful and crowd-pleasing competition at the Edwin W. Pauley Pavilion on the campus of the University of California, Los Angeles (UCLA). The gymnasts were spotlighted on a specially built podium in the brightly decorated arena where sell-out crowds attended every session.

The entire UCLA campus became an Olympic showplace, not only was the gymnastic competition held there, but an Olympic village was also created there and the tennis competition was held in a new stadium adjacent to Pauley Pavilion. The athlete village housed more than 3,500 athletes and delegates in existing dormitories in a

casual park-like setting. Tickets for the demonstration sport of tennis at the 8,000-plus seat Los Angeles Tennis Center sold out quickly after going on sale.

The proximity of the two venues and the village allowed some services such as transportation and media facilities to be shared among all three and some staff to be shared between gymnastics and tennis. Schedules for the two venues did not overlap, preventing traffic congestion. Artistic gymnastics began 29 July and ended 5 August, while tennis ran 6-1 1 August. For the first time in Olympic history, rhythmic gymnastics was a medal sport with competition taking place 9-1 1 August at Pauley. With tennis competition in the mornings and afternoons and rhythmic gymnastics in the evenings, there were no problems with spectator parking for those two events.

Compulsory and optional competition for artistic gymnastics ran from 29 July to 1 August. The women competed on 30 July and 1 August in two sessions a day, with two sub-divisions within each

70 Pauley Pavilion is awash with color as set up for the men's team competition.

71 Rhythmic gymnastics makes its debut in the Olympic Games in 1984.

session. For the men, compulsory and optional competition on 29 and 31 July was divided into three sessions each day. The original gymnastics schedule included 12 men's and 12 women's teams in addition to individual competitors. Because of the boycott, only nine men's teams and nine women's teams and the various individuals actually competed. The schedule was not modified, however, allowing a smaller number of teams (two or three, instead of the original three or four) to compete in each session. Once all-around competition began on 2 August, one session per evening was scheduled through the individual finals on 4-5 August. Romania won the women's team gold medal with 392.20 points, with the United States taking the silver with 391.20 and China capturing the bronze with a 388.60 total. The United States' Mary Lou Retton was the women's all-around winner with a 79.175 total, just edging out Romania's Ecaterina Szabo who totaled 79.125. Szabo's teammate Simona Pauca captured the bronze with 78.675. Individual event gold medalists were: Szabo (ROM), horse vault, 19.875; (tie) Julianne McNamara (USA) and Ma Yanhong (CHN), uneven bars, 19.950; (tie) Szabo (ROM) and Pauca (ROM), balance beam, 19.800; Szabo (ROM), floor exercises, 19.975.

In the men's team competition, it was the United States edging out the Chinese for the gold medal, with the U.S. scoring 591.40 to 590.80 for China. Japan took the bronze with 586.70. The men's all-around gold medal went to Japan's Koji Gushiken with 118.700. Peter Vidmar of the United States was second with 118.675, and Li Ning of China took the bronze medal, scoring 118.575. Individual event gold medalists were: Li (CHN), floor exercise, 19.925; (tie) Vidmar (USA) and Li (CHN), side horse 19.950; (tie) Gushiken (JPN), and Li (CHN), rings, 19.850; Lou Yun (CHN), horse vault, 19.950; Bart Conner (USA), parallel bars, 19.950; Shinji Morisue (JPN), horizontal bar, 20.000.

Canada's Lori Fung became the first gold medalist in rhythmic gymnastics, scoring a 57.950 in the four combined events (hoop, ball, clubs and ribbon). Doina Staiculescu of Romania was second with 57.900 and Regina Weber of the Federal Republic of Germany finished third at 57.700.

Field of play

Installation of a one-meter-high podium inside Pauley was the LAOOC's primary construction task at gymnastics. The podium elevated the artistic gymnastics apparatus and gymnasts could perform without the usual clutter of tables, chairs and scoring devices which were placed around the perimeter of the platform at floor level. The entire podium and surrounding

floor was covered in a light gray carpet, resulting in a clean, uncluttered field of play. Complex wiring systems (telephone, sound, electrical, scoring) were placed either under the floor carpet or under the podium. One of only a few of its kind in the world, this podium had been used at the 1976 Montreal Olympics. AMF (the equipment supplier), purchased the podium from the LAOOC, which had purchased it from Ramon Ltd., the Canadian firm which manufactured it. Ramon Ltd. set it up in a warehouse in the summer of 1983 in order to train an LAOOC construction supervisor. It was used for the 1983 McDonald's International Gymnastics Championships at Pauley Pavilion and it took an untrained crew of 25 in addition to the trained construction supervisor to set it up.

The original agreement with UCLA set 7 July as the day the LAOOC would have complete access to begin construction at the gymnastics facilities. However, the LAOOC was granted an earlier, conditional move-in day of 18 June. Wiring and electrical work was started earlier than planned and once it was completed, the podium was installed in three days. Some additional pieces were constructed to enlarge the podium at the high bar/uneven bar area and to have spare parts for broken or damaged units. Because the men and women performed on alternate days, apparatus had to be changed on the podium every evening after competition finished. This procedure took the events crew of 10 plus six AMF equipment representatives about 90 minutes each night. Equipment was stored either under the podium or in nearby storage rooms. Upon conclusion of the artistic competition 5 August, the podium was struck in about 12 hours to prepare the rhythmic gymnastics setup. This mid-Games construction procedure was as follows:

- Removal of gymnastics apparatus
- Removal of podium
- Removal and resetting of the judges' tables and platforms
- Removal and resetting of technology equipment, including telephones, Swiss timing and sound and electrical connections
- Resetting of ABC cameras
- Pull-out of existing bleachers
- Resetting of platforms and scaffolding
- Resetting of Look items
- Reworking of carpeting
- Installation of rhythmic competition floors

Two rhythmic competition carpets of blue, bound in white were placed on either side of a raised, wooden competition floor. The wooden floor was a federation requirement but not one rhythmic gymnast used the surface during the entire competition. However, the wood floor was used for a team rhythmic demonstration at the end of competition each night. The entire changeover from artistic to

72

rhythmic took place in a 24-hour period from 2100 on 5 August to 2000 on 6 August.

Moving the artistic gymnastics apparatus in and out of Pauley and the training sites took a cooperative effort from AMF, two private moving companies and the LAOOC Material Logistics Department. Six-and-one-half 45-foot trailers of equipment were unloaded in six hours by 15 moving company crew members and 30 AMF representatives and moved into the three training gyms in the Wooden Center. AMF then set up the apparatus in about 16 hours. For the two training gymnasiums at the USC Village, two-and-one-half 45-foot flatbed trailers of equipment were unloaded by a crew of 12 in about five hours. The more fragile competition equipment that was used on the competition podium (one set each of men's and women's apparatus) was sent directly to Pauley by AMF and set up after the podium was installed and most of the arena construction work finished. Two more trailers containing auxiliary equipment for the podium, such as custom-made mats, were set up at the same time in Pauley by the AMF crew.

The artistic gymnasts trained primarily in the Wooden Center at UCLA where four gym setups were provided for men and four for women. A fifth setup for both men and women was provided at the USC Village. Equipment was identical for all sites and included a full set of AMF apparatus, a complete spring floor and AMF mats and springboards. The competition warm-up site in Yates Gymnasium (at the Wooden Center) basically had the same equipment and mat setup as the podium. Teams trained alone for four-and-one-half hour periods each day

72 Judges confer on the floor of Pauley Pavilion before entering scores.

Sports Administration and Competition Management

and had the option of scheduling additional training on a sign-up basis. Training for rhythmic gymnasts was scheduled at three sites for three-hour periods. Podium training was scheduled on 7-8 August with an hour allotted for each individual. Competition warm-up took place both at Pauley and at the Wooden Center.

Four days of podium training in Pauley on 24-27 July provided the athletes with the opportunity to practice under the same schedule and conditions as the first four days of competition and allowed LAOOC staff to undergo a

formal dress rehearsal. The draw on 19 July during the FIG Congress, which determined the order of competition for 29-30 July (men's and women's compulsories), applied to podium training as well. The same schedule was used for the third and fourth days of podium training. The media was allowed to view podium training under the same restrictions as actual competition and this solved the problem of having training sites in areas of the village that were off-limits to the press. The gymnastics commissioners also invited venue volunteers and guests to view certain sessions of the last two days of podium training, giving hundreds of "gymnastics family" personnel who were unable to obtain competition tickets the opportunity to see the world's top gymnasts.

Sports administration and competition management

Pauley Pavilion served gymnastics competition needs extremely well but it did not possess the kind of office space and media facilities needed for an Olympic event. Therefore, the LAOOC contracted with UCLA to use the first floor of a nearby office building (the Morgan Center) for competition and management staff offices, FIG offices and meeting rooms and a press interview room. Although the LAOOC

was able to move into Pauley Pavilion early (18 June), the gymnastics staff did not have access to the Morgan Center until 7 July. The LAOOC was responsible for moving UCLA's office equipment from the first floor of the building and storing it before moving in its own office equipment and telephone system. Some departments such as Technology, Finance, Health Services and Spectator Services were able to use existing space in Pauley. Food Services used a grassy, enclosed field south of Pauley to feed staff from gymnastics and tennis. Television and telephone trailers were also parked on the field. Press Operations' need for a large area for a sub-center was filled by utilizing the Ackerman Student Union, about 200 yards from Pauley. A very large ballroom was used as a media work room for tennis, gymnastics and village needs. From a shared staff and equipment standpoint, this worked extremely well. But media needing to file stories quickly after competition could not easily get to Ackerman because of the congestion caused by spectators and village visitors in the area between Pauley and the sub-center.

A lack of adequate parking on campus meant the LAOOC had to shuttle the majority of staff for the two UCLA venues and the village from a parking area one-and-one-half miles from UCLA. Shuttle service was provided 21 hours per day (0400-0100) from 7 July through the end of the Games. Spectator parking was scattered

around the campus and was pre-sold by UCLA Parking Services to many ticket-holders and over-crowded parking conditions that were expected never occurred.

Space for scoring and results management was basically included on the field of play, although Swiss Timing had a room adjacent to the field of play and the technology and results management offices were located off the arena concourse. The complexity of gymnastics scoring required that several different groups work together. Swiss Timing provided mechanical judging devices, scoring boards, posted scoring results boards and the superior judges' controls. Computerland of Allentown, Pennsylvania, provided programming and computers for the compilation of start lists, scores and standings; manual scorers provided a backup system of scoring and a results management team reported official results after they had been tabulated by Swiss Timing and double-checked by both the manual scoring system and the personnel from Computerland. As the judges scored each gymnast's performance, an electronic relay from the superior judge flashed the scores via a monitor to Swiss Timing, Computerland and the results management team. Swiss Timing

73 All competitions in artistic gymnastics are held on a podium raised one meter off the floor.

tabulated the four judges' scores which were then flashed on the electronic monitors around the apparatus being scored while Computerland and the manual scorers compiled results. The system worked well because of Computerland's expertise in scoring gymnastics meets but the results management team did not have a computer program advanced enough to compile individual standings after each rotation.

A unique athlete security situation was created at gymnastics because Pauley Pavilion was bordered on the north side by the village (with a security fence separating the two); on the west side by the tennis venue and on the east side by the main entry for the village and the Morgan Center, where gymnastics venue staff offices were located. A great deal of congestion developed at the one remaining side where spectators and visitors to the area gathered. Because the gymnastics warm-up facility was located at the Wooden Center just beyond the village fence, the Federation Internationale de Gymnastique (FIG) insisted a secure route be provided between the two. The LAOOC decided to build a three-story scaffold bridge between the Wooden Center and Pauley. Visually, the archway was an impressive structure that became one of the most photographed symbols of the UCLA Village. Large Olympic rings hung on the white scaffolding and flags of all 140 participating nations stood behind the bridge, creating an impressive picture.

Some drawbacks to the bridge plan developed when athletic trainers, equipment personnel, language services staff and press operations staff needed access to the Wooden Center. Because Wooden was inside the village, bridge access privileges were initially limited to only athletes and coaches. A similar security problem developed because the press interview room was located in the Morgan Center. Since Security did not want athletes mingling with the public outside the arena between Pauley and Morgan after competition, the athletes had to cross the bridge to the Wooden Center, exit Wooden and then exit the village through a special security gate into the Morgan Center. This procedure was cumbersome for athletes who usually were fatigued after competition and frustrating for journalists who were on deadline and had to wait for the athletes at the interview room.

From the standpoint of providing a protected route for the athletes, the bridge worked very well but it created access problems for staff that were never resolved and did nothing to keep the athletes warm before competition because it was not a completely enclosed structure.

Volunteers and paid staff at gymnastics totaled 646 (not including transportation) and nearly 100 staff members were shared with the tennis venue. The Material Logistics, Food Services and Technology departments were entirely shared while other departments such as Press Operations and Spectator Services were partially shared. Because the two venues were so close and schedules did not overlap, the idea of shared staff and services was excellent, although tennis management felt it should have had a sport-specific staff. Services such as concessions, security and maintenance were provided by contracted staff.

Summary

More scores of 10 than ever were posted by Olympic artistic gymnasts in 1984, thrilling sell-out crowds at Pauley Pavilion on the campus of UCLA. Pauley served well as an arena for gymnastics and the athletes were showcased on an impressive one-meter-high podium that was built to raise the apparatus and provide a clean, uncluttered field of play. The podium provided a better view of the competition for everyone from spectators and the television audience, to photographers. The podium and the entire floor of the arena was carpeted, giving the arena a plush, professional look.

The proximity of an Olympic village and a second venue to the gymnastics venue created a number of unique situations. A visually impressive bridge was built between Pauley and the Wooden Center in the village to allow athletes a safe passageway to the

74

competition site after they warmed up. But the bridge itself created many access problems for staff. About 100 staff members were shared between gymnastics and tennis and staff from both venues ate meals at the same site. A majority of the staff for the village and the two venues were bused to the campus from a large parking lot a mile away. Pauley Pavilion lacked large meeting rooms but UCLA was able to provide nearby office space for venue management. Some press facilities were shared with the village and tennis and were located slightly farther away and in a more congested public area.

The gymnastics venue required some extensive construction and setup operations. Besides building the actual podium, apparatus on the podium had to be changed over to a men's or women's setup each night. As soon as artistic gymnastics concluded, the LAOOC was faced with a quick changeover to rhythmic gymnastics. An incredible effort by venue staff was required to remove the podium and artistic equipment and set up the rhythmic floors in just under 24 hours. Two days of rhythmic training gave much of the venue staff a rest before competition began on 9 August. It marked the first time rhythmic gymnastics had been contested as an Olympic medal sport.

74 A major element in the temporary modifications for the gymnastics competition included this scaffold bridge which provides a secure pathway for athletes between warm-up and competition areas.

75

**30.09.12
Handball**

Before the 1984 Olympics, handball was not well-known in the United States. But nearly 13,000 spectators turned out for the men's final at The Forum in Inglewood, California, site of the Olympic basketball competition. The men's preliminary matches and the entire women's tournament was staged at Titan Gymnasium at California State University at Fullerton. The capacity of the gymnasium was reported to be 3,300 but 3,700 spectators packed the facility for the evening session on 31 July and most of the other sessions were sell-outs.

Eleven days of preliminary competition were held in Fullerton, with men and women competing every other day. Two sessions were held each day for men's pool play while one session was scheduled for each day of women's competition. The men's teams were divided into two groups of six and round-robin play within each group determined pairings for the final round. The two sixth place teams in each group played for eleventh and twelfth places, the two fifth place teams in each group played for ninth and tenth places, and so on. Matches to determine fifth through twelfth places were held in Fullerton on 10 August. The LAOOC then faced the challenge of converting The Forum into a handball venue for the men's medal games on 11 August. Yugoslavia emerged from its pool in first place with four wins and

one tie while the Federal Republic of Germany won all five of its pool games. Then in an exciting match for the gold medal at The Forum, Yugoslavia edged the FRG, 18-17. Romania defeated Denmark for the bronze medal, 23-19, also at The Forum. Bjorn Jilsen of Sweden led all scorers in the tournament with 50 goals and 16 assists. For the women, a single round-robin tournament was played entirely at Fullerton. Yugoslavia won the gold medal by virtue of its five wins in pool play. Korea took the silver medal after compiling a pool record of three wins, one loss and one tie. China was third with a record of two wins, two losses

75 This third place match between Romania and Denmark takes place in The Forum just hours after the basketball competition was concluded.

and one tie. Yugoslavia's Jasna Kolar-Merdan totaled 48 goals and six assists in five games to lead all women's scorers.

Field of play

A synthetic playing surface made by the BAT Taraflex Company was used for all handball games. At Fullerton, the LAOOC had the task of laying down the 29-meter by 42-meter Taraflex Sport M Green 512 T surface over an existing basketball court that was slightly smaller in both width and length than the Taraflex court. For this reason, about one-fourth of the existing lower level bleacher seats had to be eliminated. The actual competition area was a green, 20-meter by 40-meter zone while the out-of-bounds area was orange. An identical but entirely green playing surface was installed at Santa Monica College, one of the handball training sites. On the morning of 10 August, a special handball conversion crew consisting of five LAOOC material logistics staff members, four handball staff members, five staff members hired by BAT Taraflex and one technical representative of BAT Taraflex removed the playing surface at Santa Monica College. Later that afternoon, the flooring was trucked to The Forum and staged in the south tunnel. Upon the conclusion of the men's matches for 11th and 12th places at Fullerton, the officials' platforms were dismantled and sent to The Forum. As soon as the medal ceremony for basketball concluded that same evening, a combined work force of The Forum staff and LAOOC handball staff began the 12-hour task of cleaning and converting The Forum from a basketball venue into a handball venue. Participating country flags and pictograms were appropriately replaced and scoreboard signs were converted. A crew made up of Forum personnel removed the 37,800-pound basketball court and fork-lifts were used to remove the lower-level seats on the east side of the arena. Two BAT Taraflex technicians helped several members of the LAOOC handball staff install the Taraflex surface. Catch nets were installed and the court was relined with white marking tape. New Porter goals were installed and the officials' platforms and team benches were set up opposite the Olympic Family seating area. The results management team's setup had to be relocated and ABC cameras were repositioned. A final wet mop of the Taraflex surface was completed by 1100 on 11 August, three hours before the scheduled gold medal match. In an attempt to televise the match to a large, European audience during prime time hours, the gold medal match began at 1400 hours, preceding the bronze medal match.

Locker room space was more than adequate at The Forum, but at Fullerton, one large locker room had to be sub-divided to accommodate three teams. Athlete warm-up areas were small and lacked air-conditioning at Fullerton, so fans were installed. Inside the 12-meter by 20-meter warm-up room, two goals were placed on the wood floor and nets were hung to protect the walls. The air-conditioning system was excellent in Titan Gymnasium and maintained temperatures at 67 degrees. No warm-up facility was provided at The Forum, though teams were allowed an extended warm-up period of up to one-half hour on the competition surface. At Fullerton, a 10-minute, combined team warm-up period on the competition surface was provided before each game.

Adidas supplied 297 Jet men's balls and 148 Bang women's balls which were divided among the training and the competition sites. Adidas also provided air pumps, needles and ball bags. The Porter Equipment Company of Chicago, Illinois, supplied all goals, goal nets, catch nets and railing padding. Goals were nearly perfectly measured to within 1 to 1.5 millimeter tolerance. Porter technicians provided all set-up and performed minor repairs on the equipment. A clever system of attaching the goals to the playing surface with velcro-type material aided technicians in the quick set-up and tear-down of the two-meter by three-meter goals. Porter also designed, fabricated and installed a protective padding for the spectator railing on the east side of the Fullerton gymnasium. Two goals, three goal nets and two catch nets were provided for the training site at Santa Monica College; four goals, five goals nets and four catch nets were provided at the training site at California State University at Dominguez Hills and seven goals, 11 goal nets and four small catch nets were provided at the competition site. Three goals and three goal nets were stored until needed at The Forum, while other items, such as the Taraflex floor at Santa Monica College, were transferred to The Forum just before the finals.

The heaviest demand for training occurred at Fullerton, as expected. Not only did athletes want to become familiar with the competition field of play, but an outdoor pool with a surrounding athlete lounge area became very popular with the competitors. Santa Monica College was the second most preferred training site because it offered a 20-meter by 40-meter BAT Taraflex surface identical to that at Fullerton and was close to both the UCLA and USC athlete villages. Two 20-meter by 37-meter hardwood courts were available for training at California State University at Dominguez Hills, but were not heavily utilized because they were slightly shorter than regulation courts and were made of wood instead of the Taraflex surface. Teams were allowed

76

a minimum of one two-hour training session per day between 0800 and 2000. LAOOC competition staff thought training hours should have been extended to 2200 since evenings proved to be popular for training.

76 The Olympic Look takes its place at California State University at Fullerton, site of preliminary handball competition.

Training sites	From USC	From UCLA
Titan Gym (Fullerton)	64 km (40 miles)	45 km (28 miles)
Dominguez Hills	35 km (22 miles)	26 km (16 miles)
Santa Monica College	26 km (16 miles)	10km (6 miles)

Sports administration and competition management

Most staff at Fullerton were divided into two work shifts per day. Existing office and classroom space at Fullerton gave the LAOOC most of the venue office space it needed. Trailers were brought in for food storage and a post office and tents were erected for ticket information, an athlete lounge and the staff entrance.

A video-viewing service was provided for the athletes but was rarely used, partly due to the availability of tapes at the villages.

Construction at the venue was minimal and primarily limited to set-up of the field of play. A mid-Games construction emergency occurred when a spectator railing collapsed during a match at Fullerton. A few spectators sustained minor injuries and the venue construction crew immediately repaired and reinforced

77 California State University at Fullerton is ready to begin Olympic handball competition.

77

the railing. A new scoreboard was erected at Fullerton, including a time clock, and areas for match score and country names. An existing scoreboard was utilized at The Forum.

The statistics crew for handball consisted of three persons; one to maintain a match report and two to compile goalie and court statistics.

Summary

The small gymnasium at California State University at Fullerton worked well for the majority of the Olympic handball tournament, providing spectators with an intimate, "up-close" view of the action, while the staging of the men's finals at The Forum lent prestige to the event and greatly expanded spectator seating. The final session attracted 12,958 spectators.

A BAT Taraflex playing surface was utilized for all handball games. One Taraflex floor was installed at Fullerton while another served as a training surface at Santa Monica College and later was moved to The Forum for the finals.

In retrospect, the Olympic handball tournament was a success considering that handball previously was not well-known in the United States. Although the boycott of the Games by the Eastern bloc nations kept some of the world's best handball teams from attending, the LAOOC handball competition staff thought it resulted in a highly-competitive tournament because each of the teams that attended the tournament felt it had a legitimate chance for a medal.

30.09.13 Hockey

Newly-refurbished Weingart Stadium at East Los Angeles College (ELAC) was the site of 57 men's and women's field hockey games during the 14 days of the 1984 Olympic Games. The stadium face-lift was part of a series of improvements around the campus over a period of two years that included the permanent installation of a new artificial playing surface called "Super Turf 84" for the hockey competition.

The Weingart Foundation, a non-profit philanthropic California corporation, pledged more than \$3.2 million to help refurbish the ELAC stadium including installation of the Super Turf field and an all-weather synthetic track made of Regupol. Additional improvements were made to the stadium and surrounding area.

The field hockey competition schedule was grueling, with five games per day scheduled on six of the 14 days of competition, and four games scheduled on most of the other days. The competition commenced the day after Opening Ceremonies and concluded the day before Closing Ceremonies, with no rest days scheduled. Most of the venue staff of 642 (excluding contractors) was

divided into two shifts each day, though management generally worked the entire day.

Twelve men's teams were divided into two pools and round-robin play within the pools determined the semifinal pairings. The winner of each pool played the second place team in the other pool. The winners of those matches played for the gold medal and the losers played for third and fourth places. Cross-pool play determined fifth through twelfth places. In semifinal action, Pakistan edged Australia, 1-0, and the Federal Republic of Germany defeated Great Britain, 1-0. Then, before a crowd of 16,731, the largest of the tournament, Pakistan defeated the Federal Republic of Germany, 2-1, to win the gold medal. In another one-goal game, Great Britain beat Australia, 3-2, to capture the bronze medal.

For only the second time in the history of the Games, women competed in hockey. Round robin play among the six participating nations determined the final rankings. Holland won four

games and tied one to win the gold medal, while the Federal Republic of Germany finished with a record of two wins, one loss and two ties to take home the silver medal. The United States women earned the bronze medal with a record of two wins, two losses and one tie, after edging Australia, which finished with the same record, in a penalty stroke play-off, 10-5.

Field of play

In 1982, work started on the refurbishment of the stadium. Construction focused on installing the Super Turf artificial surface, made by Super Turf International of Garland, Texas. An asphalt base was covered with a one-half-inch foam pad, then covered with tightly-packed three-eighths-inch tall artificial grass resulting in a fast, springy playing surface. The turf was installed in July 1983 and was used by the college during the year preceding the Games. In addition to the competition field, which measured 180 feet by 300 feet, a half-field covered with the same artificial surface was located just south of the main stadium for warm-up and training. The extremely popular Super Turf surface was laid over existing outdoor volleyball courts and was removed after the Games. A third

field, a regulation-size natural grass field, was available for training but was rarely utilized.

Very warm temperatures in the East Los Angeles area necessitated frequent watering of the competition pitch to keep the field cool. The watering also helped prevent injuries and reduced friction on the ball by keeping the ball on the surface. Four two-inch hoses were used to water the field before and after each game and during halftimes. The field was soaked each evening and at midday between sessions in order to keep the field wet during play. The soaking kept the sub-surface wet and meant the watering crew could periodically touch up dry patches at the surface. The locations of the dry areas varied, depending on the time of day, temperature and wear and tear from previous games. Up to eight staff members were used to water the key areas, with two or three persons usually assigned to each hose. The LAOOC competition staff recommends permanent sprinkling systems be installed at future Olympic hockey fields to eliminate constant, manual watering of the turf.

79

79 The Australian team in conference during the competition.

During the pre-competition phase from 14-27 July, daily training times on the Super Turf pitch, the Super Turf half-field and the full grass field were between 0800 and 2000 hours. Teams were scheduled on the competition field on a rotating basis so that every team had the opportunity to train on each field. If a team assigned to train on the highest grade training pitch (the competition surface) declined to train during its allotted time, the team scheduled on the next highest grade training area was moved to the more desirable area. Because only a few teams arrived during the first week, only the competition field was utilized. Demand for training times increased during the second week of training but the grass field was still not needed. Teams often paired up for training periods, which meant only half to two-thirds of the assigned training times for the other two fields were filled. Because the grass field was ignored, the field crew there was assigned to the other fields. No training was scheduled on 28 July. Once competition began on 29 July, practice was restricted to the two training fields, except on 8 August when the

women were allowed to use the competition field. The grass field was never utilized, however, because of the preference of the teams to train on the half-field in order to simulate the playing conditions of the Super Turf surface. As it was, only 75 percent of the available time on the half-field was used during the first week of the tournament. By the second week, only 33 percent of the available time was utilized.

Kookaburra Dimple balls were provided by the A.G. Thompson Company of Australia for both training and competition. Each of the 12 men's teams and six women's teams were sent 20 balls late in the spring of 1984. When the teams arrived in Los Angeles, each team was given 20 more balls. Including competition balls, 960 Kookaburra balls were used in all. The Porter Equipment Company of Chicago, Illinois, provided competition goals and nets at all three fields as well as one spare set of goals at each field.

The competition field was surrounded by a 12-inch barrier net placed 10 to 12 feet from the sidelines and 30 feet beyond the endlines, to keep balls from rolling away from the field. Ninety-one youths from the Los Angeles area were used for putting balls in play, watering the field, passing out refreshments for athletes and officials and assisting with locker room duties. Duties for the ball persons rotated daily and each person worked two of every three days. Eight ball persons were required for field duty per match with two placed on each side of the field. Balls were put into play from the side of the field by the ball person placing a new ball on the line where the competition ball had gone out-of-bounds. When a ball went over the end line, the ball person on the nearest sideline raised one hand and rolled a ball to the player who required it. Each ball person was equipped with two balls to prevent long stoppages of play. The ball person's priority was to put the ball in play and not to retrieve a competition ball that had gone out-of-bounds.

All venue contact with competing teams was handled by two team administrators and several schedule coordinators. Due to the unexpected amount of training by the teams during competition, the team administrators helped revise transportation schedules during the second week of competition. Though most teams preferred to return to the villages to eat, the team administrators or schedule coordinators helped deliver box lunches to the athlete lounge to those who ordered them. The schedule coordinators also prepared half-time refreshments and delivered them to the ball persons at the field. Each team received its own tray and a third tray was provided for officials. The trays were brought to the field ten minutes before half-time of each scheduled match. Refreshments were also provided in the locker rooms at the end

of each match. Another service the schedule coordinators provided was notifying their assigned team to warm up or go to the stick check area when a preceding game went into overtime. The schedule coordinators also helped rearrange transportation for teams that played an overtime game. Finally, an important post-game service provided by either the team administrator or schedule coordinator was coordinating press interviews or doping control with the team manager.

An athlete lounge area located in tents at the half-field warm-up area proved very popular with the athletes. Electronic Messaging System terminals were available along with a large-screen television. Tables with umbrellas and chairs were provided and athletes were encouraged to eat lunch there.

Because an extremely large locker room was available at the ELAC gymnasium where venue management was housed, the LAOOC was able to assign a locker and lock there to every competitor and official for the duration of the Games. The locker room was divided into two sections (one for men and one for women) and lockers were numbered and grouped by NOC. A separate locker room facility at Weingart Stadium provided six individual team locker rooms during competition.

Sports administration and competition management

Spectator attendance at Weingart Stadium totaled 150,732 with on-site ticket sales contributing greatly to the total. A crowd of 16,731 attended the men's finals.

In addition to utilizing Weingart Stadium, the LAOOC also used a nearby gymnasium, volleyball courts and adjacent intramural fields at ELAC for office space, venue services and a training area. The scope of construction at the venue included numerous permanent and temporary improvements. Funding for the permanent improvements was primarily from the Weingart Foundation. The LAOOC supervised all construction, which began in late 1982 and continued until July 1984. Permanent improvements included the following:

- Replacement of the existing stadium football field with a synthetic playing surface provided by Super Turf
- Installation of a synthetic running track by Regupol
- Repainting of the entire stadium facility, inside and out
- Installation of a four-inch waterline with five couplers around the inner perimeter of the stadium wall for watering the synthetic playing field
- Installation of a new public address system

- Upgrading of the stadium wheelchair access provisions, including addition of wheelchair platforms, parking accommodations, signs and restroom facilities
- Refurbishment of the locker rooms, press box and stadium office facilities
- Completion of a new 60,000-square-foot intramural hockey field
- Installation of signs renaming the stadium "Weingart Stadium"

Other lasting improvements made around the campus included refurbishment of the campus tennis courts and campus auditorium and development of a student park.

Temporary improvements at the stadium, provided by the LAOOC, included:

- Addition of shade structures at the 50-yard-line for judges, results input personnel, two competing teams and two teams waiting for the next game
- Provision of a 150-foot by 160-foot synthetic turf warm-up field near the stadium. This was placed on an existing volleyball court where the nets were temporarily removed
- Sub-division of the gymnasium with partitions to provide office work spaces for venue management, Security and Technology
- Installation of white tents for the Olympic Family hosting lounge, athlete lounge, bus drivers' lounge and various access control points where shade was a requirement
- Installation of indoor/outdoor carpet to protect the gymnasium floor
- Addition of temporary electrical power to the gymnasium
- Installation of an eight-foot chain link fence to separate different access-controlled areas such as Press Operations, the athlete lounge and the staff entrance
- Construction of a scaffold bridge to allow the athletes to have private access from their lounge to the field of play
- Addition of temporary hardwall partitions in two of the four existing locker rooms to create two additional locker rooms
- Placement of three awards flagpoles at the west end of the stadium for IOC, LAOOC and federation flags, and placement of flags of the participating nations on either side of the ceremonial flags
- Addition of hardwall partitions in a stadium locker room to create a doping facility and separate the officials' locker room

A shaded judges' platform for six was built on the sidelines at mid-field with the results input area immediately behind it. Shade structures were also provided at the locker room facilities' sideline exit for teams waiting for upcoming games. For teams playing the second or third game of a session, a stick check was held approximately 35 minutes before game time in the pre-

game holding area. A stick check was held on the sidelines five minutes before the first game of a session to keep games on schedule.

Summary

A demanding but successful 57-game Olympic field hockey tournament was played at East Los Angeles College's Weingart Stadium. The 14-day schedule for 12 men's and six women's teams was played in a refurbished 22,000-seat stadium on a new Super Turf surface.

The installation of the artificial turf was completed a year before the Games and improvements were made at the stadium and surrounding areas during the two years preceding the Games, thanks to a large donation by the Weingart Foundation. The Super Turf pitch provided a fast, springy playing surface, and had to be frequently watered to keep it cool and soft. A half-field covered with the same Super Turf surface was temporarily installed for the Games and proved to be extremely valuable in allowing teams to train and warm up on a field with conditions that simulated the competition surface.

Because of the warm, humid conditions at the venue, a shade structure for Olympic Family seating below the press box would have been very popular but was not constructed. Sideline shade structures were provided for teams and officials, however, and were greatly appreciated.

The LAOOC competition staff used eight ball persons per game to prevent delays in the action when a ball went out-of-bounds. Sideline barrier nets stopped the balls while the ball persons put new balls into play. This service was highly appreciated by both the competitors and officials. The ball persons also helped with refreshments and locker room duties.

A crowd of 16,731 attended the final game on 11 August and attendance averaged a little more than 6,000 per session over a period of 24 sessions. A smaller stadium that could have brought the spectators closer to the field might have been preferable, though the facilities at ELAC proved fully satisfactory in all areas and left a legacy for future use by the community.

**30.09.14
Judo**

More athletes from more nations than ever before participated in the 1984 Olympic judo competition. Eight sell-out crowds in as many nights saw 223 athletes from 61 different countries compete in the Eagles' Nest Arena at California State University at Los Angeles (CSULA). Initial concern over the size of the arena (4,300 seats) faded as the site proved to be an intimate and friendly setting for spectators and officials alike. Every seat in the gymnasium provided an excellent view of the competition. Each NOC could enter a maximum of eight competitors, one in each of the seven weight categories and one in the open category. Athletes were not allowed to participate in more than one weight category. All contests in one class or category, including the final,

were held on the same day. One weight class was contested each day from 4-11 August with medals awarded at the conclusion of each event. Two bronze medals were awarded in each category. Competition began at 1600 hours each day and finished between 1815 and 2045, depending upon the number of athletes and the pace of the competition. The preliminary and repechage bouts lasted five minutes, while bronze medal repechage bouts and finals bouts lasted seven minutes. The half middleweight category (up to 78 kilograms) had the most competitors (42) and the greatest number of bouts (48). For the entire tournament, 266 bouts were held.

Thirteen different countries shared the 32 medals awarded in judo. Japan and Korea each captured five medals. Gold medal winners were as follows: Shinji Hosokawa (JPN), extra lightweight (to 60 kg); Yoshiyuki Matsuoka (JPN), half lightweight (to 65 kg); Byeong-Keun Ahn (KOR), lightweight (to 71 kg); Frank

Wieneke (FRG), half middleweight (to 78 kg); Peter Seisenbacher (AUT), middleweight (to 86 kg); Hyung-Zoo Ha (KOR), half heavyweight (to 95 kg); Hitoshi Saito (JPN), heavyweight (over 95 kg); and Yasuhiro Yamashita (JPN), open category.

Field of play

The competition tatami, made by Judogi of France, was elevated by a 75-centimeter-high scaffold platform. Made up of 128 one-meter by two-meter mats, five centimeters high, the 16-meter by 16-meter tatami was divided into a 10-meter by 10-meter zone of competition and a three-meter-wide safety perimeter. The entire tatami was green except for a one-meter red warning zone at the edge of the zone of competition. The carpeted 18.3-meter by 18.3-meter platform added another meter on each side of

81 Judokas grapple at California State University at Los Angeles 'Eagles' Nest Arena.

the tatami. Seated directly adjacent to the north side of the platform were 24 referees. All support officials, the jury, International Judo Federation (IJF) members and the LAOOC competition staff were seated at tables on the south side of the competition platform. A stanchion and chain barrier surrounded the field of play, providing a minimum of five feet between the edge of the platform and any public area. Press seating and some spectator seating was available in bleachers on the west side of the platform and Olympic Family seating was split between the east side of the competition area and the northwest portion of the first-floor bleachers. Most of the spectator seating was located in bleachers on the second level of the gymnasium. Seating for non-competing athletes was limited to about 80 at the floor level because of space limitations and a last-minute change from a planned usage of existing bleachers to portable bleachers. This reduced the total number of seats available so the spectator-athlete overflow was accommodated in the press seating area.

Because the LAOOC had planned for maximum training needs, 17 private training areas with eight-meter by eight-meter tatamis proved more than enough since the need for training space was lessened because some teams had arranged their own training schedules at local clubs. Seven of the training tatamis were set up for the duration of the Games in the first level of the gymnasium and two of those were also used as warm-up areas. The other 10 tatamis were set up on the second level of the gymnasium, overlooking the competition area. On the first few days of competition, these had to be removed each afternoon in order to pull out bleachers in this area, but when training demand fell off sharply, these training tatamis were removed altogether. Twenty-four training tatamis were received from Judogi and the extras were put aside in case spares were needed. The training tatamis had a 250-kilogram density while the competition tatami had a slightly firmer 300-kilogram density.

An Olympic first occurred during the daily weigh-in, when an automatic scale produced a digital tape printout of each competitor's weight on a gummed label that was easily affixed to the athlete's weigh-in form. Weigh-in occurred daily at 0900 and never exceeded one-half hour in duration. At 0800, athletes were allowed to use the official scales for an unofficial weigh-in. All of the athletes who participated in the weigh-in made their weights. Practice scales identical to the official scales were also available to the athletes in the locker room between 14 July and 11 August.

The official draw for the tournament was conducted at 1000 hours on 29 July in the competition hall with participation limited to coaches, team officials and the media. Pictures were taken of the completed board after each weight category was drawn and became extremely valuable when a competitor's name was inadvertently omitted from an approved start list later in the competition. A metal rotating cage with numbered table tennis balls was used to draw the athletes' start positions. As each position was drawn, metal strips with the athletes' names engraved on them were attached to a magnetic competition ladder board.

Three seamstresses at the venue sewed the athlete numbers on the competitors' uniforms.

Sports administration and competition management

Most of judo's space needs were filled by using existing offices, meeting rooms and storage areas. Two dance studios were converted into a press sub-center and an interview room; classrooms were used for technology offices and an IJF hosting room and a locker room was used for the doping control facility. Ten tents and four trailers were brought in to accommodate Food Services, Olympic Family Services, an athlete lounge, telecommunications, staff entry, Materiel Logistics and Spectator Services. Seating for the Olympic Family was severely underestimated and the overflow was accommodated in the original handicapped seating area, where more than enough seating had been planned. Another seating area for the handicapped was set up elsewhere in the arena.

Construction at Eagles' Nest Arena covered a variety of needs. Building the platform for the tatami was of foremost importance, but numerous cosmetic changes were made to the building. Extensive painting was done both inside and outside the gymnasium; all bleachers were reconditioned; additional lighting was permanently installed directly over the field of play; and the spectator entrance was repaved. Although the LAOOC's contracted move-in date was 1 July, a much-needed early access date was granted. This allowed the LAOOC to install security fences and do much of the refurbishing work (painting of walls and reconditioning of bleachers). Some of the other construction tasks at the arena included installing some permanent air-conditioning coils, building a sauna in an equipment room adjacent to the locker room and setting up a public address system between the scorer's table and locker room for call-up of athletes. Portable bleachers supplemented existing bleacher seating and portable air-conditioning units were brought in to provide additional cooling.

82

One construction project that will remain as a permanent reminder of the university's role as an Olympic venue was a large, ceramic mural depicting a variety of Olympic sport scenes. Made up of 7,000 one-foot-square tiles, the nine-ton, 92-foot by 24-foot structure was mounted at the spectator entrance on the west outer wall of the arena.

LAOOC staff at the venue numbered 306 and were supplemented by CSULA concession, maintenance and sound technicians. A dress rehearsal was held 2 August involving every department and function. Bogus tickets were even printed up to train ticket takers. Venue management thought that the realistic rehearsal contributed greatly to the smooth operation of the venue during the Games.

Summary

The 1984 Olympic judo competition attracted sell-out crowds every night to Eagles' Nest Arena at California State University at Los Angeles during the eight days of bouts. The 4,300-seat gymnasium provided spectators with a close, intimate view of the competition, which attracted a record number of athletes and nations.

The competition tatami, provided by Judogi, was elevated on a 75-centimeter-high platform and gave everyone in the arena a better view of the competition. More than enough training tatamis were provided at the venue.

The competition arena received a face-lift as the LAOOC did extensive repainting, reconditioned bleachers and added air-conditioning and lighting. A huge ceramic mural was mounted at the spectator entrance and will remain as a reminder of the 1984 Olympic experience at CSULA.

Modern pentathlon

The LAOOC successfully gave modern pentathlon a separate identity at the 1984 Games by developing a central venue for the sport. Not since the Helsinki Games of 1952 had the modern pentathlon been staged in one location. The decision to hold four of the five modern pentathlon events at Coto de Caza, a scenic resort residential community located 54 miles (87 kilometers) south of Los Angeles in Orange County, resulted in sell-out crowds on each of the four competition days and provided Orange County with a showcase Olympic event. Swimming was held 20 miles (32 kilometers) away in Irvine, California. The alternative would have been to stage the five modern pentathlon events miles apart at the individual sport venues—the riding event at Santa Anita, fencing at Long Beach, swimming at the

University of Southern California, shooting at Prado Park and running at a fifth site. Traveling time to and from these spread-out sites for training and competition would have been a disservice to the athletes.

In a bold step, the LAOOC chose to use a handicap start for the 4,000-meter cross-country running event, so that the winner of that final event would be the 1984 modern pentathlon gold medalist. This system, both from a political and an organizational standpoint, potentially posed serious problems if not carried out with precision. In the handicap system, which had never before been used in an Olympic Games, the runners depart onto the course in the order of the competition standings after four

events. With the competition leader starting at time 0:00, the remaining athletes delay their starts in order of current standing, depending upon the number of points by which they trail the leader.

The decision to use Coto de Caza as the central venue site for modern pentathlon was well-received by the Union Internationale de Pentathlon Moderne et Biathlon (UIPMB). The unique venue was located within a residential community of 600, many of whom volunteered to assist the LAOOC in operating the event. Excellent housing for the athletes and officials was provided there throughout the training and competition periods.

Coto de Caza was easily transformed into an Olympic modern pentathlon venue. An existing equestrian center was utilized for the jumping portion of the competition. Fencing took place in a converted, 27,000-square-foot

83 The resort community of Coto de Caza provides an excellent facility for the multiple disciplines of the modern pentathlon.

covered riding ring. The Heritage Park Aquatic Center in nearby Irvine easily accommodated the swimming event. Coto de Caza's 24-target pistol range was built for Olympic use and the running event took place on Coto de Caza's rolling hills surrounding the equestrian center.

Fifty-two athletes from 18 nations participated in the individual competition, making it the third largest Olympic competition since the sport was introduced in 1912. The contest for the gold medal was close, as the top two finishers entered the running arena side-by-side at the end of the 4000-meter race. Daniele Massala of Italy won the gold medal with 5,469 points, followed by Svante Rasmusson of Sweden who took the silver medal with 5,456 points. Carlo Massullo of Italy captured the bronze medal, finishing with 5,406 points. Italy won its first-ever team gold medal with a point total of 16,060. The United States was second with 15,568 points and France was third at 15,565.

Field of play

By utilizing a central venue, the LAOOC had more flexibility in arranging all training and competition times to best suit the needs of the athletes. The following was the official schedule of major events:

Date	Time	Event
19/7	0800	Technical delegates inspect horses
23/7	1500	Jury of Appeals inspects riding and running courses
24/7	0830	Team representatives inspect horses
27/7	0900	Organizational meeting and draw
29/7	0800	Draw for horses, first round
	0900	Riding competition, first round
	1500	Draw for horses, second round
	1600	Riding competition, second round
30/7	0800	Fencing competition
31/7	0900	Weapons (pistol) inspection
	1400	Swimming competition
1/8	0900	Shooting competition
	1500	Walk-through of running course
	1700	Running competition
	1800	Awards ceremony

Riding

The order of ride for the morning session was determined by a draw at the Technical Meeting on 27 July, while the afternoon line-up was determined by the order in which the horses had competed during the morning round, thereby ensuring each horse an equal rest period. Half of the competitors competed in the morning session and

the other half in the afternoon session. At the start of each session, the athletes and horses were paraded into the arena for the draw for horses, where they faced the spectators in two parallel lines, horses being placed behind the athletes. After the selection process, each competitor received 20 minutes of warm-up time on his horse, according to an exact time schedule, before proceeding to the competition ring.

The jumping course was 600-meters long and contained 18 obstacles including a triple combination, double combination, water jump and a bank. A Swiss Timing scoreboard showed both the competitors' time on the course and penalty points accrued.

Instead of buying or leasing horses, the LAOOC sought individuals who were willing to donate the use of their horses for a four-week period. Horses were selected depending on their suitability for an amateur rider and capability of competing safely over a three-foot, eleven-inch jump. Each donor, before signing an agreement with the LAOOC, was required to fill out an information sheet about their horse describing age, sex and equipment used, as well as veterinary, medical and insurance information. Since the maximum number of athletes allowed to compete in the Olympic modern pentathlon competition is 66, the LAOOC needed to acquire a minimum of 38 horses, based on two athletes per horse plus five reserves. Eighteen horses were brought in for training and 54 were used for schooling over the course. That number was further narrowed to 30 since only 52 athletes actually competed.

Schooling for the competition horses began at the venue four weeks prior to the event. Six schooling riders and two assistants were each assigned nine horses. Horses were jumped and hacked on alternating days, while half the horses received schooling in the morning and the other half in the afternoon. Jumps were set at two feet to two feet, six inches in the beginning and eventually raised, and since most of the horses had not jumped water, ditches or banks before, schooling also focused on these jumps. Horses that proved unsuitable were dropped leaving the LAOOC with 41 horses to show to the Technical Committee.

Fencing

The fencing competition was held in a covered riding ring, which was converted to an air-conditioned fencing hall. Vinyl tarps were hung to form walls and the dirt floor was carefully compacted and leveled. Large tarps were laid over the dirt and then covered with grey carpeting. Temporary bleachers were then installed to seat 2,000 spectators.

The 52 athletes completed 18 rounds of round-robin competition in 12 hours, for an average of 45 minutes per round. Warm-up began 90 minutes before the event began on the nine competition pistes (three more were kept in reserve). The light-weight aluminum pistes were manufactured by International Sports Equipment, Inc., of Southern California. The electronic scoring devices were loaned by the Uhlmann Company of the Federal Republic of Germany. The pistes and scoring equipment were identical to those used at the Olympic fencing competition. A variety of fencing repair equipment was available at a self-help station and four armorers were available to assist repairs and to monitor weapons control.

Twenty-six Federation Internationale d'Escrime (FIE) licensed judges were borrowed from the fencing venue and the LAOOC competition staff recommends that communication be maintained between the two federations prior to the event.

Swimming

The Heritage Park Aquatic Complex was an excellent facility for the swimming event, as the 50-meter pool there had been used for major international competitions in the past. Temporary bleachers increased spectator seating to 4,500, and Swiss Timing equipment was installed, featuring a touch-pad system and a results scoreboard.

The field of 52 athletes was divided into nine sections. Entries were distributed in reverse order of the standings following two events. The bottom four athletes in the standings competed in the first race, and six competed in each of the remaining eight sections with the top six competitors (after two events) placed in the last section. Competitors were allowed to warm up in the competition pool before the first race and a second pool was available to athletes to warm up before the other sections. Each race required about 10 minutes to complete and the entire event lasted approximately 90 minutes. There was a competition staff of 39.

Shooting

The competition pistol range consisted of 24 targets and equipment for the event was purchased from the Spieth Company of the Federal Republic of Germany. The competition and practice ranges were built by Coto de Caza to LAOOC specifications and will remain as part of the Coto de Caza's permanent facilities. Only athletes, along with one coach per athlete and competition officials were allowed within the competition area. Separate areas were provided for UIPMB officials and spectators. The mandatory warm-up range was located immediately adjacent to the competition range and consisted of individual booths and stationary targets. Shade structures were provided for the athletes at both

the competition and practice ranges. The entire pistol range was situated in the southern-most section of Coto de Caza, which also contains skeet and trap ranges. While the pistol range shelter and range equipment were provided by Coto de Caza, targets and other competition equipment were provided by the LAOOC. The LAOOC utilized 57 competition staff members at the site.

Three waves consisting of 17, 17 and 18 athletes, respectively, were necessary for the shooting competition. The athletes within each wave were determined by the competition standings after three events, and by the reverse order of start, so that the top 18 competitors competed in the final wave. The first wave began its warm-up period at 0800 hours on 1 August. At 0850 the first wave was moved as a group to their respective target booths on the competition range. During a ten-minute preparation period, athletes handled their guns and the competition judge inspected the pistols to insure that each met UIPMB rules. The group then fired one series of five rounds as an optional sighting series. Following the scoring of this series, four series of five rounds each were fired for competition, with the targets scored between each series. Spectators followed the scoring sequence through closed circuit televisions monitoring each target. The closed circuit television sets were mounted on the range roof, overlooking the spectator area. After each wave was completed, the athletes were taken back to the weapons security area to return their weapons, and then taken directly to the doping control area for a breathalyzer test.

Firearm security was tight during the Games and safety standards at the range were strictly enforced. No weapons of any kind (guns, arrows or javelins, for example) were allowed inside any of the Olympic villages, though one team mistakenly brought its pistols into a village in violation of the rules. Guns were checked upon arrival at the Los Angeles airport, collected there and transported to Coto de Caza, where 24-hour security was maintained at the storage area. Athletes were allowed to check out weapons only for training and competition, and could not reclaim them until leaving Los Angeles. During the World Modern Pentathlon Junior Championships held at Coto de Caza in 1983, safety standards varied from one delegation to the next. Thus, written safety policies were distributed by the LAOOC to the competitors and range personnel strictly enforced those standards. The LAOOC competition staff recommends that the

Sports Administration and Competition Management

UIPMB distribute a standard set of safety procedures to all participating nations.

Running

The 4,000-meter running course crossed numerous privately owned properties at Coto de Caza. The course was staked and taped on both sides to produce a four-meter-wide lane for the athletes. Swiss Timing provided the necessary electronic timing system, and the federation provided an unofficial points timer for early results and unofficial standings. A scoreboard kept the leading competitor's running time. For the handicapped start, a concentric clock, provided by the U.S. Modern Pentathlon Association, was used to plot the starting times.

The athletes participated in an official walk of the running course two hours prior to the starting time (1700 hours), which was regarded as part of their warm-up. Fifteen minutes before the start, competitors lined up in two lanes-competitors wearing even numbered bibs on one side and those with odd numbers on the other-in correct starting order. Even with the staggered start, all 52 runners were on

the course within 10 minutes, indicating the closeness of the competition going into the final event. All runners were on the course before any finished, and the entire competition was over in 30 minutes.

Members of The Athletic Congress (TAC), the U.S. national governing body for athletics, acted as course monitors and the LAOC utilized 66 volunteers for the competition staff.

Training

A training schedule based on the anticipated arrival dates of each team was created in advance and included some flexibility for early arrivals. For riding, training sessions were scheduled during early-morning and late-afternoon because of the expected warm weather in July. Two teams, comprising eight individuals, were accommodated during each of the four daily training periods. Horses used for training were segregated from those being trained for competition, and all athlete training was limited to

flat work. Training took place in a large corral next to the stable area, which was also used as a warm-up ring for competition. Athletes generally were allowed 45 minutes of training time which was more than adequate for flat work.

Twelve pistes were available for training in the main fencing arena. On several occasions, as many as 10 teams were scheduled during a two-hour period.

For the first week of swimming training, from 14-22 July, a 50-meter pool was made available at El Toro High School, approximately 12 miles from Coto de Caza. During the second week, training moved to the competition pool at the Heritage Park complex where eight lanes were available. One team was assigned to each lane two hours per day.

Shooting training took place at the competition range where the 24 target points accommodated six teams at a time. Shooting and riding sessions were coordinated so that a team could train in both sports on a particular morning or afternoon.

There were no formal training sessions for running, although certain areas were reserved for that purpose.

Athletes were not allowed to train on the competition course, however. All teams' training schedules were flexible enough for athletes to include running training without having to forego training in other sports.

All teams were given equal training time in each sport, and training periods were generally scheduled at the same time of day that the individual sport competitions were planned for.

Sports administration and competition management

Athletes checked into the official athlete villages at USC and UCLA before being transferred to their accommodations in rental guest housing at Coto de Caza. One-hundred and fifty beds in 47 lodges were allocated for athletes, coaches and competition officials at no additional cost to the NOCs. Each team was originally allocated only six beds, but some special requests were

84

85

86 Exhausted competitors finish the modern pentathlon with the cross-country running competition.

86

honored at the last minute. An additional 18 rooms were used to accommodate IF officials, Jury of Appeals members, and Congress delegates. Special rates were made available to the UIPMB and the LAOOC handled all the billing and collection of funds. The LAOOC used several guest rooms for venue management offices, a transportation and athlete information center, doping control and a 24-hour medical office. Other venue space needs were filled by utilizing 31 tents and 11 trailers.

Security fencing was erected around the entire venue at Coto de Caza and at the swimming site as well. Other construction at the venue included temporary bleachers for spectators. Attendance at all the modern pentathlon events was excellent which LAOOC planners credited to the central-venue concept. More than 6,200 spectators witnessed the riding event on the first day; nearly 2,000 attended fencing; 4,500 attended swimming at Heritage Park; and nearly 6,500 attended the shooting and running events on the final day. All-day tickets were sold for the final day's events and hundreds of unexpected spectators showed up to watch the shooting competition in the morning. A picnic area at Coto de Caza was the site of a huge barbeque for the spectators between sessions of the riding event and on the final day.

A fleet of 18 buses shuttled spectators and staff between a large parking lot outside of Coto de Caza and the venue. The buses ran throughout the day and were more than adequate for the venue transportation needs.

While 826 total staff were required to operate the venue, each of the five sports had its own competition staff. The venue service departments such as Transportation and Press Operations served all five sports. The staffing totals are listed below.

Summary

The LAOOC tested two unconventional ideas for the modern pentathlon event and had great success with them. First, a central venue was developed, which was rare in Olympic history. Coto de Caza, a residential community in Orange County, California, was selected as the site for four of the five modern pentathlon events. The LAOOC believes the concept attracted many more spectators than if the five events been held at the respective fencing, swimming, shooting, riding and running venues.

The other bold idea was the use of a handicap start for the running event. This was new to the Olympic Games and it was carried off with the utmost

care and precision to avoid political and logistical problems. The staggered start was highly successful and allowed for a much more exciting finish because the first finisher was the overall modern pentathlon gold medalist. The runners are started on the course based on their standings after the first four events.

Facilities at Coto de Caza were easily adaptable for the modern pentathlon, though the swimming event had to be held 20 miles away in Irvine, California. Athletes and officials were housed in guest lodges at Coto de Caza, a great convenience for training and transportation purposes, considering the venue was located 54 miles south of the athlete village at the University of Southern California (USC). About one-third of the venue staff were Coto de Caza residents and the entire staff was selected well in advance of the Games, in time to stage the World Junior Championships of Modern Pentathlon in 1983. Though that event was not officially an LAOOC-sponsored event, venue management felt it served as an excellent test of the facilities and staff.

Coto de Caza was a unique venue considering it was actually situated within a residential community. But its advantages were many. It provided a scenic backdrop for the modern pentathlon and brought a highly competitive event to Orange County, California. Cooperation from the venue owners and residents was outstanding. And once again, Coto de Caza allowed the LAOOC to give modern pentathlon a separate identity by providing one central venue site.

87

87 The existing facilities at Coto de Caza make its use as an all-in-one venue for the modern pentathlon possible.

88

30.09.16 Shooting

After considering more than 75 locations for the Olympic shooting range, Prado Recreational Area in San Bernardino County was selected in June 1983. Construction began in August 1983 on the 65-acre site and in less than eight months, the ranges, built from scratch, were completed in time for the Inaugural Championships of the Olympic Shooting Range held 9-16 April 1984, a pre-Olympic test competition. The Inaugural Championships provided an excellent staff dress rehearsal and shakedown of the new facilities while allowing shooters to become familiar with the range.

Although the range was ready for the Inaugural Championships, numerous venue improvements needed to be made before the Games, including a major site beautification project. By the time the Olympic villages opened on 14 July, construction at the venue was complete, except for a few Look items. Although the facilities were to be constructed as temporary, the LAOOC donated what was essentially a permanent facility to the San Bernardino County Department of Parks and Recreation on 4 August 1984 and it will remain part of the

recreational facilities there. The LAOOC left behind all buildings, perimeter fencing and range operating equipment. The installations for the competition included the following:

- 50-meter rifle and pistol range
- 25-meter rapid fire pistol range
- 50-meter running game target range
- 10-meter air gun range, enclosed and climate controlled
- Clay target with three Olympic trap trenches and three skeet fields combined

Shooting competition began 29 July and continued through 4 August. Medal ceremonies for the men's free pistol competition were held at noon on the 29th and were the first of the Games. Eleven events were conducted during the seven days of competition, including three first-time events for women. Women had been allowed to compete against men in open events in past Games, but this was the first time individual women's events were scheduled. The new women's events were the sport pistol (25 meters), air rifle (10 meters) and the small-bore standard rifle, three positions (50

meters). A new 10-meter air rifle event was added for men. Two mixed events were conducted, clay target shooting, trap; and clay target shooting, skeet, with 200 targets each.

Because of the new events for women, a record number of athletes participated in the 1984 Games. Ninety-two women competed, compared to six in the 1976 Games, while 448 men competed, the most ever. A total of 68 NOCs were represented. Each NOC was allowed to enter a maximum of 20 competitors, with a limit of two per event. Of the 20 competitors, the maximum number of male competitors per NOC could not exceed 14 and the maximum number of female competitors could not exceed 10. An NOC could enter a maximum of six women for the three women's events and four additional women could be entered in the clay target events. The maximum number of male rifle competitors could not exceed four.

A world record was tied in the men's small-bore rifle while Olympic records were tied, broken or established in eight events. The following are the gold medal results from the 1984 Olympic shooting competition: free pistol, Haifeng Xu (CHN), 566; women's sport pistol, Linda Thom (CAN), 585

89

88 Tools of the trade in the shooting competition include these rifles.

89 Although a permanent range was built, much temporary construction was done at the Prado Recreational Area to prepare for the shooting competition. This partially finished entry tower was augmented by many other Look elements.

(shoot-off); smallbore free rifle, English match, Edward Etzel (USA), 599; women's air rifle, Pat Spurgin (USA), 393; clay target shooting, trap, Luciano Giovannetti (ITA), 192 (shoot-off); running game target, 50-meters, Yuwei Li (CHN), 587; smallbore free rifle, three positions, Malcolm Cooper (GBR), 1,173; women's small-bore rifle, three positions, Xiaoxuan Wu (CHN), 581; rapid-fire pistol, Takeo Kamachi (JPN), 595; men's air rifle, Philippe Heberle (FRA), 589; clay target shooting, skeet, Matthew Dryke (USA), 198.

Field of play

The Olympic Shooting Ranges were located in Chino, California, approximately 65 miles east of Los Angeles. The newly constructed range was located on U.S. Corps of Engineers flood control land that is leased to the San Bernardino County Parks and Recreation Department for outdoor recreational uses. There was no possibility of flooding during the Games, but the Olympic facility was raised in elevation to a level above the seasonal water storage level.

Heat and wind were definite factors during the competition. While morning temperatures averaged near 75 degrees Fahrenheit, daytime high temperatures averaged 89-90 degrees at the site. Wind also increased in the afternoons. Air-conditioning equipment was installed inside the air gun ranges while the 25-meter pistol, running game target and 50-meter rifle ranges had openings between the roof and back walls, allowing breezes to flow through the buildings. Shooters at the skeet and trap ranges, however, could not escape the climate as wind presented problems in controlling the flight of the 'bird' and affected the competitors' ability to hear the target release instructions.

The shooting ranges, venue tents and trailers and adjacent parking facilities covered approximately 30 acres and were surrounded by a security fence. An additional parking lot and a buffer zone located outside the fence completed the 65-acre Olympic Shooting Range complex.

Clay target (skeet and trap)

The clay target ranges consisted of three 90-meter by 300-meter skeet and trap fields, oriented slightly east of North. The ground in front of the ranges was generally level with a slight rise 300 to 400 meters from the range. Two 750-capacity spectator stands were located to the rear of the line of ranges, providing complete visibility. The three ranges were separated by space large enough for two additional skeet fields, eliminating target crossover. A safety fence was installed approximately 15 meters behind the skeet range base chord.

The trap pit interiors were constructed with adequate room to provide a safe working area for trap personnel. Automatic traps provided by the Spieth Company of the Federal Republic of Germany were installed according to UIT specifications.

The courses of fire in both skeet and trap were 200 birds over a three-day period with 75 targets on each of the first two days and 50 on the third. The 1 IO-millimeter diameter by 26-millimeter height clay targets, which were black with orange dome, were manufactured by the White Flyers Company of Texas.

Running game target

Located between the 25-meter pistol and 50-meter rifle and pistol ranges, the running game target consisted of two target units, each equipped with Spieth target carrier mechanisms. The range included a sight-in range to the right of range B with space for two shooters. Ample space for several hundred spectators, shooters and officials was available to the rear of the range. Closed-circuit television showed the shot values to the shooters and spectators at the same time they were being manually displayed on scoring clocks. Earth berms and safety baffles surrounded the range to assure maximum safety.

50-meter and 10-meter rifle, 50-meter pistol

Spieth automatic target changing mechanisms were equipped to handle rifle and pistol targets at the 50-meter range. The prone phase was shot on 200-centimeter by 90-centimeter by 60-centimeter high tables which were folded back for kneeling and standing phases of rifle and for the free pistol event. At the 10-meter indoor range, 35 firing points faced away from the center of the building, allowing the center space to be used by spectators. Spieth electric target carriers could be operated by the shooter during training but were operated by the competition staff during the event.

25-meter pistol

Eight Spieth turning target mechanisms were installed in four double bays at the 25-meter pistol range. The bays were constructed with tunnels providing safe access for separate and safe scoring in each bay. The range was surrounded by earth berms and a concrete wall with overhead baffles.

Each competition was supervised by the governing international jury while more than 400 LAOOC staff members and volunteers conducted the competitions.

The following is a list of targets used during the Games:

Type	Manufacturer/ country	Quantity*
Trap and skeet	White Flyer/ USA	400,000
Running game target	Edelmann/ FRG	18,000
10 m air rifle targets	Edelmann/ FRG	120,000
50 m rifle targets	Edelmann/ FRG	100,000
25 m rapid fire pistol targets	Edelmann/ FRG	10,000
25 m/50 m pistol targets	Edelmann/ FRG	8,000

*Targets ordered for the pre-Olympic event are included in the totals

Training

Training was scheduled from 14-24 July and consisted of a morning open practice session starting at 0900 with an afternoon session at 1300. Practice during this period was open to all athletes with squadding (division of shooters into relays) occurring on a random basis and relay time on a set schedule each day according to each different range needs. The 50-meter range was set up for both free pistol and rifle competitors at the same time. The number of targets for each discipline varied according to demand. All practices during the training period from 25-27 July were scheduled by

90

91

squadding between 0900 and 1700. Equipment inspection and verification was conducted from 14-27 July at the discretion of the team. When not in use during the competition period from 29 July to 4 August, the ranges were available for training.

Equipment control

Since no weapons of any kind (firearms, arrows, javelins, swords) were allowed in the athlete villages, the LAOOC picked up the shooters' equipment as it arrived at the Los Angeles International Airport and transported it to Prado, where 550 metal storage lockers were provided. The athletes were each assigned one or two personal lockers with combination locks. The LAOOC did not unload and store equipment from its airport shuttle vehicle. It was up to the athletes to handle and secure their own equipment at the shooting range.

Arms and equipment control began 23 July and continued through 3 August. All rifles, pistols and special equipment used in the competition

90 Preparations continue to ready the shooting houses for competition.

91 Special equipment as installed to facilitate the shooting competition.

Sports Administration and Competition Management

were inspected and, if passed, given an approval seal. Measuring devices and scales used in the controls of the guns were checked as well.

Upon arrival at the venue each day, athletes were dropped off at the team tent areas where their equipment was stored. Teams were assigned areas within the tents of the athlete preparation area where tables and chairs were available. The athletes moved directly to assigned firing points to set up their equipment prior to the event. Set-up took anywhere from 10 minutes to one hour. Access points to all ranges were secured and athletes did not have to mingle with the spectators. Athletes were notified of their assigned points by team managers 48 hours in advance. The drawing of lots for squadding in skeet, trap, running game target, women's sport pistol and men's rapid fire took place two days before each competition.

The LAOOC provided an equipment service area within the enclosed athlete area, while individual vendors serviced equipment in an area outside the athlete area. Ammunition was available for sale within a secured area.

Sports administration and competition management

At the Inaugural Shoot in April 1984, the venue was staffed and operated as a dress rehearsal for the Games. Shooters fired under Olympic rules and the competition and venue staff tested most venue services including accreditation, access control, security, medical services, ceremonies and press operations. Food service for the staff and athletes was not tested and ticketing and spectator control were not necessary since the public was admitted free. Many lessons were learned from the event and changes made before the Games included addition of safety screens at the 25-meter range, improvement of operating control at the running game target range and addition of shade material to prevent shadows from distorting target visibility.

Pre-Olympic trials for the selection of the U.S. national team were held at the facilities in June 1984 but most of the corrections at the venue were not completed until shortly before the Games.

Summary

Because it had a new facility to design, construct and operate, the LAOOC was able to tailor the Olympic Shooting Ranges to its exact needs. Five covered shooting ranges and a clay target range were constructed at the Prado Recreational Area east of Los Angeles for the Games and will remain as part of the recreation area there.

Three individual women's events and a men's air rifle event were added for 1984 and the skeet and trap shooting events were designated as mixed men's and women's events. At past Games, women were allowed to compete in some open events, provided they qualified for their national team.

A pre-Olympic test event, the Inaugural Championships of the Olympic Shooting Ranges, was held 9-16 April just as the ranges were completed. The Olympic dress rehearsal proved absolutely necessary as numerous construction details were corrected in time for the Games.

While it was indeed difficult to locate an adequate shooting site in the Los Angeles area, the delay caused organizers of the event frustration in the pre-Games period. However, construction of the site was completed in time for the Games and after the Inaugural Shoot, the staff and venue were ready to host a record number of shooters. Range equipment functioned without incident and all competitions went off as scheduled.

93

30.09.17 Swimming

For the first time since the 1960 Games in Rome, the Olympic aquatic sports were held in an outdoor pool.

Swimming, diving and a new Olympic sport, synchronized swimming, were held at the Olympic Swim Stadium on the campus of the University of Southern California (USC). The new pool, built specifically for the 1984 Games with funding from McDonald's Corporation, featured movable bulkheads, an Olympic first.

A separate venue, Pepperdine University in Malibu, California, was used for the water polo competition.

When Los Angeles was awarded the Games in 1979, the organizers knew that there was not a pool in Southern California that would meet Federation Internationale de Natation Amateur

(FINA) requirements for the swimming, diving and synchronized swimming competition and that a new pool complex would have to be built. An announcement was made in August 1980 that McDonald's would provide funding for both the permanent pool facilities and part of the funding for the necessary temporary amenities required for 13,500 spectators, seated in temporary bleachers. Total seating at the venue was 17,105, including media and Olympic Family seating. The LAOOC provided all temporary competition and venue management space needs. Ground breaking ceremonies were held on December 1981, while dedication took place on 7 July 1983. At the first swim meet

held in the new pool on 14 July 1983, Vladimir Salnikov of the USSR set a world record in the 800-meter freestyle. During the Games, 11 world records were broken in 10 events and 38 Olympic records were surpassed, quelling any doubts that the pool was not "fast".

Swimming

Swimming competition helped start off the 1984 Games, with four finals held on the afternoon of 29 July. Competition in the 15 men's and 14 women's events continued daily through 4 August except for 1 August, which was an off day. Preliminary heats began at 0830 every morning. Finals took place every afternoon, beginning at either 1615 or 1700. Total spectator attendance for the 12 swimming sessions was 131, 123.

93 A race begins in the Olympic pool while training continues for divers. Note the athlete support facilities in the tents behind the diving well. Press seating at the Swim Stadium is also shown.

Sports Administration and Competition Management

Each NOC was allowed to enter two competitors in each event and one team in each relay and was allowed to carry a maximum of 31 men and 28 women for the swimming and diving competitions. There were no qualifying standards. Preliminaries and A and B finals were held in all events except the 800 meters, 1,500 meters and relays. Individual competitors and relay teams were seeded for the heats in accordance with the times submitted on the official entry forms by each NOC. A draw was held in cases of identical times.

Sixty-two nations were represented in the Olympic swimming competition, including 513 male and 270 female competitors. Gold medal winners in the men's events were as follows: Ambrose Gaines (USA), 100-meter freestyle, 49.80; Michael Gross (FRG), 200-meter freestyle, 1:47.44; George Dicarolo (USA), 400-meter freestyle, 3:51.23; Michael O'Brien (USA), 1,500-meter freestyle, 15:05.20; Richard Carey (USA), 100-meter backstroke, 55.79; Carey (USA), 200-meter backstroke, 2:00.23; Steve Lundquist (USA), 100-meter breaststroke,

1:01.65; Victor Davis (CAN), 200-meter breaststroke, 2:13.34; Gross (FRG), 100-meter butterfly, 53.08; Jon Sieben (AUS), 200-meter butterfly, 1:57.04; Alex Baumann (CAN), 200-meter individual medley, 2:01.42; Baumann (CAN), 400-meter individual medley, 4:17.41; United States, 4 x 100 meter medley relay, 3:39.30; United States, 4 x 100-meter freestyle relay, 3:19.03; United States, 4 x 200-meter freestyle relay, 7:15.69.

Gold medalists in the women's events included Carrie Steinseifer (USA) and Nancy Hogshead (USA)(tie), 100-meter freestyle, 55.92; Mary Wayte (USA), 200-meter freestyle, 1:59.23; Tiffany Cohen (USA), 400-meter freestyle, 4:07.10; Cohen (USA), 800-meter freestyle, 8:24.95; Theresa Andrews (USA), 100-meter backstroke, 1:02.55; Jolanda De Rover (HOL), 200-meter backstroke, 2:12.38; Petra Van Staveren (HOL), 100-meter breaststroke, 1:09.88; Anne Ottenbrite (CAN), 200-meter breaststroke, 2:30.38; Mary T. Meagher (USA), 100-meter butterfly, 59.26; Meagher (USA), 200-meter butterfly, 2:06.90; Tracy Caulkins (USA), 200-meter individual medley, 2:12.64; Caulkins (USA), 400-meter individual medley, 4:39.24; United States, 4 x 100-meter medley relay, 4:08.34; United States, 4 x 100-meter freestyle relay, 3:43.43.

Diving

Diving competition began the day after swimming finished. Each of the four diving events took two days, beginning with the women's springboard preliminary rounds and finals on 5 and 6 August, followed by the men's springboard on 7 and 8 August, the women's platform on 9 and 10 August and the men's platform on 11 and 12 August. Nearly 132,000 spectators attended the 12 sessions of diving.

The competition order in each of the preliminaries was decided by a draw at 1200 on the day before the event and the 12 best divers after preliminaries advanced to the finals where they competed in reverse order of their total scores. Each NOC was allowed to enter two divers in each event. Forty-seven men and 35 women representing 30 countries competed. Greg Louganis captured both of the men's diving gold medals, with a score of 754.41 in the springboard event and 710.91 in the platform. Canada's Sylvie Bernier won the women's springboard competition with a score of 530.70 while China's Jihong Zhou won the women's platform event with a score of 435.51.

Synchronized swimming

Synchronized swimming made its Olympic debut on 6 August with the preliminaries of the duet competition, beginning at 1000 hours. The figures competition was held 8 August and the duet finals were held 9 August, beginning at 1330 hours. Spectator attendance totaled 42,831 during the competition. In May 1984, a solo competition was added and took place on 12 August. Forty-eight athletes representing 20 countries competed. The United States team of Tracie Ruiz and Candy Costie won the duet competition with a score of 195.584. Ruiz was also the solo gold medalist, scoring 198.467.

Field of play

Construction of the new pool and diving well for the Olympic swimming, synchronized swimming and diving competitions was finished in time for three pre-Olympic events in the summer of 1983. During the bidding and contract award stages, USC explored, with LAOOC assistance, adding bulkheads that would bridge across each end of the pool and form artificial pool ends, to which the timing touch-plates would be attached.

The faces of the 4-foot deep bulkheads are perforated plastic which allowed the wave created by the swimmer to pass through or under the bulkhead

94 A panoramic view of the Olympic Swim Stadium during the Games

94

instead of bouncing off the bulkhead, or in the absence of the bulkhead, the pool wall. With the movable bulkheads in place, the pool length can be adjusted to precisely 50 meters, though the overall length was 52.59 meters (172.667 feet) with a width of 22.885 meters (75.083 feet). Each of the lanes measured 2.489-meters (8 feet, 2 inches) wide. Minimum depth was two meters (6 feet 7 inches) with a maximum depth of 3.962 meters (13 feet). The LAOOC received permission from FINA to install the bulkheads, provided the LAOOC could completely stabilize the bulkheads and survey the pool so that each lane was measured exactly the same. FINA also had to approve the pool depth, which had to be greater at one end to accommodate synchronized swimming.

One of the bulkheads was set at the middle of the pool to create a 30-meter pool for synchronized swimming.

The diving well, measuring 22.885 meters (75.083 feet) square, was constructed just to the east of the competition pool. The minimum depth was established at two meters (six feet, seven inches) with a maximum depth of 5.181 meters (17 feet). Two

1-meter temporary springboards were used for practice. Two 3-meter metal frame springboards and two concrete frame 3-meter springboards were installed along with a diving tower that included 5-meter, 7.5-meter and 10-meter platforms.

The swimming facilities were sited near USC on property they had available and which suited their long-term needs. In retrospect, however, this siting proved to be a handicap when planning the extensive temporary facilities. Diving boards had to be placed on the south side of the diving pool so that the divers faced north, away from the sun. The swimming pool was located on an east-west axis, west of the diving pool, since existing structures at USC prevented any other plan.

Unfortunately, spectators sitting in the bleachers on the south side of the swimming pool were faced with an obstructed view of the diving well. Conversely, seats that were placed on the east side of the diving pool were too far from the swimming pool. As it was, all of the Olympic seating, which was temporary, was placed on the north, south and east sides of the pool complex.

Another result of the orientation of the diving well was that television cameras and judges' stands had to be moved constantly, depending on the time of

day, so they did not look into the sun while viewing the event.

During the swimming competition, the seating of nearly 800 non-competing athletes became a problem. They sat in the bleachers east of the diving well, while Olympic Family members sat in the stands south of the pool at the finish line. A compromise was reached when special tickets were printed and distributed by the federation to the coaches, allowing up to 150 athletes to sit at the finish line each session.

All athletes walked from the USC Village, entering the swim venue at the southeast corner through a special village walkway. Athlete preparation and training facilities were located at the entrance. An all-aluminum, pre-fabricated warm-up pool was installed above-ground to the southeast of the competition area. The 50-meter by 49.40-foot pool (without deck) was six feet, six inches deep. The pool arrived by truck, was welded on-site and erected in approximately 30 days. The pool was heated and lights were installed for night use.

Other facilities in the warm-up area included two shower trailers, temporary toilets, massage and rest tents and an information area. Thirty minutes before his or her scheduled event, the athlete proceeded from the warm-up area to a pre-event holding area located just south of the competition pool. There, the athlete officially checked in and waited to be escorted to the competition pool. A post-event holding tent, media interview area, rinse-off showers, whirlpool and medical facilities were located in the vicinity of the holding area.

The equipment used at the venue for swimming, diving and synchronized swimming was varied and extensive, with items ranging from laundry baskets for the swimmers, warm-up clothing to extra noseplugs, goggles and hand paddles. Essential items included:

Swimming competition equipment

- 10 Competitor racing lanes (Kiefer McNeil, USA)
- 10 starting blocks (Whitten)
- 6 Maxiflex / Durafirm diving boards (Arcadia Air Products, USA)
- 2 Sportflex tower surfaces (Mondo Rubber Company, ITA)
- 10 pace clocks
- 10 large, brass hand-held bells (lap cow bells)

- 2 false start ropes
- 10 lap counters
- 2 (100-foot) steel measuring tapes
- 48 aquatic boards
- 48 pull buoys
- 48 pulling tubes
- 6 red and white backstroke pennants
- 10 sandwich boards, water tolerant, 30 x 40 inches
- 4 split time stopwatches
- 5 pool thermometers (F./C.)
- 16 laundry baskets with design approval
- 20 nose clips
- 10 sets of hand paddles
- 20 pair swim goggles
- 20 (3-foot by 6-foot) exercise mats (for diving)
- 1 Porta-pit with harness (for diving)
- 14 flash cards (for diving)
- 21 sets of flash cards for judges (for synchronized swimming)
- 7 judges stands (for synchronized swimming)
- 75 white deck chairs (with design approval)
- 4 red flags, two-square inches, wood handle
- Tool box, assorted tools
- 4 (50-foot) hoses with power nozzles
- 8 (50-foot) extension cords, grounded
- 36 garment bags
- Synchronized swimming sound equipment included at each training site and competition site were two variable speed cassette decks, two underwater speakers, air speakers, mixer-amplifier, microphone and stopwatch.

Training

Training requirements for swimmers were planned by the LAOOC to include a minimum of two, two-hour sessions a day, based on six athletes per lane at the seven training sites, competition pool and warm-up pool. Because fewer athletes actually participated than there was capacity for, training space was more than adequate. Teams were scheduled on a rotating basis in the competition pool. No training was allowed in the warm-up pool during competition times. Athlete entry was strictly enforced and limited only to those warming up for an approaching race or cooling down after competition. The competition pool was available for open training between competition sessions, but only to athletes competing that day, though this was difficult to enforce.

All pools opened at 0600 each day and closed at 2000.

The divers' training schedule consisted of two 90-minute sessions at one training site and at the competition site. For the synchronized swimmers,

the allocation of training hours varied because few teams requested training prior to 29 July. Two training sites and the competition site were available. The divers were also allowed to train during the preliminary swimming trials. This unique plan was approved by FINA.

Swimming—description of training sites

Location	Description
Barnes Park	20 miles (32 km) from USC-one 50-meter, 6-lane pool
Exposition Park Swim Stadium	.6 miles (1 km) from USC-one 50-meter, 8-lane pool
Olympic Swim Stadium	16 miles (26 km) from UCLA and adjacent to the USC Village-two pools; 50-meter, 8-lane competition pool and 50-meter, B-lane warm-up pool; available during non-competition hours
Roosevelt High School	10 miles (16 km) from USC-one 50-meter, 8-lane pool
Smith Park	20 miles (32 km) from USC-one 50-meter, 8-lane pool
Sunset Canyon Rec. Center	at UCLA Village-one 50-meter, 8-lane pool
Van Nuys/ Sherman Oaks Rec. Center	10 miles (16 km) from UCLA-one 50-meter, 8-lane pool
Verdugo Park Pool	16 miles (26 km) from UCLA-one 50-meter, B-lane pool

Synchronized swimming—description of training sites

Location	Description
Cerritos Olympic Swim Center	35 miles (56 km) from UCLA, 20 miles (32 km) from USC-one indoor 50-meter pool with a depth and configuration nearly identical to the competition pool
Olympic Swim Stadium	16 miles (26 km) from UCLA and adjacent to USC-one pool available from 29 July to 12 August between 1900 and 2000 during non-competition hours
Sunset Canyon Rec. Center	at UCLA-one 50-meter pool

Diving—description of training sites

Location	Description
Industry Hills Swim Center	50 miles (80 km) from UCLA and 35 miles (56 km) from USC-springboard and platform diving facilities available
Olympic Swim Stadium	16 miles (26 km) from UCLA and adjacent to USC-the competition well available for training during non-competition hours

95 Diving proves popular with a huge audience in the Swim Stadium at the University of Southern California.

96

96 Pepperdine University in Malibu, California provides a scenic backdrop for the water polo competition.

The water polo venue

The spectacular view surrounding Pepperdine University made the water polo venue one of the most beautiful of the 1984 Games. The campus, located in the foothills of the Santa Monica Mountains, overlooks the Pacific Ocean.

The Raleigh Runnels Memorial Pool at Pepperdine, constructed in 1975, had to be adapted for Olympic use because it didn't meet FINA specifications for a minimum pool depth of 1.8 meters. This was easily resolved by plugging the drains in the pool gutters and allowing the water to rise to the deck level. The total facilities used at Pepperdine were excellent.

The LAOOC competition staff thought that the use of two separate venues for the aquatic sports relieved scheduling and traffic problems and permitted water polo to gain its own identity. The water polo venue had its own staff, with the exception of the commissioner whose responsibilities covered all aquatic disciplines.

A highly valuable tool in the training and identification of staff and in the testing of the venue facilities was the III FINA Cup, held at Pepperdine in May

1983. It was the first of the LAOOC's 1983 events and gave great impetus to the planning for all of the venues and the various sports competitions held that summer. The event was technically a success, proving for the first time the LAOOC's ability to organize and run an international-class pre-Olympic sports event. However, design and Look features were still in the early planning stages and many of the service departments such as access control, accreditation and ceremonies had problem areas that were pinpointed and resolved in later events.

During the Games, more than 73,000 spectators attended seven days of competition. Forty-two games (six per day) were played beginning with the preliminary rounds on 1-3 August and the championship round on 6-7 and 9-10 August.

Yugoslavia and the United States played to a 5-5 tie in the last game of the tournament on 10 August and both teams finished with four wins, no losses and one tie after the championship round. Yugoslavia won the gold medal on the basis of total goals scored. The Federal Republic of Germany won the bronze medal. Manuel Estiarte of Spain led all scorers in the tournament with 34 goals.

Field of play

The 50-meter by 25-meter competition pool was divided by a decorative canvas screen to create a 30-meter by 20-meter field of play and a shallow warm-up area. The pool depth at the west end of the competition area decreased to four feet which did not meet with FINA regulations. Therefore, the field of play was made one foot shorter than its ideal dimension and the overflow valve was shut off to allow the water in the pool to rise almost to the edge of the deck. Platforms for judges at the edge of the pool were built 18 inches off the deck to keep water from splashing on them. At its normal depth, the pool contained 700,000 gallons (2.65 million liters) of water and was illuminated by 52 flood and deck lights. Extra temporary lighting was provided by the LAOOC. Pool maintenance was provided by Pepperdine staff, under the direction of the LAOOC.

Floating goals and nets were made by the Porter Equipment Company of Chicago, Illinois, and competition balls were Mikasa W 6000.

Water polo competitors had the choice of three training sites. The competition pool was the favorite and teams were scheduled into 90-minute time blocks once a day. The Sunset Canyon Recreation Center 50-meter pool within the UCLA Village was available to all aquatic athletes on a sign-up basis. The Exposition Park Swim

Stadium, a 50-meter pool located just a few minutes away from the USC Village, was available for practice, though time had to be divided between swimming and water polo. Training times at the two off-site pools was between 0600 and 2000 hours each day, beginning 14 July. Twenty Mikasa balls were available at each site.

Sports administration and competition management

A single commissioner had ultimate authority over the four aquatic sports. A carefully planned management system that was tested and developed during the four 1983 events at USC and Pepperdine, functioned extremely well for the 50 ticketed sessions of aquatic sports during the Games. Water polo was assigned its own venue manager and competition director. At USC, one venue manager supervised all venue services and three competition directors directed the competition staffs for swimming, diving and synchronized swimming. During the Games, the commissioner spent most, if not all, of his time at USC, because of the complex integration of the venue and village construction schedules at USC as well as the demanding competition schedule. This required the venue manager at Pepperdine to be self-sufficient in managing the events for water polo.

Recruitment of the 1,568 paid and volunteer staff members at the two venues began before the 1983 pre-Olympic events and was accomplished primarily with volunteers from members of the national governing bodies and local aquatic clubs and service organizations. The staff and management system as well as the facilities were put to a true test at three pre-Olympic events held at the Olympic Swim Stadium and one at Pepperdine.

The key management personnel from each venue met separately once a week starting in November 1982 to determine roles and develop job descriptions for every required job at the venues. They also met and worked with the overall LAOOC management staff to coordinate each venue's needs with the total Olympic picture.

The McDonald's International Swim Meet at USC was held on 14-15 July 1983 and attracted 330 swimmers from 20 countries, including the USSR and the German Democratic Republic. The new pool passed its first test. The

Sports Administration and Competition Management

meet, which was run concurrently with the McDonald's International Diving Invitational, 14-17 July, was covered by some 403 members of the media. More than 750 volunteers assisted the LAOOC staff in staging the two events.

The Sunkist American Cup II for synchronized swimming on 5-7 August at USC drew competitors from 15 nations and 180 members of the media. Over 400 volunteers worked the event.

Since FINA officials and judges were to officiate the competitions during the Games, the LAOOC also attempted to use some of these same individuals for the LA83 events. This helped define the responsibilities between the LAOOC and the federation.

Many of the volunteer job descriptions were developed during the LA83 events and refined before the Games. Some of the key positions at the USC venue developed as follows:

Escort teams of three assisted in the timely entrance and exit of athletes on and off the pool deck during competition. Swimmers were lined up in the order of lane assignments and a lead escort preceded the swimmers in a particular heat onto the deck through the entry gate at the southeast end of the field of play while the trail escort followed the last swimmer (lane eight).

The swimmers were led to their assigned place at the starting blocks at the east end of the pool for introductions by the announcer. After the event, the role of the trail and lead escorts were reversed as the swimmers were led off the pool deck. A badge escort collected and returned the swimmer's Olympic accreditation badges as they entered and exited the field of play.

A personal effects carrier was assigned to each lane to collect a basket of the swimmer's clothes once the gun was fired for the heat. The carrier replaced the full basket with an empty one on the deck for the next heat, but left behind the swimmer's robe or towels on the swimmer's chair. The full basket was taken to the post-event room. Another person monitored the swimmers' belongings in the post-event room and any items not immediately collected by the swimmers were placed in small plastic bags which were sealed and labeled with the proper lane and event number and sent to the athlete services area. Synchronized swimmers and divers left their belongings in the pre-event areas and picked them up there after competition.

Groups of eight deck marshals worked either an 0530 to 1400 shift or a 1330 to 2200 shift during the pre-competition phase. Two persons were assigned to monitor access lanes and equipment at the warm-up pool. At the

competition pool, two marshals were assigned to monitor deck access; two were assigned to monitor traffic, lanes, equipment and schedule on the pool deck; one marshal monitored the diving pool deck access; and one served as a supervisor. During the actual competition phase, the schedule of the deck marshals was as follows:

- 0530 to 1130, six persons scheduled
- 0730 to 1230, six persons scheduled
- 1230 to 1500, four persons scheduled
- 1500 to 1830, six persons scheduled
- 1600 to 1830, six persons scheduled
- 1600 to 2200, four persons scheduled

Deck marshals strictly enforced the rule allowing only athletes involved in competition on a particular day or session into competition and warm-up areas. Open swim training was available in the competition pool between sessions only for those athletes competing that day, and at the Los Angeles Swim Stadium (the 1932 Olympic pool) during competition sessions. A shuttle service operated every five minutes for the Swim

Stadium. Swim coaches were informed, in writing, of these policies when they arrived in Los Angeles.

While staff was being recruited and trained, the design of the temporary facilities for the LA83 events and the Games was taking place. The key design factors at USC were the location and orientation of the competition facilities, spectator access and location of competition support facilities. The competition pool is wedged between a parking structure and McClintock Street, on an east-west axis that dictated that bleachers be placed north and south of the pool. The entire venue incorporated a portion of an existing baseball field at USC, its support building, an intramural field, a football practice field, a surface parking lot and a four-story garage. The site was divided by McClintock Street, a private university road. All ancillary competition and spectator facilities were temporary and supported all three aquatic sports that were held there.

Because of the proximity of the parking structure to the pool, bleachers on the west side of the stadium would have blocked public access and were not constructed. Bleachers, however, were constructed to the north, south and east of the swimming and diving pools. The east bleachers extended 25 feet into McClintock Street. Spectators entered the venue entirely from the west and were seated on the west half

98

97 Turn judges ensure competitor compliance with the rules of swimming, while the band looks on.

98 A diver in action at the Olympic Swim Stadium.

of the bleachers to the south of the pool, and in the bleachers north and east of the pool. Journalists and Olympic Family members entered from the south of the venue and were seated on the eastern half of the southern bleachers near the swimming finish line. Non-competing athletes sat in available seats in the Olympic Family and press sections, and in the seats to the east of the diving pool.

No parking was available for spectators near the venue. Staff parked in the structure west of the venue.

The USC and Pepperdine site plans were arranged so that each major user (spectators, athletes, staff and media) had its own entry, pedestrian circulation system and space.

Construction of the temporary facilities began in May of 1984 and was not completely finished when the villages opened on 14 July. This created gaps in venue security and swimming organizers had to request assistance from the Los Angeles Police Department (LAPD) on the pool deck during swimming practice times. Construction personnel access and delivery of materials to the site also became a security issue until construction was completed and the access control program could be fully implemented. Within one week from the date the village opened, however, the USC swimming complex was 75 percent complete. The week before competition was devoted to making final inspections and installing decorative items.

As soon as competition was completed on 12 August, tear down of the venue began. Within two weeks, the site was almost empty. By 1 September, the USC football practice field had been resodded and a week later 95 percent of the venue was cleared except for the permanent competition pools.

Summary

Two competition venues, both outdoor, were used for the four aquatic sports events. Water polo was held on the beautiful campus of Pepperdine University, overlooking the Pacific Ocean. Swimming, diving and synchronized swimming, a new Olympic sport, were held at the new Olympic Swim Stadium, which was built with funding from the McDonald's Corporation. A garden-like atmosphere was created at the competition sites by planting thousands of flowers and trees and decorating the venues with brightly colored banners. Theme towers were erected at both Pepperdine and USC to mark the spectator entrances.

A single commissioner supervised all four sports, though each sport had its own competition director and each venue, its own venue manager. A volunteer staff was recruited, trained and worked at four pre-Olympic events held at the two venues in 1983. Paid and volunteer staff totaled 1,568 during the Games (excluding contract staff).

The 1983 events included the III FINA Cup for water polo on 7-14 May; the McDonald's International Swim Meet 14-15 July; the McDonald's International Diving Invitational 16-17 July; and the SunKist American Cup II for synchronized swimming 5-7 August. These events provided a true test of the new facilities, an evaluation of personnel and positions and a definition of the responsibilities between FINA and the LAOOC.

During the Games, the schedule of events was carefully coordinated and at least one of the four aquatic sports took place each day of the Games. Most staff at USC were given at least

99

one day off a week. Swimming began 29 July and finished 4 August with a rest day on 1 August. Water polo competition was held 1-3 August, 6-7 August and 9-10 August. Diving began the day after swimming finished and concluded on 12 August. Synchronized swimming was scheduled for 6 August, 8-9 August and 12 August and was coordinated with the diving schedule.

In retrospect, all of the competition facilities worked exceptionally well. At water polo, the water level in the existing pool was not deep enough but was successfully raised. The pool was divided into a warm-up and competition pool through the use of a cleverly designed screen. At USC, 11 world records were set in the new competition pool, which had moveable bulkheads for the first time in the Games. The bulkheads, made of perforated plastic, forced the waves to pass through or under the bulkhead, eliminating wake and making the pool even "faster". One bulkhead was moved to the center of the pool to create a 30-meter by 22.5-meter competition area for synchronized swimming.

Fifty ticketed sessions in 15 days of the four aquatic sports attracted nearly 380,000 spectators and were serviced by more than 1,500 volunteers and paid staff. The volunteers brought with them an unselfish and friendly attitude and provided a lasting impression for the spectators, officials and athletes at the USC and Pepperdine venues.

99 The swimming and diving complex at USC uses many temporary facilities for the Games, including the above-ground training pool at right.

30.09.18 Tennis

The LAOOC reintroduced tennis to the Olympic Games as a demonstration sport in preparation for its status as a medal sport in 1988. Sell-out crowds for every session saw some of the top young tennis players in the world.

Singles competition for 32 male and 32 female athletes was held at the newly built Los Angeles Tennis Center on the campus of the University of California, Los Angeles (UCLA) from 6-11 August. The 7,000-seat stadium (center court seating) was bordered on one side by the athlete village at UCLA and on another side by the gymnastics venue.

Policies governing Olympic medal sports are set forth in the Olympic Charter but do not apply to demonstration sports. Therefore, the LAOOC and the International Tennis Federation (ITF) planned the format for the Olympic tennis competition in Los Angeles. To help solve accreditation and housing issues for athletes and officials, the ITF was treated like an NOC and was responsible for all player entries and Olympic Family lists. The athletes were housed in the UCLA Village and were able to attend Opening and Closing Ceremonies if their national delegations allowed

them. Coaches (accredited as technical advisors) were housed in a nearby college.

Any player born in 1964 or later was eligible to compete, regardless of professional or amateur status. Special medals were designed for the demonstration sports which were similar to the official Olympic medals, with the Cassioli design on one side and tennis athletes on the other.

The umpires and referee were selected by the ITF and the LAOOC-appointed competition director and the referee controlled the matches. There were no incidents for the Jury of Appeals to settle.

Steffi Graf of West Germany defeated Sabrina Goles of Yugoslavia 1-6, 6-3, 6-4 to win the gold medal in the women's single elimination bracket. Raffaella Reggi of Italy and Catherine Tanvier of France each received bronze medals since there was no playoff for third place. Stefan Edberg of Sweden won the men's gold medal by beating Francisco Maciel of Mexico 7-6, 6-1. Jimmy Arias of the United States and Paolo Cane of Italy received bronze medals.

Participants were invited to compete based on the following criteria: 20 players were selected by the ITF from nominations submitted by national associations, four players were selected by the United States Tennis Association, and eight players were selected by the ITF from the 1983 Junior World Rankings. The 36 countries represented in the event were limited to two male and two female athletes, with the exception of the United States, which entered four women and four men.

Field of play

Completed just prior to the Games, the eight-court Los Angeles Tennis Center stadium and clubhouse was funded through private donations raised by UCLA and the Southern California Tennis Association. The Olympic competition used only four of the hard-surface courts and temporary bleachers were raised on the additional courts to bring the seating capacity to 8,700 at center court and 1,000 on court two.

Four courts were utilized during the first three days of competition, two courts the fourth day and one court for the semi-finals and finals on the fifth and sixth days. The concrete courts were treated with a chemical process

called Pacific Pave, and were in excellent shape for the tournament.

Penn tennis balls were furnished for training, warm-up and competition. The *Star in Motion* was printed on the 360 dozen balls ordered for the tournament.

A local sporting goods store provided a racket stringing service to the athletes at no charge and also offered equipment repair, a pro shop service and issued items such as sawdust. The players had a lounge in the clubhouse where EMS terminals, refreshments and a tournament desk were available. The tournament desk volunteers helped participants schedule practice times and generally served as a link to the training site while carrying out the tournament schedule. Athletes could schedule training on the Olympic competition courts or could practice at one of the six courts in the UCLA Village specifically reserved for tennis players. Five more recreational courts were located in the village and the tennis competitors found sufficient court time available.

100 The Los Angeles Tennis Center is a new facility built just before the Games by the University of California, Los Angeles.

101

101 Fans flock into the tennis venue; tennis was a demonstration sport in the 1984 Olympic Games.

Sports administration and competition management

Because a new facility was utilized, the LAOOC did not have to spend any time restoring or upgrading the venue. Early access helped the staff become familiar with the structure because there were no existing tenants at the time. Most of the construction at the venue dealt with installing Look items, erecting temporary bleachers around court two and putting up tents for staff entry, spectator first aid, press operations and food services. Some light standards were removed from the center court seating to reduce obstructed-view seats. Administrative offices were established in the existing two-story clubhouse and a converted storage area. The press sub-center, shared with gymnastics and the village, was located in Ackerman Student Union, approximately 400 yards from the venue. The shared services were a good idea but the location was too far away. However, a press interview tent was set up inside the venue next to the clubhouse. Off-site parking and a shuttle service for staff was shared with gymnastics and the village and the two competition venues shared food service facilities. Nearly 100 staff members worked both gymnastics and tennis under an "umbrella staff" concept. For press operations, food services and technology, the sharing of staff worked well. But the Material Logistics Department should have been separated so efforts at each venue could be concentrated. From a financial and logistical standpoint, the umbrella concept was a good idea. However, staff training schedules, accreditation and sport-specific tasks may have been better served by having separate staff.

For the sport-specific tennis staff, the majority had worked as volunteers at Southern California tennis tournaments and were familiar with the event and their responsibilities. A total of 375 paid and volunteer staff worked at tennis.

Summary

Tennis was awarded demonstration status in 1984 and was highlighted before sell-out crowds at the newly-built Los Angeles Tennis Center.

The LAOOC tournament limited entries to 32 men and 32 women and doubles play was not included. Although tennis organizers thought doubling the number of athletes may have created even more spectator interest, the size of the tournament was sufficient given the constraints of the facility.

The use of a new facility that had already been planned and paid for with private funding helped showcase the tennis event and also precluded making many facility improvements. The location of the tennis venue next to the popular gymnastics venue and UCLA Village helped draw attention to tennis.

102

103

**30.09.19
Volleyball**

More spectators than ever before witnessed the 1984 Olympic volleyball competition, as the Long Beach Convention and Entertainment Center's Main Arena accommodated more than double the seating of any previous Olympic volleyball venue. All matches were held on one court at one site and the 12,033-seat arena was sold out six months before the Games began.

The Long Beach complex was also host to fencing, creating a unique shared-staff situation. Though fencing and volleyball both had their own competition staff, most support departments and venue management were shared. Some facilities were shared as well. The huge Exhibition Hall was used primarily for fencing preliminary bouts and also served as a

102 The Long Beach Arena is covered in festive colors for the volleyball competition.

103 The volleyball tournament includes competition for 10 men's teams and eight women's teams.

warm-up area for both fencing and volleyball. Two volleyball courts were set up in a corner of the hall and temporary walls were built around them in an attempt to keep the noise away from the fencing competition pistes. Spectators used the same lobby entrance for both sports but large pictograms and alert ticket takers prevented confusion. Since venue management was shared, less office space was needed for support operations than if there had been two separate venues.

On the competition side, volleyball action began at 1000 hours on 29 July and went almost nonstop until 11 August. The first ten days of competition were made up of two two-match sessions a day, with men and women competing on opposite days. The women's final match was on 7 August, while men's semi-finals began 8 August with five matches scheduled. A rest day was set for 9 August and men's finals were held 10-11 August.

China emerged from the eight-team women's field with the gold medal, beating the United States 16-14, 15-3 and 15-9 in the final. Japan defeated Peru 13-15, 15-4, 15-7 and 15-10 to take the bronze medal. The U.S. men won the gold medal from a 10-team field, beating Brazil 15-6, 15-6, and 15-7 in the final. Italy beat Canada 15-11, 15-12 and 15-8 for the bronze medal.

Field of play

An innovative approach to building the competition floor proved extremely successful. The surface provided by the BAT Taraflex company was of proven quality but the LAOOC faced the challenge of laying the floor on a wooden basketball court for the first time. Because standard U.S. basketball courts are 66 centimeters narrower than international volleyball competition requirements, the LAOOC construction crew fabricated the necessary addition. A second problem of an eight-centimeter dropoff around the free zone was solved when 60-centimeter-high foam barriers placed around the court perimeter brought attention (by color deviation) to the drop-off and served as a safety buffer as well. The barriers were in small sections and were easily moved to allow competitors and competition personnel to walk on and off the court. A non-porous BAT Taraflex floor was installed, despite the insistence of the Federation Internationale de Volleyball (FIVB) that a porous floor be installed, because insufficient air-conditioning often causes perspiration on non-porous surfaces. The LAOOC knew, however, that the arena's cooling system was excellent and that the "non-porous" Taraflex floor was actually slightly porous. The Taraflex Sport M Orange floor was used on the competition surface with Taraflex Sport M Green 512T flooring installed for the free zone. The orange and green floor surface contrasted with the purple foam barriers surrounding the court, adding to the festive look.

Lighting in the arena had been upgraded by the City of Long Beach in the spring of 1984, but was still unacceptable to the FIVB, although no lighting standards or requirements had ever been set forth by the federation. Prior to competition, the angle of the lights was still too direct and the intensity too great. Each light had to be individually diffused. The decorative ceiling banners helped to further diffuse the total light, but the 47-degree angle of the lights could not be corrected. A fixed angle of 80 to 90 degrees above the court is recommended by the LAOOC.

Communication was initially a problem both for teams warming up for upcoming matches and for individuals warming up during a match. The solutions were easily identified and implemented. Because the team warm-up areas at the Exhibition Hall were so far from the competition arena, closed circuit television screens were installed so teams that were warming up could follow the match that was in progress without running back and forth to the arena. For the competing teams' exercise area, which was just out of audio and visual range of the coaches, a microphone/speaker system was set up between the team benches and the warm-up area.

One thousand volleyballs were ordered from Mikasa of Japan and were divided up between the competition court and the four other training sites. Mikasa also provided air-pressure gauges, manual ball inflation pumps and ball inflation needles. The Senoh Corporation of Tokyo, Japan, provided 25 nets, 22 antennas plus spares, 11 sets of standards, measuring rods, referee stands and special court mops.

Nine courts were used for team training, including the competition court at the Long Beach Arena, but not including the two warm-up courts in the Exhibition Hall. Training was scheduled between 0900 and 1900 each day but the LAOOC volleyball staff thought 1900 to 2100 would have been popular training hours. On 28 July, training began at 0600. An attempt was made to allow teams more than the one-to-two hour training sessions on the competition court, as allowed by FIVB. From 14-27 July, the arena was available for training between 0900 and 1900 hours, providing more than adequate training time for all teams. At the outlying training sites, which offered two courts at each site, teams were allowed to schedule two two-hour sessions a day if they shared a training facility. One site, Los Angeles Valley College, was farther from the villages than any other training site, except Long Beach Arena. It was used very little, causing some crowding at the other sites. Lockers, showers, volleyballs and first aid facilities were available at each location.

Volleyball training sites	Distance from USC/UCLA village
Long Beach Arena	37 km (23 miles) from USC
	51 km (32 miles) from UCLA
Los Angeles Valley College	27 km (17 miles) from UCLA
Los Angeles Trade Technical College	3.2 km (2 miles) from USC
Manual Arts High School	0.5 km (0.3 miles) from USC
Palisades High School	8 km (5 miles) from UCLA

Sports administration and competition management

Space requirements for the competition and venue staff were generally filled by adapting existing offices at the Long Beach facility. The shared venue management staff occupied the meeting room area in the lower level of the Terrace Theater and an elevated hallway overlooking the main spectator lobby while the volleyball competition staff utilized rooms off a concourse encircling the volleyball arena.

The coordination of materiel logistics, construction, spectator services and other support services was crucial because of the complexity and size of the Long Beach Convention and Entertainment Center. For this reason, sharing venue management and support departments with fencing was crucial. Since the LAOOC had contracted with Facilities Management Inc. (FMI) for electricians, stagehands, maintenance personnel and other support services for the entire venue, one central management staff was necessary. Though each sport had its own commissioner, one venue director and two assistants supervised the entire Long Beach venue. Most support departments were shared, though each sport generated specific needs. For this reason, the sharing of staff was not always acceptable to some sport-specific personnel who wanted sport-specific staff.

Volleyball had its own competition staff of 224. This included a statistical crew that provided detailed game and match statistics almost instantly. A small computer was used to compile such statistics as blocks, hitting errors and kills. An operator entered each statistic into the computer during a game as another person called the plays. A third person provided a manual backup. A typist compiled a detailed play-by-play with the help of a caller and a person providing manual backup. The game-by-game statistics were well-received by the world broadcasters but the written press was more interested in the final match statistics. An explanation of the scoring system was provided to the media in English and French to help explain statistics they may not have previously seen. The results management team was required to provide only match scores and line-ups.

Summary

The popularity of volleyball in Southern California helped fill the biggest arena ever to host Olympic volleyball. The arena was part of the massive Long Beach Convention and Entertainment Center, which also served as the site for fencing. Within the facility, the huge Exhibition Hall was able to accommodate fencing preliminaries and volleyball and fencing warm-up areas while fencing finals were held at the Center's Terrace Theater. All volleyball matches were held on one court in the main arena. Because fencing and volleyball shared the venue, venue management and most support staff were shared as well. This shared-staff concept saved space and provided crucial coordination of venue services.

Existing office space filled the volleyball competition staff's needs as well as the office needs of the shared venue management and support staff. Permanent seating for 12,033 was filled to capacity.

A BAT Taraflex non-porous playing surface was installed over a basketball court with great success. Placing the volleyball flooring over the wooden court instead of the traditional concrete base provided a springy surface as opposed to the unyielding cement. An innovative foam-barrier system around the free zone was acclaimed by athletes and medical personnel as an excellent safety device. Lighting in the arena was initially a problem because of the intensity and angle of the individual lights. After the lights were individually diffused, the 47-degree angle was less of a problem, but LAOOC officials recommend an 80-degree angle which should be required by the FIVB.

Competition for the 13 days of men and women's volleyball was intense and sell-out crowds of 12,033 were counted at all of the 24 volleyball sessions.

104

30.09.20 Weightlifting

Newly-built Gersten Pavilion at Loyola Marymount University took on the festive and dramatic look of a true weightlifting hall, with the aid of colorful banners, a center stage and spotlights on the athletes.

Construction of the 63,800-square-foot (5,930-square-meter) facility was completed late in 1981 at a cost of \$4.2 million. Competition took place in the new gymnasium. An older gymnasium adjacent to the new facility was utilized for training. An 11,000-square-foot canvas-covered scaffold structure was erected within a few steps of the competition platform as a warm-up area.

The LAOOC built the lifting platforms for competition, warm-up and training out of hand-selected kiln-dried Douglas Fir lumber, reinforced with iron bars. The four-meter square competition platform was elevated one meter off the Pavilion floor by a 12-meter-square stage. A special backdrop of steel

scaffolding decorated with colorful banners was built behind the lifting platform to hold two scoreboards and two 10-foot by 15-foot closed circuit television screens. The popular television screens showed instant replays of lifts and followed the pre-lift and post-lift action in the warm-up room. Spectators looked on from the right and left of the lifter while seats for the press were located directly in front of the competitors.

One-hundred and eighty-seven athletes from 48 NOCs competed in the 10 weight classes. One weight class was contested on each day of competition from 29 July to 8 August, beginning with lifters up to 52 kilograms and ending with the over 110-kilogram weight class. A rest day was scheduled for 3 August. Competitors were divided into two groups according to their best

qualifying performances. The lifters with the lower qualifying marks were placed in group B, with that session beginning each day at 1400. Those with the better marks competed in group A. The group A sessions began at 1800 hours each evening. An awards ceremony was held at the conclusion of each evening session. Organizers had originally scheduled three sessions per day in certain weights, but group C competitions were unnecessary since the boycott of the Games by the Eastern bloc nations reduced the overall number of competitors.

The following are the gold medal results for weightlifting: up to 52 kg, Zeng Guoqiang (CHN), 235.0; up to 56 kg, Wu Shude (CHN), 267.5; up to 60 kg, Chen Weiqiang (CHN), 282.5; up to 67.5, Yao Jingyuan (CHN), 320.0; up to 75 kg, Karl-Heinz Radschinsky (FRG), 340.0; up to 82.5, Petre Becheru (ROM), 355.0; up to 90 kg, Nicu Vlad (ROM), 392.5; up to 100 kg, Rolf Milser (FRG), 385.0; up to 110 kg, Norberto Oberburger (ITA), 390.0; over 110 kg, Dinko Lukim (AUS), 412.5. Olympic

104 Rolf Milser of the Federal Republic of Germany lifts 217.5 kg in the clean and jerk competition to earn the gold medal in the 100 kg class.

records were broken or tied in the following weight classes: up to 56 kg, Lai Runming (CHN), snatch lift, 125.0 kg (276 lbs), equaled the previous record; up to 90 kg, Vlad's (ROM) total of 392.5 kg (865 lbs), clean and jerk of 172.5 kg (380 lbs), and snatch lift of 220.0 kg (485 lbs), were all Olympic records and in the up to 100 kg class, Vasile Gropa's (ROM), 217.5 kg (480 lbs) lift in the clean and jerk equaled the Olympic record.

Field of play

Great care was taken in the construction of the competition lifting platform. First, two-inch by six-inch by four-meter-plus kiln-dried lumber was hand-selected. Those pieces were laminated together to form one-meter by four-meter sections, which were reinforced by four one-meter by three-fourths-inch iron bars. Each section's top side was sanded before being drilled and doweled for further assembly. The dowels prevented vertical movement between the sections. Seven more iron bars were drilled into place to hold the four sections together. When the platform was completely assembled, it was cut to perfect measurement and sanded. The platform held up beautifully during competition and was sanded every third day to keep it as smooth as possible. The first platform that was built did not hold together when tested 48 hours before the competition, but another company was able to build the competition platform in 18 hours with another 12 hours needed to assemble it at the competition site.

For the 10 warm-up and 24 training three-meter square platforms, two-inch by four-inch by 10-foot lumber was again hand-selected. The pieces were laminated into 10-foot by six-inch sections and then laminated again in two 10-foot by three-foot sections and one 10-foot by four-foot section. The tops were sanded and each section was drilled in five locations for the connecting rods. Also, at the point where the sections were to be joined, slip rings were added to hold the connecting rods in place and to prevent movement between sections, although this didn't work as well as hoped. Unlike the competition platform, the training platform sections were not doweled and the sections tended to move vertically. The three sections were tightly bolted together with five iron rods. The top was sanded again when assembly was complete.

All barbells for competition and training were supplied by the York

Barbell Company of the United States. The following is a list of barbell equipment at the venue:

Other equipment included 82 disc racks, 41 rosin boxes and 41 chalk boxes. The 135 pounds of chalk that was ordered proved to be too much and the 32 pounds of rosin was not enough. Equipment used only at the training and warm-up areas was as follows: 24 pair squat racks, 48 pair lifting blocks, two power racks, two bench presses, two incline presses, two hyperextension benches, four situp boards and six four-foot by eight-foot stretching mats.

Competitors arrived approximately two-and-a-half hours prior to the scheduled start of a session to prepare for the official draw of lots, which determined the order of the weigh-in and the order of the competitors' appearance on the platform. Two hours and 15 minutes before the start of a session, coaches and athletes gathered for the draw. *Sam the Olympic Eagle* weightlifting dolls, which had the lot numbers attached to the bottom of their feet, were selected by each competitor, who were allowed to keep the dolls as souvenirs. Two hours before competition, the official weigh-in began. A scale was provided in a reception area for lifters to check their weight. Athletes were allowed to bring their coach into the weigh-in room and were required to show their Olympic accreditation badges. Athletes were weighed in the nude or at most in briefs. When motionless on the scale for a moment, the scale recorded their bodyweight and produced a digital readout of the exact bodyweight. This weight was then put on the official weigh-in results sheet, along with tentative first attempts in the snatch and the clean and jerk. After the coach or athlete initiated the weigh-in form, the coach was given session badges for the athlete and team officials. These session badges were used as required entry passes for the warm-up area and everyone including LAOOC staff was required to have one in order to enter the warm-up area. Different colored badges were used for each day and session.

105

106

105 Weightlifters train in the Alumni Gymnasium of Loyola Marymount University.

106 This colorful, giant scaffold structure encloses the athlete warm-up area for the weightlifting competition.

Sports Administration and Competition Management

A spacious warm-up area was provided a short distance from the competition platform, complete with 18 individual rest cubicles, 10 warm-up platforms, a sports medicine area, liquid refreshment area and two televisions. The warm-up room was a temporary structure made with steel scaffolding, canvas and a wood floor. Air-conditioning was provided both there and in the competition hall. The only negative aspect of the warm-up room was that the wood floor could not take the constant pounding of weights being dropped and began to bounce and vibrate, requiring daily repair.

Athletes were well taken care of at the training facility, located just to the north of the competition arena. Not only was the gymnasium well-equipped, but athletes, coaches and team officials were provided with a lounge that included a secluded, outdoor pool and whirlpool, sauna and massage tables. The training hall was a converted basketball gymnasium that was carpeted and decorated before the barbells and weights—more than 18,800 pounds worth—were brought in. Each of the 24 10-foot square by 3.5-inch-high lifting platforms was equipped with a 312.5-kilogram barbell set, two squat racks, two weight racks, one chalk box, one rosin box and two chairs. A pair of lifting blocks was available for every other platform. Other equipment at the training area included two vaulting boxes, six stretching mats, four abdominal boards, two hyperextension benches, two free-standing power racks, two bench presses, two incline bench presses and six 177.5-kilogram barbell sets.

The training hall was run by a manager and two assistants. A crew of 20 attendants (10 per shift) maintained and cleaned the platforms after each training session.

Training times for all teams were scheduled on a rotating basis. The designation of platforms was according to size of team. Each team got at least one platform and never had to share a platform with another team. A team that consisted of more than three athletes was given as many as four platforms. If the training hall was not full, teams were allowed to use

empty platforms. Peak training days were 25-27 July, and at least three athletes used the training area every day between 16 July and 8 August. The least popular training session was 0830-1030 hours; the busiest sessions were 1600-1800 and 1830-2000. More staff and equipment was available than needed, but the area was planned with more countries in mind than actually attended. The media was allowed into the training area with 24-hours advance notice and permission.

Sports administration and competition management

Two closed circuit television screens that followed the action of lifters in the warm-up area were extremely popular with the spectators. The screens also showed replays of each lift. The two 10-foot by 15-foot screens were positioned on both sides of a nine-foot-long by five-foot-high scoreboard that indicated athlete name, country, attempt, weight being attempted, time to lift the weight and "good lift/no lift" red and white lights. The scoreboard was highly visible except that the red and white lift lights were too small and not bright enough. Also, the horn that signalled the lifter to lower the weight was not loud enough. A second horn was added by the competition staff. Included on the large backdrop behind the lifting platform was the main scoreboard, showing athlete name, country, bodyweight, all attempts (successful and unsuccessful), best result, total and final placing. The lifters were listed according to the lot numbers they had drawn prior to weigh-in. Information on the board was excellent, but because the board was positioned too high, many spectators could not see it.

A nine-foot by five-foot Swiss Timing scoreboard, identical to the one on stage, informed those in the warm-up area what was happening on stage. Near the scoreboard were three eight-foot tables where the warm-up room expeditors worked. They were in

constant communication with a staff member at the announcer's table and relayed information concerning the order of lifters, the weight to be attempted next and changes to the order of competition, if any. The expeditors were also in contact with the loader leader to relay information on how to ready the bar for each upcoming lifter. Small eight-inch by 12-inch erasable plastic boards were used as attempt cards and laid out in the order of lifting on the tables. A card was prepared for each competitor during the weigh-in and draw and was updated throughout the competition.

A critical area of competition preparation is the loading of the barbell, where a mistake can cost a medal or cause an injury. The LAOOC recruited nine athletic men to be loaders. One was a loader leader, while the rest were divided into two teams. Each team alternated sessions so each could work an equal number of "A" and "B" sessions. The loaders sat just off-stage and were constantly ready during competition. If there was no change of weight between lifters, two loaders adjusted and positioned the barbell. If there was a change, two loaders removed the collars and weights, if needed, and left the stage while two other loaders brought additional or different weights to the barbell, and loaded, adjusted and positioned it. This system was well-rehearsed and the concept of connecting the loader leader with the expeditor in the warm-up area with head-sets prevented delays in the competition. The LAOOC competition staff looked for loaders who were in good physical condition with weightlifting experience. A working knowledge of kilograms was also helpful. Other responsibilities of the loading crew included cleaning and weighing of the weights and barbell before each session in addition to cleaning, sweeping and mopping the platform.

Bleachers for 4,500 spectators were placed on the two sides of the lifting platforms while judges and officials and the media were placed in front of the competition platform. The configuration transformed the arena, built for basketball, into a true weightlifting hall.

Summary

A facility recently built for basketball was successfully converted to an Olympic weightlifting hall at Gersten Pavilion on the Loyola Marymount campus.

The Loyola facilities were able to accommodate the training area while the LAOOC constructed a temporary but pleasant warm-up area adjacent to the competition arena. An added plus

for the athletes who spent long days at the venue was an athlete lounge, complete with an outdoor swimming pool and whirlpool.

The weightlifting organizers provided an added attraction for the spectators when two 10-foot by 15-foot television screens were placed on a scaffold structure behind the weightlifters, and showed instant replays of the lifts as well as action in the warm-up area.

Excellent planning and organization led to a competitive, exciting event and every detail from the selection of the barbell loaders to the construction of the competition platform was meticulously planned.

107

30.09.21 Wrestling

A technically perfect competition will not be the only memory from the 1984 Olympic wrestling events. Competitors and spectators alike will recall a spectacular arena, decorated carefully from top to bottom with color-coordinated competition mats, festive banners and Olympic pictograms. Even the scoreboards were designed with the spectators and competitors in mind. A revolutionary computer-generated call-to-the-mat system was used for the first time.

The arena, part of the Anaheim Convention Center in Anaheim, California, was arranged in a special Olympic configuration that placed 7,200 seats in a tight oval around the three 12-meter by 12-meter octagonal competition mats. Spectators sitting in the first few rows sat just a few feet from the action.

Three competition mats specially colored by the HGB Backstrand Company to match the Olympic Look

were set up on 30-inch-high octagonal-shaped platforms in the convention center's main arena. A light grey carpet was placed around the mats, down the sides of the platforms and over the entire arena floor creating a safe, uncluttered field of play. Other venue space needs were filled by using the 100,000-square-foot North Hall, the 12,000-square-foot Grand Lobby and several other convention rooms and offices.

Preliminaries, group finals and finals were scheduled in the 10 weight classes for the two wrestling styles. Greco-Roman was contested from 30 July through 3 August and freestyle wrestling began 7 August and concluded 11 August. Each weight class required three days of competition, with finals scheduled the third, fourth and fifth days of each wrestling discipline.

Three off days were scheduled between the two styles to accommodate television scheduling. Two sessions were held each day, beginning at 1200 and 1800 hours.

Because of the distance from the

villages to the venue, the Federation Internationale de Lutte Amateur (FILA) made an exception to the rules, and the weigh-ins were held on the morning of each day of competition between 1000 and 1030 hours. The draw was held at 1030, according to the following schedule:

Greco-Roman draw schedule (kg)		
30 July	31 July	1 Aug
48	52	57
62	74	68
90	+100	82
		100

Freestyle draw schedule (kg)		
7 Aug	8 Aug	9 Aug
48	52	57
62	74	68
90	+100	82
		100

107 The wrestling competition at the Anaheim Convention Center features action on three mats simultaneously.

A total of 44 nations were represented at Anaheim. There were 135 wrestlers from 28 countries participating in the Greco-Roman competition and 151 wrestlers from 41 nations competing in the freestyle events. Each NOC was allowed to enter one competitor per weight class, in each style, for a maximum of 20 participants. The overall number of wrestlers was much smaller than anticipated due to the boycott by the Eastern bloc nations. However, the Greco-Roman competition had a high percentage of world championships medalists and recognized world-class performers. The absence of world champions was felt more severely in the freestyle events.

The following gold medal results were recorded in the Greco-Roman competition: 48 kg, Vincenzo Maenza (ITA); 52 kg, Atsuji Miyahara (JPN); 57 kg, Pasquale Passarelli (FRG); 62 kg, Weon-Kee Kim (KOR); 68 kg, Vlado Lisjak (YUG); 74 kg, Jouko Salomaki (FIN); 82 kg, Ion Draica (ROM); 90 kg, Steven Fraser (USA); 100 kg, Vasile Andrei (ROM); + 100 kg, Jeffrey Blatnick (USA).

The gold medal results in the freestyle competition were as follows: 48 kg, Robert Weaver (USA); 52 kg, Saban Trstena (YUG); 57 kg, Hideaki Tomiyama (JPN); 62 kg, Randy Lewis (USA); 68 kg, In-Tak You (KOR); 74 kg, David Schultz (USA); 82 kg, Mark Schultz (USA); 90 kg, Ed Banach (USA); 100 kg, Lou Banach (USA); + 100 kg, Bruce Baumgartner (USA).

Field of play

The three competition mats, each 12 meters (39.37 feet) in diameter were made by the HGB Backstrand company of Sweden. They were colored to coordinate with the Look of the Games. They had a chrome yellow competition zone, a red warning zone and a blue out-of-bounds area. The mats were placed on octagon-shaped platforms, 30-inches high, that were originally tried out at the World Espoirs Freestyle Championships held at the Anaheim Convention Center in August 1983. The 36-inch height of the platforms for the Espoirs meet proved to be too high, making access difficult. Though the competition was not officially sponsored by the LAOOC, it was a good test of the arena facilities. A manual call-to-the-mat system and athlete staging procedures were tested, and many Olympic staffers were identified. Operational plans were modified after the 1983 event, and the wrestling organizers felt the Espoirs meet was an invaluable experience for their pre-Games planning and organization.

Because of the reduced number of competitors during the Games, the LAOOC was able to conduct a higher percentage of the bouts on the center mat (or mat "B") which was better situated for the five host broadcaster television cameras that were centrally

located around the mat. Of the 242 Greco-Roman bouts, 124 took place on the center mat and 121 of the 271 freestyle bouts were contested there. In consideration of the spectators and television, the competition secretariat and the staging officer made an effort to prevent two contestants from the same country from appearing on the platform at the same time. The format of the championship finals was to conduct the bouts for third and fifth places simultaneously on the two outer mats, followed by the championship bout in singular fashion on the center mat. Though this did not conform with usual FILA procedures, the federation was extremely cooperative in approving this minor deviation as it was within the overall competition phase.

Delivery of the contestants to the mats was done through the joint efforts of the staging staff, escorts and announcers. Wrestlers moved to a final warm-up mat located immediately outside the entrance to the arena. If a contestant was late in appearing, staging stewards conducted a search. The final warm-up area was equipped with a 10-meter by 10-meter HGB Backstrand mat and the call-to-the-mat video system and staffed with escorts. The staging chief advised personnel in the warm-up area which bout was next and on which mat. Two escorts assembled the wrestlers and their coaches just inside the arena door, but out of sight of most spectators. Upon cue from the staging chief, the announcer introduced the wrestlers and escorts then led the wrestlers to their proper corners. In general, much of the credit for the orderly progress of the competition can be given to the team of announcers. Working closely with the staging staff, they maintained a timely flow of wrestlers to the mats and kept the spectators informed as to the identity of the contestants, the results of the competition and fine points of the rules and the styles of wrestling.

A revolutionary call-to-the-mat computer-video system was highly acclaimed for its efficiency in displaying current and upcoming bouts and made it very clear which color singlet each contestant would be wearing. This was part of a three-channel television system that allowed wrestlers and staff to follow the action in the main arena. One channel showed the bout currently in progress on a closed circuit system, one showed the host broadcaster network programming (mostly other Olympic events), and one channel showed the call-to-the-mat system. Wrestlers warming up in the North Hall area, for example, were able to keep track of the action at all times.

The call-to-the-mat system itself was a small computer equipped with a color monitor, programmed to include current and upcoming bout information. The television screen was divided into three horizontal bands, the top band for mat "A", the center band for mat "B" and the bottom band for mat "C". Each band was five lines deep, and each line indicated the weight class, country code of the wrestler in red, bout number and country code of the wrestler in blue. The color screen actually indicated red for the corresponding "red" wrestler and blue for the "blue" wrestler. The first line showed the bout on the mat, the second line flashed the bout on deck and the remaining lines displayed the next bouts to follow, in order. As a new bout moved to the mat, the others were scrolled upward and another was added on the bottom line. The system performed without a single flaw, was easy to operate and was easily understood by athletes, officials and coaches of all languages. Twenty-one screens were placed in various locations around the athlete areas in the North Hall, in the warm-up area and in venue management offices.

While the computer-aided call-to-the-mat system worked flawlessly, a separate attempt at using computer assistance was not so successful. A computer program was written to assist in the competition pairings but never functioned effectively. A skilled competition staff was able to manually prepare the pairing summaries within 15 minutes. Pairings were completed and verified within 10 minutes of the close of weigh-ins, and were published by the call-to-the-mat system no less than an hour before each session of competition. The mat schedule followed quickly and hand-drawn programs were delivered immediately to the arena floor for the assignment of officials. All systems were declared "ready to wrestle" an average of 31 minutes prior to each session's starting time. The failure of the computer pairings program was a disappointment because the program was too slow (requiring 40-60 minutes). A lack of coordination of essential information between the program writer and the secretariat led to the collapse of the pairings program. However, the computer program did significantly contribute to the production of weigh-in lists for the next day's competition.

Weigh-in took place each day of competition between 1000 and 1030 hours at the venue. Each weight class was assigned one scale for use throughout the competition. These 10 scales were used only for the official weigh-ins, while two other scales were available in the North Hall near the training center so athletes could check their weights. The official Toledo scales displayed digital readouts in increments of .05 kilograms. The

contestant's actual weight was printed on a tape readout, which would only print when the athlete was completely motionless on the scale. The tape gave absolute evidence of the reading upon the face of the scale. The weighing-in was conducted each day by referee-judges assigned by FILA. They were assisted from the pool of competition timers and scorers. Entry to each scale was controlled by an arrangement of ropes, so that only one contestant was admitted at a time to the scales, after verification of his license and Olympic credentials. Behind each scale was a large display board, with numbered spaces easily visible to athletes, coaches and officials. When a contestant's number was determined in the draw, a label bearing his country code was affixed to the board in the appropriate numbered space. Symbols were attached later to indicate subsequent weigh-ins or elimination from the competition.

Once he was properly weighed in on the first day of competition in his weight class, the athlete was directed to a large bowl to select one of many egg-shaped plastic containers. Sealed within each container was a handkerchief imprinted with the *Star in Motion*, the weight class and an individual number. After making public the number drawn, the athlete was allowed to keep the handkerchief as a souvenir. The "eggs" were identical, unmarked and opaque, and because the numbers were folded inside the handkerchiefs, security of the draw was total. An effort was made to limit the number of eggs in the bowl to the number of wrestlers entered. But because of errors in the entry lists, some numbers occasionally went unclaimed and at the close of the weigh-in, contestants' symbols were moved upward on the display board to fill any vacancies, in accordance with FILA rules. The weigh-in manager was entrusted with the official timepiece, opening and closing the weigh-in period by sounding an air horn. Over the last few minutes he would announce the remaining time and call for countries whose contestants had not yet appeared. Throughout the competition, the weigh-in and draw were problem-free.

Wall charts to announce the pairings were mounted in handsome glass-covered wooden frames. One set of charts was maintained in the spectator lobby and another set in the warm-up area for athletes and coaches. A third set was maintained in the pairings area and was substituted chart-by-chart for those on public display as they were updated. In the tradition of wrestling in the United States, the champions were presented with the wall chart of their

weight class in private after the awards ceremony.

Following each competition, an escort service was provided to reduce the number of people with direct access to the athletes and coaches. One all-purpose group of escorts was very successful in getting the individuals to media interviews, ceremonies and doping control.

Training was available for the wrestlers in the North Hall at the convention center. Six 10-meter by 10-meter mats, individually draped for privacy, six stationary bicycles and two trial scales were located there. This area served primarily as a warm-up area before athletes proceeded to the final warm-up area just outside the arena. Athletes could also train within their respective villages at USC and UCLA. At the USC Village, nine private, partitioned training areas, each equipped with a 10-meter by 10-meter (32.81 feet) HGB Backstrand mat, were available. Six private training areas and mats were available at UCLA. Each team was allowed to use one mat for two hours a day for Greco-Roman and two hours for freestyle competitors. Training dummies of various weights, medical facilities, toilets and Toledo scales were also located at the site. Training areas in the villages were not fully utilized.

Sports administration and competition management

The Anaheim Convention Center was divided into three working areas—the North Hall, the Grand Lobby and the Arena.

The North Hall became a mini day village for the athletes, open daily from 0700 to 2200 hours. LAOOC planners attempted to create a park-like atmosphere in the large, 100,000-square foot area. Fifty carpeted team rooms, two temporary structures for 10 showers, two dry heat saunas for 10 wrestlers, and two whirlpools were just a small part of the total operation. Twenty 24-foot by 25-foot semi-private rooms were assigned to teams, depending on their size. These "A" rooms included a conference table for six, massage table, foot locker and 12 beds. In 30 (12-foot by 28-foot) "B" rooms were conference tables for four, six beds, a footlocker and massage table. The walls of these rooms were constructed of pipe and drape partitions which were eight feet high. Two additional 14-foot by 25-foot hardwall-enclosed private team meeting rooms were available and included a large conference table and chairs.

Complete breakfasts and lunches were served daily in the North Hall for the athletes and their coaches. Athletes could select from a large number of food groups at the buffet-style food area and approximately 210 meals were served twice a day.

The training center was located in the

North Hall, along with doping control, a complete medical facility and the weigh-in area. In addition, the North Hall offered a recreational area with televisions, card tables and ping pong tables. A small area outside between buildings provided some fresh air and sunshine. The North Hall was off-limits to everyone except athletes, coaches and LAOOC staff and was highly secure.

Adjacent to the North Hall was the Grand Lobby (12,000-square feet), used primarily for LAOOC venue management and service departments such as technology, results distribution, protocol and language services. Several large rooms were used for competition management, security, pairings, officials briefing, press operations and interview areas.

The competition secretariat was of vital importance to the smooth operation of the wrestling competition. This person had total responsibility for the flow of information to and from the pairings master, the communications staff, the head officials, the FILA Bureau and the teams. Specific duties included supervision of the computer system, programs, pairings and bout sheets; coordination of weigh-in lists; and consultation with the FILA technical delegation to determine the number of rounds to be wrestled in each weight class for each session, the order of weights to be paired and wrestled and the mat assignment of each group in each weight class.

The bout sheets, drawn to FILA specifications, were bilingual (French and English) and were done in triplicate. The third sheet was separated and delivered to the judge. The second copy remained attached to the mat chairman's score sheet, and his scoring marked through to the second page. At the conclusion of the bout, all three copies were returned to the secretariat. The Swiss Timing computer tape then was attached to the chairman's copy and the two official sheets were filed in the pairings area where the results management team prepared the results for copying and distribution. The unofficial second sheet was delivered to the announcers and copied and distributed to the media for quick results.

The timing-scoring devices by Swiss Timing were exceptional and the down time for the entire competition totaled only four minutes on one mat. Scoreboards provided by Swiss Timing were specially designed with the spectator in mind. A three-sided, three-level letter-digital electronic display board followed the same format as the call-to-the-mat display and showed the country code in the proper color (red or blue) of the

competitors, the bout number, the weight class, points and cautions, bout time and time period for each mat. Scoreboards strategically located on each mat at floor level were provided for the competitors and floor officials. They were also visible to the television cameras. The mat chairman for each mat entered the information for the individual scoreboard at his mat, which was duplicated on the central spectator scoreboard. Each entry and time on the scoreboard was printed on a tape at the control panel and attached later to the official results.

Swiss Timing also provided an electronic official confirmation system, in which the mat chairman or judge awarded a point or caution to a particular athlete by pushing a spring release button on his control panel. The information was instantly illuminated in red or blue from a small box located next to the official.

Each mat was equipped with one official FILA video camera. Two recorders were used on each mat to insure a successful recording. FILA was given a master tape of the entire competition, a tape of all finals and a tape of all protests at the conclusion of the competition. Several protests were decided with the help of the video tapes.

Wrestling organizers planned special entertainment and ceremonies at Anaheim. A live band entered the arena 10 minutes prior to the first match of each session and entertained the spectators and included a version of the Olympic Fanfare. The fanfare followed the procession of the mat officials into the arena two minutes prior to the first match.

Ceremonies platforms were located on the south end of the arena, attached to the "A" platform near the athlete staging area. Prior to each championship match, six trumpeters marched to the center mat and played a fanfare announcing the entrance of the athletes. During the awards presentation following each championship match, the trumpeters again entered the arena and played while the athletes were escorted a short distance to the awards platform. An electronic flag-raising apparatus was located at the north end of the arena.

Summary

An intimate yet dynamic atmosphere was created at the Anaheim Convention Center for the 1984 Greco-Roman and Freestyle Olympic wrestling events. At center-stage were the three competition mats which were colored to match the Olympic Look and placed on octagon-shaped platforms. Gray carpeting on the platforms and floor and strategically placed flowers and plants contributed to the festive atmosphere.

Spectators easily followed all the competition through easy-to-read scoreboards and announcements that detailed the identity of the contestants, the results of the competition and the fine points of the rules and styles of wrestling.

For the athletes and competition staff, a revolutionary call-to-the-mat computer video system bridged the language barrier and kept everyone informed as to which bouts were on deck, which color (red or blue) the competitors would wear and which mats they would compete on. The system worked without a flaw.

The facilities at the convention center provided plenty of space to create an athlete's mini day village. Meals were served twice daily, a recreational area was provided, individual team meeting areas were assigned and a training and warm-up area was established.

The competition arena itself was molded to fit competition needs. Bleachers were arranged in an oval around the three competition platforms and spectators were very close to the mats. The overall effect was that of an entertaining three-ring production, complementing a well-run and highly competitive wrestling event.

**30.09.22
Yachting**

For the first time since the 1956 Games at Melbourne, the Olympic yachting venue was located near other Olympic competition sites. The Long Beach Harbor-adjacent to the fencing and volleyball venue-was the 1984 yachting site and its existing facilities were such that the LAOOC needed only to construct temporary support structures.

The selection of the yachting venue was the LAOOC's first major site agreement and was signed 24 March 1980. The agreement called for the city of Long Beach to provide, at no expense to the LAOOC:

- The physical support facility for the event and all necessary equipment for handling racing boats and support craft
- All public services associated with the boat facilities, including land and water security, traffic control, all emergency services and utilities

In addition, the agreement called for the Southern California Yachting Association (SCYA) to provide at no cost to the LAOOC, all logistical support necessary for the racing activities and

the usual race equipment required for the event. In turn, the LAOOC provided all administrative and technical support including timing, scoring and results and attendant and competitive boat services. The LAOOC also constructed a permanent boat hoist.

The Olympic Harbor consisted of a portion of the Long Beach Downtown Shoreline Marina, including gangways "CC" through "GG" with slips for approximately 350 boats. The only permanent facilities within the area were three shower facilities. The Shoreline Marina was not the site originally specified in the 1980 agreement. At that time, plans for the new marina had not yet been drawn and the

108 Sailors prepare for competition at the Olympic Harbor.

agreement specified use of the Alamitos Bay area of Long Beach. In late summer 1982, construction of the new Long Beach Downtown Shoreline Marina was well underway, however, and the city of Long Beach proposed that the Olympic venue be located there instead of at nearby Alamitos Bay.

Tents and trailers served as the primary space elements, with tents accommodating such services as yacht measurement and repair, food and beverage areas, Olympic Family hosting, media facilities and individual team shelters. Containers were provided for the storage of equipment.

Stabilization of the beach area where the Finn, 470, Flying Dutchman, Tornado and Windglider class boats were stored was accomplished by using artificial turf. The turf minimized blowing sand and was a surface over which yacht trailers could be moved.

Four course circles were laid out for the seven yachting classes, including the International Windglider class, which was new to the Games in 1984. It was the first time four circles had been used at an Olympic Games and more than 40 square miles of total water area were designated as part of the venue. The location of the four racing areas was largely based on the experience gained from three pre-Olympic regattas staged by the Olympic Classes Regattas Organizing Committee (OCROC). The OCROC was made up of five yachting organizations, including the SCYA, and its sole purpose was to stage a series of Olympic training regattas.

The 60 NOC entries for the 1984 Olympic regatta were the most ever in Olympic competition by a wide margin. The addition of the boardsailing event, which had 38 entries, was a large factor in the record turnout. The Finn and 470 classes recorded the next largest number of entries with 28 each. The following is the schedule of key events at the venue:

Key events

10/7		Olympic harbor open for delivery of yachts
14/7		Olympic harbor fully operational
16/7	0900	Measurement schedule draw for Finn spars and sails
	0930	Measurement schedule draw for all other classes except Windglider
19/7	0900	Commence 470 measurement
20/7	0900	Commence measurement of all other classes except Windglider
27/7	1630	Measurement closes
30/7		Practice race
31/7-3/8		First through fourth races
4-5/8		Reserve days
6-8/8		Fifth through seventh races
9-10/8		Reserve days

109

All races were sailed as scheduled and no reserve days were needed to complete the regatta. Gold medal winners were as follows: Russell Coutts (NZL), International Finn, 34.70; Jonathan McKee, Carl Buchan (USA), International Flying Dutchman, 19.70; Luis Doreste, Roberto Molina (ESP), International 470, 33.70; Robbie Haines, Ed Trevelyan, Rod Davis (USA), International Soling, 33.70; Bill Buchan, Steve Erickson (USA), International Star, 29.70; Rex Sellers, Chris Timms (NZL) International Tornado, 14.70; Stephan Van den Berg (HOL), International Windglider, 22.70.

An Olympic boardsailing exhibition (OBE) was held in Santa Barbara, California on 10-11 August to demonstrate three different boardsailing disciplines. As the result of a compromise, only Windsurfer International equipment was used for the demonstration of the freestyle, slalom and a long-distance race. When the boardsailing class was added to the Olympic program, there were only two sailboards which had been recognized as suitable for international class competitions by the IYRU—Windglider, built in the Federal Republic of Germany, and Windsurfer, built in Southern California. The IYRU selected Windglider for use at the Games, but because Windsurfer International held patent rights in the United States and

was unwilling to license the other builder in the U.S., an LAOOC-sponsored compromise was negotiated whereby the Olympic racing class was sailed with Windgliders and the OBE used Windsurfers.

Field of play

The seven yachting classes were raced on four course circles which were divided into the following classes; Windglider on Alpha course; Finns and 470s on Bravo; Solings and Stars on Charlie and Flying Dutchman and Tornado on Delta. The Alpha course was located inside the Long Beach breakwater where the water was flatter but the wind was usually just as strong as at the other three race areas.

The Alpha course marks formed an equilateral triangle and the competitors sailed approximately 9.5 nautical miles in each race. The Bravo and Charlie courses were right angle isosceles triangles. Competitors sailed approximately 11 miles to complete the Bravo course and 13 miles to complete the Charlie course. Delta course was an acute triangle with a 13-nautical mile course planned for the Flying Dutchman class and a 15-nautical mile course planned for the Tornado class. The first and third marks for the Tornados were approximately 200 meters outside the marks for the Flying Dutchman class. The approximate compass bearing from the starting line to the first mark was displayed from the race committee boat located at the start.

109 Extensive temporary facilities converted the Long Beach Downtown Shoreline Marina into the Olympic Harbor.

Original and new marks were inflatable shapes as follows: original marks on Alpha course were orange truncated cones and new marks were orange spheres; at Bravo, original marks were yellow spheres while new marks were orange spheres; for Charlie course, original marks were orange cylinders and new marks were orange cylinders with black horizontal stripes; at Delta area, original marks 1, 2 and 3 (Flying Dutchman) were orange cylinders and original marks 1T, 2T and 3T (Tornado) were orange truncated cones while new marks 1 and 2 were large orange truncated cones, and new mark 1T was a yellow truncated cone and 2T was an orange truncated cone with black vertical stripes.

At all areas except at the start and finish in Alpha area, the port end starting and finishing mark was an orange cone. In Alpha area, the port end starting mark was a staff with an orange flag mounted on a rubber dinghy and the port end finishing mark was an orange flag on a whip.

In each area, the first warning signal was made at 1320 hours, the preparatory signal at 1325 and the starting signal at 1330. Class flags were displayed with their warning signal and lowered one minute before the starting signal. The starting line was between a staff displaying an orange flag on the race committee boat and the starting mark. Before the warning signal for the first class, each yacht sailed on a starboard tack past the stern of the race committee signal boat and was required to hail her national letters, which were then acknowledged by the race committee. The finishing line was between a staff displaying an orange flag on a race committee boat and the finishing mark.

Mark boats were stationed in the vicinity of each mark. At the finish, a mark boat was stationed beyond the finishing line. Each mark boat displayed one of the following distinctive signals:

- Alpha area; blue
- Bravo area; yellow
- Charlie area; green
- Delta area; orange

The Olympic harbor and the body of water encompassing the field of play served as the training site for yachting. While the explanatory brochure had stated that launching from the harbor would not begin until 14 July, venue construction was far enough along that launching was able to commence on 10 July. An estimated 24 NOCs brought 75 tune-up yachts or "trial horses" to Long Beach for training purposes while other NOCs brought or chartered more than 70 coaching boats. All of these yachts and coaching boats were removed from the harbor by 1930

hours on 29 July. The sailors of the tune-up yachts and relatives of the sailors were accredited as team supporters and badged at the venue.

The number of team supporters allowed on the venue at any given moment was limited to one per accredited team member or official.

In all classes except Finn and Windglider, NOCs supplied their own yachts, sails and equipment. Chartered boats were permitted, though arrangements had to be made outside the LAOOC.

In the Finn class, all hulls, centerboards and rudders were supplied by the LAOOC. No alterations were allowed unless in accordance with the measurement regulations. A \$400 refundable deposit was required from each NOC that entered a competitor in the Finn class, plus a \$100 refundable deposit if the competitor wished to use LAOOC-provided spars and sails. Forty International Finn dinghys were purchased from a Midwestern manufacturer. The boats were built during fall and winter of 1983-1984 and were delivered to Long Beach by 1 March 1984. All were fully equipped, including spars and sails. Competitors rated them as the most competitive and equal Finns ever used in the Games.

In the Windglider class, all sailboards and attached equipment were loaned to the LAOOC.

Yacht repair services were arranged for as follows:

- An outside contractor staffed a 10-foot by 40-foot trailer for sail repair. Users were charged for services. The LAOOC applied Alpha letters (the IYRU one or two-letter country codes) to the Finn and Windglider sails at the trailer.
- Five volunteers staffed a 50-foot by 100-foot tent and crews could work on their own boats and rigging, or pay for the LAOOC volunteers to do the work. The LAOOC provided fasteners, screws and bolts.
- Vanguard, Inc., provided two technicians at a 10-foot by 40-foot trailer to handle maintenance of the Finns.
- A local chandlery stocked small boat hardware in a 12-foot by 56-foot trailer, with a rigging loft.
- An inboard and outboard engine repair area accommodated more than 200 various-sized power boats needed on the water for competition, official spectators and press.
- A marine gasoline and diesel service station was located within the secured Olympic harbor. The fuel requirements (more than 35,000 gallons) were paid for by the LAOOC as a gesture of appreciation to the yacht owners that volunteered their boats. The U.S. Coast Guard used the same facility for its requirements.

In addition to the nearly 172 competition vessels at the venue, 94 course boats were used for such

functions as race management, judging, mark set, mark rounding, patrol, rescue and gear boats. An additional 15 performed measurement spot checks on the water. Local yacht owners donated their boats for these purposes and served as skippers of the vessels. As each boat arrived at the Olympic harbor for the first time, it was checked by security and mechanically inspected. Two outboard mechanics worked four hours each day and three inboard mechanics worked five hours per day.

Purpose	Number	Size ranges
Protocol spectator	7	35' to 60'
Official spectator	20	35' to 55'
Press	27	35' to 45'
Photographers	13	12' to 27'
Host television/ Official film	4	20' to 25'

The 20 official spectator boats, each with a capacity of 20 to 30, were available for use by team substitutes and officials, team supporters and off-duty staff on a daily sign-up basis. Coaches, team leaders and alternates had priority and the total number of official spectators served each day was more than 400.

Sign-up for the press and photo boats was coordinated by the venue press chief and her staff. Up to 216 persons could be accommodated on the 27 press boats while approximately 50 photographers were accommodated on the smaller photo boats.

The United States Coast Guard provided security throughout the pre-Games and competition periods. There were nearly 600 reserve and regular officers, enlisted personnel and auxiliary personnel. The protection of athletes and race management officials on the field of play was assured through a process in which a different color security flag was selected each day and flown by all official boats. Only those boats carrying the approved flag were allowed in the course areas. The Coast Guard increased its level of port security to protect Olympic-related vessels-including hospitality ships-

and Olympic-related port facilities. Platforms were also provided for the United States Secret Service and Department of State to carry out their responsibilities when dignitaries were on the water.

The Coast Guard's plans for controlling the public spectator fleet, which had to stay outside the restricted area at 200-300 meters from the field of play, was based on expectations that spectator boats would number in the thousands each race day. This plan proved to be more than adequate as there were seldom more than 200 on any given day.

Sports administration and competition management

The Southern California yachting community was blessed with a wealth of talent and experience in the area of race management. However, it was readily apparent in the early planning stages that a series of Olympic training regattas was essential to the success of the 1984 events. These regattas not only provided training for those people who would be involved in the staging of the Olympic yachting events, but they allowed potential Olympic sailors from around the world a chance to gain experience in the same waters at the same time of year as the Olympic events.

To this end, five organizations came together in the summer of 1980 to organize and stage a series of three pre-Olympic regattas. These groups were the SCYA, the city of Long Beach, Alamitos Bay Yacht Club, the Long Beach Yacht Club and the United States Yacht Racing Union. They formed a group known as the Olympic Classes Regattas Organizing Committee (OCROC). The OCROC put on three successful regattas in the summers of 1981, 1982 and 1983. The conservatively estimated 250,000 volunteer hours worked at those events was a major factor in the successful Olympic regatta.

After the 1982 regatta, the LAOOC decided to move the venue from Alamitos Bay to the Long Beach Downtown Shoreline Marina. Observations made during that regatta led to the development of the Olympic venue site plan for the 1984 Games. The Olympic harbor consisted of the first five gangways of the Long Beach Downtown Shoreline Marina breakwater, a portion of the adjacent beach, two large parking lots and three shower facilities. The site is located within the authority of the California Coastal Commission and permits were required for the staging of both the 1983 regatta and the Olympic regatta.

The most spectacular element of the site was the jetty where the flags of the nations flew on 30-foot flag poles. An LAOOC-financed boat hoist was designed and built under the direction of the city of Long Beach engineer. It is the only item that will remain from the Olympic venue.

110

Twenty-six trailers were installed on the paved parking areas to house all venue operations. Competition facilities were based in tents and trailers. Sixty team tents of various sizes were provided within the venue but were not heavily utilized. A temporary shower and locker area built on a 30-foot by 30-foot concrete deck supplemented the existing shower facilities.

Boats were stored on the beach on trailers and on dollies. The LAOOC provided 29 (40-foot by 8-foot) and 14 (20-foot by 8-foot) international shipping containers for the storage of yachting equipment. Each container was equipped with lockers. The larger teams were assigned their own containers while the smaller teams shared. Eleven teams brought their own containers, many of which contained machine shops and other

built-in equipment. The LAOOC provided electricity to these containers, but not to the LAOOC-supplied containers. Storage for small boat equipment was in individual dock boxes immediately adjacent to each yacht entered.

Approximately 290,000 feet of beach area required stabilization and cover for the storage of the Finn, 470, Flying Dutchman, Tornado and Windglider classes. SuperTurf, Inc., an official LAOOC supplier, sold the LAOOC 165,000 square feet of used SuperTurf, taken from two football fields in the United States. Additional new turf from the company, plus a light synthetic ground cover, was used on the rest of the beach.

111

A 30-foot by 30-foot tent was erected for press operations but was enlarged to original 40-foot by 40-foot specifications to provide adequate work space for the media. Many members of the media used the more extensive press facilities across the street at the Long Beach Convention and Entertainment Center, where fencing and volleyball competition took place. Media access to the yachting venue was limited to the press area, except when they were issued a temporary armband which allowed sixty-minute access to the athlete area. Originally, only 40 armbands were made available but due to a high demand from specialty media, the number was increased to 80.

Measurement of the yachts

All yachts entered in the Olympic regatta were measured in accordance with their class rules and any special rules contained in the brochure "Sailing Instructions and Measurement Regulations" approved by the IYRU in November 1983 and published by the LAOOC in January 1984 and mailed to all NOCs.

An International Yacht Racing Union (IYRU) Measurement Committee of five oversaw the role of the LAOOC Measurement Committee, which consisted of seven international class measurers and was assisted by a staff of 125 during the Games. The Measurement Committee, in cooperation with the official LAOOC supplier, Toledo Scale, developed new weigh-in techniques that achieved new levels of precision in all aspects of yacht and yacht equipment weighing.

110 Boats returning to the harbor after competition.

111 The many yachts at the Olympic Harbor are arrayed against the Long Beach city skyline.

112 Boardsailing competitors compete in the Olympic Games for the first time in 1984.

112

During the three years prior to the Games, the LAOOC Measurement Committee designed, developed and tested the following:

- Rigid sail measurement tables for each class
- Five "A" frames on which to hoist yachts, using electric-powered chain falls during the weighing process
- A Soling dolly which allowed IYRU templates to be applied to the boat to determine if the hull complied with the class rules
- A series of stands and tables to handle Flying Dutchman and Tornado class yachts during measurement

A radically new system of measuring Stars made it possible to measure a Star hull in less than one hour by using go/no-go gauges and optical sighting devices. A hydraulic positioning dolly was used to manipulate the Star hulls over a grid pattern.

An old measurement fixture for the 470 and Finn classes was modified and refurbished to provide for new and more precise application of the 470 class IYRU and Finn class templates.

A draw took place on 16 July at 0900 hours to designate a day and time for the measurement of each yacht. Only the team manager or his delegate and the yacht's crew were allowed to be present at the measurement. All hulls, sails and spars were required to carry the measurement marks, bands, stickers and label prescribed in the class rules.

Before the actual measurement of yachts started, measurement staff began using a sticker system to identify more than 170 practice yachts and team support craft which were allowed on the venue for a period of time prior to the start of the Games. This same system insured the timely removal of all practice and support craft from the venue.

Competition boats were marked with a color-coded, numerical yacht and component sticker identification system, developed to identify the class of yacht, the individual yacht and as many as 12 of its components. The security-proof stickers made changing components impossible and assisted measurers during the on-the-water measurement check.

The Measurement Committee took advantage of state-of-the-art technology in pioneering the use of electronic detection devices to find illegal materials in 1983. In May 1984, the IYRU approved the LAOOC's request to perform "exotic materials testing" at the Games. Four highly skilled volunteers who specialized in non-destructive testing were enlisted for the project. More than 100 spectrographic analysis tests were conducted during the Games, resulting in the discovery of 12 illegal centerboards or rudders, all of which were impounded and replaced by legal components.

During the measurement procedures, 95 hull sail and equipment deficiencies were discovered, though all yachts were measured well within the time allocated. Three yachts were eventually disqualified, causing one country to withdraw its entry and two countries to make other charter arrangements. Despite the fact that each yacht was supposed to have been previously measured and approved by

its class (as evidenced by the certificate submitted with each yacht), few yachts appeared to meet quality standards of measurement specified by the classes and used at these Olympic Games. For example, a yacht which had won its own class world championship twice in recent years had to be rejected, subject to extensive and prolonged modification which was not possible to complete before the close of measurement. The Measurement Committee recommended that the classes review their own measurement procedures on both new and old yachts at national as well as international events. Refresher courses for class measurers and potential measurers were also recommended.

Numerous items of alternative equipment and sails were also measured to replace previously measured items, if needed. Competitors were also assisted in weighing their personal equipment and clothing to meet class rules.

Once competition began, the Measurement Committee handled many replacement or repair items. It also conducted on-the-water checks—checking as many as 20 items per yacht—to make sure the items had been previously approved. For this test, two yachts in each class were randomly selected each morning. Identity of the selected yachts was not revealed to the class measurers until all yachts were at sea and on the starting line. The selected yachts were kept under observation during the race, intercepted after they crossed the finish line and escorted to the measurement dock. Each yacht was kept under close surveillance to prevent any change of gear or jettisoning of illegal equipment. Once ashore, all stickered and stamped items, as well as corrector weight installations, including those previously made and those made for these Games, were verified. Individual contestant and gear weight were checked as well.

A few organizational recommendations were suggested by the Measurement Committee:

- Furnish copies of the preliminary Measurement Regulations six months in advance of the start of measurement.
- Furnish updated copies of Measurement Regulations as part of a "survival" kit for each contestant upon arrival at the venue.
- Team leaders should be at the venue two days prior to the start of measurement to have all questions

answered. Team leaders should also be aware of such items as the schedule and forms for appealing measurement deficiencies, the addition of third compasses on Finns and the use of gloves on Windgliders.

- Charter boat owners should not be allowed to present a yacht for measurement prior to the arrival of a team leader or the contestant.
- Contestants should bring a current measurement certificate, measurement form, royalty receipt information and any and all other certifications specified in the measurement regulations rather than sending them with the entry form. This will prevent loss of documents and allow the Measurement Committee to make proper and legible copies.

A vital communications link among the contestants, their team officials and the LAOOC was formed by the class coordinator's office. They answered questions and requests for information on the average of once every eight minutes and totaled more than 6,400 questions during the Games. Information requests ranged from changes in sailing instructions to requests for pre-measurement decisions and responses were distributed to the contestants via a successful team mailbox system. Daily results were made available at this office as well.

Another special communications service was provided by the United States National Weather Service (NWS), which distributed daily meteorological and oceanographic forecasts and data. The NWS utilized experienced marine specialists and high technology to meet the sensitive requirements of the competitors and venue operators. The service was deemed highly worthwhile and included extensive research on the meteorology of the course area prior to the Games. Full services commenced 19 July and the daily forecast package included hourly forecasts of wind, wind waves and currents, a synopsis, swell forecast, remarks, an outlook for next day, wind data over the past 33 hours and two or three weather charts. A questionnaire was included to get feedback from the participants. Approximately 150 copies of the forecast, in French and English, were distributed each day. Briefings in French and English were conducted each day at 1000 and 1730 hours. Attendance at the 1000 briefings ranged from 65 to 90 but was 10 or fewer at the 1730 briefing. Other services consisted of a training session on 16 July to inform the teams of the weather services available and the

113

meteorology of the area; a briefing at 0800 hours on each competition day for the competition co-directors; consultation services and access to a computer and satellite animation device.

Race management communications at the venue were provided by more than 200 licensed amateur radio operators who received extensive training prior to the Games. These operators proved most valuable, and, if unavailable in future Games, could be replaced by marine and commercial radio operators. The marine VHF channel could be used for race management and commercial UHF for venue management.

Race management at the four circles was provided by a skilled committee which had run the three prior Olympic Classes Regattas in Long Beach. The experience gained in the pre-Olympic regattas also benefited the IYRU jury. Ten members of the international jury of 16 had served on one or more of the OCROC juries during the pre-Olympic

113 Many of the teams use specially outfitted shipping containers to store equipment and make modifications before and during the competitions.

Sports Administration and Competition Management

regattas. During the Games, the jury heard 77 protests, including requests for redress and reopening of hearings.

After the last boat crossed the finish line on each course each day, results were radioed back to two scoring trailers where results were computed both manually and with the aid of the "sailscore" computer system. The computer-generated results were handed to the results management team for copying and distribution. Four reports were generated after each race—preliminary order of finish by class, summary pending protest, unofficial summary and official summary. The unofficial summaries were available within 12 minutes after the last boat crossed the finish line. When possible, results at each mark were radioed in for the press.

Because of protests, five members of the Scoring Committee normally stayed until midnight each race night while the remainder of the committee was released in the early evening.

The Olympic boardsailing exhibition

To demonstrate three of the four disciplines of boardsailing, an Olympic boardsailing exhibition (OBE) was held on East Beach in front of the Cabrillo Pavilion in Santa Barbara, California, on 10–11 August 1984.

Triangle racing took place at the Olympic Harbor on Windgliders as one of the seven classes of Olympic yachting while Windsurfer was used to demonstrate the freestyle competition, slalom competition and a long distance race in the OBE.

Sixteen male and 16 female participants representing nine countries were selected through a series of regional regatta eliminations and were allowed three practice days at the Santa Barbara course before competition began at 0900 on 10 August. Measurement of the boards was scheduled for 1200 on 5 August while a lottery draw and checkout of the boards was held on 6 August.

Five IYRU jurors oversaw the event and 216 LAOOC staff members, mostly volunteers, carried out the venue and competition operations. All support vessels, including those for perimeter control, emergency evacuation, the race committee, shuttles and press were loaned and operated by local volunteers.

Athletes were housed at a local college, which also served as a staff and competitor accreditation and lunch area. A security fence surrounded the venue compound and access to the area was limited to those with accreditation badges. Outside of the venue compound, bleachers were provided for Olympic Family members. Nearly 5,000 spectators watched the competitions on 10 August while an estimated 10,000 attended on 11 August.

Summary

The LAOOC had two primary advantages over organizers of recent Olympic Games. The first was the availability of a venue close to other Olympic competition sites for the first time since 1956. The second was the ability to construct temporary, less expensive facilities.

Four racing circles were established within 40 square miles of water surface on the Pacific Ocean, just off the Long Beach Downtown Shoreline Marina, where venue support facilities were established. Sixty NOCs were represented during the seven days of racing, a record number. Entries for the seven classes, which included a Windglider class for the first time, totaled 172. All races were sailed as scheduled and no reserve days were needed to complete the regatta.

The formation of the OCROC for the specific purpose of organizing three pre-Games regattas was a major factor in the successful staging of the yachting competition during the Games. Out of the Games' total of 1,363 LAOOC staff at the venue, 1,339 were volunteers, many of whom were recruited to work the early regattas.

Measurement of the yachts was thorough and strict, but fair, according to the participants. Management of the race courses was well thought out and carried out with precision and fairness. Finally, the unselfish contribution of the many volunteers was recognized by the IYRU, which dubbed the 1984 competitions as "the smiling Games of L.A."

31

31.01 Area of responsibility

The complex communications and information requirements of an Olympic Games at which 23 sports were contested by more than 7,000 athletes, supported by an organizing staff of more than 50,000, over a 4,500-square mile-area necessitated a heavy reliance on technical means. The LAOOC's use of technology to solve many of the unusual as well as expected challenges of the Games provided new answers to some of the continuing problems which confound organizers of mass events such as an Olympic Games.

Some areas of endeavor were well-recognized before any technology department was formed within the Organizing Committee. Communications via telephone, telecopier and telex would be required, as well as computerized systems to handle financial reporting and Games results. Timing and measuring systems were also recognized as an obvious requirement for operation of the sports. Less obvious requirements were addressed in the development phases; although much equipment and many systems were used at the Games, not every problem was resolved by resorting to technical means. In all, some 13 areas were covered by the Technology Department:

- Data processing, including all computer-based systems
- Electronic information and messaging systems
- Paging and "beeper" systems
- Photocopying
- Radio communications and support
- Results computation, compilation and distribution
- Results publications
- Scoreboards
- Sound reinforcement
- Telecommunications, including telephones, telecopiers and telex
- Timing and measurement
- Video systems, including television and video-display scoreboards
- Word processing

The main aims of the Technology Department were to provide equipment and systems to meet the needs of users that were simple to use, easy to maintain and dependable enough to withstand vigorous use over a very short time period. This goal was reached and surpassed as nearly every system installed was well-received by all user groups and breakdowns were infrequent if they happened at all.

31.02 Development of requirements

A technology adviser joined the LAOOC in 1979 to examine the possibilities for automating some of the ongoing operations of the pre-Games period as well as to begin long-range planning for the Games itself. The major problems presented by an undertaking such as the Olympic Games were examined and, against these constraints, planning began.

The major problems confronting the installation of technical systems centered around the short time frame of the Games: only 16 days. Because of this short "life," Games technology was complicated such that:

- Choice of systems had to be carefully made, allowing for discard of system pieces which might not be finished in time, since the first date of usage was absolute: the opening of the villages and of the Games could not be pushed back to allow further development.
- Installation of all systems had to take place very quickly and would, in the LAOOC's case, be placed in rented facilities which were not suited for housing such systems.
- Testing of systems for load and stress under Olympic conditions might not be possible, yet each system was required to work more or less perfectly upon installation.
- Training time for staff in the operation of the systems would be very short.
- Use by athletes, dignitaries, journalists, officials and others had to be even simpler than for staff, since most of them would learn about the systems from LAOOC staff members.
- Use by people from around the world required not only systems that were simple to use in English, but would be readily understood by individuals speaking almost any language.

A strategy to meet the need for technology against the above parameters was structured in 1980. Guidelines were developed for the growth of the technology area and included seven basic principles:

First, well-known firms in each area of technology would be used to supply equipment, personnel, systems and support. Since each firm would already be established in its field, it would be more capable of delivering equipment. Moreover, manufacturer's accessories and maintenance programs are usually superior to those supplied by others and could better meet the exigencies of a Games-period emergency. This posture was designed to leave the LAOOC in a management role only, which was a much more appropriate function, given its short-term nature.

Second, the LAOOC desired to use the most prestigious and diverse firms available for each functional area, thus minimizing the number of companies involved. This was in line with the Organizing Committee's overall goal of de-commercializing the Games and took advantage of the fact that the more "exposed" a company was by exhibiting a number of its products at the Games, the more committed it would be to ensure the performance of those products.

Third, the top priority was the development of communications between the venues and villages. Systems for communications should be designed with the maximum integration possible and be simply arranged for use by both staff and Olympic Family. This goal was realized more than at any prior Games through the introduction of the Electronic Messaging System.

Fourth, computerization of projects would only be attempted for longer-term requirements, as applications which lasted for only a short period (i.e., the Games period of two to four weeks) were costly and would probably benefit equally from partial automation on small microcomputers. This was the case with many smaller sports-related programs which were used at the venues.

Conversely, the fifth stratagem recognized that the results compilation and distribution function was so massive as to require computerization from the start. Modifying existing systems seemed to be a better choice than starting from the beginning, since the increasing complexity of each sport would doubtlessly require more specialization than previously included in past results systems. These new requirements would tend to focus only on the needs of each sport and less on the integration of each sport into the whole of the Olympic Games system.

Sixth, development of applications for each broad category of technology would be left to the last possible moment, as long as it was clear that the application would be finished in a timely manner. This requirement would ensure that the maximum amount of data would be available from the user in order to alleviate repeated false starts on a particular application, only to find the requirements constantly changing during the development phases.

Finally, testing and refinement of the major systems were considered important. Systems which were absolutely necessary to the conduct of the Games, such as results, would be tested in "live" events during 1983, if not earlier. All computer applications were targeted for completion by January 1984. It was determined that complete automation of related systems, such as results, scoreboards and timing was not necessary, but could be considered, for example, if provided by a single entity.

The earliest planning targeted the results, ticketing and timing systems—each crucial to the operation of the Games—to be developed first. As with all technology functions, it was hoped that a sponsor arrangement could be made to provide the LAOOC the necessary technical means with which to put on the Games, but without having to purchase equipment which would certainly have to be sold afterward at a tremendous loss.

The necessary sponsors were acquired over the next two years and the basic requirements for most of the easily recognized functions were planned during that period. These included the three areas mentioned above, plus telephone and related voice communications planning. New technologies presented themselves as well as new requirements and the areas of display paging, electronic messaging, radio communications and video were either incorporated into the existing plans for various departments or changed the LAOOC's ability to function in certain areas and opened new areas of endeavors for certain departments. As an example, the existence of the Electronic Messaging System (EMS) with its inquiry capabilities against a pre-existing data base set the Press Operations Department into motion to compile a suitably detailed information bank to answer the myriad questions of Olympic journalists. EMS also changed the reporting procedures for many departments which had planned to communicate by telephone during the Games, risking, of course, busy signals and line overloads at peak periods. Instead, many of these departments created formatted reports for the EMS which could be filled out quickly and then transmitted for receipt by a central department's control center.

Although not all of the eight principles of technology management were implemented completely, they did establish the general framework to allow the timely and well-tested development of those systems absolutely necessary to run the Games. In addition, sufficient freedom was left in the development phases to allow the integration of new systems and technologies into the Games and to respond to the requests of other departments which wanted to use technical resources for their own requirements.

1

2

- 1 Swiss Timing's touch pad system registers swimmers' intermediate and final times.
- 2 Runners take off from electronic starting blocks that amplify commands through built-in speakers and contain an automatic false start control device.

31.03 Functional areas of operations

Although the Technology Department began with a single advisor in 1979, it expanded as needed and involved over 3,000 people at the time of the Games, working in four major areas of technology. The LAOOC's full-time technology staff peaked at 83 in the late stages of the pre-Games period.

The first full-time technology staff member, hired in mid-1982, was a manager of data processing. One additional staff member specializing in telecommunications was added later that year. By the middle of 1983, the technology staff had grown to 18 and the major divisions were established. The four major areas of endeavor included data processing, results, telecommunications and television operations. A fifth group was formed late in the pre-Games period, concurrent with the Games Staffing program to assist in the acquisition of short-term volunteer staff to actually work at the Games.

The data processing group was responsible for the planning, development and implementation of the accommodations, accreditation, financial, Games Staffing, personnel scheduling and press dossier systems. In addition, it managed the installation and training programs for individualized personal computer and word processing systems.

The results group handled the entire results process, including event timing, scoreboard displays, compilation and printing of results, results distribution and results publications. Included within this group was the massive photocopying system deployment.

Telecommunications handled the Electronic Messaging System (EMS), Olympic Messaging System (OMS), all paging and radio communications, telephones, telecopiers and telex systems. The responsibility for telephone systems included placement of switchboards and lines for land-based systems and the procurement and allocation of mobile radio telephones and cellular systems.

The television and sound operations group was primarily responsible for liaison with the host broadcaster (ABC) and those foreign broadcasters who had purchased exclusive television rights from the LAOOC. In addition, the group handled all sound reinforcement responsibilities and managed the installation and maintenance of all video systems, including closed-circuit systems within the venues and the video scoreboard at the Los Angeles Memorial Coliseum.

The fifth function was added in February 1984 to handle the recruitment and processing of staff to work during the Games in the technology area.

The structure of the Games staff was determined after successful use of volunteers along with the permanent staff in the LA83 events. Volunteer technology managers and staff were solicited from the Citizens Advisory Commission in early 1983 and those who responded positively entered a lengthy training program. These sessions focused on the operation of the various systems to be used, since each of the venue technology managers would eventually have to train a number of other staff in the operation of each type of technology. After successful events in 1983, the highest-rated volunteers were designated as venue technology managers (VTMS) at various venues and began to recruit their own staffs from among acquaintances and friends. Assistant venue technology managers and supervisors were then placed in a training program similar to the one used for the VTMS in late 1983 and early 1984.

A large number of volunteers were arranged through the local telephone companies, which have a program for veteran employees or recent retirees. These individuals were designated as venue telecommunications managers and staff at each site.

The Technology Department determined that certain sites would not be handled by volunteers, but rather by permanent LAOOC Technology staff members. These sites all had long operating periods and complex installation problems, requiring three to four months of work on each. Included were the three villages, the Biltmore Hotel (headquarters of the IOC during the Games), International Broadcast Center, Main Press Center and Olympic Arrival Center. The assistant VTMS at most of these sites were also permanent staff members, although there was a mix of volunteers in the village technology staffs.

All venue technology managers were required to work full-time for four to six weeks prior to the Games in addition to the competition period. After installation, most sites operated on a two-shift basis from approximately 0800-2400 hours daily. Around-the-clock operations were mounted at the three villages, Main Press Center and Olympic Arrival Center and assistant VTMS generally served as managers of technology operations on the second and third shifts at each. Site organization within the technology group usually included:

- Venue technology manager
- Assistant venue technology manager (one per shift)
- Photocopier/telecopier group, including a manager and assistant manager, plus, at the larger venues, a copy center supervisor and assistants

- Results group, including a manager and assistant manager, plus, at larger venues, a distribution supervisor and assistants
- Scoreboards/Sound/Timing group, including a manager and assistant manager
- Telecommunications group, including a manager and assistant

Each group had an appropriately sized cadre of staff to assist in copying, distributing results, running messages and the like. In all, some 3,000 volunteers and 2,000 sponsor-supplied staff worked at the competition and support sites to provide technology services during the Games period.

A Technology Command Center (TCC) was set up during the Games to provide assistance in major problems during the Games and to receive status reports from the VTMS in the field. The TCC operated on a one-shift basis until early July, when two-shift coverage was begun as the villages, Biltmore Hotel, Main Press Center and Olympic Arrival Center prepared for operations. Beginning on 13 July (one day prior to the opening of the villages), the TCC began continuous operations which lasted through the middle of the Games, when coverage was reduced

to two shifts. An average of four people staffed each shift with an LAOOC technology staff manager in charge of each. During the three weeks before the villages opened and the subsequent two weeks until the competitions began, the Construction and Technology Departments operated a five-person installation coordination center. This group monitored all work by installers, including electricians, sponsor technicians and telephone installers, to ensure that schedules were met, obstacles overcome, and that no interdepartmental disagreements delayed completion.

31.04 Review of systems used

31.04.1 Audio Distribution System (ADS) and Olympic Message System (OMS)

The Audio Distribution System is a product of the International Business Machines (IBM) Corporation which allows the transmission and retrieval of voice messages on audio tape. The ADS allowed users to leave a recorded message by punching buttons on any digital keypad (touchtone-type) telephone according to instructions on the tape. The users identified the intended recipient of the message by punching in the name and then leaving the message, which could be of any length. Messages were retrieved in a similar manner. The system was operated on IBM Series/1 mini-computers.

3

3 The LAOOC's computer ticketing needs are filled by two IBM System/38 computers at the LAOOC Ticket Data Center in downtown Los Angeles.

The ADS was originally installed for use by LAOOC staff in 1983. A large number of commands and instructions came with the system and training classes were held by IBM. For the Games, it was felt that the procedures for leaving and retrieving messages had to be as simple as possible so that incoming athletes and officials would be able to use ADS. The need for simplicity required substantial conversion of the existing ADS software program and the "new" system was known as OMS (Olympic Message System). Ten man-years of effort were required to complete the conversion process.

As created, OMS allowed users to receive voice messages from any digital keypad-type telephone and to send messages to anyone else who was registered within the system. User groups included athletes and officials living in the two Los Angeles villages, presidents, secretaries-general, technical delegates of the International Federations and all members of the International Olympic Committee. The system allowed messages to be left or retrieved in 12 languages: English, French, German, Russian, Spanish, Arabic, Italian, Japanese, Korean, Mandarin, Norwegian and Portuguese. Users were able to obtain the language they desired by keying in a three-digit code for their country.

A total of nine OMS computers were in place for the Games. Three each were placed at the villages at UCLA and USC, one was used for development and testing and two were located at the LAOOC's administrative headquarters in Culver City. One of the machines

located within the LAOOC was also used for development and testing, leaving seven for actual operations. The six units at the villages worked as one (via telephone tie lines) for the users and allowed athletes and officials to leave messages for each other for pick-up at the other village, if desired. Individual registration into the system was done using the LAOOC's accreditation records; because of the many last-minute changes, the registration data had to be corrected constantly in order to be accurate. The system was connected via telephone lines to the main telephone switching unit at each site.

Information on the operation of the system was sent to the National Olympic Committees prior to the arrival of the athletes in Los Angeles. Upon arrival, all athletes (and other potential users) were given postcards in the 12 languages of the OMS which instructed recipients on how to call Los Angeles and leave a message on the system. If the athlete or other user desired, he could write his own message on the postcard and IBM representatives then collected and mailed it.

Once it was installed, the OMS worked very well. OMS units were available around-the-clock for 30 days and activity was recorded during every half hour of the day on each day of

operation. Special kiosks were constructed to draw attention to the OMS and to provide clear instructions for use. Kiosks were placed in heavily populated areas of the village, including the food service areas, housing units, main entrance and in the NOC Service Centers. Additional units were installed at the Olympic Arrival Center and at the Biltmore Hotel for use by IOC and IF members. Kiosks had visual display systems powered by IBM Personal Computers which showed the names of all persons who had messages waiting on the OMS in alphabetical order. Telephones were also part of these kiosks and allowed calls to be made from that point. A videodisc player was included and explained procedures for use in the 12 OMS languages.

Incoming calls were directed to the OMS by the NOCs as long as their offices were open. After that point, calls were forwarded to the village message centers, whose staffs were also trained by IBM to connect the caller to OMS to leave a message. IBM supported the OMS project with 44 training representatives, seven system administrators, 14 couriers/messengers and six kiosk technicians.

Over 60,000 calls to OMS were made by approximately 16,000 users. Reports noted that some athletes used the system over 100 times. In all, over 108,000 minutes of messages were left on the system. The ability to send and receive messages in most of the

world's primary languages was met with tremendous enthusiasm by the athletes, especially. It should be noted that the OMS was the only communications device at the Games that was available for use in languages not employing the Latin character set.

37.04.2 Data processing

A wide scope of data processing was undertaken by the LAOOC and eventually required the use of two IBM System/38 computers, with an attached network of 123 terminals and 58 printers. In addition to these two units which provided the computer firepower for a variety of administrative needs, the LAOOC Ticketing Department utilized two other System/38 computers strictly for ticketing functions. Other computer systems were used outside of the LAOOC to support a few other automated functions of the Organizing Committee.

The acquisition of staff to handle data processing needs began at the LAOOC in mid-1982. One year later, the data processing staff had grown to 15 persons, plus eight contracted and sponsor personnel. Continuous reorganization of the group occurred until June of 1984, when three major

4 Technicians install broadcaster commentary positions at the Rose Bowl.

Technology

groups were established to service the LAOOC's needs through the Games period. These included development, operations and technical support. The development group included a manager, two systems analysts, two technical writers and from seven to ten contracted programmers. The seven members of the operations group included a manager and six operators while the technical support group consisted of a manager, one assistant and two sponsor support personnel. In all, the data processing team totaled 15 LAOOC staff members at the end of the pre-Games period, plus two sponsor support personnel and the contracted programmers.

The development of various systems was extremely fragmented. Systems were developed in response to requests from operating departments for assistance; requirements for each system were tuned to the specific needs of the department serviced, rather than incorporated into a master information-handling network. This was in accord with one of the Technology Department's guiding principles that systems should not be interdependent. Each user had specific, immediate needs that were usually developed at a late stage and insufficient time existed to ascertain all potential uses of the data across all potential department users in the Organizing Committee.

Fortunately, the data processing group did not have to deal with any of the requirements of the ticketing system (handled by the LAOOC's Ticketing Department and IBM support personnel) and the results system (handled by the results group in concert with contracted programmers). In addition, there were a large number of systems which were operated outside of the LAOOC's System/38, but which were set up by the data processing group: project activity and scheduling, two financial systems, a payroll system, and many Personal Computer-based systems.

The project activity and scheduling system integrated time lines for various activities from many departments into master schedules as well as producing a number of reports. This system was used by the LAOOC's Planning Department to forecast and track activities. Although heavily used from August 1981 to November 1982,

the system fell into disfavor because of the tremendous amount of time required to maintain it. Additionally, the level of knowledge required about the specific activities needed to stage the Games was lacking, rendering the tracking function useless. This system was operated at an existing computer service bureau. The earliest financial system was installed in 1980 and was a simple modification to an existing software package. This modified system was then used to support the LAOOC's accounting functions until a more complex financial package was installed in June 1983. Thereafter, the original financial program was used to produce monthly budget reporting. The very large financial system installed in mid-1983 was supplied by Walker Interactive Products, an official supplier to the LAOOC. It controlled and tracked purchase order processing, materiel management including warehousing, accounts payable and accounting information. The "Walker system" required a long installation period and was finally operational in June 1983. The system was run at the computer center of LAOOC sponsor Transamerica. The LAOOC's payroll processing utilized several different groups over time, but finally was handled by Pay-Fone Systems, an official supplier of payroll processing services.

The System/38 operations began in earnest in March 1983, when one System/38 was ordered for installation at the LAOOC's administrative headquarters. A similar unit was used by Ticketing beginning in November 1982. The administrative data processing unit was activated in June 1983 and upgraded continually through early 1984. A second System/38 was lent to Ticketing in May 1984 and a back-up was added for administrative purposes in the same month. Testing of the back-up systems for the System/38 began in June and installation of terminals and data lines to the eight remote operating locations began late in the month. All equipment was removed from the remote sites by the end of August.

As configured for LAOOC use, each of the two System/38s on which the administrative data processing was done included main storage of eight million bytes plus six disk drives each containing 735 million bytes of storage (4.4 billion total). An uninterruptable power supply capable of supplying power for 15 minutes was added as was a one-million watt diesel generator, both to ensure that the computer would not be subject to any kind of power failure. During the Games period, one computer was used for development and testing only and the other powered the remote sites. In all, 181 devices were attached to the System/38 at the peak of usage in the two weeks prior to the Games. The LAOOC's administrative headquarters had 51 terminals and 12 printers, the largest complement of equipment at a

5

6

5 A Canadian athlete checks the Olympic Message System for his messages at one of the athlete villages.

6 LAOOC Systems Analyst Jim Lane checks the progress of the computer badging system.

single site. Other locations with System/38 presence included the four LAOOC staffing centers (eight terminals plus 12 printers), the Uniform Distribution Center (two plus three), the Biltmore Hotel (four plus three), the Main Press Center (16 plus six), Olympic Arrival Center (24 plus eight) and the three villages. There were six terminals and five printers at UCLA, nine terminals and six printers at USC and three of each device at UCSB.

The System/38 supported five major applications: accommodations, accreditation, Games staffing, press dossier and training site scheduling.

The accommodations system was a modification of an existing software system provided by IBM. While the standard version of the program was meant to handle reservations and accounting for a single hotel, modifications were added to allow it to track the 75-plus official hotels and campus residence units which were part of the LAOOC's accommodations inventory. The system allowed for booking of reservations, acceptance of deposits, calculation of balances due and printing of ready-to-mail confirmation notices. Although only a few of the many features of the overall software package were used, no reservations were lost and the room inventory was easily tracked. The accommodations software was first used in August 1983, although modifications continued through October of the same year.

The accreditation system was developed to print accreditation badges and to access code assignment pieces for two-part (staff and contractor) badges. A total of 128,000 badges were produced without substantial difficulty, although 25,000 were voided or cancelled for reasons unrelated to badge processing or printing. Badges for Olympic Family members were produced without incident, although "E"-category badges (media) were printed incorrectly due to a human error which later prevented use of bar code readers on those badges. The late registration of many Olympic Family members also hindered production time, although the system performed flawlessly once the proper data was entered. The major difficulty regarding staff badges was the manual matching process between identification portions of the badges (top half) with the appropriate access code portions (lower half). The system became operable between 15 March and 15 June 1984.

The Games Staffing system was developed to handle the processing requirements for staff. This included collating of application data, matching applicants with job requisitions, placing on the payroll and forwarding the appropriate pay rate, processing the applicant for an accreditation badge, if necessary, and other functions. The program also included numerous recruitment/processing status reports for the benefit of the LAOOC's senior managers. More than any other, this system evolved on a daily basis as the needs were defined and redefined at successive stages of the recruitment process. The Games Staffing system also had the important ability to single out small groups of staff for communications by form letters and to feed selected information to other systems electronically (accreditation, EMS, OMS and payroll) or through print-outs of the data requested (personnel scheduling systems and security checks). Various phases of this system became operative between October 1983 and April 1984.

The press dossier system was designed to meet the needs of the Press Operations Department for the compilation of various pieces of data concerning the news media as gathered from several kinds of accreditation and registration forms. Its most important sections tracked payments for services and the services demanded, especially housing (including preferences for cost and location), insurance and parking passes. The dossier system also provided management reports of numerous types and fed information to other systems such as accreditation, EMS and transportation. This system became operational in January 1984, with additional features added up to 15 March.

The training site scheduling program allowed Sports Department schedulers to book teams into various practice times at various training sites without double-booking or overbooking a site. A common data base of training sites and bookable times was created, which could be filled by schedulers responding to over-the-counter requests from team officials at a village scheduling desk or in response to requests received through the EMS. Because training requirements were a function of many variables, the system allowed the requestor to specify the preferred location, time or other variable and would then display all available choices. The ability to print a team's schedule while the requestor waited on the spot was also included and the information was provided to the LAOOC's athlete transport group as well. Some confusion occurred in the earliest days of use as sites which were used for both competition and training

were double-booked because of their "double" identity in the system. This was quickly resolved and the system was fully effective in meeting the booking needs for athlete training. The athlete training system was delivered in April 1984, but some modifications were made in June.

Other, more minor applications of the System/38 included the printing of ready-to-mail uniform vouchers for staff members, based on the Games Staffing system and an interface to the accreditation system which informed the Electronic Messaging and Olympic Messaging systems of the names and other characteristics of system users.

Overall, the data processing group was successful in the provision of automated processing for its user groups. The most notable difficulties for the group were the short time frames in which it had to develop and deliver a "ready-to-perform" system, based on requirements which were either incomplete or constantly changing. Conversely, the capacity of the System/38 was taxed to its absolute limits for the two weeks prior to the Games and this caused long waits for some users trying to input data into the accreditation and press dossier systems especially; indeed, batch processing jobs were not allowed to be processed from 0800-2000 hours daily because of the heavy use by the remote sites during that period. The hardware provided by IBM worked very well and it was not necessary to use the back-up computer for that purpose. The ease with which the System/38 could be programmed and reprogrammed was a much-appreciated strength in the last weeks and months.

In retrospect, the most important observations regarding the data processing effort included:

- Systems should be kept as simple as possible. The last-minute changes necessary for any reason are easier to apply to a simple system. The acceptable level of simplicity for training is the ability to use the system without any training at all.
- System modifications will continue through the Games if not stopped at a point in time. Frequent meetings with departments requesting data processing services will help to sharpen the needs and will lead to better initial development and fewer

changes. The data processing group finally stopped all changes to all systems one month prior to the Games. It should be noted that automation of many systems can be handled better on smaller-sized microcomputers. In some cases manual operation of systems worked as well as automation on computer.

- Training, procedures and forms surrounding a system are equally as important as the functioning of the system itself and will help—if implemented early—to maximize usefulness of the system when delivered. Moreover, there should also be a manual back-up system for all automated functions as a protection for prolonged downtimes or poorly designed systems which do not perform properly.

Each of these recommendations is set against the basic truth that the short time period of the Games, coupled with the generally short time frames for development, testing and training prior to operations does not lend itself to systems which are operationally unique or technically elegant. The overriding concern must be the satisfaction of the needs of the client group involved so that the overall operation of the Games is either enhanced by data processing automation or at least not held back.

31.04.3 Electronic Messaging System (EMS)

The unquestioned star of the technology systems used at the Games was the Electronic Messaging System introduced by the American Telephone and Telegraph Company (AT&T). The EMS became the principal vehicle for communications and information between sites and serviced the needs of athletes, journalists, officials and the LAOOC staff and management. Its ability to send messages to one or more individuals registered in the system was a quantum improvement in the dependability and efficiency of communications at the Games. In addition, the availability of results and related background information about specific athletes and the Games in general was of great assistance, especially to journalists. The easy-to-use nature of EMS allowed users to participate directly in the communications and information-gathering process and eliminated the need for hundreds of individuals to operate the system for the ultimate users.

The system was defined in November 1982 and a skeletal system was

7

8

7 EMS, the acronym for the Electronic Messaging System, is the principal vehicle for the communication of information throughout the Olympic area.

8 Athletes find EMS terminals readily available in the athlete villages and easy to use

demonstrated at the Meeting of the IOC Executive Board with the NOCs in January 1983. After that, substantial effort was put into the development of the system in both the communications and information sections between February and November 1983. During the LA83 swimming and diving events, the results portion of the system was tested. A test system was installed in the LAOOC's administrative headquarters in Culver City in November and the final version of the system was available at the LAOOC in April 1984. During the Games, EMS terminals and printers were distributed to over 100 sites and included approximately 1,700 terminals and 300 printers of varying sizes and speeds. The basic functions of the EMS were divided into communications and information:

Communications

- Electronic mail
- Notice boards
- Paging
- Telex
- Forms

Information

- Competition results
- Games-wide results
- General information about the Games
- Profiles of athletes, including registration data
- Schedules of the Games and related activities

Electronic mail was the most important feature of the system and set it apart from all other information systems used at prior Games. Users had to identify themselves to the system before being allowed to compose and send messages or to receive messages in their electronic mailbox. Identification to the system (known as "log in") required the typing of the individual's six-digit personal identification number, which was printed on his accreditation badge. In general, the communication functions were only open to those who were accredited for the Games. Following log in, an individual password was required; everyone had an initial password based on their family name, but the system allowed for password changes. About 4,000 password changes were made by a small number of users.

Once identified by the EMS, a logged-in user was able to write messages to anyone else entered in the system (i.e., accredited for the Games), could retrieve and view messages sent to him by someone else, and could reply directly to someone who had sent a message or could forward that message to someone else. The "write mail" function allowed messages to be addressed to up to five people at one time. No limitations existed on the length of message which could be entered. This feature of EMS was used about 250,000 times during the Games period. The "read mail" feature allowed retrieval and viewing of any messages sent to the person logged in and permitted a reply to be sent to the sender of the message without utilizing the "write mail" function. Another option allowed the forwarding of the message to up to five other people who might have interest. Printing was available at any stage. The "read mail" function was very popular and was used about 500,000 times. Experienced users often used the forwarding feature because of the lack of any "carbon copy" capability in making replies. In addition, users who wished to retain their reply in addition to the message sent to them frequently included their own names on the forwarding list, thus adding to their own message queue. A helpful feature was a "return receipt" with messages sent; this provided a notification to the sender (in his message queue) that the message sent had been viewed by the recipient.

Notice boards were electronic bulletin lists which were open to designated groups such as all LAOOC managers, news media, NOC chefs de mission and the like. Users were designated by the LAOOC and each individual could be assigned permission for up to six different notice boards. Differing levels of permission were also assigned, including reading and writing privileges, deletion privileges, and for a few senior LAOOC managers, complete control over deletion of all notices on specific boards. Although some users posted some rather silly notices in the beginning, the notice boards were generally well received. Almost 40,000 notice boards were defined for use, over 38,000 of which were for 217 different LAOOC departments and sub-departments at 179 different site locations; about 200 of these were used. Remaining notice boards numbered about 900 and 330 of these were used. Most boards contained less than ten messages at any one time. The notice board feature was used about 100,000 times.

Paging was unavailable to the great majority of users, but was crucial for those to whom it was available. A combined effort between AT&T and radio/paging sponsor Motorola allowed transmission of pages through the "write mail" function of the EMS. For those who were using the Motorola alphanumeric display paging units, a 40-character message could be transmitted through EMS along with the tone. The primary (and heavy) users were pager-equipped LAOOC staff members numbering almost 3,000. Some pagers were used by members of the media who also found the EMS/pager interface useful. It is probably not an understatement that the Games management concept—decentralized venue authority with centralized departmental, fiscal and security controls—was successful because of the EMS/pager network.

The telex feature was designed to relieve pressure from the telex centers at the various press sub-centers. If a journalist provided the LAOOC with a valid International Telecommunications Union (ITU) card, his card number would be entered in the EMS registration process and permit the transmission of telex messages through the EMS. Message transmission costs were charged against the card number. This feature was not well understood by journalists and did not fulfill its hoped-for function. Technically, however, the interface between the EMS and the telex network performed without difficulty and 418 telex messages were sent.

The EMS network also supported inbound telex traffic and routed the message to the person concerned if the telex message contained the word "EMS" at the beginning and also listed the recipient's Olympic identification number (same as the log in number). Failure to explain this feature clearly to journalists coming to Los Angeles limited its usefulness. Telexes received without any identification for routing were sent to a "dead-letter" mailbox which was reviewed by LAOOC staff and forwarded to the proper party. In total, 3,101 telex messages were received by the EMS during the Games period, most of which were routed to LAOOC staff members. The interface with telex was operative well before the Games, however, and proved very valuable to LAOOC staff to whom telexes were routed automatically in the three months prior to the Games. Almost 6,000 telexes were received by the LAOOC during this pre-Games period.

The other noteworthy communications feature was for ordering services through EMS "forms." Various services were available through this method, including athlete interviews, box lunches at the venues, special transportation and scheduling of training sites. Numerous intra-departmental reports were also compiled through the use of forms. For example, the Press Operations Department required its venue press chiefs to file a daily report describing the provision of services to news media and had a specifically designed form available for that purpose. Use of forms was restricted by the registration information which was provided to the EMS from the LAOOC's accreditation system. Of the 40 forms designed, 11 were available to more than 50,000 users, five were available to more than 5,000 users, five were available to more than 2,000 users and 22 were available to groups of 100 or less. The forms feature of the EMS was requested approximately 15,000 times during the Games period.

The information side of EMS did not require the identification of the user to the system and was thus available to anyone who had access to an EMS terminal. The most-used portion of the information bank was the summary of Olympic results covering all Games competitions and the Olympic Information and Games Schedules module. Both were requested over 150,000 times each, with 120,000 requests made for athlete profile and registration information.

At the competition sites, the EMS terminal screens carried a list of the results produced for that site on that day. Each result was numbered and a user could view the result desired by simply pressing the keys corresponding to the number of the result desired. However, this feature applied to the results of that day only. To examine results of prior days or of sports not taking place at that site, the "complete results" feature had to be used.

The "complete results" feature used a menu of the 23 sports plus summary statistics for selection of the sport and event desired. This menu was shown on the terminal screens at non-competition venues instead of the "today's results" list. Users could enter the number of the sport they were interested in and then determine the specific event and results they wanted. This multiple menu system worked very well and was simple to use. In addition to the raw results, the complete results function also had a summary of the medal winners in each sport and of the records (world and Olympic) set in each sport. In total,

more than 3,000 individual results were received by the EMS through a tie-line with the LAOOC's results computer center. A total of 100 megabytes of storage was required for this information.

The Olympic Information and Games Schedules module contained background data on the organization of the LAOOC, Olympic Arts Festival, Olympic Family, information about past Olympic Games and sport-specific information about the Games. Additional reports were available on weather and on medical matters. The information in the LAOOC section included profiles of the Board of Directors and the members of the senior management, a history of how Los Angeles won the right to stage the Games, financial organization and projections, housing, ticketing, the torch relay, transportation, venues and village profiles and information about the LAOOC's youth programs. The Olympic Arts Festival section reviewed the OAF administrative staff, daily schedules, schedules by discipline, a review of all performing companies and the venues at which performances would be given. The Olympic Family information section provided data on the International Olympic Committee, IOC Sessions from 1892–1984, the International Sports Federations concerned with the Games in Los Angeles as well as the National Olympic Committees.

The Olympic Games information section reviewed past Games sites and participation, eligibility requirements, the events on the program for 1984, medical requirements and the history of the Olympic Oath and torch relay. Sports information included sections on each sport, including the IF concerned, the venue, LAOOC staff members responsible for the conduct of each sport, Olympic and world records, past Games and world championships results, and yearly and all-time best marks lists for those sports concerned. A short review of the facilities and staff at each of the villages was also included. Weather data for prior years and the daily forecast was included in that section and medical reports were kept up to date through the medical information section.

The Olympic Information section was compiled and input by the Press Operations Department. Storage required for this module totaled 25 megabytes.

The profiles of athletes were also compiled by Press Operations and included statistical data on athletes who had placed in the top eight in Olympic Games events from 1972–1980, in the top eight at world championships from 1972–1983 and in the top three at regional championships from 1972–1983. Individuals who set world records were also noted. Over 2,400 biographies were compiled and entered into the system. These historical profiles complemented the registration data which was also available in the system, as drawn from the athlete registration forms processed by the Sports Department and input into the results system. The information used was then transmitted from the results system to the EMS. Athlete registration data included name, country, event, height, weight, date of birth, athlete number, jersey number (if applicable) and best qualifying performances. Registration data was available on nearly every athlete. The athlete profile group, including athlete registration data, consumed 75 megabytes.

The EMS itself was housed in 14 AT&T 3B20S computers, 12 of which were used for the application programs and communications with the EMS terminals and printers. The other two computers provided system monitoring and external interfaces. Communications was provided through a series of statistical multiplexers connected to more than 200 digital and analog data lines. EMS software required about 75,000 lines of source code. As had been expected from the initial concept of the EMS, it had to respond to the needs of about 100,000 users. This required 500 megabytes of storage and the user data base was replicated on each computer. The user mailboxes and notice boards together required about 600 megabytes of storage. In all, some 3,000,000 messages were sent during the Games period.

The EMS provided the communications bridge which overcame the massive difficulties foreseen in operating an Olympic Games as widely dispersed as those in Los Angeles. With its multi-functional abilities, it provided a one-stop communications network and tool for communications, information and paging. The response to the system was excellent, as nearly all users had little difficulty in using it. In most instances, the written instruction cards were ignored in favor of "hands-on" trial-and-error experience. Although the system response slowed as more and more people began to use the system, log-in took 15 seconds or less over 98 percent of the time.

9

10

9 A Xerox technician demonstrates the proper use of Xerox photocopying equipment.

10 Equipment is ready for use for the LAOOC's computerized results system.

Addressing and transmission of electronic mail took five seconds or less about 99 percent of the time. Other than a problem in receiving results for a few hours on 1 August, the EMS was always operational and a feared overload which would have required shutdown of predesignated terminals and printers never occurred.

Although explanations of the system in French, German and Spanish were provided, they were little used as the English screen instructions proved easy to understand. While basic text-editing features would have been helpful in the "write mail" function, almost all users agreed that the system provided a new plateau in communications and information systems at a multi-site sporting event. Of note for the future is that the EMS showed conclusively that non-computer literate people can use a sophisticated communications/information system effectively if it is properly constructed for such use.

31.04.4 Paging services

Given the widespread nature of the Olympic sites, it was important to be able to contact senior LAOOC managers on a moment's notice. In cooperation with LAOOC sponsor Motorola, an effective paging system was devised which fully covered the Southern California area and allowed individuals to be contacted wherever they were.

Motorola set up a five-site broadcast network to simultaneously carry pages to all areas covered by the site transmitters, each with an effective radiated power of 667 watts. All LAOOC competition, support and training sites were covered along with large portions of the freeway system in the Southern California area. To ensure adequate coverage at all locations (and even within buildings), small stations were added at both Los Angeles area villages, the Biltmore Hotel, the LAOOC's administrative headquarters in Culver City and at the Long Beach Convention and Entertainment Center. The effective radiated power of each of these stations was 12 watts or less.

Three of the five major transmitters were installed in August of 1983 with the balance installed as sites became available. The entire simulcast network was fully operational four weeks prior to the Games. Paging was initiated either through the Electronic Messaging System (EMS) or through stand-alone paging terminals. The EMS paging interface to the main paging computer worked very well, and the ease with which pages were initiated encouraged heavy use of the pagers and assured constant communications. Motorola "Metro 200" paging terminals were installed in case of EMS failure only and were located at the message centers at the UCLA and USC Villages. One Metro 200 terminal was located at the LAOOC's Culver City administration complex in 1983 and was the primary initiator of pages until the EMS was operational. All of these terminals had uninterruptible power supplies to prevent shut down resulting from electrical failures at the sites concerned.

Paging equipment consisted of two types. Under its sponsorship agreement, Motorola provided 1,400 tone-only pagers ("beepers") which emitted a tone to signal a page. Individuals who were thus paged retrieved the message through their EMS mailbox. Motorola also provided 1,500 pagers that displayed an alphanumeric message of up to 40 characters in length. With these pagers, individuals received not only a tone announcing that they had a message waiting for them on the EMS, but also a short message, often obviating any need to find an EMS terminal. These pagers were so useful that the LAOOC rented 450 in addition to the sponsorship allocation.

Pagers were also made available for rental to news media and 719 were rented, including 41 tone-only, 397 of a model which had an eight-character numeric-only display, and 281 of the full 40-character alphanumeric display model.

The paging program was a complete success. Because the system worked so easily, staff members were not hesitant to initiate pages and the increased communications helped to overcome difficulties posed by the broad area over which the Games were

staged. Although Motorola had feared that the paging rate might be as high as 1.25 pages per unit per hour, the actual peak was only 0.287 pages per unit for the highest hour during the Games. The average hourly call rate was 0.151. Total pages exceeded 7,000 on 20 July and 8,000 on the busiest day, 26 July, the date of the dress rehearsal for Opening Ceremonies. The heaviest paging traffic was generally observed between 0700–2000 hours with peaks from 1000–1600. The following gives the raw paging data for the Games period; note especially that the villages opened on 14 July, the Opening Ceremonies took place on 28 July and the Games ended on 12 August.

Date	Pages
13 July	988
14 July	2,027

11 August	5,890
12 August	3,074
13 August	2,740
14 August	2,073

Although most pagers were assigned to individuals, some were assigned by function. For example, each duty officer at the Operations Center used the same pager. This helped communications with those performing particular functions, even if the individual being paged was not known by name. Almost all managers at each site had either a tone-only or display pager. While full-time LAOOC staff members were assigned pagers, additional units were provided to commissioners for distribution to site staff at venues.

In retrospect, the paging program was nearly flawless and the interface with the EMS worked very well and contributed significantly to the use of pagers among LAOOC staff members. Future organizers will do well to develop a similar system that allows easy and fast paging between senior staff members.

31.04.5 Personal computers

Under its sponsorship agreement with the LAOOC, IBM provided 200 of its Personal Computers ("PCs") to the Organizing Committee. These units proved very worthwhile and were used in a wide variety of applications, including management reporting, office automation and sports scoring.

The PCs were initially delivered to the LAOOC in December 1982, and more than 65 machines were in use by the middle of 1983. Needs grew dramatically beginning in March 1984, when 85 PCs were in place. Augmented by rental units, there were 245 PCs in use during the Games. The major uses of PCs during the Games included personnel scheduling/access control (85 machines), Olympic Messaging System scrolling "message waiting" displays (45 machines) and sports scoring and statistics (40). The remaining 75 PCs were scattered and used for many different functions.

The personnel scheduling and access control programs allowed individuals to be scheduled by name, by department and by specific job. The idea was to schedule individuals ahead of the Games and then update the schedules as necessary. The venue access portion of the program then allowed or disallowed venue access to individuals (via the bar code readers) based on their work schedules. Although almost every department used this program to schedule people for Games assignments, the reaction to it for access control was mixed. Those who kept up their schedules found it worked well. Others preferred manual methods.

The sports scoring and statistics programs either were already in use in the United States or were developed specially for the Games. The need for these programs was based on the limited abilities of the overall results program to calculate individual results or generate pairings or start lists automatically. Many federations, however, preferred manual methods to even a PC-based system. In all cases, manual back-up for each PC system was available.

Sixteen different programs were used to support 12 different sports: archery, basketball, boxing, fencing, gymnastics, modern pentathlon, shooting, swimming (including separate programs for diving, synchronized swimming and water polo), tennis, volleyball, wrestling (two programs) and yachting. The archery program was used to maintain running totals on the competitors' scores and update the scoreboards. Summary reports

were generated for input into the LAOOC's results system, which carried competition summaries only. The PC-based archery program also provided detailed reports on each archer's performance for the benefit of the competitors and coaches and for tie-breaking purposes. The program was well received and included features which made it applicable to world championships in archery, such as calculation of team scores. Of particular benefit to the smooth operation of this program was its trial use at the 1983 World Target Archery Championships, hosted by the LAOOC.

The basketball program was used to record statistics at the end of each match and to produce various reports, including cumulative statistics for each team and a cross check against the manually-prepared box score. The program was an already-existing package used at an American university for its own basketball statistical reports. The best feature turned out to be the ability to quickly compile cumulative individual and team statistics following each match.

Automation of the random draw of boxers for initial pairings was a principal feature of the boxing system. The program also gathered details on scoring of each judge and provided statistical reports to help analyze the quality (or bias) of the judges. This program was developed by the LAOOC.

The fencing system was designed to establish initial competition pools from rankings provided by the International Federation, process results and produce start lists for subsequent rounds. However, the program was not completed in time and was not used. The federation and LAOOC competition staff staged the competition using manual methods of drawing and pairing.

An existing gymnastics package produced start lists and processed results. After processing the initial start list, the program accepted compulsory competition scores and generated a ranking of all competitors and teams and a start list for the next round. Scores were added for each succeeding competition to produce the required additional start lists for each phase of the team and individual competition program. This system worked very well and assisted greatly in the smooth flow of the sport.

An existing scoring and start list system was also used for modern pentathlon. Individual and team results were produced for each of the five events as well as cumulative individual and team rankings after each event. In addition, the system produced start lists and competition scoring cards.

Scoring of the shooting competitions was handled by a well-established system provided by the National Rifle Association. The program handled the different scoring procedures for 11 different events and provided start lists and match results.

Swimming used four systems, each one serving a different discipline of the sport. The swimming package was used to prepare start lists and seeding sheets. The diving and synchronized swimming programs both provided statistical analyses of the scoring by each judge for each dive or figure routine. The completed statistical tables were provided to the appropriate FINA Technical Committee within 30 minutes following the completion of each round of competition. The water polo program compiled individual statistics following each match and provided reports on cumulative individual and team statistics and rankings of competitors and teams in various categories. The system also produced a score sheet for use as start lists and for recording the raw statistics during the matches.

The tennis system performed a similar function in gathering data regarding the play of each competitor. A wide variety of statistics were collected and printed for distribution to players, coaches and news media following each match.

The volleyball system also collected data during the matches and reported individual statistics after each set and match and up-to-date cumulative match totals. The system was enhanced just prior to the Games to allow statistical information to be displayed on the television monitors of some broadcasters.

Two systems were used for wrestling. One program paired athletes within each weight class in accordance with manually drawn lot numbers and produced score sheets for use by officials. The pairings produced served as input documents for the main results system. The second program was a unique "call-to-the-mat" system which displayed a listing of the ongoing and upcoming matches on each of the three competition mats. The expected start time of each match was posted, along with the participants and the current time. Color television monitors with this information were distributed throughout the venue and were well received by athletes, officials, news media and spectators.

Scoring in yachting was handled by a PC-based system which produced reports for all classes and a wide range of scoring reports. No problems were reported with this system.

In addition to the personnel and sports statistics systems, a small number of administrative systems were used. Programs for use by the Finance, Purchasing, Torch Relay, Transportation, Travel and Youth Departments were all developed and used to varying degrees. The common goal of most of these systems was to keep records of

transactions such as investments for the Finance Department, conversion of purchase order requisitions into actual purchase orders (Purchasing), issuance of airline tickets for travel and scoring and ranking of student tests given as part of the Grow With the Olympics youth program. Scheduling for the torch relay was aided by a PC-based system that analyzed the schedules proposed and posted error messages if the schedule could not be met, based on the information input.

The transportation programs were designed to automate the detailed scheduling for the athlete and media transportation systems. The largest system was used for athlete transportation planning and operations and included two parts. The first calculated the required departure times from each village, given a required arrival time at a competition or training site, factoring in the day and time involved and traffic conditions expected to exist. After manually grouping the trips into working assignments for drivers and equipment (buses), the assignments were input into the system which then kept track of the assignments of specific drivers and buses to routes and work periods and provided daily reports for operations. The athlete transport program was used at both the UCLA and USC Villages during the entire period of operations, from 14 July–14 August.

The media transport system used a portion of the tracking capabilities of the athlete program for its daily operational reports, including modifications to schedules. The program was successfully used at the Main Press Center over the same time period as the athlete transport system. IBM provided pre-packaged software used for a variety of purposes to augment its support of LAOOC administrative users. These packages included data base management systems, electronic spread sheets and text editors.

While the use of Personal Computers did not provide the LAOOC with abilities it did not already possess, they did allow better use of staff time by automating numerous tasks that would have otherwise required hundreds of man-hours in laborious record keeping and tracking. The ability to provide nearly instantaneous reports for administrative and competition purposes at the various sport site was much appreciated by the site management and International Federations alike. Further use of PC-type systems will certainly occur in the future as users become more sophisticated in their approaches to the use of automation in competition management.

31.04.6 Photocopying

The LAOOC was well aware of the seemingly endless needs for photocopying at the Games. In addition to the massive administrative requirements in the pre-Games period, results had to be copied by the thousands for distribution at the Games, along with start lists, technical orders and various communications among all sectors of the Olympic Family and the LAOOC. In 1982, the LAOOC enlisted an appropriate sponsor for photocopying and telecopiers in the Xerox Corporation. Over the next two years, these two entities worked very closely to assure that the needs of the LAOOC were met as the organization grew and to devise plans for the Games which would adequately fulfill the demands made at each site.

Xerox and LAOOC technology staff members met with each individual department to ascertain overall Games copying needs. The major requirements included copiers for results, venue administration and venue press sub-centers. Copy models appropriate for each need were determined and approved by the LAOOC department managers involved. Xerox then proceeded with procurement responsibilities.

The initial installation task occurred at the LAOOC's administrative headquarters in Westwood and later in Culver City. Between 1982 and the middle of 1984 (at the end of the pre-Games period), the LAOOC produced some 32 million copies on Xerox equipment. At the administrative headquarters building in Culver City, 23.3 million copies were made on 29 copying devices, including eight high-speed machines with automatic feeders. Three high-speed copiers were concentrated in a copying center, which handled only high-volume tasks with large sorting or stitching requirements.

The preparation for the Games period included special operations by Xerox to ensure the success of the photocopying effort. The equipment provided was standardized so that copy operators could be effective at any venue without having to learn the procedures for use of several different kinds of machines. The standardization of equipment also assisted in the ordering of supplies and spare parts and an improved ability to provide service. Specially-picked installation teams and technicians were also used for the Games. Xerox delivered and installed all equipment and provided trailers with supplies and parts which were left at each site during its operating period. A command center was set up on a 24-hour per day basis and helped with various problems. In all, some 350 technical staff were involved in installing and maintaining the more than 900 copiers and telecopier units involved in the Games. Xerox also trained over 500 LAOOC volunteer copy operators who worked with the machines during the Games.

Site	Number of copiers	Number of copies made
Archery	3	104,326
Athletics	33	2,984,941
Baseball	6	109,331
Basketball	13	665,165
Boxing	12	512,075
Canoeing and Rowing	11	544,110
Cycling	10	239,525

Biltmore Hotel	27	1,286,820
Broadcast Center	13	1,776,221
Main Press Center	28	4,067,153
Olympic Arrival Center	7	120,060
Uniform Distribution Center		187,828

Venue equipment performed very well, despite tremendous copying loads. Servicing was done during non-competition hours and allowed generally trouble-free operation of the equipment.

Copying at the sports venues totaled 11,821,922. Another 11,081,652 copies were made at eight other principal support sites (three villages plus the five other sites listed above). Various other pieces of equipment were installed at a few other sites, but did not have large copying volumes. A total of 150 large-volume machines were utilized along with 302 smaller-scale units. Including the 22 million copies made during the Games period, the LAOOC's total volume was a staggering 53,977,818 through 19 December 1984.

Xerox also provided free copying privileges to the news media at the International Broadcast Center and at the Main Press Center. Six units were made available at the IBC, including one high-volume copier and five smaller ones. The copy total there was 383,989. At the Main Press Center, one high-volume and one lower-volume

unit was available and contributed 213,200 copies. Rental services were available and were used by some members of the news media. A total of 45 copiers were rented, including five high-volume units.

Overall, the photocopying effort was very successful. No equipment was lost or stolen and the technical performance of the equipment and technical staff was excellent. Careful estimation of the needs at each site allowed for proper distribution of equipment and sufficient back-ups in case of emergencies (which did not occur). The enthusiasm of the sponsor and the dependability of its products resulted in excellent service both in the pre-Games period and at the 67 Games sites where copying was needed.

31.04.7 Radio broadcasting

The LAOOC was involved in low-power radio broadcasting on non-governmental frequencies in a very limited way. Recognizing the needs of journalists, radio commentators and television broadcasters to gain access to athletes in interview situations, the Press Operations Department developed plans for mixed zones (informal interview areas) and formal interview areas. However, in a few sports, it became apparent that competitions would continue while interviews from prior events in the same session would be taking place. This presented the media with the difficult choice of missing an event or

an interview, especially at athletics, cycling and swimming.

The technical solution was to provide wired output of the interview rooms at the press/radio/television seating locations, or arrange for low-power radio broadcasts over commercial channels of the formal interviews at those sports. Since the wired output option was extremely expensive, the LAOOC arranged for low-power broadcasts within the area only of the particular venues concerned. A transmitter was connected to the output of the microphone amplification system of each venue interview room and the signal was carried over one of two AM radio channels.

Although the transmitters were delivered and installed and pocket radios were distributed to journalists, the results of the program were dismal. Journalists still preferred to go to the interviews themselves, perhaps because the information about the radio broadcasts of interviews was not well publicized. In the future, organizers need to consider the needs for such a system and, if implemented, must publicize it sufficiently to encourage use.

31.04.8 Radio communications

Although wire-based communication systems were fully satisfactory to support much of the LAOOC's communication needs, the highly mobile nature of many senior managers, site managers and

supervisors required an extensive radio-based communication system. The LAOOC worked with sponsor Motorola to design systems utilizing hand-held radios within the sites and mobile radio-telephones in automobiles for use by senior LAOOC management staff. Systems for in-transit security communications and for transportation operations were also developed.

The basic design for the systems used at the venues and villages was completed in December 1981 and revised in October 1983. Radio system planning was much more difficult than for any other area of technology.

Although all systems suffered from a lack of knowledgeable users early in the planning period, the radio systems had to function within a limited number of channels allocated to the LAOOC by the U.S. Federal Communication Commission (FCC). This meant that if the needs of one department increased such that it required additional channels, those needs could only be met by decreasing the channels available for other functions. Thus, as the needs of the Security and, especially, the Transportation Department grew, other departments had to be cut back. The final requirements for the allocation of

portable radios was completed in early 1984 after meetings were held with each department involved. After that point, allocations of portable radios could be changed, but channel assignments could not. Although Motorola's contractual commitment specified the loan of 2,030 portable radio units, the LAOOC rented an additional 2,300 hand-held units raising the total to 4,330.

Special radio systems were provided at each site. Additional systems were installed to meet the needs of the Transportation Department, which required integration of radio systems already installed in existing vehicles.

At the venues and villages, the systems stressed simplicity in installation and operation. This was especially important because of the certain lack of experience of the users on the equipment. Additional system design was necessary to meet the needs at the Los Angeles Memorial Coliseum, Long Beach Convention and Exhibition Center, the gymnastics venue at UCLA's Pauley Pavilion, modern pentathlon at Coto de Caza, the out-of-stadium events and the three villages.

Three to seven channels were furnished at most sites, depending on operational requirements. The venue message centers were equipped with desktop base stations capable of accessing all channels at the site with the exception of the security channel. Each venue's security command center had a desktop base station unit which could access all channels.

The more complex venues required repeaters. At the Coliseum, eight channels were eventually necessary with repeaters used only for transportation. Simplex (non-repeater) channels were arranged for administrative needs, competition staff, health services, ushers, security for athletes and security for Exposition Park. Changes had to be made after the Games began because ushers for athletics, boxing and swimming could not share the same channel; the same problem required an additional channel to separate the medical and administrative radio traffic for athletics. The repeaters for transportation were necessary because communications were required with the athletics warm-up area at Cromwell Field inside the USC Village. The requirements for the systems in Long Beach and at gymnastics and modern pentathlon also involved repeaters because of the large area covered by each of the venues. Channels for administration, security, sports and transportation, plus a back-up channel, were available on all systems.

The out-of-stadium events included the marathons, cycling road races and the equestrian endurance competition at Fairbanks Ranch. Two vans were outfitted with four repeater stations each, a large antenna structure which

11

12

11 An LAOOC private security officer, equipped with a walkie-talkie, inspects the Drake Stadium track at the University of California, Los Angeles.

12 LAOOC President Peter V. Ueberroth (center), accompanied by LAOOC Press Secretary Amy Quinn, communicates via radio.

could be quickly set up and removed, and over 100 portable radios with chargers. A gasoline-fed generator provided power. Three repeaters were designated for active use at each site, with one for back-up.

The LAOOC and Motorola also recognized the need for radio communications by the IFs, NOCs and others, and were granted authorization to use several frequencies by the FCC. In addition to those required by the LAOOC to operate the Games (paging links, security systems, transportation systems, venue and village systems and mobile radio systems), additional frequencies were made available for assignment to other groups which needed them. Eighteen NOCs reserved more than 50 frequencies in total and 11 LAOOC sponsors booked a total of 20 frequencies. A frequency was also booked for the producers of the Official Film of the Games.

At the UCLA and USC Villages, additional design was required because of the large-scale security and transportation requirements. Because each village covered a large ground area and required radio communications inside buildings constructed of concrete and steel, repeater channels were set up. A total of 12 channels were assigned at each, including one for administration, two for transportation and nine for security. The transportation channels included one for athlete bus loading and another for all other transportation requirements. The security channels included one for all village security and eight other channels which covered either geographic security areas or networks of guards working on the village perimeter or on the grounds in general. The 12 repeaters were housed in a single location at both villages, along with two back-up repeaters and a paging station. An uninterruptible power supply was provided to power all stations except the paging unit.

The UCSB Village radio requirements were fewer than those for the Los Angeles area villages, and included simplex (no repeaters) operations for administration and security. Transportation required a repeater system with a single channel.

The mobile radio-telephone system was designed to extend contact between the LAOOC administrative headquarters in Culver City and numerous senior managers while they were in their cars en route to meetings and the like. In addition, they allowed access to the area telephone network. Nearly 300 LAOOC vehicles were equipped with these units. A total of eight channels were used, including one channel for all users and seven sub-channels for assigned personnel in construction, health services, security, sports commissioners, support operations, transportation management and transportation repair.

Additional radio systems included a special arrangement for the in-transit security group and for transportation operations. The in-transit security system included 660 portable radios to be used for emergency communications by security guards aboard athlete buses. The U.S. Department of Defense provided base equipment for the local law enforcement agencies to communicate with the guards, but no such equipment was provided to the LAOOC. Motorola did provide equipment for monitoring in-transit security operations only; other communications were handled on the transportation operations channels. The communications system worked well enough, but it was recommended that a simplex system be considered to eliminate unwanted crosstalk between guards on different buses.

The transportation operations system required channels for communications among athlete buses, media buses and fleet dispatch. In addition, transportation management and road service emergency communications were necessary and were handled on a sub-channel of the mobile radio-telephone system.

The athlete transportation communications requirements involved operations at the Olympic Arrival Center (OAC) at the Los Angeles International Airport and at both villages. At the OAC, operations were divided into hosting of arriving dignitaries and teams, loading of the teams onto buses and route selection for the eventual destination of the guests. Repeaters were provided at the airport for the hosting and loading functions to assist the operation of the portable radios. Communications regarding route selection were obviously sensitive; voice-privacy radios were provided for transmission of the route approved by the security representative at the OAC dispatch center. Communications during the transit portion of the route were handled by the contracted bus company, which had its own radio system and installed a base station in the LAOOC's OAC dispatch center.

At the villages, the major areas of concentration included the loading of buses, route selection and in-transit security. Transportation towers were erected at both UCLA and USC and

included not only LAOOC dispatch and management personnel, but also related law enforcement and security personnel, local transportation authorities and the like. Repeater stations on the campuses assisted the transport tower personnel in communicating with the loaders on the ground, while bus drivers were called from the tower on their existing bus radios (channel one). Route selection was handled in the same manner as at the OAC via the voice-privacy radio network. Tower security officers informed ground-level security officers of the appropriate route, which was then communicated personally to the drivers. Communication with the drivers en route was maintained on channel two of their existing bus radio, with emergencies handled on existing channel three. Equipment was also present in the towers to handle in-transit security communications.

Communications with emergency back-up buses utilized a fourth channel on the existing radio system of the ARA Services buses quartered at the South Gate bus yard.

The media bus system utilized the fourth and fifth channels available on Los Angeles Unified School District (LAUSD) buses. The central point for all media bus dispatch was the Main Press Center. Bus loading and dispatch operations were similar to those at the villages and were controlled inside the transportation operations center in the MPC's North Hall. Small scaffold structures and portable radios were used for directing loaders on the ground, rather than from heavily-equipped, massive towers as at the villages. Additional portable radios were equipped for use with the bus channels for loading (channel four) and en route (channel five). In-transit security was not provided for media buses.

The fleet dispatch center was located in South Gate. Equipment was provided to allow communications with either of the bus radio systems, ARA (the official Athlete Transportation Management Company) or LAUSD, and with the ARA cover buses. In addition, the aforementioned sub-channel on the mobile radio-telephone system was available for transportation repair vehicles.

Overall, the radio communications needs of the LAOOC were extensive, but were fully met by Motorola. Over 40 individual radio systems were designed and installed in a very short time. Very few problems relative to the dependability of the equipment surfaced and the quality of the communications was generally excellent. Most of the complaints heard from staff were about the insufficient number of hand-held radios available at the sites, a question of allocation of resources rather than the quality of the communications system installed.

31.04.9 Registration and results

The registration and results function was the most people-intensive task handled by the Technology Department. During the Games, over 2,000 people were directly involved in the compilation, processing, printing and distribution of the results from the 23 sports. The major components of the results function can be divided into the development of the software required, hardware required, pre-Games operations and Games operations.

Because of the tremendous number of events and rounds, it was clear from the beginning that a computer-based results system would be necessary and that any such system would have to be approved by the International Federations. In order to reduce the risk of not completing the development of a new results software system in time for the Games, it was decided to purchase the rights to use the results software from the 1976 Olympic Games and update it for use in Los Angeles. The software, nicknamed "SIJO" from its French title, "Système d'Information des Jeux Olympiques," was initially used in Montreal and then purchased and modified for the Games of the XXIInd Olympiad in Moscow in 1980. The LAOOC acquired the 1976 version and then hired a firm, which had been involved in both the original development and the modifications for Moscow, to modify it once again.

The SIJO system was extremely flexible, as it allowed for free-form entry. However, it was not a true scoring system and had almost no ability to calculate scores and determine qualifiers for succeeding rounds. These functions were performed manually in Montreal, as desired by the IFs at that time. In response, a number of microcomputer-based systems were developed by the LAOOC at the direction of the sports commissioners to handle the actual scoring and ranking requirements of each sport. SIJO was designed to register athletes, assign athlete numbers, create start lists, accept data entry of scores or times, format and/or sort the data input and then produce results in printed form. The strength of the SIJO system was its electronic dissemination abilities allowing results and start lists produced by the system to be distributed to many sites automatically. The LAOOC focused on these capabilities in using SIJO and modified the Montreal version to meet the needs of the 1984 program of events and post-1976 rules changes.

The major software changes in SIJO included:

- Addition of new sports or disciplines within existing sports, including baseball and tennis as new sports and the disciplines of rhythmic gymnastics and synchronized swimming.
- Addition of new events within existing sports, such as the women's 3,000 meters, 400-meter hurdles and marathon in athletics and the women's individual road race in cycling.
- Restructuring of the results report format to emphasize English headings instead of French, as had been used in Montreal, and allow for input of measurements in feet and inches for events such as the shot put, discus and javelin.
- Addition of a summary program called "Main Events of the Day" (MED) which provided summaries of medal winners and records broken in each sport, overall summaries of gold medalists across the entire Games, medal winners in all sports, records broken in all sports and an unofficial tally of medals won by each nation.
- Special interface with the Electronic Messaging System (EMS) to allow query of Olympic results and start lists on the 1,700 EMS terminals spread across the Southern California area. This was especially significant since the use of the self-operated EMS as an inquiry terminal eliminated the need for operator-assisted SIJO inquiry terminals as had been provided in 1976.
- Special processing programs allowing for automated typesetting of the results for use in the publication of the "Olympic Record" daily program and for automatic linkage of the results output to the computerized distribution system of three leading press wire services.

Changes were requested continuously, even up to the day of Opening Ceremonies. However, the major changes were identified well prior to the Games and were completed in time for testing and modification based on the test results. Most of the development occurred between March 1982 and June 1983. The publications and wire service interface programs were developed rather late (through April 1984) and although some problems surfaced with each, both worked satisfactorily.

The configuration of the system hardware was discussed at length over a period of three years. It was recognized that because of the continuous production requirements of the results system, a temporary outage for even a few hours was unacceptable. The LAOOC endeavored to provide primary results (i.e., results of individual matches or races as opposed to summaries) within ten minutes after receiving an approved result sheet from the appropriate officials. Any "downtime" would be disastrous. The result was the placement of the results system's central computing facility at an existing computer service center, where the environment would be favorable for the operation of such equipment. The McDonnell Douglas Automation Company (known as "McAuto") was chosen and became an official supplier of results computer services for the LAOOC. Although the development of the system was handled on an existing McAuto computer, it was decided that equipment which would be dedicated only to the results system was the best way to ensure perfect performance. Two IBM model 4381 computers were installed at McAuto, although only one was required to run the results system. The second machine provided complete back-up and special, uninterruptible power supplies were provided for both. A back-up unit was provided for every piece of equipment used at the host computer site. The Games-dedicated computer network was turned over for LAOOC use in May 1984.

At the venues, IBM terminals, printers, modems, controllers and multiplexers were used for input, output and communication functions. A new concept was the use of Xerox electronic imaging printers which allowed high-quality output of the results in specified fonts and with graphics such as the *Star in Motion* or the pictograms for each sport. This was a tremendous improvement over the output provided by dot-matrix printers and provided not only a more attractive results sheet or start list, but one which was also far easier to read.

Communications between the sites and the central computer was handled by leased telephone lines with dial-up telephone lines as back-up.

Operations in the pre-Games period centered on software modifications, testing and the development of operating plans by the international accounting firm of Ernst & Whinney, the LAOOC's official manager and operator of the results system. Ernst & Whinney was responsible for the operation of the overall system, including input, output and distribution.

While the software modifications were ongoing, tests were made periodically to show the fitness of the system and the ability of Ernst & Whinney to understand its operation. The most useful tests came in July 1983, when the modified SIJO software (including the interface with the EMS) and the Ernst & Whinney results team were matched in live action at the LAOOC's cycling and swimming events. In August, the results system and team were tested again at the LAOOC-hosted synchronized swimming and gymnastics events. The synchronized swimming event provided a test for a new sport on the Games program while the gymnastics event was the testing ground for the new Xerox electronic printers. Few other such formal testing opportunities were held, although in retrospect, it would have been preferred to have some sort of test event for the results team in every sport. Problems which arose at some sports would have been eliminated if a live test had been held prior to the Games.

Ernst & Whinney developed system operating plans under the direction of five managers of specific functions: athlete registration, data systems/equipment and network configuration, distribution operations, staff planning/recruiting and training and venue results operations. Recruiting took place at many levels and included venue results managers (39), input supervisors (eight), output supervisors (37), senior terminal operators (67), operations specialists (37), input operators (121), output operators (80), distribution supervisors (eight) and distribution clerks (331). Their task was to complete the input and distribution tasks following each event within ten minutes after the receipt of official results data. The basic steps included:

- Receiving and entering results data as provided by IF officials
- Verifying and approving official results
- Producing hard copy results of each event for mass copying
- Logging results produced
- Copying results for distribution
- Distributing paper copies of results to press, sports officials, VIPs and others as necessary
- Providing results to each electronic interface system: EMS, publications and wire services

The largest results staff was at athletics, where 86 people were utilized on two shifts. A total of 72 persons worked at the Main Press Center, 48 at swimming, 36 at gymnastics and 31 at fencing. Venues with the least number of staff included football (nine), cycling and weightlifting (ten) and baseball (11).

By late May of 1984, the necessary tests on the system had been completed and the installation of the host computers at McAuto was nearly finished. All results computer operations were then transferred from McAuto's shared computer network to the Games-dedicated system. Training of the almost 750 Ernst & Whinney personnel assigned for the Games commenced at a local high school, where not only were people trained, but all equipment which was to be used at the venues was tested in the training session. Testing took approximately one week after beginning on 20 June and equipment began to be delivered to the sites, depending on the LAOOC's access date and the availability of communications lines. Final delivery for many venues did not start until just one or two days prior to the Games, since equipment continued to be used for some last minute trainees and for the athlete registration center. Although all data and dial-up telephone lines were eventually installed, there was some concern on a day-to-day basis over delivery dates. It would have been easier to have had these lines installed earlier with some limited access by the results team for line testing. A few sports and events, notably archery and the cycling road races, utilized a mobile input/output trailer which contained pre-installed equipment and moved from site to site as necessary.

All results system personnel received Ernst & Whinney training, which consisted of 22.5 hours for non-distribution clerk personnel and 12 hours for distribution clerks. Integral to these training sessions were venue-specific training, a dress rehearsal and the on-site preparation training phase.

The first phase of the actual results process was the registration operation which was coordinated as part of the LAOOC's Athlete Registration Center, beginning on 9 July 1984. From that date through 27 July, "by name" registration forms were input into the SIJO system using 11 terminals and printers. Although all registration forms were required to be turned in by 14 July (18 July for athletics), there were many late forms which were always accepted for entry by the IF concerned. The SIJO system, however, did allow for late entry.

Technology

Notes:

- (1) The listing above does not include controllers or multiplexers.
- (2) Printers include small dot-matrix IBM printers and larger Xerox 2700 electronic imaging printers.
- (3) Telephone lines generally included two dial-up lines backing up every leased line.
- (4) Fencing and Volleyball had separate input terminals (4 and 2, respectively) and shared common lines and output equipment.
- (5) Gymnastics and Tennis had separate input terminals (4 and 2, respectively) and shared common lines and output equipment.
- (6) The Mobile Input/Output unit serviced Archery and the one-day events at Mission Viejo (cycling), the Artesia Freeway (cycling) and at Fairbanks Ranch (equestrian).

Results software system transaction summary

Date	Registration transactions	Results transactions	output transactions	Other transactions	Total transactions
23 July	2,721	500	918	445	4,584

Totals	6,872	203,608	122,925	89,113	422,518

Notes:

- (1) This transaction summary includes:
Registration: transactions in the registration of athletes and officials.
Results: all production of start lists, results, summaries and Main Events of the Day lists.
Output: all output to associated printers, remote printers and output interfaces to EMS, publications and wire services systems.
Other: includes all system inquiry, SIJO service and CICS (data management program) service transactions.
- (2) Statistics are not available for 26 July; statistics for 6 August prior to 1000 hours were lost.
- (3) Statistics for 11 and 12 August are estimated.

Results production and copy volumes

Site	Number of results produced	Number of notes & quotes	Number of originals	Number of copies made	Total copies made
Sport Venues:

Totals	297,900	946,500	1,244,400

Typically, once data entry for a specific sport was completed, a SIJO sub-program assigned athlete numbers beginning with the number 0001. In sports which had separate competitions for men and women, SIJO separated the competitors by sex, then sorted the entry list by NOC, using the three-letter country codes assigned to each NOC. Entrants were then sorted alphabetically by family name within each NOC code and numbers assigned sequentially. Thus, entrants from Afghanistan (AFG) and the Netherlands Antilles (AHO) always received low numbers in each sport they entered, while the highest numbers were assigned to entrants from Zaire (ZAI), Zambia (ZAM) and Zimbabwe (ZIM). For sports with mixed competitions for men and women (e.g., equestrian), athlete numbers were assigned without any pre-sorting by sex.

No renumbering was made once numbers were assigned. Late entrants were simply added into the overall assignment process in their sport if the athlete numbers had not already been assigned, late entrants were assigned the next available number, regardless of which NOC had entered them or the alphabetical order of their family name vis-a-vis other entrants.

The registration function was moved from the LAOOC's Athlete Registration Center in Westwood to the Results Control Center at McAuto on 28 July. All registration changes took place thereafter that point. Although there were some extremely late changes, the registration system worked well. The interface program for publications proved workable as the overall entry list publication for the Games was produced on time on 28 July. The number of changes in spelling which were requested were slight and amounted to only about 1½ percent. This was less than expected and was principally due to good concentration and checking procedures at the time of entry.

Venue results operations were generally very successful, but the ease and grace with which results were produced at each site varied widely. Those venues at which Ernst & Whinney results input personnel were located on or near the field of play, and at which the input team received an approved results sheet from the sports officials, worked very well. Venues where these elements were not present resulted in some difficulties. Verification procedures for results varied from sport to sport and while some took too much control, others tried to bypass the SIJO system entirely. Overall, however, Ernst & Whinney worked very well with Swiss Timing, McAuto (and the associated IBM equipment) and Xerox to provide excellent result service which was dependable and timely. All of the mentioned companies provided a cooperative effort which extended to servicing. The limited number of equipment failures was due completely to the aggressive servicing concepts of all suppliers and was a key to the successful operation of the results service.

Distribution services were present at all sites and provided the link between the finished results sheets and the actual users, which were primarily members of the news media. The planning of delivery routes for results, estimation of the number of originals and copies to be made was done in detail and generally worked very well. In addition to distribution of the results, the distribution function also delivered auxiliary information materials including SIJO-produced start lists and match progress/statistics and non-SIJO-produced information, such as the notes and quotes sheets, play-by-play and race-in-review reports produced by the Press Operations Department's venue press chiefs at each site. Because of the large volume of copies required for the press at some sites, plastic shopping baskets were used by the distribution clerks. This helped to prevent soiling of results and minimize the fatigue factor inherent in the distribution of hundreds of sheets of paper many times each day.

Distribution of results also took place at non-venue sites, including the Biltmore Hotel, International Broadcast Center, Main Press Center and the three villages. Main Events of the Day (MED) output was available in hard copy form at the International Broadcast Center and Main Press Center only, but was also available through the EMS.

Output through the publications and wire service interfaces worked well most of the time, although the wire service interface failed several times because of format problems and a problem with the canoeing results. The publications software was more dependable, but also suffered from a lack of specificity in its requirements.

A Results Control Center (RCC) was set up at McAuto to oversee the entire results operation, act as a "help" station for venue operations and a monitoring station for all equipment and lines. The RCC could also act as an input/output station for venues in an emergency and handled all registration additions and changes after 27 July. The RCC was staffed from 0600 hours daily until the nightly batch processing had been done for the next day, which sometimes required around-the-clock operations. After a flurry of calls in the initial days of venue operations, the RCC was relatively quiet during most of the Games period. The efforts of the on-site results managers proved sufficient to handle almost all of the developments which occurred at the venues.

Overall, the results system met the needs of the LAOOC and the Olympic Family members who received information and results from it,

especially the news media. A total of 6,931 results originals were produced and over 1,500 pages of Press Operations-generated notes and quotes were copied and distributed. Over 10 million pieces of paper were used altogether and the sports results were consistently delivered in the desired 10-minute time frame. The SIJO system worked as expected and no major equipment or software failures were experienced.

However, the following points should be noted for future organizers:

- The SIJO system, while fully satisfactory in Los Angeles, has certain procedural rigidities which reduced its effectiveness and has a lack of computing power which required time-consuming manual calculations and entry in some instances. A more disciplined screen format would have allowed for fixed fields and easier interface to other systems, notably the EMS. Computing power for adding specified fields and performing other routine calculations is absolutely necessary in future systems. Better screen-editing features, such as tabbing, would also help to speed processing.
- System integration may be possible between timing, scoreboards and results at many sites. These functions were separate in Los Angeles because of the different contractors used and the aversion to developing a completely new system for fear of inadequate testing time and possible Games-time failure. However, the repetitive input process was inefficient and time-consuming and the potential for errors was obvious. In any new system, interfaces with timing and input for scoreboards on the front end should be considered and distribution interfaces for an EMS-type system, publications and typesetting systems and a wire service-standard system are all important and necessary. In each, it is important not only to develop and test the systems prior to Games use, but also to educate the end users—the company supplying an EMS-type system, the printer or typesetter used and the wire services involved—about what to expect in a Games-time environment as opposed to a test environment.
- Computing power for SIJO was completely contained in the central computers housed at McAuto. Although these units worked well, it might be wise to consider a transfer of some of the computing power to the sites to allow stand-alone processing if the central system breaks down. In this way, central processing failures caused by one sport or event will not affect results production for other sports.
- Close coordination in development must be maintained between both the sports and press departments. Although the results system is present to support the sports, the primary customer of results services is the news media. Both groups must understand the interest of the other and both must be accommodated where possible. In some instances, sports officials cared little about the LAOOC's results system and either ignored the Ernst & Whinney results team or just scribbled a new start list or result onto a piece of blank paper. News media, on the other hand, were almost always attentive to the competition and demanded results as soon as possible. There were a few instances where the microcomputer scoring systems were used for initial results for press at the venues, followed by the official SIJO version later.
- The importance of having people who are knowledgeable about the sports they are involved in on the results production venue teams cannot be understated. It is highly recommended that experts in each sport be found, if possible, to assist in the development of results format and to work with the competition officials during the Games. Some of the sports are extremely technical and have their own vocabulary (e.g., judo) or complex scoring methods (modern pentathlon). The challenge to produce results quickly and accurately can only be overcome by someone who can talk to the competition officials (and news media) in their own language. In a number of instances, the microcomputer-based systems saved the results production team because their output was sufficiently useful for the officials and media which required the information. This was the case at archery, modern pentathlon and shooting, especially, where complex input and official scoring chores were handled well by microcomputer systems which could produce results for distribution to officials and press very quickly. Those results were then the basis for input to SIJO.
- At many of the sports, sets of the results and summaries of the day's competition were requested by press and sports officials. This was somewhat expected, but not planned for in the large quantities requested. These demands, along with those for compilation of results books summarizing the results of each sport individually at the end of its competition period, were rather frustrating. Each journalist might go through five sets of results by the end of the Games: distributed individual result sheet, daily summary of a particular sport, next day publication in the "Olympic Record", publication in the all-sports results edition of the "Olympic Record" and the requested individual sports results summary

books. The latter was specifically not provided since it was felt that the all-sports results edition of the "Olympic Record" (published on 13 August) was a more appropriate review of the results from the Olympic Games. Daily summary books proved helpful, but were compiled only through additional copying and manual collating and stapling.

31.04.10 Results publications

The LAOOC needed to provide a comprehensive daily summary of all results of the prior day and of start lists for the current day for use by Olympic Family members and for sale to the public as a program. Although considerable discussion took place in 1982 and 1983 regarding the publication of individual programs for each sport, it was decided that the Games would best be served by producing an overall publication. Notably, the program would be reusable by spectators attending multiple events on the same day and distribution problems would be minimized since the product would be identical over all sites.

As designed, the "Olympic Record" was a tabular-sized newspaper featuring two sections bound within the same cover. The middle or results section contained the results of the previous day for each sport and the start lists for the current day in that sport, printed on newsprint paper and arranged in alphabetical order. A short report summarized the highlights for that sport for each day. A few photographs and filler stories completed the pages allocated for each sport, based on the expected number of results and start lists. This results section was printed in black ink only and was distributed (unbound) free of charge to Olympic Family members, including the news media. The first section was wrapped around the results section and contained either 24 or 32 pages of feature stories and information on each sport. Those copies which included the wrap-around section were printed on higher-quality paper stock and included color photographs on the front cover. The interior copy and photographs were black and white and the spine was stitched. The entire publication was trimmed as well. This spectator edition of the "Olympic Record" was sold to spectators at all sites at \$3 per copy. It was estimated that approximately 20,000 copies of the results only section of the "Olympic Record" and up to 100,000 copies of the spectator edition would be required daily.

Substantial difficulties in organization were encountered as no one company could be found to handle all parts of the production process along the guidelines which the LAOOC was determined to use. Bids for printing only were then accepted. Finally, separate companies for typesetting and printing (with subcontractors) were located and agreements were made. SIJO software was modified to allow transmission to the typesetting firm, which then re-programmed its own computerized system to allow for automatic setting, layout and pagination of the results and start lists as produced by the SIJO system. Camera-ready pages could then be produced without the need for manual paste-up, saving precious time. It should be noted that the primary difficulty in the project came from the tight time frame in which the "Olympic Record" had to be produced. Although copies of the results-only section were needed by 0600 hours daily with most of the spectator editions required by 0700 hours, some events did not finish until 0030 of the same day. The requirement to wait so long for the final results and subsequent start lists necessary for inclusion in the "Olympic Record" were the primary reasons that so few companies had any interest in it.

After settling the problems of production logistics, a small staff was developed within the Technology Department to handle the project. A managing editor was chosen in December 1983, an associate project director in April 1984 and an associate editor in charge of the writers joined in May 1984. Writers were hired in April, June and July of 1984 to pre-write sections of the spectator edition and then to write the daily copy for inclusion in both the results-only and spectator editions.

About three-fourths of the spectator edition copy was written before the Games with a large amount of other material which could be used as fillers in either of the two sections. Copy for the results-only section was translated into French by the LAOOC's Language Services Department while the spectator edition wrap-around section was entirely in English.

During the Games, the managing editor was joined by six persons comprising the writing staff, two photo editors and a design coordinator. This group was located at the Main Press Center, adjacent to the Language Services Department office and a few feet away from the Press Operations Department's information services office. Seven people assisted with production, including four assistant editors and three editorial assistants. Two people worked directly with the printers and two others worked out of the Results Control Center to control the transmission of data to the typesetting firm.

Actual production usually began around 1200 hours each day when transmissions began between the

13

Results Control Center and the typesetter. These continued during the remainder of the day and sometimes until 0300 hours of the following day. Also beginning at noon, the writers began transmitting stories to the typesetters via modem-equipped IBM Personal Computers at the Main Press Center. As many as 18 stories each day were transmitted in English and French. Stories for the spectator edition section had a deadline of 1500 hours daily, while copy regarding the various sports was required at various times as late as 2330 or 2400 hours because of late games or slow translation.

At the typesetter, layouts were approved daily beginning at noon and the selection of photographs and writing of captions usually began around 1100 hours. The color photograph for the cover was needed by 1500 hours daily in order to make separations in time for printing. By 1500 hours, final editing of the spectator edition stories was being completed and final page designs were being completed for that section. Each assistant editor was responsible for several sports during the Games and checked the results-only section for completeness and designed the remaining pages assigned to each of their sports, filling with photographs and pre-written stories, if necessary.

The typesetting firm combined all necessary stories and photographs in both sections and produced camera-ready film for printing use. Three or four sets of film were produced daily to satisfy the multi-plant printing approach utilized by the printing company selected. All film for the spectator edition pages had to be delivered to the main printing plant by 1800 hours daily, while the film for the results-only pages had to be delivered by 0145 hours.

13 The LAOOC "Olympic Record" contains all Olympic results and is published daily during the Games.

After printing and binding was completed, the finished publications were distributed to the venues via a contracted messenger service.

The first edition of the "Olympic Record" was for the Olympic Family only and contained entry lists for each of the sports and events in alphabetical order by NOC and then by family name. An overall list of competitors and team officials was also published in the same edition. A total of 23,000 were printed and distributed. The editions of the "Olympic Record" during the Games included an average of 16,600 copies of the results-only edition for the Olympic Family and just over 63,000 for sale to spectators. A final edition of the "Olympic Record" was available to Olympic Family only and included complete results of all competitions held during the Games. This edition was delivered just 14 hours after the end of the Closing Ceremonies and was printed in 25,000 copies. Including the entry list and results editions, a total of over 1.2 million copies of the "Olympic Record" were produced.

Although not always well received by the public, the "Olympic Record" sold well in the last week of the Games and was very popular among the Olympic Family. In retrospect, given the rigid deadlines, a remarkable job was done of preparing and publishing it.

31.04.11 Scoreboards

An important part of the Games technology effort went into the provision of appropriate scoreboards for the use of athletes, news media and spectators. Given the tremendous interest in the Games which would lead to high attendance figures and the restrictive public address announcement policies of most of the IFs, adequate scoreboards were essential.

Although several of the stadiums selected by the LAOOC had existing scoreboards, it was clear that additional or new boards would be necessary. As a part of the agreement with Swiss Timing (through the Westinghouse sponsorship agreement), it was required to provide scoreboards where necessary and additional boards where needed to increase the amount of information available. The surveys for scoreboard needs and placement were made at the same time as the surveys for timing equipment. As with timing equipment, Swiss Timing's agreement required it to provide whatever scoreboard displays each International Federation agreed was adequate.

The most complex set up was at athletics, where new scoreboards had been installed by the venue's management in 1983. Swiss Timing provided the rolling event time to the peristyle scoreboard and provided another large public scoreboard mounted over the tunnel entrance at the southwest end for the benefit of spectators unable to see the main scoreboards. Ten lines of 32 illuminated characters were available

14

for displaying information such as start lists, order of finish, pictograms and the like. The free-field lamp matrix scoreboards already existing in the Coliseum were used for posting lane and finish information and for videotape replays of events in color. The use of the videoboard is described in the section on video in this chapter.

Additional scoreboards utilized at athletics included four rotating scoreboards placed at each field event to indicate the distance achieved. The results were entered by operators on the field level and included both the metric and imperial measurement as well as the competitor number. The attention and importance assigned to all boards in the Coliseum by the commissioners responsible assured their success as spectator information tools.

Other large scoreboards installed by Swiss Timing included canoeing and rowing (6 lines of 10 characters each), cycling (5 lines, 20 characters), gymnastics, swimming (10 lines, 32 characters) and weightlifting. Small boards were provided for a number of other sports and mostly included just one to three lines of information.

Existing scoreboards were used at baseball, basketball, boxing, football, handball, hockey and tennis. A manual scoreboard was installed at archery.

The boards were used without incident and performed very well. Swiss Timing and its sub-contractor for scoreboard support managed to install each board in good time and removal was made in a timely fashion after the end of the Games.

In retrospect, the emphasis on the IF agreement to the information displayed on the scoreboards may have been misplaced. Although timing requirements are crucial to the generation of basic results and therefore a primary concern of the federations, the interest in what information is available for spectators belongs more to the organizers than to the competition officials. The LAOOC's sports commissioners often requested bigger or better scoreboards than were required by the IF concerned; happily, good cooperation between the IFs, Swiss Timing and the Organizing Committee resulted in installations which met both the needs of the IF involved and the spectators for that sport.

31.04.12 Sound reinforcement

A variety of sound reinforcement problems had to be addressed for the successful operation of the Games. Public address systems, press interview systems and athlete warm-up systems were all requested by the departments concerned. The major efforts of the sound operations group focused on the provision of new, permanent systems at two sites and a variety of smaller, temporary systems at other sites.

14 A Swiss Timing secondary scoreboard is mounted over the west tunnel of the Los Angeles Memorial Coliseum and provides such information as start lists and results.

15

16

17

15 A new public address system, consisting of two giant loudspeaker housing units at the peristyle end of the Los Angeles Memorial Coliseum, is installed for the Games.

16 A supplemental time clock is used at The Forum, the venue for the basketball competition.

17 A Swiss Timing scoreboard as installed for the cycling competition.

The permanent systems were installed at the Los Angeles Memorial Coliseum, site of athletics, and at East Los Angeles College, site of hockey. Equipment supplied by Panasonic Industrial Co., official supplier of sound equipment and systems, was used at these sites as well as at the sites requiring temporary sound reinforcement.

At the Coliseum, a new system was installed for Games use and was left for permanent use by the facility. A computerized study helped to determine the proper configuration of equipment and mounting locations within the Coliseum and led to the installation of two giant loudspeaker housings at the east (peristyle) end. Inside, 28 horns and 24 bass loudspeakers were installed, powered by 30 dual 200-watt amplifiers. The system met the LAOOC's needs and fully satisfactory public address services were delivered over the system. The very special requirements of the Opening and Closing Ceremonies were handled by the Ceremonies Department through contracted firms hired specially for those events only.

At East Los Angeles College, another permanent system was installed and left for use afterward. The 22,000-seat facility was augmented by the installation of twin speaker columns at one end of the stadium and controlled from the existing announcer's booth high above the field sideline.

The remaining sound installation challenges were temporary in nature. Public address systems were installed for those stadiums which did not already have systems in place. The most notable of these "stadium systems" was at the equestrian venue at Santa Anita Park, which added temporary grandstands in areas where horses normally roam during the horse racing season, at Lake Casitas for rowing and canoeing and at the USC Swim Stadium. At Lake Casitas, the public address system was primarily for the spectators, but the athletes-stationed 2,000 meters away in their own area-wanted to hear the commentary provided to spectators. This was provided via a special transmitter with receiving stations in the athlete area connected to the athlete sound system, which was also used for paging and warm-up information. At the swim stadium, extensive pre-competition testing had to be performed in order to properly synchronize the music above and below the water for the synchronized swimming events.

At most of the other sites, athlete call-up or paging systems were arranged in addition to press interview room systems. In all, 26 systems were dedicated to press use at a total of 31 sites and included not only microphones, amplifiers, mixers and speakers, but also multiple-output patch boxes which allowed journalists to record the speaker's comments without placing an unsightly glut of microphones on the speaker's desk. Each multiple-output box contained 16 outputs for microphone or line level inputs to the recording devices of the journalists concerned. More than 40 of these units were used in total, with six at the Main Press Center and fewer at each competition site.

Special requirements in the villages included installation of systems for performers in the coffeehouses and discos and additional sound reinforcement in the campus theaters.

The logistics of installation and operation of these various systems was difficult because of the many sites and large amounts of equipment involved. Overall, some 57 mixing consoles, 215 amplifiers, 250 microphones and 930 speakers were used. Additional equipment included various types of cassette decks, equalizers and turntables. About 25,000 feet of microphone cable and 20,000 feet of speaker cable were used to patch the systems together. A technical staff of 22 assisted in the project, including seven who served as crew chiefs and supervisors.

The LAOOC's sound operations group also arranged the recording and electronic "sweetening" of national anthems from all participating nations. After each NOC provided sheet music for its anthem, recordings were made using the United States Army Band and multiple copies were produced after completing the master tapes. Similar attention to quality and consistency between venue sites was given to all other recorded music and sound, most of which was prepared at the direction of the sound operations group.

Overall, the sound reinforcement effort was fully successful. The installation of permanent systems at two major sites left an enduring legacy from the Games in the sound area and the temporary systems performed almost flawlessly under heavy use. The control measures exerted over the taped anthems and other music used at the Games assisted the overall presentation of the awards ceremonies in particular and the venue atmospheres in general. The key to these successes was the choice of a supplier who could supply a wide range of products easily integrated to meet any need and have dependable and efficient installation crews properly organized to deliver the needed systems in the short installation period available.

31.04.13 Telecopiers

Telecopier (facsimile) machines were provided by Xerox Corporation under its sponsorship agreement with the LAOOC that primarily filled the need for photocopiers. The need for telecopiers was expected to be primarily press-related, but the LAOOC also found substantial utility in these units for its own communication requirements in the pre-Games period.

Xerox offered several different types of telecopiers with varying degrees of speed and efficiency. It was important to establish the parameters of operation for these units in order to ensure proper communications with other machines around the world. Care was taken to educate news media about which telecopiers made by other manufacturers were compatible with the Xerox line. Tests were carried out with a few newspapers in early 1984 to establish the compatibility of their specific equipment with that used by the LAOOC. The unit primarily available at the Games sites for journalists met CCITT standards I, II and III for transmission. The Press Operations Department informed accredited news media of the type and compatibility of the units to be used in its brochure "*Facilities for Journalists, Volume 1,*" published in February 1984.

Out of the total of 370 telecopiers, 172 machines were used by the press: 42 in the Main Press Center, 127 at the various sports sites and villages and three for the Olympic Arts Festival press rooms. The LAOOC's major administrative needs required 95 machines at the sports competition sites, plus 24 at the three villages, four at the International Broadcast Center, 15 for administrative use at the Main Press Center and 18 at the Biltmore Hotel for IOC use. Forty-two other telecopiers were distributed over 20 other sites. The greatest concentrations of telecopier equipment came at the Main Press Center (57 total, including 15 for administrative and 42 for press use), boxing (35 total including press requirements), athletics (25), the Biltmore Hotel (20) and gymnastics (14).

A total of 18 telecopiers (all capable of meeting CCITT standards I, II or III) was rented by Xerox to news media agencies upon request.

The basic LAOOC uses for these machines were in the inter-office transmission of documents. Telecopying was used for materiel requisitions from the LAOOC's main warehouse, since it was faster than the inter-office mail delivery system. Communications with the LAOOC's Washington, D.C., Annapolis, Boston and Stanford offices were also carried out primarily by telecopier.

Some machine-performance problems were noted due to the greater than normal exposure to sun and wind during the LA83 events. Xerox made physical changes in the units used for the Games to cope with the non-office environment in which most machines were used.

No major problems were reported with the telecopiers and all of them operated dependably and were serviced regularly to avoid breakdowns.

31.04.14 Telephones

The LAOOC depended heavily on existing and newly installed telephone systems to provide communications at its many sites. Major contributions to the telephone network were made by the American Telephone & Telegraph Company (AT&T), Pacific Bell and General Telephone and Electronics (GTE). The latter two companies provide local telephone service in the Los Angeles area and both AT&T and Pacific Bell were LAOOC sponsors.

In order to have the capacity to carry the expected avalanche of telephone calls and related service requests, the local telephone companies accelerated their already-existing installation programs for fiber-optic cabling in the Los Angeles area. Since fiber optic cables have many times the capacity of the copper cables which had been in use, the local companies were able to handle the additional Olympic telephone traffic with a minimum of new line construction which would be utilized for the Games and nothing afterward. Pacific Bell, with the greatest service territory in Southern California, installed over 300 miles of fiber optic cable prior to the Games. The heaviest user of the fiber optics program was the host broadcaster, which utilized fiber optic lines for almost all of its 82 video circuits between the sites and the International Broadcast Center. In addition, both companies developed mobile telecommunications trailers which could deliver audio, video and telephone data and voice transmission services of almost all types at each site and which could be installed in a short time. Conduit construction for the major sections of the fiber optics system began in mid-1983 and was completed near the end of the year.

Technology

Actual fiber installation began in January 1984 and was completed in sections and tested through June. Installation on the sites began after the first sections were completed in April and May and continued until just prior to the opening of the Games.

AT&T, as part of its sponsorship agreement, loaned 400-, 600- and 2,000-line switching networks for use at the LAOOC's major sites, including competition and support locations. All competition venues were equipped with these systems except at baseball and equestrian, where existing equipment was adequate for Olympic requirements. Competition venues located on the same site shared a single switching network, as, for example, at the Long Beach Convention and Exhibition Center, where fencing and volleyball were held. The switching systems for the UCLA Village were shared with the gymnastics and tennis venues and the USC Village system also hosted swimming requirements. In addition to the competition sites and villages, special switching networks were also installed at the LAOOC's administrative headquarters building, at the International Broadcast Center and at the Main Press Center. Smaller central office (centrex) switching units were installed at the Biltmore Hotel, Materiel Distribution Center and at the Olympic Arrival Center. A few ordinary business lines were ordered at each site as a precaution against power outages or failures of the switching systems at the sites. All other sites used only ordinary business telephone line service to meet their telecommunications requirements. Placement of actual telephones was developed by the technology group in coordination with the site management staff and the central departments which had a presence at each venue or village. This was an extremely time consuming and repetitive task since most of the eventual users had not been hired when placement planning had to commence.

Care was taken to protect against abuse of the telephone systems installed by LAOOC staff or other individuals. Each telephone line was reviewed to determine what level of access would be assigned to it. Five different levels of access were specified. Many telephones could only call other telephones located within that venue; others were limited to calling Olympic venues, villages and support sites, and some could call anywhere within the Southern California area. Only a few telephones were installed that could call anywhere within the United States and even fewer had unrestricted access to international lines.

18

In addition to meeting the LAOOC's telephone requirements, the local telephone companies (sometimes in conjunction with AT&T and other carriers) provided a wide range of telecommunications services to a variety of customers. The most demanding requirements were for the high number of broadcast-quality lines used by the host broadcaster and other radio and television broadcasters who transmitted pictures and sound of the Games from Los Angeles. A total of 1,337 broadcast audio lines were ordered in addition to the 83 video service lines.

Other special services included installation of 3,794 business circuits and 565 trunked business systems at Olympic sites. A total of 310 data transmission lines were ordered along with 357 private lines (operating between two points only, outside of the ordinary telephone interconnection system). Approximately 65 special data circuits for points outside

19

18 Pacific Bell technicians installing some of the 300 miles of cable in Southern California prior to the Games.

19 Telephone operators answering a few of the five million calls handled during the Games.

California were ordered; many were direct lines between Los Angeles and European cities for use by news media transmitting photographs. Cellular mobile telephones, introduced in the Los Angeles area just prior to the time of the Games, were provided to the LAOOC by sponsor Motorola and were installed in automobiles of senior executives (100) or were handheld (20). Another 225 cellular telephones were installed by Pacific Bell for other Games customers. It was not surprising that thousands of requests were made for ordinary business line telephone service in the last 90 days before the Games and required tremendous effort by the local telephone utilities to meet this demand at hotels, hospitality centers, offices, security and transportation depots, supplier and vendor locations and warehouses.

News media ordered a large number of private telephones for its own use. News media ordered 982 ordinary lines for use at the Games, 471 of which were for the Main Press Center. Journalists, like all other Olympic users (including the LAOOC) who ordered ordinary business lines, were required to pay between \$663 and \$957 per line at each site they wished to install a telephone, depending on when their order was placed. The lowest rates were available for orders placed before 30 September 1983 and the highest for orders received after 1 July 1984. Rates rose on a graduated scale every three months.

Public services, such as coin-operated telephones and charge-a-call telephones, were also provided by all three telephone companies. AT&T, Pacific Bell and GTE all installed calling centers in the Exposition Park area as well as at the three villages. Pacific Bell provided 247 coin-operated telephones at various locations and 853 charge-a-call telephones for use by news media at sub-centers and in the Main Press Center. GTE also provided over 100 charge-a-call telephones. One charge-a-call telephone and one telephone from the LAOOC's village switching network were provided to each National Olympic Committee in its office. NOCs had the option of ordering additional telephones at their expense. The rates for such telephones were the same as for the press. The LAOOC-provided telephone was restricted to calls to other Olympic sites, including all other venues, villages and support sites including the Biltmore Hotel.

Telephone credit cards were much in demand by news media and by some NOCs and over 1,100 were issued.

The LAOOC published numerous in-house telephone directories for

employee use, which gradually included numbers at the sites, as the Games approached. A full site directory, including telephone numbers for major LAOOC departments, all NOC offices and intra-site numbers for the venues and villages was available in mid-July, just after the opening of the villages. Venue listings included a general number and specific numbers for the commissioner's office, International Federation office, massage center, press sub-center, protocol office, security office and venue management office. Numerous department numbers were provided for the villages. A short trilingual (English, French and Spanish) section explaining the use characteristics of the Olympic telephone system was included. Over 15,000 copies of the directory were printed and distributed to the site managers.

Well over five million telephone calls were handled during the Games period by 1,500 operators spread across the sites. The largest volume came at the LAOOC's administrative headquarters, where ten operator consoles were operated around the clock, from 1 June-17 August 1984, handling an estimated 58,000 calls daily. Total volume at the LAOOC was over 1.15 million during the actual Games period of 28 July-15 August. Calls to the USC Village/swimming venue were nearly 900,000 during the Games period with traffic at the UCLA Village/gymnastics/tennis venues totaling more than 750,000. Among non-village sites, the athletics/boxing venue group was highest at 361,626 with the Main Press Center next at 246,716. Daily telephone call traffic averaged about 300,000 calls per day from 28 July through 3 August, then dropped to between 200,000-225,000 calls per day through 12 August. The systems installed at all sites worked very well once fully operational. Only a few breakdowns were reported.

The overall telephone installation total was approximately 7,500 and the total number of calls exceeded 5,000,000.

31.04.15 Telex

The need for telex services was felt initially by the Organizing Committee for its own needs, but was mostly the concern of the press during the Games. The LAOOC worked with Western Union International, which was the official supplier of telex services for the Games.

In the early stages, the LAOOC utilized a single telex machine for administrative purposes, but expanded to four machines in the year prior to the Games. Incoming telex traffic averaged 50 per day from December 1983 to March 1984 and increased to 100 per day from March to May and 300-400 daily from the beginning of June until the beginning of the Games. A staff of five persons was required to handle the distribution of incoming telex traffic until a special task force was organized to route EMS messages to concerned staff members via the LAOOC's in-house EMS terminals. Outgoing telexes averaged 40 per day from November 1983 to March 1984, then increased to approximately 200 per day from March through July.

Needs for the Games period were mostly for the news media. Journalists from outside North America depended on telex heavily, especially at the Main Press Center for transmission of their stories. The technology group worked closely with the Press Operations Department, which specified the amounts of equipment necessary for press use at the various sub-centers and at the Main Press Center.

Installation of the 210 terminals and 285 lines went smoothly with all but 11 lines/machines dedicated to press use. Non-press telex terminals included four for the IOC Secretariat at the Biltmore Hotel and two each at the NOC Service Centers of the three villages. One on-line and one off-line terminal were installed for the FIFA Secretariat at a hotel in Pasadena. The largest concentration of machines was planned for the Main Press Center, where 60 outgoing lines were scheduled to be installed.

During the Games, the terminals worked well, but operators were sometimes undertrained or unavailable. Moreover, journalists quickly overwhelmed the MPC telex station as soon as the Games began, choosing to file their stories there, rather than at the various venue sites as had been expected. The total number of lines was increased to 90 (included in the total of 285) and delays in transmissions were corrected after a few days. In addition to the on-line terminals, 59 off-line terminals were available for journalists to perforate their own paper tapes for transmission at the telex station. Of the off-line terminals, 25 were located at the Main Press Center. Of the total of 13,983 messages transmitted during the Games, 9,900 originated at the Main Press Center. The station with the next highest message transmission volume during the Games was the Coliseum/Sports Arena press sub-center, where 381 messages were sent.

The total number of messages sent was well above expected. While telex service in Montreal eight years earlier had transmitted 8,209 messages with roughly the same number of journalists and other Olympic Family officials, the 13,983 messages sent from Los Angeles represented a 70 percent

increase. Of the Los Angeles message total, well over 95 percent was generated by journalists. The number sent from the three villages combined was little more than 200 and the IOC sent approximately 120. Total transmission minutes totaled 145,725, equivalent to more than 101 solid days of telex transmissions. The pattern of outbound telex traffic was as follows:

Date	Messages sent
19 July	59
20 July	68
21 July	55
22 July	112
23 July	150
24 July	219
25 July	319
26 July	505
27 July	624
28 July	439
29 July	469
30 July	790
31 July	742
1 August	925
2 August	1,016
3 August	777
4 August	556
5 August	536
6 August	792
7 August	851
8 August	696
9 August	837
10 August	896
11 August	563
12 August	549
13 August	409
14 August	29
Total	13,983

It had been hoped that many journalists would utilize the telex transmission capabilities of the EMS. The "write telex" feature was easily added to an individual's option menu by submitting an International Telecommunications Union (ITU) credit card number in advance of the Games. Few journalists took advantage of this, however, and only 418 telex messages were sent from Los Angeles via the EMS.

Inbound telexes during the Games period totaled 3,101 via EMS and 923 otherwise. A special "Herogram" service was set up for National Olympic Committees which wanted to direct congratulatory (or other) messages from within their country to their office facility in the village. NOCs electing to do so rented a separate telex terminal for their village office and then publicized the telex address number of that machine within their country.

Interested fans and supporters could then send messages directly to that NOC's office in Los Angeles. Although only a handful of teams utilized this service, some 15,759 messages were sent with almost 85 percent originating outside the USA.

WUI also provided private telex lines to requesting press agencies in their offices in the Main Press Center and to National Olympic Committees in the villages. A total of 15 such lines/machines were rented. In addition, 23 private communication line services were ordered by press agencies at the Main Press Center.

31.04.16 Timing and measurement

The requirements for timing and measurement services for all of the sports were handled by Swiss Timing. After soliciting bids from a number of potential timing sponsors, Swiss Timing was chosen and included in a sponsorship agreement with the LAOOC in conjunction with Westinghouse. An important factor in the choice of Swiss Timing was its long experience in timing and measurement at past Olympic Games. Under its agreement with the LAOOC, Swiss Timing was responsible for timing services, measurement services (including wind speed gauges), scoring services for sports such as gymnastics and diving, scoreboards (where necessary), and associated support equipment. This additional equipment consisted mostly of small computers to calculate scores, display devices, power panels and the like. A Los Angeles firm was subcontracted to provide support structures for the scoreboards. Services were provided for all sports except baseball and tennis, which did not require any timing services to support the competitions.

Numerous visits were made to Los Angeles by the Swiss Timing group to define and determine the specific needs for each sport. The last major survey of the venue occurred in May 1983 and the detailed planning was begun in September of the same year. Final deployment plans for equipment and personnel were completed in March 1984.

The specific services provided by Swiss Timing included:

Archery: Timing of the shooting periods including display of time remaining in minutes and seconds. Information provided also included the identification of the competitors in rotation order and a lamp to indicate which group was shooting. No data was transmitted to television.

Athletics: For track events, a starting and finishing system was provided. The starting system included a specially designed starter's pistol which simultaneously activated the primary and back-up timing systems

upon firing. In addition, the starter was equipped with a microphone for the starting commands, which were amplified and distributed via speakers fixed to the starting blocks. An automatic false start control detected runners who left the blocks prior to the firing of the starter's pistol in all races of 400 meters and shorter and the 4 x 400-meter relay. Intermediate times were provided for the leading runner at various points through photo-electric cells placed around the track; times were usually provided at the starting and finishing lines for multi-lap races as the runners passed by. Finishing systems included three separate photo-finish cameras which produced pictures within 20 seconds following the completion of a race. Times to 1/100th of a second appeared on the film as well as a rapid reading and printing device which allowed not only quick examination of the photograph, but also a print within six seconds. Back-up timing systems consisted of two videotape machines to record competition in slow motion at 100 frames per second and included an electronic time on the tape via a character generator. The rolling time was used by scoreboards and television and an unofficial finishing time was posted via photo-electric cells at the finish line. Static displays fed to television included the world and Olympic records.

Field event measurement was assisted by wind speed gauges supplied by Swiss Timing. Two special units for the measurement of performances in the jumping and throwing events were available as well as clocks for counting down the amount of time remaining for trials in the field events.

Two digital clocks displaying the rolling time were also provided for the lead vehicle for the marathon and for the walking events.

Basketball: The existing Forum scoreboard was used for the game countdown timer. A second timer for back-up was provided with an independent power supply. A countdown clock for the 30-second shooting period was provided at each end of the court. The scores and time were transmitted to television.

Boxing: The display of the rounds and time remaining in each was posted on the existing scoreboard. Equipment was added to sound a loud tone to signal the preparation period before each round, the beginning and end of each round and the count after a knockdown.

Canoeing and Rowing: A complex timing system was installed which provided assistance at the start and finish, plus intermediate times for all boats. A closed-circuit video system was used to check for false starts. Starting devices were provided as appropriate for the two sports. A wind gauge was positioned at the start and at the 1,000- and 2,000-meter marks. Intermediate times were taken at the 500-meter, 1,000-meter and 1,500-meter marks for rowing and at the 250-meter, 500-meter and 750-meter marks for canoeing. Two photo-finish cameras were provided at the finish line along with a manually operated finish horn. Clocks showing the time of day were positioned in various places around the athlete's area and along the course. The rolling time, intermediate times and finish order were provided for the scoreboard and for television.

Cycling: At the Velodrome, a starting pistol was provided along with electric contact strips on the track. A photo-finish camera was used for the sprint while a videotape system recording at least 100 frames per second was available for the pursuit and kilometer races. Intermediate and final times were provided for scoreboards and television. For the road races and team time trial, starting and photo-finish timing equipment was provided. Intermediate and final times and the lap numbers were fed to television.

Equestrian: Timing was provided to 1/100th of a second for the jumping and Grand Prix des Nations. Displays also showed the assignment of penalty points. The time taken to complete the course and penalty points were both transmitted to scoreboards and television. For dressage, timers were provided along with clocks showing the time of day next to the ring and in the paddock area. For the three-day event, a synchronized starting clock using photo-electric cells was provided.

Fencing: Timing of the bouts was accomplished via electronic timers with illuminated digital displays. An acoustic signal was sounded when each bout ended. Fencing-specific scoring equipment was provided by Uhlmann Fecht-Sport of the Federal Republic of Germany. No data was transmitted to television.

Football: The count-up of playing time was displayed on the existing Rose Bowl scoreboard. Back-up watches for referees were also provided. Similar provisions were made for the other stadiums. The time was transmitted to television.

Gymnastics: Scoring equipment was operated by the IF judges and not by Swiss Timing. The equipment allowed transmission of a contestant's number, display of the marks submitted and calculation of the score according to the rules. Mat clocks were provided for the balance beam and floor exercise stations and showed penalty points for exceeding the time limit or moving off the apparatus. Data available for television was the same as displayed on the mat clocks.

Handball: Rolling time during play was provided during the matches on the Titan Gymnasium scoreboard. A back-up timing system was also provided and both units were operated by IHF officials. The rolling time and penalties were provided to television.

Hockey: The time was displayed on the scoreboard. Back-up systems, including watches for the referees, were provided. Timing information was provided to television.

Judo: The timing system measured the time of the bouts and the out-of-action periods and provided an audible tone at the end of the contest. A back-up timer was also provided. A control desk was provided for keeping track of advantages and penalties. No data was transmitted to television.

Modern Pentathlon: Basic equipment was provided for each discipline. A starting pistol and touch pads allowed for automatic timing to 1/100th of a second in swimming and provided the order of finish. Electronic digital timers were provided for fencing, and manual stopwatches were provided for the shooting competition. Photo-electric cells provided timing to 1/100th second for equestrian. The running portion of the pentathlon was timed by a photo-finish camera and 1/100th second printer. No information was available for transmission to television.

Shooting: Digital clocks indicated the count-down time in hours and minutes and back-up watches were provided for the judges. Clocks indicating the time of day were also provided. No data was provided to television.

Swimming: The basic timing system included a pistol for the start of the races and a touch pad system at both ends of the pool for registering intermediate and final times. A videotape system was also used as a back-up for the touch-pad finish system. The starting blocks included an electric contact to check for false starts in relay races. A speaker was used for each starting block to transmit the starting signal. The timing system provided order by lane with intermediate and final times and order by finish to 1/1000th of a second. The video back-up system recorded at 100 frames per second and allowed timing measurement to 1/100th of a second. The rolling time, leading split and world and Olympic records were provided to television.

For diving and synchronized swimming, scoring pads were provided to each judge and the central unit for the chief judge allowed handling of points and averages, degree of difficulty and dive number.

The average was calculated and then displayed on the scoreboard and fed to television. For water polo, devices for keeping the time of play and between-period breaks were provided for operation by FINA officials. The 35-second shot clocks were connected to the main event timer for control by a single game timer. The period, time and scores were transmitted to television.

Volleyball: Timing was not required, but information was displayed on two scoreboards and the information displayed was also transmitted for television use.

Weightlifting: The remaining time for each lift was displayed on consoles for the judges, along with other information including the decision of the officials regarding the validity of a lift. No data was provided to television.

Wrestling: Each of the three mats had a console for controlling the time in each period and identification of the period and a second console for the awarding of points. An electronic back-up console was provided along with manual stopwatches for back-up timing.

Yachting: Electronic timers with printing capabilities were used for timing, backed-up by manual stopwatches. No data was transmitted to television.

In general, timing in sports featuring individual performers such as athletics and swimming was controlled by Swiss Timing personnel. In team sports and sports using multi-judge scoring systems, equipment was usually operated by officials of the International Federation concerned. The LAOOC arranged for the receipt of the equipment and distribution to the venues prior to the arrival of the Swiss Timing installation teams. The installation period went smoothly as the teams fanned out to various sites, finishing one venue completely before moving on to the next. Complex venues including athletics and swimming required nearly full-time attention during the pre-Games period to complete the installation process.

Considerable concern arose late in the pre-Games period because the group providing this crucial service was not present in Los Angeles or even in the United States. However, with Swiss Timing's tremendous familiarity with Olympic installation and operation pressures from past Games, the equipment was effectively installed and performed without incident. The background, experience and knowledge of the Swiss Timing teams proved valuable in many situations and the take-down phase was equally as fast and thorough as the installation.

31.04.17 Video

Numerous television and other video systems were installed at the Games, requiring more than 3,000 television sets and a myriad of cabling and transmission systems. Some form of video service was installed at nearly all venues and villages, plus major systems at the Biltmore Hotel and the Main Press Center.

At the venues, a closed-circuit system was installed using coaxial cable, providing the international feed of the sport taking place at the site plus the programming of the local television station affiliated with the host broadcaster. Unless another sport was being shown by the host broadcaster as part of its domestic television programming (on the local affiliate), broadcasts of events taking place at other sites were not available. The location and quantity of television sets at each site were requested by the commissioner and his staff. The Technology Department determined the number of sponsor-donated sets to be provided. Cabling was begun approximately two weeks prior to the Games and few difficulties were experienced.

At the villages, special master antenna systems were installed to improve the reception of the local host broadcaster-affiliate and allow village residents to view the domestic programming offered by ABC. Due to the heavy costs involved, it was decided not to provide the all-venue feed produced by the host broadcaster; provision of the world feed would have required cabling from the International Broadcast Center to each village. Instead, antennas were placed on the roofs of various buildings and coaxial cable was run to various locations. In retrospect, it would have been better to provide the villages with the all-venue host broadcaster feed, despite the expense. Village residents were only able to view the U.S. domestic program, which featured the exploits of American athletes, rather than the international feed, which concentrated on no individual competitor or team, but provided basic coverage of events for use by all broadcasters around the world. The ability to view the world feed would have increased the enjoyment of the Games on television by all village residents.

Special requirements at the Biltmore Hotel included "monitor walls" in the suites of the IOC President and LAOOC President. These 20-monitor panels allowed simultaneous viewing of all venues at which a competition was taking place plus the local Los Angeles television station programming. Throughout the hotel, closed circuit channels were used for viewing the world feed of various sports, thanks to a connection between the Main Press Center and the Biltmore.

A coaxial cabling system from the International Broadcast Center carried all venue feeds produced by the host broadcaster to the Main Press Center (MPC). A special distribution system was installed and allowed the installation of a video recording center which produced tapes of all events for use by the press video viewing center within the MPC and for each of the three villages. The video recording center utilized over 40 videocassette recorders and almost 2,000 tapes while the video viewing center was equipped with 40 playback decks and 13-inch television monitors. Over 800 journalists used the video viewing center during the Games. A television lounge with seating for 180 featured 32 large-screen television sets on the main floor.

News agencies with private offices also had opportunities to rent television sets and receive the closed-circuit feed of all host broadcaster venue signals and the accompanying reception of local stations. Wiring for 250 such sets was provided and 184 were rented at \$105 each. The rental process was handled by the Press Operations Department, which then coordinated the delivery of the cable drops and monitors to the various agencies. A daily listing of the events and the channels on which they were to be shown was programmed on Channel 14.

Special video programs included the installation of projection television systems, low-power broadcast installations and the video-ready scoreboard at the Los Angeles Memorial Coliseum. The projection systems produced pictures on very large screens that were several feet in size, but required dimmed light or complete darkness to work effectively. The most notable installation was at weightlifting, where projection systems showed the lifters in the warm-up area. Other locations included the village discotheques, lounges and the Olympic Arrival Center. Twenty of the projection systems were used in all.

Low-power television proved to be the answer to a difficult problem in the Coliseum. Although provided at many prior Games, the expense of installing closed-circuit television monitors in the press seats for athletics led to a decision not to do so at all. A late solution was found which allowed reception of

the three athletics feeds (one track and two field) produced by the host broadcaster and the signal of the local affiliate of the host broadcaster. This was accomplished by using a low-power transmitter to provide these signals within the bowl of the Coliseum only. Standard television receivers were then placed in the press seats and could be tuned to any of the channels featuring the three venue feeds or the local station programming. Some 235 sets were provided for journalists at athletics. A similar situation was faced at swimming just one week before the Games, but 100 sets were available for press use and a transmitter was easily arranged. Low-power television was also used for spectators at the Velodrome for cycling and for canoeing and rowing competitions at Lake Casita. All of these systems were well received and were especially effective in view of their low cost as opposed to cable-based systems.

At the Coliseum, a new video-ready scoreboard was erected in June 1983. Because of the central place of the athletics competition at the Games and the tremendous number of spectators expected to attend all sessions of the sport, a special effort was made to effectively use the videoboard for entertainment and information. Prior to each session of athletics, a short highlights film was shown which included still images or film of past Olympic competitors or competitions relevant to the day's events, plus highlights of the competitions held in previous sessions, with graphics in both English and French. During the competition, pictures were taken from six host broadcaster feeds (one track, two field, one finish line-only shot, a slow-motion replay feed and the overall world feed with graphics) and augmented by three videoboard cameras. This combination worked very well and provided not only a wide variety of images to choose from, but also allowed special emphasis apart from television because of the three videoboard cameras. Especially popular to watch, during the longer races, were the replays of the end of races, field event performances and close-up shots of medal winners during the awards ceremonies. A cohesive crew was developed using an LAOOC producer with the existing Coliseum videoboard technical crew.

Overall, the video program for the Games was fully successful. People came to expect television sets and often took for granted that they would be provided. Fortunately, with 3,037 sets at the various sites, few people were disappointed. The most notable improvement for the future would be the provision of the basic feed for all venues at the villages. The ability to use low-power television transmitters instead of installing coaxial cable at venue sites was a worthwhile development and could be of continuing use in future events.

20

20 The image of FRG high jumper Brigitte Holzäpfel is immediately broadcast over the video-ready scoreboard at the Los Angeles Memorial Coliseum.

21 Swiss Timing scoreboards display intermediate times of runners at various points around the track.

21

Telephone station and call statistics for selected sites

The following profiles the number of telephones installed at each site where an AT&T-provided switching network was installed, including all venues and villages except at baseball and equestrian where the existing equipment was adequate. Call statistics below are as measured from 28 July–15 August 1984.

The figures below do not include statistics from centrex systems installed at the Biltmore Hotel, Materiel Distribution Center or Olympic Arrival Center.

31.04.18 Word processing

The major tool for the LAOOC's word processing needs was the Displaywriter system supplied by IBM as a part of their sponsorship agreement. These stand-alone units have extensive text-entry, editing and printing capabilities and were more appropriate for constant revisions of long documents produced by the various departments than ordinary office typewriters. Although 100 Displaywriters were initially expected to be used by the LAOOC, the Games-period number grew to 190 in the face

of overwhelming demand from the LAOOC staff. The relatively easy operation of the unit combined with its ability to instantly revise and print letter-quality documents made it a staff favorite.

The basic configuration of each unit included 320k memory and 25-line on-screen display with a 60-character per second letter quality printer and automatic sheet feed paper handler. Software used included a basic word-processing program, a data base manager and report generator, an 11-language electronic dictionary and spelling checker and a graphics generation package.

Extensive amounts of time were spent in training LAOOC staff as operators on the machines, beginning in January 1983. Total enrollment in the program over the 18-month period prior to the Games included 360 persons and covered over 8,000 hours of training.

31.05 Summary

By any measure, the Technology Department was successful in assisting the many operating departments of the LAOOC with automated means of communications and information. The functions of results, results publications, scoreboards, sound reinforcement and timing—so visible before the public—were well handled. Not only did technological equipment allow the Games to proceed smoothly, but also added to the enjoyment of the millions of Olympic spectators who attended the events.

The assistance provided to the internal operations of the Organizing Committee was monumental. The impact of the combined electronic messaging and paging system was truly amazing. Never before had so many non-computer literate individuals been able to harness so much communications and information power with so little or no training. The ability to initiate communications dependably, quickly and easily allowed LAOOC management to function independently at the sites and remain in touch with the central departments which provided services for all sites.

In the future, other organizers should note the following elements:

- The Technology Department managed to bring together a group of sponsors who not only provided products for use during the Games, but worked closely to initiate new projects and coordinate their independent systems. Although most of the sponsors were competitors, their dedication to making the Games successful was a major step toward ensuring the

problem-free operation of the technical systems. Otherwise, for example, the paging and telex interfaces with the EMS would never have happened. Even the basic input of the user names and the associated list of permitted functions from the LAOOC's computerized accreditation system to the EMS required tremendous cooperation and coordination between IBM and AT&T. The interest in creating interlocking systems led to a new level in communications efficiency and use.

- With the tremendous increase in technology in today's world, potential Games systems must be evaluated carefully. Once selected, the most important task is to educate users—whether Organizing Committee staff members or Games-period guests—regarding the availability and operation of these systems. Although many systems were used in Los Angeles, most of the attention was focused on the EMS: its easy operation and obvious availability invited trial use. It would be worthwhile for organizers to consider circulating primers on the availability and use of all systems installed for the Games and to have "demonstrator" models available during pre-Olympic competitions. Demonstration systems should also be installed in the Organizing Committee offices to allow visitors the opportunity to learn about the various systems before they return to the host city for the Games.

- Despite the best planning, technical equipment is worthless if not properly installed in a timely manner. Care must be taken so that Construction and Technology Department management—both central and at the sites—combine schedules for installation of technology-dependent elements such as electrical power and trailers so that systems are available at the time they are needed by venue staff.
- The operation of the technology systems during the Games was well handled by the venue technology managers. The intensive training program allowed each to become proficient with all systems in use and helped tremendously in the early days of venue operations, since users operating various systems for the first time depended on the expertise of the venue technology managers. Equally important for the VTMs and the full-time LAOOC Technology Department staff was the ability to experiment with and learn the idiosyncrasies of most of the systems at the many LA83 events. These events helped to familiarize everyone with the systems to be used in an environment which was close to Games conditions. The opportunity for "live" testing of technical systems is an absolute necessity for any venture on a scale as large as the Olympic Games.

Site	Number of stations	Number of calls received
Archery	100	34,598
Athletics/Boxing	527	361,626
Basketball	137	94,184
Canoeing/Rowing	117	77,611
Cycling	113	37,683
Fencing/Volleyball/Yachting	339	156,762

Totals:	210	285	59

Note that all terminals and lines were for press use except for four terminals and lines at the Biltmore Hotel (IOC use), two terminals and lines at each village (NOC Service Center) and the installations at the Huntington-Sheraton Hotel (FIFA use).

Technology

- The use of an electronic messaging system provided a new plateau in communications ease and efficiency. AT&T's EMS handled the diverse needs for messages, Olympic information, schedules and added the possibilities for paging and telex services for those who had such needs. Not only was the communications function integrated because of the EMS, but the requirement for many additional interpreters and translators was eliminated. The system was worthwhile because of its "one-stop" communications and information abilities, and was staggeringly successful because of its easy operation. All such systems must be similarly easy to understand and use if they are to be successful.
- The desire for closed-circuit television coverage of the Games at the sites was remarkable. It seemed as if every department at every site felt some need for a television set to view competitions taking place at that site as well as those taking place at other sites. It should be noted that the interest in such viewing was highest among staff and proved to be a positive motivational tool. Those organizing similar events should consider the motivational benefits, as well as protocol or status requirements when placing television sets.

- The need for closed-circuit feeds to the villages from all venues was underscored in 1984. Although tapes of all competitions were available, athletes and team officials were unable to view live competitions at sites where their countrymen were competing and may have thus missed some feeling of team unity in the giant multi-sport program of the Games. Despite the potentially large costs, future organizers are recommended to provide this service at the villages, if not elsewhere.

The technology services provided at the Games of the XXIIIrd Olympiad proved that innovation and the willingness to apply untried solutions can result in systems that solve problems which have plagued Games organizers for decades. As the pace of technical discovery quickens in the future, the possibilities for further improvements are limited only by the collective mind of the organizer and by the nature of the event in which the new system must function. Those that combine widely available, easy-to-use equipment with an important function demanding automation for successful operation will improve the quality of the Games.

32

32.01 Concept and goals

If the Games of the XXIIIrd Olympiad were to be successful, television would have to play a large role. To fund a privately-run Games without the support of government money or an Olympic lottery (then illegal in the state of California), the LAOOC would have to secure the funds from the sale of exclusive television rights in the United States and other countries. The popular success of the Games would largely depend upon the reaction of television viewers around the world who watched the Games. With a potential television audience in the billions, as opposed to the 7.7 million tickets available, it was important to assure the widest possible viewership and to make preparations which would make a favorable impression of the Games on television viewers in countries around the world.

Planning for television rights sales began even before Los Angeles had secured the right to host the Games in 1978. The actual sales process began immediately after the appointment of the senior management in late March 1979. Rights sales continued through 1984, concluding only days prior to the Opening Ceremonies on 28 July. Although the LAOOC wished to raise as much money as possible from the sales of world-wide rights, it also recognized the inability of some small nations to pay large sums for these rights. Moreover, among such countries it was as important that the Games be shown there to develop interest in them and in the Olympic Movement as it was to derive the greatest possible income. However, the LAOOC fully expected each large nation to pay a fair price for the rights to televise the Games.

Revenues from television broadcasters were often split between rights fees and additional payments for other assistance and services rendered by the LAOOC. Per an agreement with the International Olympic Committee, one-third of all fees paid for the television rights were remitted to the IOC with two-thirds retained by the LAOOC. The IOC has typically split its share in thirds again, keeping one-third (one-ninth of the overall rights sale fee) for its administrative costs and distributing two-thirds of its share to the International Federations and NOCs (the latter share distributed through the Olympic Solidarity program). All monies paid by broadcast entities for assistance, services and items other than rights were retained by the LAOOC. Technical broadcast facilities and equipment such as cameras, commentator positions, production equipment, studios and the like, had to be arranged and paid for independent of the rights and services fees paid to

the LAOOC. The Organizing Committee's agreement with ABC as host coordinating broadcaster required ABC to coordinate all such technical requirements on behalf of the other broadcasters licensed by the LAOOC.

The LAOOC developed and expanded its Television Operations Department beginning in 1983. In coordination with the Press Operations Department, the program for servicing those who had bought broadcast rights during their work in Los Angeles was developed and executed. Although the basic concept was to have broadcasters deal directly with the U.S. rights-holder/host broadcaster for all of their production and technical requirements, certain areas required direct supervision by the LAOOC and led to the creation and development of the TV Operations group.

32.02 Sales of the television rights

32.02.1 Sales in the United States

On 1 March 1979, the fledgling Organizing Committee which had not appointed its senior management, was headquartered in the law offices of its chairman (who was also the president of the local group which had secured the franchise to organize the Games) and had only a few thousand dollars of working capital. The raising of more than half a billion dollars to support the Games and the forming of a staff which would operate them was started through the immediate marketing of U.S. television rights to eager bidders representing cable, network and pay television.

Rights fees for televising (both Olympic and Olympic Winter Games) in the United States had risen steadily since the first (large-scale) TV broadcast from Rome in 1960. Rights cost almost \$400,000 then but reached \$4.5 million at Mexico City and \$7.5 million for Munich. Rights and technical facilities for the American Broadcasting Companies (ABC) reached \$25,000,000 for the Montreal Games and the National Broadcasting Company (NBC) paid \$85,000,000 for rights (\$35 million) and facilities (\$50 million) for the Games of the XXIIrd Olympiad in Moscow in 1980. The LAOOC hoped to negotiate a large fee which would provide the Organizing Committee with a firm financial base for its operations.

Important steps toward the realization of this goal were made during the negotiations for the awarding of the Games to Los Angeles. In April 1978, the leadership of the IOC met with the bid committee from Los Angeles and others and established that the Organizing Committee would negotiate the United States television rights agreement subject to the approval of the final agreement by the IOC. In addition, the rights agreement would be written in English and subject to the laws of the state of California. These were unusual provisions in light of the Olympic Charter (1978 Provisional

Edition) which states that "*The IOC may grant a broadcast and/or distribute the Games in its national territory*" and that "*all agreements with radio/television networks, whatever their terms, shall only be negotiated jointly by the IOC and the (Organizing Committee)*". All other television rights agreements were to be negotiated jointly by the IOC and LAOOC. Distribution of the television rights payments was also agreed to with one-third of the rights fee to go to the IOC and the remainder to the Organizing Committee.

The LAOOC's Television Advisory Commission initially met on 9 May 1978 and determined that the sale of rights would include presentations and negotiations rather than simple blind bidding. At a later meeting, it was decided to require each company bidding for the U.S. rights to deposit \$750,000 as a show of good faith to enter the bidding process. These deposits were to be refunded, without interest, after selection of the U.S. rights-holder. An initial deposit of \$500,000 was required to show serious interest in April-May 1979 with the remaining \$250,000 qualifying entities for the actual bidding in September 1979. Five companies including ABC, Columbia Broadcasting System (CBS), Entertainment and Sports Programming Network (ESPN), NBC and Tandem Productions, posted the required deposits and were allowed to proceed into the bidding process. The April deposits provided the LAOOC with \$2.5 million in much-needed start-up cash.

Prior to the beginning of the actual bid presentations, the U.S. television negotiating sub-commission, composed of experts in the field, explored the probable worth of the U.S. television rights from the viewpoint of the bidders. Probable airtime of the Games was calculated along with the number of commercial (advertising) minutes, an estimated advertising rate and production costs. The resulting estimates led the negotiating sub-committee to believe that the sales of rights and support services for Los Angeles would be for an amount far greater than could have been anticipated by reference to the prior history of increased rights sale fees over time.

Actual presentations began in September 1979. The LAOOC determined that the necessary ingredients of the winning bid would include: (1) supply of a host broadcaster signal including audio and video for use by non-USA broadcasters licensed by the LAOOC; (2) a television broadcast center provided by the winning bidder at no cost to the LAOOC and (3) a rights/production and support services fee of

at least \$200 million (\$100 million for each). ABC's bid of \$100 million for rights and \$125 million for production and supportive services of the LAOOC was selected and on 26 September 1979, the IOC and LAOOC announced the award of the exclusive television rights for the 1984 Olympic Games to ABC. The agreement was signed in Nagoya, Japan, on the same date.

The IOC and LAOOC agreed on the IOC's share of the rights fee, amounting to \$33,500,000 and providing for nearly three-quarters of the total to be paid by mid-1980 for maximum financial impact to the IOC.

The agreement among ABC, the IOC and the LAOOC noted the payment fee and schedule as well as a variety of terms. The LAOOC agreed to assist ABC in its role as host coordinating broadcaster of the Games, including priority over all other media regarding camera and commentator locations, technical facility placement and access to athletes for interviews. A clause was placed in all other television rights agreements declaring and explaining ABC's priorities in these areas. The LAOOC also agreed to arrange for first-class accommodations near the venues for production personnel at ABC's expense and to provide accreditation and parking, as needed, for ABC personnel and vehicles. Additional provisions were made for lighting and power, results service, security and other services. ABC also was given an opportunity to buy Games tickets at a later date at its own expense.

As host coordinating broadcaster, ABC agreed to provide a live basic feed of virtually all venues including color picture and international sound (natural sound without announcer or commercials) to be made available to broadcasters licensed by the LAOOC. The agreement noted plans to present events such as archery, football preliminaries, shooting and yachting via a different medium such as film but to make whatever coverage was compiled available to the LAOOC and the LAOOC's other licensed broadcasters. ABC additionally agreed to provide a central television broadcast center of at least 100,000 square feet at no charge (for the raw space) to the LAOOC and its licensed broadcasters. The basic feed would be produced at the venues and delivered to this central broadcast facility at ABC's expense, including the audio and video circuits from the originating sites necessary for delivery. The costs of improvements to the raw broadcast center space by broadcasters would be charged to licensed broadcasters although no payment was required to ABC to simply take the basic feed from its delivered location at the broadcast center and send it on to another site for broadcast, editing or other production work. ABC agreed to coordinate all other broadcaster requests at the expense of the broadcast entities

concerned, including construction at the broadcast center, equipment installation there and at the venues, production, results and transmission facilities and support services.

The agreement also entitled ABC to an appropriate adjustment in the amount paid to the LAOOC if the USA team or other prominent national teams did not participate in the Games and as a result, the value of the rights were diminished.

32.02.2 Sales in Australia

Although aligned with the Asian Broadcasting Union through the 1976 Games, Australia became an important purchaser of broadcasting rights in 1980 when the Seven Network paid \$1,360,284 for rights to the 1980 Olympic Games in Moscow. Since strong competition existed in Australia among three networks, the LAOOC accepted bids for the rights to the Games.

An agreement was reached with Network 10 of Australia and announced on 2 February 1982. Its bid of \$10.6 million in the first bidding round was sufficient to end the competition

and gain the exclusive broadcast rights in Australia for the Games. A detailed agreement was concluded later the same year. Both television and radio exclusivity were included, with radio rights exclusive for a period of 48 hours following the completion of an event covered in the programming. Network 10 later sold, with permission, its exclusive radio rights to the Australian Broadcasting Commission.

The agreement noted ABC's host broadcaster responsibilities and the availability to Network 10, without charge, of raw space in the broadcast center to be arranged by ABC. For all production and technical requirements in addition to the raw space at the broadcast center, Network 10 agreed to deal with ABC.

32.02.3 Sales in Europe

Television rights sales in Europe involved two different groups, roughly split along geographical lines. The European Broadcasting Union (EBU, also known as Eurovision) consists of western European, north African and Mediterranean coast nations, while the Organization of International Radio and Television (OIRT, also known as Intervision) is made up of Eastern European countries including the Soviet Union. The LAOOC dealt independently with the geographic regions represented by these groups.

The recent rights fees paid for European television coverage of the Games included \$6.5 million for EBU and OIRT together in 1976 (half for rights and half for facilities) and in 1980 \$5.95 million for the EBU (\$5 million in rights) and \$1.5 million for the OIRT (all rights). Negotiations regarding European TV rights sales began shortly after conclusion of the ABC agreement.

The EBU nations had traditionally held together in negotiations, presenting the organizers with a difficult negotiation position regarding the western European area. However, in late 1981, a commercial television station in Italy offered \$10 million for rights in Italy alone, more than the EBU had previously bid for all of its 36-nation territory. Although the LAOOC would have preferred to deal individually with the larger member nations of the EBU, a series of meetings culminated in Los Angeles on 3 December 1981, when the EBU, IOC and LAOOC agreed on a \$19.8 million package including \$12 million for rights and \$7.8 for services provided by the LAOOC. Fifteen million dollars (\$15,000,000) of the total was payable by 1 March 1982, with the remainder spread out over an agreed schedule.

A detailed agreement was completed in February 1982, including the detailed package of services rendered by the LAOOC:

- Assistance in securing accommodations for EBU personnel, at EBU's expense
- Accreditation as necessary for EBU personnel for entry into the venues and villages
- "Raw space" at the International Broadcast Center
- Assistance in arrangement of EBU's camera and commentator booth requirements, including both fixed and portable cameras
- Assistance in obtaining duty-free temporary import licenses
- Information services, both electronic and written
- Assistance in the hiring of local staff and in obtaining work permits if necessary
- Availability of tickets for purchase for EBU personnel and guests
- Transportation assistance, including priority parking for EBU vehicles and help with vehicle rentals
- Use of the LAOOC's *Star in Motion* emblem and *Sam the Olympic Eagle* mascot in the EBU member countries' advertising and promotion of the EBU broadcast of the Games

Sales to the OIRT countries were complicated by the problems of currency conversion and exchange rate against the United States dollar in the member nations. Several schemes for rights sales including cash and various kinds of equipment were proposed, but since the negotiations carried on into February 1984, the LAOOC had no need for the proposed supplemental equipment.

An agreement was finally concluded in February 1984 for rights fees totaling \$3,000,000. The contract included a caveat that reduced the rights fee to \$2.5 million if Poland decided not to televise the Games. In view of the boycott by most of the OIRT-member nations, an agreement was made to fix the rights fees at \$2.5 million for OIRT's coverage of the Games in Los Angeles.

32.02.4 Sales in Japan

Negotiations for rights sales in Japan began in 1979. In past Games, Japan had purchased rights as a member of the Asian Broadcasting Union (ABU) until 1980, when TV Asahi purchased exclusive rights for \$4.5 million. The LAOOC determined early that it would deal independently with Japan.

Negotiations continued into 1983 with the television entities in Japan forming a pool-the Los Angeles Olympic Japan Pool or LAOJP-to deal with the LAOOC as a single entity. The pool included the national Nihon Hoso Kyokai (NHK) network and more than 100 commercial broadcasters in Japan. An agreement was finally reached in February 1983 for the sale of the rights for \$16.5 million with another \$2 million for a services package similar in scope to that of the EBU. In addition, rights for all of the LAOOC's 1983 events were purchased for \$500,000.

Countries which purchased exclusive television rights to the Games

NBC Sports Television	0	85,000	0
Westwood One (Spanish) Radio	0	0	100
Total	33,862.2	101,182.3	286,764

Note that another \$500,000 was paid by Japan for the rights to the LAOOC's 1983 events: the rights/services sales total was thus \$287,264,000.

32.02.5 Sales in North and South America

In both Canada and South America, broadcasters dealt with the LAOOC as a group to purchase television rights. In Canada, the National Canadian Broadcasting Corporation (CBC) joined with the CTV network and Le Reseau de Television TVA Ltee. as a consortium, while 18 Central and South American nations worked through the Organizacion de la Television Iberoamericana (OTI) to purchase Games TV rights. In 1976, OTI paid \$600,000 for rights and facilities and \$1,060,000 in 1980. Canada's 1980 payment for rights was \$1.2 million in Canadian dollars.

The Canadian consortium noted that while it produced its own bilingual coverage of the Games, a substantial percentage of its population was close enough to the United States to receive U.S. broadcasts, including ABC's. This was a factor in the eventual agreement of rights sales of \$3 million in cash. In addition, the Canadian consortium agreed to provide consulting time from members of the host broadcaster team from ORTO '76 and some radio transmission equipment.

Members of the OTI group began rights talks with the LAOOC in 1981 and concluded an agreement in April 1983. Although only a taped highlight summary had been used by most of the OTI members in 1976 and 1980, heavy unilateral coverage was expected in 1984, especially by Brazilian and Mexican television entities. Under its agreement with the LAOOC, a total of \$2,155,000 was paid by the OTI in rights fees.

An agreement for television rights for 12 nations affiliated with the Caribbean Broadcasting Union (CBU) was completed in April 1984 for the sum of \$99,000.

32.02.6 Sales to other areas

Sales of television rights to other areas began immediately after the award of U.S. television rights and were not completed until days prior to the Opening Ceremonies of the Games. Major areas of concentration included Asia, with scattered activity in smaller areas.

Asian broadcasting of the Games had previously been arranged in conjunction with the Asian-Pacific Broadcasting Union (ABU), which purchased rights in 1976 for \$2.1 million including Japan. In 1980, the Japanese bid separately, and the remainder of the ABU acquired rights for \$450,000. The LAOOC dealt separately with the largest Asian nations, while the ABU completed its financial obligations to the Organizing Committee of the 1980 Olympic Games and the IOC through 1982.

The LAOOC was able to sign rights agreements with broadcasters from New Zealand and the Philippines in 1982. Both agreements were announced in July 1982, with the Broadcasting Corporation of New Zealand paying \$450,000 for rights and the Kanlaon Broadcasting System paying \$400,000. The completion of these agreements was especially significant in demonstrating the LAOOC's commitment to independent negotiations with Asian broadcasters.

Additional agreements were signed with major broadcasters in 1983 and early 1984. Rights for Hong Kong were sold for \$325,000 in late 1983 to Television Broadcasts Limited (TVB). Broadcasting rights for the People's Republic of China followed in December 1983 for \$200,000 and a \$3.5 million agreement for television rights and services was reached in March 1984 between the LAOOC and the Korean Television Pool (KTVP). Korean television rights sold for \$2 million, with another \$1.5 million paid for special reports and services regarding the LAOOC's preparations for hosting the world's broadcasters at the Games of the XXIIIrd Olympiad. Television rights for Chinese Taipei were sold later for \$300,000.

An agreement for television rights in Malaysia was completed in June 1984 for \$190,000 with the Sistem Televisen Malasia Berhad. The ABU, representing eight remaining Asian nations, finally signed an agreement with the LAOOC for television rights to signals obtained from another area broadcaster for \$125,000.

Sales in Africa were concluded with the 43-nation Union of National Radio and Television organizations of Africa (URTNA) in April 1983 for \$200,000. However, only eight nations could actually contribute rights fees and the actual total received was \$110,000. Most of the accreditations and production facilities were utilized on behalf of Nigerian television.

Eleven Arab nations combined to purchase television rights through the Arab States Broadcasting Union (ASBU) for a total of \$350,000. It was the final agreement to be completed and was signed only 11 days prior to the opening of the Games. A separate agreement for broadcast rights with the Arabian-American Oil Company (ARAMCO) was made for \$60,000.

32.02.7 Reflections on the sales of broadcasting rights

There is no question that a significant factor in the financial success of the Los Angeles Games was the successful sale of television and radio broadcasting rights. In all, 156 nations acquired such rights and payments to the LAOOC totaled slightly more than \$287,000,000—almost three times as much as collected in 1980. Moreover, the wide viewership arranged by these rights brought an estimated audience of more than 2.5 billion persons the opportunity to see Games action and helped to make the Games of the XXIIIrd Olympiad an artistic as well as financial success.

In retrospect, the following observations can be made:

- A significant factor in the negotiation of the U.S. television rights was the examination of the worth of the rights to the winning bidder from the bidder's perspective. The careful examination of the probable advertising revenues and production and rights costs adjusted the sights of the negotiation team toward an appropriate level eventually reached by ABC's winning bid of \$225,000,000 for rights and related services.
- The attempt by the LAOOC to remove itself from the business of being the host broadcaster was successful. A significant concern of the original negotiators of the U.S. rights agreement was to place upon the winning broadcaster the responsibility for hosting the foreign broadcasters whom the LAOOC would license to carry the Games. This prevented the LAOOC from entering a business it knew little about and recruited a partner whose business was television production.
- Rights sales to individual countries rather than regional union groups proved startlingly successful in the Asian-Pacific region. Rights sales to Australia, China, Chinese Taipei, Hong Kong, Japan, Korea, Malaysia, New Zealand, the Philippines and the ABU totaled \$33,090,000. The total paid for the same region in 1976 was \$2.1 million and in 1980, \$6,310,284. The same approach might have worked in Europe had the individual national members of the EBU purchased rights individually.

□ While the sums for rights in nations able to pay them soared in the period prior to the 1984 Games, several unions and their members were restricted by economies not as well developed or by currency exchange and valuation problems. Keeping in mind the importance of exposing the Games to as wide an audience as possible while raising necessary revenues, the LAOOC—with the knowledge and approval of the IOC—adjusted rights payments in some areas and accepted less in others. Although not generally successful, the attempts to look for technical and other barter items which could be purchased in nations using their own currency and then shipped to the LAOOC was creative and should not be overlooked in the future.

32.03 Television operations by the host broadcaster

32.03.1 Areas of responsibility: Basic and unilateral

ABC accepted a mammoth responsibility in becoming the host broadcaster for the Games of the XXIIIrd Olympiad. Its task included not only production of vision and sound for those sports which ABC would show to its domestic (U.S.) audience but also the arrangement of signals from all venues so that the world-wide broadcast community could bring the Games to their domestic audiences as well. Accordingly, ABC was required to plan for every venue regardless of U.S. interest in order to provide appropriate service for the hundreds of foreign broadcast entities which eventually purchased rights from the LAOOC to televise the Games. The initial coverage plan was submitted in September 1979 with ABC's bid for the United States broadcasting rights and was refined in the final agreement among ABC, the IOC and the LAOOC. However, much work remained before the coverage, as presented during the Games, took shape.

In order to meet the needs of its client broadcasters, ABC met several times with broadcast groups beginning in November 1981. ABC outlined the basic coverage areas and provided equipment reservation and pricing information for broadcasters requiring commentator positions, offices, radio and television studios, videotape machines and other facilities. Representatives from the major telecommunications companies operating in the USA were also present to discuss circuit requirements and booking of satellite time.

Individual meetings with broadcasters were held by ABC after exclusive-rights agreements were completed by the LAOOC. The Olympic Broadcasters Advisory Commission (OBAC) was formed in early 1983 since most of the major broadcast entities had acquired rights or were very close to doing so. The first OBAC meeting was held in May 1983. Topics included: access controls within the broadcast commentary areas at the venues, camera locations—especially unilateral cameras and production trucks—at the

venues, distribution control, results service, scheduling, transportation and other items. A listing by broadcaster and venue of the unilateral cameras desired was compiled. The LAOOC also distributed a detailed questionnaire regarding areas under the control of the Organizing Committee such as accreditation, housing and transportation.

A second OBAC meeting was held in September 1983, at which ABC distributed its first handbook for broadcasters, the *"International Broadcast Center: Update No. 1"*. The IBC preparations were dealt with in detail, including sections on venue coverage preparations. The OBAC meeting again focused on the IBC preparations, telecommunications requirements and venue coverage plans and a one-day meeting with the LAOOC was held.

ABC published additional details of its plans in *"International Broadcast Center: Update No. 2"* in January 1984. Information on the progress of the IBC construction project, venue camera coverage, bookable facilities, production cueing and support services were included along with technical guidelines for participating broadcasters and an LAOOC report noting the results system and transportation services proposed. This information was updated during the final OBAC meeting in April 1984.

The final five-day OBAC meeting focused on: scheduling and venue-by-venue production plans (day one); results/timing and announcer information systems (day two); venue commentator positions, research information and coverage of the Opening and Closing Ceremonies (day three); distribution center, world unilateral camera platforms and IBC operations (day four) and a meeting with the LAOOC on day five. Accreditation, results system operations and transportation were the main issues discussed with the LAOOC.

The major aim of these meetings was to familiarize broadcasters with the preparations made for them so that their own broadcast operations would proceed as smoothly as possible. Meanwhile, ABC had its own domestic programming to complete in addition to its broadcaster responsibilities since more than 187 hours of coverage were scheduled. ABC set up another broadcasting center for its own (United States) coverage (the Unilateral Broadcast Center or UBC) and developed its own programs there. This approach proved successful as all of the International Broadcast Center's (IBC) resources were dedicated to servicing the foreign broadcasters producing their own programs and were not borrowed for ABC's unilateral needs.

6

32.03.2 International Broadcast Center

ABC chose the Sunset-Gower Studios in Hollywood, California, as the site of the International Broadcast Center (IBC). Formerly the home of Columbia Pictures, the studios were built in the 1930s and the lot offered a number of empty soundstages which could be easily adapted for broadcaster use. They were also located close to an office of Pacific Bell, one of the local telephone utilities, which became the convenient coordinating point for venue feeds.

ABC's IBC operation was divided into eight departments: booking office and telecommunications, engineering, finance and administration, information office, logistics, physical plant and construction, venue operations/world production liaison and venue operations/liaison staff. The booking office handled all requests for bookable facilities such as studios and venue unilateral camera positions and processed all telecommunications requirements, including video and audio circuits. Engineering was responsible for all technical facilities, including the IBC distribution center and transmission control and venue commentator system operations. Finance and administration processed broadcaster and vendor accounts, personnel and shipping and receiving in addition to equipment purchases. The information office acted as a liaison with the LAOOC, prepared and distributed the IBC Update series and produced the 150-page International Broadcast Center Manual of Information, which was distributed to broadcasters upon arrival. The logistics office handled IBC accreditation, parking, security, support services and vehicle rentals. The physical plant and construction

6 Cameraman shoots panoramic view of Southern California scenery for insertion into television broadcasts.

Television and Film Operations

group physically transformed the Sunset-Gower Studios into the IBC and installed air-conditioning, necessary electrical support and the hard walling for broadcaster offices. Venue operations/world production liaison provided information on athlete profiles, daily briefings, news conferences, summaries and venue scheduling. Venue operations/liaison staff was responsible for coordinating the broadcaster operations in the venues and supervised the venue managers and liaisons at each site, including assistance with results and pre and post-session unilateral programming sessions.

Construction began after each broadcaster specified its needs for offices, production space, studios and the like. Contracts were signed by each broadcast entity making modifications, with facilities for the EBU (including separate facilities for the British BBC and ITV and the German collective ARD/ZDF) and the Consortium of Canadian Broadcasters begun in May 1983 and completed approximately six months later. Construction of areas specified by Australia's Network Ten, the LAOOC, Broadcasting Corporation of New Zealand and Kanlaon Broadcasting of the Philippines began in October 1983 and was completed in

February 1984. Remaining construction for broadcasters from the OIRT and OTI groups, as well as the Korean TV Pool, was started in February 1984 and completed in June. The staggered construction schedule allowed flexibility in the final design, and the IBC finally contained slightly more than 110,000 sq. ft. (10,223 sq. m) of ground space for broadcaster use.

Broadcasters, support groups and vendors with offices were housed in buildings 13, 20, 21 and 22, stages 4, 8 (including support building 8S), 9 (including support building 9S), 74 and 75 and trailers placed in a central, open area.

All of these facilities were removed after the Games, and the lot was restored to its original condition.

Facilities for broadcaster program support included the accreditation, booking and information offices along with supplemental coverage made available by ABC. Accreditation for IBC-only access took place at a trailer open from 0900-1700 hours daily. The

LAOOC operated an accreditation booth for regular Games accreditation from 4-10 July for early-arriving broadcast personnel whose applications had already been submitted.

During that time, 381 persons received accreditation; all remaining accreditation was done at the Main Press Center from 14 July through the Games. Visitors' passes were arranged through the accreditation office.

The booking office was located in Stage 4 and operated from 22 July to 12 August between 0700-1900 hours daily. Bookable facilities at the IBC included:

- Off-tube commentary positions at the IBC
- The television studio in Stage 74 (including three Ikegami HK322 camera chains, a production switcher and audio console) from 26 July-13 August
- Venue parking cards for broadcaster vehicles
- Venue program summaries
- Venue unilateral camera platforms
- Venue unilateral transmission sessions
- Video tape machines in Stage 8S; three, one-inch machines were available, in addition to three (three-quarter inch) and three (half-inch)

machines (one playback only) from 24 July-13 August

Commentator position identification tags and tickets for restricted entry-events were distributed through the booking office. Schedules were compiled daily regarding national and international transmission schedules and radio frequency (RF) system television channel allocations. For items without charges, booking was made on a first-come, first-served basis. Charged items were booked only after full payment was received. Cash, cashier's checks, wire transfers to the booking office account or account transfers at the IBC bank branch were accepted. Confirmed bookings canceled at least two days before the scheduled use were refunded at a rate of 50 percent. Cancellations received less than two days before scheduled uses were not accepted. Booked facilities unavailable because of schedule changes or malfunctions were refunded in full. Overtime uses were allowed only if time was available and the additional time was charged at the normal rate.

 RF DIST. – RF Distribution System

The IBC information office provided athlete biographical and research data compiled by ABC Sports. This office also provided shot lists and time logs for the summaries compiled daily from venues covered by summary only. The information office also operated a bulletin channel on the IBC's internal television system which noted schedule changes, the restaurant menu, weather information and special events. Broadcasters met daily in the IBC briefing room on matters of mutual concern, usually at 1400 hours.

Supplemental coverage was available through the booking office. Athlete profiles compiled by ABC for its domestic programming were available to broadcasters who had to book tape machines and time for duplication. ABC required that these segments be used complete and unedited and provided description sheets and time logs to accompany all profile pieces. The opening animation pieces that introduced each segment from the venues was also available, with accompanying charts, maps and technical information. Additional coverage was available from cameras showing live shots from various scenic locations around the Los Angeles area. An audio line was installed from the main interview room of the Main Press Center to monitor news conferences at that location.

Facilities for technical services included the distribution center and transmission control as well as many bookable facilities. The distribution center processed the incoming vision and sound circuits from the venues, including events covered by summary only. Functions of the distribution control included routing, synchronization to the master signal reference, amplification for distribution and monitoring. Audio circuits carrying international radio sound were also terminated, amplified for distribution and monitored; in addition, audio and video test signals were generated for distribution at the distribution center. The transmission control served as the interface between the IBC and the telecommunications companies which carried the signals generated at the IBC through their national and international circuits to the intended end station. Program video and audio lines and communication audio lines were terminated at the transmission control, and distribution apparatus for venue feeds to the IBC television monitors was also housed there. IBC power arrangements included emergency generator back-up with automatic change-over in case of failure.

Support services at the IBC were designed to make the broadcasters feel at home. Banking facilities were available on the IBC lot from 9 July–15 August from 0900–1800 hours daily and included check-cashing and foreign exchange. DHL provided international courier services, while F.B. Vandegrift helped with customs

clearance and delivery. Food service in the rearranged Stage 79 included a full-service bar, ice cream store and restaurant. Operations began on 9 July from 0700-1500, with hours changing to 0700-2300 from 16 July-12 August. Coupon books offering food, drink and ice cream at a discount were available. The restaurant also offered after-hours food service and office coffee service to broadcasters making arrangements in advance. Language services including interpretation and translation were available at an office in Stage 4. A newsstand and office supplies shop were located in the restaurant facility in Stage 79. The U.S. Postal Service set up a modular office in the central lot area and operated from 0900–1700 hours daily from 16 July–12 August. Supplies, including raw film and tape stock, were also available. Travel services were handled by the ABC Travel Department and the Hollywood Chamber of Commerce. Amateur radio facilities for operators with the proper licenses were available.

32.03.3 Venue operations and production

Live television signals needed to be produced at nearly every venue in order to provide licensed broadcasters with a choice of events to share with their viewers. ABC required massive amounts of equipment and personnel to accomplish this task and followed a detailed plan at each site in production of the signal from that venue. The result was a series of clean broadcast signals at the IBC, each of a high technical quality, for use by broadcasters.

With 21 sports on the competition program plus two demonstration sports, a wide variety of signals was available at any one time during the day to make up the so-called "multilateral" program. The multilateral program provided audio and video feeds from the venues for use by licensed broadcasters and was sometimes augmented by individual broadcasters' own unilateral material. The multilateral program was designed to cover the competitions without focus on a particular nation or group but rather with an objective view to make it usable as widely as possible. Additional unilateral opportunities allowed broadcasters to add specialized coverage if desired. Facilities for both were provided in the ABC venue planning process.

The multilateral program consisted of signals prepared at each venue where live production facilities were located plus taped summaries of archery, preliminary football, modern pentathlon, shooting and yachting. Facilities for live transmissions included mobile

unit compounds at each site and both fixed and handheld cameras, character generators and videocassette and videotape recorders. Production trailers were also included at most sites. Each site produced a single outgoing feed for multilateral program use except for athletics (three feeds) and gymnastics (two), which featured multilateral programming of their own on the field of play. Approximately 188 cameras, 25 character generators and 40 videocassette and 75 videotape machines were utilized in all. ABC built special vehicles for the marathons (electric cars and motorcycles) and for canoeing and rowing (minimal wake boats) and used underwater cameras in diving, synchronized swimming and water polo.

The beginning and ending formats of the multilateral transmissions from each venue were standardized for easy reference. Multilateral transmissions began five minutes before the official starting time of scheduled events with the final 30 seconds prior to the transmission in black to warn broadcasters and technical staffs of the beginning of the program. Commentators were warned by audible tones in their headsets with two minutes and one minute remaining before the start of transmission. International sound accompanying the video began and ended with multilateral transmission times, although international sound for radio began 15 minutes prior to the beginning of the TV transmission and ended 30 minutes after the TV transmission did. End of transmission signals at three, two and one minute to go were sent by audible tone through the commentator's headsets.

Multilateral transmissions ended five minutes after the end of a particular session in a format agreed upon by the broadcasters. Timing difficulties for events were also planned. Matches or sessions which ran less than their scheduled time were followed by continuous generic coverage of the site with audio and video. If a match or session ran longer than scheduled, multilateral coverage continued into the next match or session immediately.

Summaries were prepared for sports not covered live: archery, preliminary football, modern pentathlon, shooting and yachting. Summaries for archery, shooting and yachting were prepared in Long Beach, near the fencing venue at the Long Beach Convention Center. A single summary for each sport, usually five to ten minutes in length and including graphics, was prepared on half-inch tape at a specially-equipped editing trailer containing three half-inch editing machines (cuts only) and one half-inch editing system with dissolve. Summaries were transmitted over the video and audio lines used for fencing final bouts prior to the start of final sessions. Preliminary football summaries were prepared for the Annapolis and Harvard venues only (the Rose

Bowl and Stanford venues were covered live), edited at the respective sites and then flown to Los Angeles and delivered to the IBC. The summaries were generally 10–15 minutes in length and did not include graphics. Modern Pentathlon summaries were prepared at the ABC compound for the cycling individual road races at Mission Viejo. They varied in length depending on the events involved and contained graphics. Summaries were flown by helicopter to the Unilateral Broadcast Center and transmitted to the IBC from there. Descriptive notes and timing logs were sent to the IBC via telecopier and distributed for all summaries.

Additional live coverage from ABC included visuals from fixed cameras at scenic locations across Southern California. These "beauty shots" were available at the IBC whenever lines were available. Taped beauty shots were transmitted from the distribution center on 21 July and occasionally thereafter. ABC also provided its athlete profile series for use by world broadcasters, who were required to arrange for machine and editing time through the IBC booking office. Broadcasters were required to use the profiles in complete form only.

Unilateral facilities for broadcasters included: venue commentator systems and opportunities for broadcaster unilateral coverage from the venues, including live on-camera shots, transmission of taped material and venue unilateral-camera platforms.

Booth table space was designed for three persons and each booth was usually equipped with three chairs, one color television monitor and a commentator's console. The console included two dual headsets with noise-cancelling microphones and could accommodate audio tape recorders for playback purposes. At athletics, gymnastics and swimming (diving), ABC provided an additional black-and-white television monitor displaying a supplemental results service which gave results and competitor ranking after each performance. Eight, four and three channels were available at athletics, gymnastics and diving respectively. For athletics and diving, two channels were used for each competition. The first channel showed the current event leaders to at least ten places plus the current competitor with present mark and rank and mark/rank after performance. The second channel listed the name of the current competitor and summarized his performance thus far. Four events could be covered at athletics and one

7

at diving; an additional diving channel listed the standings in the current round of dives. The gymnastics channels were used for group standings (channels one and two), individual standings for places 1–36 (channel three) and team standings on the fourth channel. During individual apparatus finals, channel one showed the current apparatus standings with medal winners listed on channels two and three. Rhythmic gymnastics information included start and result lists with details of order, subgroup and performances.

Venue unilateral-camera opportunities included both live on-camera shots and transmission of previously taped material. Broadcasters also had space available to mount their own cameras for additional coverage at venues. ABC allotted time prior to and after each multilateral transmission session for broadcasters to either present live on-camera coverage or to transmit taped coverage back to the IBC. A charge was made for these services by ABC, and arrangements were made through the IBC booking office. Unilateral booking was available at sites for 16 sports. The standard duration of unilateral segments was ten minutes each with five minutes between segments for preparation and switching. Each segment was delivered to the particular broadcaster's facilities at the IBC through the distribution center, and audio coordination circuits between the venues and the IBC transmission control could also be switched to the facilities of individual broadcasters at the IBC. Formatting of the unilateral segments prior to the multilateral transmission program ("pre-unilaterals") was:

Pre-multilateral program transmission format

Subject	Countdown	Time span
Audio/video identification loop	75:00–70:00	5:00
Pre-unilateral segment # 1	70:00–60:00	10:00
Audio/video identification loop	60:00–55:00	5:00
Pre-unilateral segment #2	55:00–45:00	10:00
Audio/video identification loop	45:00–40:00	5:00
Pre-unilateral segment #3	40:00–30:00	10:00
Audio/video ID for Multilateral	30:00–00:30	29:30
Pre-transmission warning: black	00:30–00:00	00:30
Multilateral transmission begins	00:30–00:00	
Pre-session format	00:00–5:00	5:00
Competition session begins	00:00–5:00	

The countup for multilaterals following a multilateral transmission was:

8

7 A roof-top view of a section of the marathon course showing ABC's use of its newly developed electric motorcycles.

8 ABC's electric car is used to televise the marathon leader.

Totals		122	80	24	81	483

Notes:

(1) Camera totals are higher than actual because of double or triple use of the same piece of equipment; actual totals included 188 cameras.

(2) "Special" cameras included mounts on boats, cars, helicopters and motorcycles among others; also included in this total were panoramic view cameras or ceiling-mounted cameras for Special effects.

(3) "Press Photo" indicates that ENG camera crews from world broadcasters had access to the press photographic positions in the venue.

Post-multilateral program transmission format

<i>Subject</i>	<i>Countdown</i>	<i>Time Span</i>
Competition session ends	45:00-0:00

Audio/video identification loop	40:00-45:00	5:00
Post-unilateral segment # 3	45:00-55:00	10:00
End of post-unilateral period	45:00-55:00	

A designated camera near the venue commentator areas was identified for on-camera unilaterals. On-camera pre-unilaterals at athletics and gymnastics were permitted only during the first segments with segments two and three reserved for transmission of material pre-recorded by broadcasters (usually using portable cameras at the site). Unilaterals between sessions at basketball, road cycling and weightlifting were not always available because of time limitations, and the timing of all post-unilaterals was subject to change because of competition session overruns.

The LAOOC provided areas for licensed broadcasters to bring their own cameras to shoot supplemental coverage to that being provided by ABC. These "world broadcaster camera platforms" varied in size from venue to venue: the largest platforms held space for 20 cameras at the Coliseum. Platform spaces were reserved through the IBC booking office and controlled by the use of armbands issued by the booking office. No charge was made for the use of these platforms. While most broadcasters used portable cameras (also known as Electronic News Gathering or ENG cameras) in these spaces, one broadcaster did mount a fixed (studio) camera on the world camera platform at athletics and at gymnastics. Each platform position, however, was designed to hold an ENG camera with tripod and a crew of three persons. In addition to the world camera platforms, broadcasters used ENG cameras and crews to record on-camera shots of commentators at work in their booths or in the mixed

zone or formal interview areas. Athlete interviews using ENG crews were popular in the mixed zone, where broadcasters had an opportunity to meet informally with competitors immediately after they had finished their events.

ABC's venue operations included not only the necessary in-stadium apparatus to provide the multilateral program feed but also compound areas at each site with trailers and trucks housing mobile production units and other equipment. Typical larger venue compounds included:

- Multilateral production trailer(s)
- Unilateral production trailer(s)
- Video taping and graphics trailer
- Space for production trailers ordered by other licensed broadcasters
- TV broadcasters' engineering and operations trailer
- TV power generator truck
- TV utility or office trailer
- Catering truck and eating area
- Temporary restroom facilities

The telephone utilities involved also located their trailers in the TV compound since they worked so closely

with ABC in the transmission of the site-produced signals to the IBC or UBC. Telephone equipment, office, power, service and utility trailers were usually present at the larger sites. Radio requirements often included production trailers and at some sites, satellite uplink dishes and trailers, usually joined by an additional power generator truck. A few venue compounds had platforms for microwave links.

The following sections describe briefly the facilities available at each site for broadcast.

Archery

This venue was covered by summary only. Two ENG cameras were assigned and covered the top five competitors for men and women. Requests for coverage of specific individuals were honored whenever possible with unedited footage available at the IBC on the following day.

Athletics (Coliseum)

Multilateral coverage included separate units for track events and field events. Track events were covered by eight fixed cameras and one ENG camera. One of the fixed cameras was mounted in the basket of a 215-foot high crane overlooking the west (closed) end of the Coliseum. Two fixed cameras and the ENG camera were positioned on the field, with the remainder in the seating area. All track events were fed to the IBC on one line, while two lines were available for field

events. Four fixed and four ENG cameras were available for field event coverage. While all four of the ENG cameras were located at the field level, two were allowed onto the infield area. The compound for athletics included 24 trailers with nine dedicated to world and/or ABC audio and video production for television offices for broadcast operations and engineering, commentator control, graphics control, production, RF systems, a tape library, and two utility trailers. One trailer was used for radio production and another for satellite control (and adjoining satellite dish). Three trailers were used by world broadcasters for their own unilateral production, and additional trailers were present for power supply and food service. The telephone utilities had a smaller compound adjacent to ABC's with four trailers-equipment, office, service and utility.

Athletics (Santa Monica College/Marathons)

A world coverage unit with three fixed cameras and one handheld camera was available. The handheld camera was assigned to the starting line area. Another handheld camera was loaded on a custom-made flatbed truck for world coverage, and an electric

motorcycle with sidecar was used with a handheld camera. A helicopter was also equipped with one camera. Camera outputs from the flatbed truck, motorcycle and helicopter were all transmitted by microwave. ABC also mounted two fixed cameras along the course on top of buildings.

Athletics (Walks)

The start and finish was covered by the Coliseum cameras, with the out-of-stadium portions covered by ENG cameras recording tape. World broadcasters desiring specific road coverage could request it, and the taped material was delivered to the IBC on the following day.

Baseball

No multilateral coverage was produced here, but ABC covered all games. For preliminary games from 31 July to 5 August, five fixed cameras were used, with one located on the infield level in a photographer's well on the third-base side. For semi final and final games on 6-7 August, two additional fixed cameras were added, with one located in the photographer's well on the first-base side and another on the field level behind home plate. A wide-angle ambience camera was fixed to the tower at the top of the elevator roof, looking down on the stadium. Signals from this camera were transmitted to the UBC via microwave and did not utilize the on-site compound.

9 At boxing, the international broadcaster commentator positions were elevated.

Television and Film Operations

Basketball

One line emanated from The Forum for multilateral broadcast use. For preliminary games, two studio cameras, three handheld cameras and two special cameras were used. Both fixed cameras were located in the seating area, while the three ENG cameras were distributed to each end of the court and behind the sideline where the team benches were located. One of the special cameras was located on one of the backboards and the other provided wide-angle views of The Forum from the hotel rooftop across the street. Two additional cameras were added for the semi final and final games: one fixed camera located at the top of The Forum grandstands and one handheld camera located on the floor.

Boxing

One multilateral line was available at this venue. For preliminary bouts, four fixed cameras were located in the stands, including one wide-angle camera near the top of the Sports Arena. Two handheld cameras were used: one at ringside and one at the mouth of the dressing room.

Canoeing and Rowing

One multilateral line was arranged at Lake Casitas. The multilateral feed was produced from four fixed cameras and six handhelds, with coverage originating from stations on the lake, facing toward the shoreline. ABC covered each phase of the course beginning with handheld cameras on the start platform and on the roof of the aligner's hut at the start line. Additional cameras were mounted on houseboats at the 500m, 1,000m and 1,500m marks, and a fixed camera was stationed on a platform at the finish line. Handheld cameras were also mounted on moving boats specially built to minimize wake. One fixed camera was located on the shore on a platform and a handheld camera roamed the shoreline near the award ceremonies area. The latter camera performed double duty capturing the award ceremonies and interviews with canoeing participants. Underwater cabling was present all along the course and required some vigorous installation work over a four-day period.

Ceremonies (Opening)

One line was available for multilateral coverage of the Opening Ceremonies. Eleven studio cameras, six handheld cameras and two special cameras were available. Eight of the fixed cameras were located in the stands, usually over spectator exits. Three studio cameras were placed at the field level, with two on tracks on the grass areas outside the running track on the west and south ends of the Coliseum.

10

A handheld camera was placed just outside the running track near the tunnel for the entrance of the athletes. Two other handheld cameras were on the infield, two more in the stands for coverage of celebrities attending the Opening Ceremonies and in the box occupied by the President of the United States, Ronald Reagan. A special camera was mounted on a helicopter and on a giant lighting tower used by the LAOOC. The latter camera captured a scenic view of the Coliseum's Olympic torch with the downtown area of Los Angeles in the background. All broadcaster personnel on the field level were required to wear the LAOOC's page costume in order to maintain the visual consistency of the ceremony.

Ceremonies (Closing)

Eight studio cameras, three handheld and three special cameras covered the ceremonies, with coverage of the closing transmitted on a separate line from the one used to cover the men's marathon. Eight other cameras covered the finish of the men's marathon: four fixed cameras—three in stands and one on the field level—and four handheld cameras on the field level. Most of the Closing Ceremonies cameras were positioned either in the stands (four fixed and one unmanned special camera), on the field level outside the running track (one fixed camera), or on the infield (two fixed cameras on the stage lighting towers and three handhelds which roamed). One fixed camera was also placed in a crane overlooking the west end of the Coliseum and a special camera was mounted on a light pole high up on the Coliseum rim. The final multilateral camera was positioned in a helicopter.

Cycling (Mission Viejo/individual road race)

One VANDA (video and audio) circuit was used for the multilateral coverage. Multilateral cameras included five studio cameras, five handheld cameras, two cameras mounted in helicopters and two cameras mounted on motorcycles. Of the five studio cameras, two were stationed on platforms, two were suspended from giant cranes overlooking the course and one was positioned on a steep hill. Of the five handheld cameras, two were assigned to work in the start/finish line area, two were on platforms and one was airborne in another crane. Two small cameras were mounted on motorcycles and two cameras were mounted in helicopters; the second helicopter camera was used when the primary unit was refueling.

Cycling (Artesia Freeway/team time trial)

This event was covered via taped summary. Two handheld cameras were used in conjunction with motorcycle equipment used at Mission Viejo.

Cycling (Velodrome)

One line for multilateral coverage was present at the Velodrome. Five studio cameras were placed either in the grandstand area (four) or on the infield (one). The two handheld cameras for multilateral coverage were split, with one on the infield near the start/finish line and the other outside and above the track on the concourse level.

11

10 An ABC cameraman and microwave technician (upper left) dress in pioneer spirit costumes to be less conspicuous while filming Opening Ceremonies.

11 ABC crews are recognizable in their LAOOC page costumes on the pool deck at swimming.

**Equestrian
(Fairbanks Ranch/endorance portion
of the three-day event)**

One line for ABC's unilateral coverage was arranged at Fairbanks Ranch. However, world broadcasters had access to this feed and could use it for their own purposes. Nine studio cameras were present along with three handheld cameras. The cameras were arranged across the course and could cover the start and finish and 29 of the 33 fences/obstacles. Although most of the cameras were mounted in platforms, a handheld camera covered the picturesque "Western Town" and a ground level camera was used for the water jump.

Equestrian (Santa Anita Park)

One line for multilateral program transmission was installed for equestrian at Santa Anita. Seven cameras (four studio cameras and three handhelds) covered the show jumping competitions, with four studio cameras and one handheld (five total) for dressage. For jumping, three fixed cameras were mounted in the grandstands, with one on the ground level shooting into the tunnel leading to the collecting ring. Handheld cameras were in the jumping ring (two) and the collecting ring (one). To ensure that the camera operator did not interfere with the competition, the cabling had to be placed in a pre-dug trench and federation and LAOOC officials approved the dress of the camera operator so as to be consistent with the color scheme of the field of play. For dressage, three fixed cameras were placed in the grandstand area, with another on the ground level between the ring fence and seating area. For all events, a side-angle camera was placed on the roof of the Santa Anita grandstands for panoramic views of the venue and the San Gabriel Mountains. When competition was not scheduled at Santa Anita, this view was transmitted for broadcaster's use at the IBC.

**Fencing (Long Beach Convention
Center Exhibition Hall)**

Coverage of preliminaries was by taped summary of unilateral requests from broadcasters only. Two handheld cameras provided coverage of matches requested through the IBC booking office. Not more than three matches could be booked and match coverage was limited to ten minutes. Unedited playback of this material was transmitted from the production trailer unit used for fencing between 1915 and 1950 hours daily. Fencing coverage did not contain graphics.

**Fencing (Long Beach Convention
Center Terrace Theater)**

Fencing finals were covered live and in their entirety; one feed was available via satellite for multilateral coverage transmission. Four studio cameras provided coverage; two were located in the seating area and two were on the stage at each end of the piste. These piste-level cameras were hidden by the curtains at each side of the stage.

12

Football (Rose Bowl)

One line for multilateral coverage was available at all times. Preliminary games were covered by four studio cameras (all in the stands) and one handheld camera at the field level. Semi final and final match coverage was augmented by two additional fixed cameras on short platforms behind each goal and a handheld camera roving the team bench sideline area.

Football (Stanford Stadium)

One line for multilateral coverage was available from this venue and all games were presented live. Four studio cameras were mounted in the stands (two overlooking midfield and one behind each end line) and one handheld camera roamed the sidelines.

Football (Annapolis and Harvard)

These venues were covered by taped summary only. Two cameras were used at each site, recording a high view from the midfield area and a high view from behind one end line. Summaries varied in length, but were usually 10–15 minutes long. Editing was done prior to shipment (by air) of both the master tape and the summaries to Los Angeles for one-day-later distribution at the IBC. Summaries did not contain any graphics, but did come with descriptive notes to aid broadcasters.

Gymnastics

Two lines for world coverage were available from gymnastics. In all, there

were 11 fixed cameras, two handheld cameras and a small camera mounted on the steel ceiling grid at Pauley Pavilion directly over the pommel horse (men)/balance beam (women). Seven of the fixed cameras were stationed at raised positions above the podium level, with two on the floor level on short tripods to cover the floor exercise mat and two on the floor for the beginning and landing of vault performances. Handheld cameras were deployed on the floor level and covered the high bar (men), pommel horse (men), rings (men), balance beam (women) and uneven parallel bars (women). Coverage of rhythmic gymnastics used six fixed cameras and three handhelds for the multilateral feed. Three were stationed for direct views of each of the three mats and two were placed on short tripods on the floor level at the far ends of the mats. Another fixed camera was placed midway up into the stands at approximately the midpoint of the center mat. Handheld cameras were placed at the corners between mats 1–2 and 2–3 and at the athlete entry/exit point from Pauley Pavilion.

Handball (Cal State Fullerton)

Coverage of preliminary matches was transmitted on one line from the venue to the IBC for multilateral coverage. Three studio cameras and one handheld covered the action at CSUF, with two fixed cameras at an elevated position on one sideline and the third on a raised platform behind one end line. The handheld was used as a roaming camera all around the court.

12 Camera crane puts ABC cameraman directly behind divers on the 3-meter spring board.

Handball (The Forum)

One line was available as at basketball. Seven cameras (four fixed and three handheld) were used, with the fixed cameras in the stands and the handheld cameras stationed on the floor level.

Hockey

One line, for multilateral coverage only, was available from the hockey venue at East Los Angeles College. Three studio cameras were used in conjunction with two handheld cameras. Two of the fixed cameras were placed high atop the sidelines, at roughly the midpoint of the field. The other fixed camera was placed on a 15-foot-high platform behind one of the goals. The two handheld cameras were used on each side of the team benches for sideline color coverage.

Judo

One line for multilateral coverage was available. Two studio cameras and one handheld were used at California State University, Los Angeles' Eagle's Nest Arena. One fixed camera was mounted on a platform bisecting the mat from behind the world commentator's booth area. The other fixed camera and the handheld camera were mounted on pedestals at the corners of the mat. The production trailer for judo was moved from cycling duty at the Velodrome following the conclusion of that sport on 3 August. The first judo matches were held on 4 August.

Modern Pentathlon

A taped summary was compiled. Events were recorded by three or four handheld cameras, as necessary. The edited summary, which contained graphics, was transported by helicopter to the UBC and was transmitted to the IBC at an agreed time each day. Requests for coverage of individual competitors or teams were honored whenever possible. The tapes of the requested performances were made available at the IBC on the day after the competition took place.

Shooting

A taped summary was prepared. Two handheld cameras were used, covering the ranges used each day and awards ceremonies. The unedited tapes were transported by helicopter to the editing facility at the Long Beach Convention Center compound for fencing. Summaries were five to ten minutes long and contained graphics. The summaries were transmitted to the IBC by 2030 hours each day. Requests for coverage of individuals or teams were honored where possible, with the unedited tapes available the day after the competition at the IBC.

Swimming (University of Southern California/Swimming-Diving-Synchronized Swimming)

One line for multilateral coverage transmissions was available. Swimming competitions were covered by four studio cameras, three handhelds and two special cameras. Three studio cameras were mounted high up in the stands and overlooked the pool. One camera was used on a track placed approximately five feet away from the pool edge and moved with the swimmers from end to end. Handheld cameras were placed on the deck at the start/finish and flip turn sides and in an underwater window at the flip turn side. Special cameras were placed in another window at the start/finish side and on top of the giant Webb Tower building overlooking the entire competition complex. Multilateral diving coverage was compiled from five studio cameras, four handhelds and the special camera on Webb Tower. One camera was on a track opposite the diving boards and moved directly in line with whichever board was being used, for a head-on view of the diver. Four other studio cameras were mounted, either on cranes or lifts, to move to the height of the three-meter springboard or ten-meter platform. Two handheld cameras were placed on the diving well deck, one on a movable lift behind the board or platform, and another in the diving well itself, with an underwater operator equipped with frogman gear. Multilateral coverage of synchronized swimming included three studio cameras, two handhelds and the Webb Tower overview camera. Two studio cameras were located in elevated positions, with one on a track alongside the swimming pool. Handheld cameras were positioned at an underwater window and underwater with a frogman operator.

Swimming (Pepperdine University/Water Polo)

One line for multilateral program use was installed. Four studio cameras were used along with one underwater handheld camera (with frogman operator) and one special camera to provide a scenic panorama of the Pepperdine campus and the nearby shoreline of the Pacific Ocean. Three fixed cameras were positioned in the stands showing the entire field of play. One camera was placed on a track behind the referee's walkway and judges' table and rolled along with the action.

Tennis

Facilities for gymnastics were used for tennis and the multilateral picture was transmitted on one of the gymnastics lines. Three studio cameras were used with two handheld cameras. Two studio cameras were mounted on

platforms elevated above the court level and one studio and the two handheld cameras were located on the sidelines.

Volleyball

One line for multilateral program use was available. The multilateral program was compiled from three studio cameras, one handheld and two special cameras. All of the studio cameras were mounted high above the courtside, while the handheld was located on the court level along one sideline. One of the special cameras provided a court view from directly overhead and was mounted on the covered arena scoreboard above while the other was positioned outside the arena and transmitted panoramic views of notable Long Beach sites, including the H.M.S. Queen Mary and the hangar for the giant airplane known as the "Spruce Goose."

Weightlifting

One multilateral program line was available at this venue. Three studio cameras, two handhelds and two special cameras were used. The studio cameras were located at the back of the arena to shoot the lifter head-on and at both corners of the platform in front of the competitor. Handheld cameras were stationed in the warm-up area, moving in behind the lifter as he ascended onto the lifting platform. A small camera was mounted directly over the lifter for an aerial view, and another special camera was located near the pavilion roof for a panoramic view of the competition and spectators.

Wrestling

One line was available for multilateral use. Five studio cameras and one special camera were used. The studio cameras were positioned in elevated locations in front of each of the three mats and on the floor level between mats 1-2 and 2-3. A special light-weight camera was mounted high up in the arena to give an overall view of the competition area and spectator seating.

Yachting

This venue was covered by summary only. Handheld cameras were positioned to cover each of the four courses as necessary. Three slips were reserved for ABC boats used to follow the competition. The summaries were compiled at the Long Beach summary center (at fencing) and transmitted to the IBC, usually before 2100 hours daily. Summaries were 5-10 minutes in length and contained graphics.

32.03.4

Reflections on operations by the host broadcaster

ABC's exhaustive efforts in the venues provided the basis for worldwide viewing of the Games. Licensed broadcasters relied on ABC's basic feed to cover the competitions and were able to produce a record number of hours of Olympic broadcasts for their viewers. Several nations reported all-time viewership records for any kind of televised event in their country, while others noted that their Games telecasts set new records for viewership of a sports event. ABC was able to marshal a seemingly endless amount of equipment for use across the venues and transmitted a clean picture for easy use by the broadcasters. In future Games, the following items should be noted:

- The separation of the international and unilateral broadcast centers was worthwhile. Foreign broadcasters were able to work in a facility and were with staff who were dedicated to their needs only.
- Care must be taken in the division of responsibility between the organizers and host broadcaster in the provision of technical services to the worldwide broadcast community. For example, the LAOOC agreed to provide its licensed broadcast partners with the signal as produced by ABC and delivered to the IBC. Unfortunately, these provisions did not clearly define the responsibility for signal synchronization, amplification and intra-IBC distribution. These functions were performed at a central location within the IBC commonly referred to as the "distribution center." All signal users, including the LAOOC (for its transmission to the Main Press Center), eventually agreed to pay a share of the costs.
- Considerable confusion was caused by a misunderstanding of the nature of multilateral and unilateral broadcasts. The multilateral program, having many elements including all active venues at any one time, was offered to broadcasters for their own use. Viewers in other nations saw the Games through this feed which was presented without announcers, commentary or commercial advertising and onto which the broadcaster in their nation overlaid its own announcements, broadcast commentary, commercials and other unilateral elements. Similarly, ABC's own unilateral broadcast featured coverage meant for United States viewers and reflected U.S. interests. It should be noted, then, that the

requirement for balanced presentation and wide scope is the key to proper presentation of the multilateral program, but has little to do with any host broadcaster's unilateral feed in terms of their responsibility to other broadcasters to provide basic coverage of the Games. ABC's multilateral operations successfully fulfilled their obligation to provide the basic coverage for all nations of the Games of the XXIIIrd Olympiad.

- Key to the success of the venue television operation of any host broadcaster is the close working relationship that they develop with the organizers. ABC's relationship with the LAOOC became better as the Games approached and both sides endeavored to enable the other to succeed. Care must be taken early to assure that broadcaster requests for information about architectural layout, compound and power locations, lighting and seating charts are met with precision. The bulky nature of television production equipment requires substantial planning and must fit together with other organizational elements not always known or understood by the host broadcaster. Close liaison will be achieved in mutually beneficial areas that eliminate unnecessary construction and installation difficulties.

32.04 Television Operations by the LAOOC

32.04.1 Concept and goals of world broadcaster liaison

Although the primary group responsible for the provision of broadcaster services was ABC, the LAOOC also had responsibility for several areas involving the world broadcast community. ABC's mandate was to provide the basic feed and the associated central (IBC) and venue technical services required for worldwide broadcast of the Games of the XXIIIrd Olympiad. Even so, this left many other matters for the broadcasters to arrange and most of them were taken up with the responsible group, the LAOOC.

Broadcaster needs for accreditation, accommodations, hiring of local staff, interviews with athletes, space for commentator positions and unilateral

camera platforms, transportation and parking and other items could only be met by the Organizing Committee. The LAOOC met with each group individually during the pre-Games period and also presented lengthy reports to the Olympic Broadcasters' Advisory Commission (OBAC) during each of its three meetings in Los Angeles in May and September 1983 and in April 1984.

During the Games, the LAOOC stationed personnel at most of the sites to assist in liaison among the broadcast community, host broadcaster and the LAOOC. In addition, a small group was formed at the International Broadcast Center to work with the broadcast groups headquartered there.

The Television Operations Department was formed at a late date, in June 1983. One person was hired as the department manager with responsibility for:

- Facilitating and managing the operations of the host broadcaster, ABC
- Acting as liaison among the LAOOC's licensed broadcasters and facilitating their requests for action and information
- Facilitating and managing the operations of the producers of the official film, Cappy Productions
- Identifying and managing (with Press Operations) all non-rights-holding broadcasters who might effect Games operations

Previous management of the logistical needs of the broadcasters (ABC and otherwise) was handled by the Press Operations group, which continued to provide some services which it was already providing for the written press.

The first six months of effort in the TV Operations Department consisted largely of: determining the broadcaster and filmmaker requirements for camera and commentator locations, need for mobile unit compounds at the venues, key dates and timelines for installation of technical equipment and the dissemination of information and policies of the LAOOC to the broadcast community. In January 1984, an assistant manager was hired, and between January and June, additional personnel were hired to manage the LAOOC's liaison station with the world broadcasters at the IBC and to work with the producers of the official film. Detailed drawings were compiled and disseminated regarding camera, commentator and compound placements for each site. Venue television coordinators were selected in the period of March to July 1984 and were responsible at each site for overseeing the operations of the host broadcaster, the LAOOC's licensed broadcasters and filmmaker.

The Television Operations Department was headquartered during the Games period at the Main Press Center. Its office, open from 0700 to 2300 hours from 14 July-12 August, acted as a clearing point for information and a resolution point for questions relayed from the venues or IBC. Members of the Television Operations group were present in five-hour shifts and spent the remainder of the time at the venues in order to provide direct contact and liaison with the broadcast groups.

32.04.2 Areas of responsibility

Especially in the liaison between the LAOOC and the host broadcaster, ABC, the Television Operations Department played the key role in maintaining good communications between broadcaster and the Organizing Committee. Since all incoming broadcaster questions and requests were routed through the department, the TV Operations staff was able to answer some questions immediately, eliminate unreasonable requests where raised and take up with persistence the remaining areas to be worked out. This approach streamlined communications with broadcasters considerably and brought all of the requirements of television to a central point within the Organizing Committee.

The major areas which were discussed between the broadcasters and the LAOOC included:

- Access dates for venue construction
- Access to athletes for interviews
- Access to compound areas for equipment and personnel
- Accreditation
- Cabling in the venues
- Camera placement locations
- Commentator position locations
- Construction costs and design
- Customs arrangements
- Event scheduling and timing
- Health services at the IBC
- Hiring of local, part-time staff
- Lighting
- Mobile unit compound locations
- Power
- Results and other information services
- Tickets
- Transportation
- Vehicle parking

32.04.3 Accreditation

Accreditation was handled by the Press Operations Department which was already providing the same services to the written media. Broadcasters were provided with accreditation forms to fill out in August 1983 or after an exclusive-rights agreement had been signed. Forms were due back in February 1984, unless the rights agreement was signed later. The number of forms given to each broadcast group depended on its individual needs for personnel in Los Angeles.

Broadcast personnel were given only three pages of the ten-page form provided to written media. This was because the nature of activity for each person was part of the overall production plan of the broadcaster involved and not subject to the whims of the individual. Thus, information about the activities of the person filling out the form was irrelevant and information was requested only about the applicant's personal background, identification of his broadcaster-employer and authorizing signatures. The Press Operations group maintained a strict policy against the accreditation of non-working personnel such as children. Three forms were rejected for applications made on behalf of children under the age of 16.

Applicants who met basic criteria such as age were classified by function as suggested by the accreditation categories listed in the Olympic Charter. Categories for electronic media listed in the Charter included "EC" for broadcast commentators, "ES" for auxiliary personnel and "ET" for technical staff. The LAOOC, in agreement with the broadcasters, changed these categories slightly. The "EC" cards were used for any broadcast personnel who required permanent access to a commentary position in the venues. This included not only commentators, but also researchers, statisticians and stage managers. Staff performing these functions required identical access, and it made little sense to classify them any differently. However, to identify which "EC" card-holders had access to individual commentator positions in the venues, ABC distributed individual commentator position numbers to specify commentator-booth occupants. These tags were distributed through the booking office at the IBC. "EC" card-holders were entitled access to the formal interview and mixed interview zones at all venues as well as the Main Press

13

13 Host broadcaster and international broadcast-feed camera positions at Pauley Pavilion were located above the still photo positions and competition staff area.

Center and venue press sub-centers. Holders of "EC" cards were also allowed to sit in any unoccupied press seats at the venues when they were not working in their commentary positions.

"ES" card-holders were classified in the Charter as "auxiliary personnel" including machinists, messengers and sound technicians. The access privileges of these personnel were identical with those holding "ET" badges, so the category of technical staff was expanded to include drivers, messengers and support staff for broadcasters. The "ES" category was reformed to meet the needs of administrators, directors, producers and other supervisory personnel whose decision-making authority was not immediately obvious from their accreditation as commentators ("EC") in prior Games. The new "E"-supervisor category helped the LAOOC to identify team leaders from broadcast groups in each venue and to deal directly with them in resolving problems or questions at each site. All "ES" badge-holders had the same access privileges as those holding "EC" badges. Holders of "ET" badges included construction workers, drivers, food service personnel, messengers and all other technical staff. "ET" card-holders had access privileges at all venues, including the formal interview and mixed interview zones, the Main Press Center and all venue press sub-centers. "ET" cards also allowed access into the press seating areas at all venues but did not allow seating privileges. Typically, "ET" card-holders delivered messages or repaired equipment in the press seating areas and then left.

With the holders of "E"-category accreditation badges of all kinds numbering 8,700, ABC was concerned about the number of people that could be accommodated (or had legitimate business) in the International Broadcast Center, Unilateral Broadcast Center or the venue television compounds. Controls were instituted to restrict access to those who needed it. Entry to the International Broadcast Center was limited to those holding "EC" "ES" or "ET" cards only or a special IBC-only card prepared by ABC. This restriction required re-badging of some broadcast personnel who had claimed journalist status on their applications and had been issued a category "EE" (journalist) badge by

the LAOOC. Unilateral Broadcast Center-only badges were required for access there, regardless of whether the LAOOC had issued an "E"-category accreditation badge. Access to the venue compounds also required a special "Compound" tag from ABC which was the same for all venues. After the accreditation forms from the LAOOC had been completed and returned, the appropriate designation was assigned and Olympic identity cards were prepared. These cards were sent to the broadcaster concerned and distributed internally to its personnel coming to Los Angeles. Olympic ID cards for broadcast personnel from ABC or the EBU were given beginning two-character codes of 02 or 03, with 01 assigned to all print media and 04 assigned to all other broadcast personnel. The special coding on the ABC and EBU cards allowed them to bypass the accommodations and finance lines since their accommodations, insurance, parking and all other financial matters had been taken care of ahead of time by their respective groups. ABC and EBU personnel thus went directly to the accreditation badging stations, presented their identity cards and were given Olympic credentials. Other broadcasters had varying responsibilities for payment and were checked through the accommodations and finance processing station and given "zero balance" slips to indicate that they owed no additional payments. Once they had been given these slips, they moved to the accreditation stations for issuance of Olympic accreditation badges. Substitutions of personnel were made during the pre-Games period and even during the Games themselves, since some broadcast personnel did not come to Los Angeles or had to be sent home because of illness.

The actual accreditation process began on 4 July 1984 at the IBC where the LAOOC set up a small accreditation center to process individuals already in possession of their Olympic ID cards and for whom an accreditation badge had already been made. This service continued through 10 July and was

14

simply a convenience station for those personnel who had come early. A total of 381 badges were issued during this time. All other processing was done at the Main Press Center, where substitutions and new applications could be processed as well. In all, 331 last-minute applications were accepted, including 200 from ABC and 82 from the EBU (70 of these 82 were local staff). ABC assisted with this late flood of applications by providing personnel to input information to the accreditation computer.

Special restrictions during the Games pertained to field of play access and to five instances of entry by special tickets. To keep the number of persons near the field of play to a minimum, the LAOOC required that those working on that level obtain bibs (vests) identifying them as personnel from the "host broadcaster," the only group with a need for such access. The number of persons allowed near the field of play was agreed upon between ABC and the LAOOC and the appropriate number of bibs was issued, with some spares for emergency repairs and substitutions. Ticketing was instituted only for those events where restricted entry was required to limit the number of press and broadcast personnel present to the number of seats available. These events were limited to the Opening and Closing Ceremonies and the final sessions of basketball (men only) and

14 International broadcast commentator and elevated camera positions at judo.

 EP denotes still photographers
 ES denotes administrative and supervisory personnel
 ET denotes technical personnel

boxing (both sessions). Tickets were provided for commentator positions, world unilateral camera platforms, official film personnel and a limited number of electronic media observers sitting in the press section. Observer tickets totaled 150 for electronic media for the Opening Ceremonies and somewhat less for the Closing Ceremonies. Basketball tickets for electronic media observers numbered 30, and 20 were available for each session of boxing.

The accreditation process was generally successful. Although the Charter quota for broadcast personnel was 4,200 (800 "EC"s and 3,400 in the "ES"/"ET" categories), the actual total, including the official film, was 4,683. The largest user of accreditations was, of course, the host broadcaster-ABC-which had 2,314 persons accredited for its television operations plus 89 for radio. The EBU was second with 1,198, and no other broadcaster had more than 310. The breakdown by function was the key to ensuring that sufficient room existed in the venues for those accredited: if the number of "EC" (commentator) and "ES" (supervisor) badges was manageable, then crowding would not occur. A total of 1,439 "EC" badges and 474 "ES" badges were distributed as well as 20 photographers and 2,750 technicians ("ET"). Despite this higher number, the lower than expected total of press accreditations kept the overall number manageable.

32.04.4 Housing

Broadcaster groups made housing one of their primary concerns immediately after signing exclusive-rights agreements with the LAOOC. Many were worried that without quick action, substantial difficulties in arranging suitable accommodations would arise. While the host broadcaster needed to spread its personnel across the area where the venues were located, most of the foreign broadcasters wanted to stay as close as possible to the International Broadcast Center in the Hollywood area. The LAOOC agreed with each broadcaster to provide housing assistance in the location and reservation of rooms from the LAOOC's own inventory of rooms reserved for use by the Olympic Family.

Pricing assistance was provided through the LAOOC's agreements with the hotels in which it had reserved rooms to hold their rate levels to those charged during the first six months of 1984. These "rack rates" were published rate levels which were available to off-the-street customers. Each of the LAOOC's hotel agreements included this clause to protect the

LAOOC's guests against short-term increases in rates for the Olympic period.

With the exception of two smaller broadcasters who dealt with the LAOOC through the Press Operations Department for their housing needs, broadcasters were not issued individual confirmations as was the press. Broadcasters which had purchased exclusive rights as groups were dealt with as groups for the allocation of and agreement to accommodations, with a resultant rise in the effectiveness of communications as well as a savings in time.

The largest user of hotel accommodations was the host broadcaster. ABC-TV's needs were met with 2,336 rooms spread over ten hotels, with another 195 rooms used by ABC Radio. The largest block was reserved in downtown Los Angeles (747), with 45 in the Hollywood area near the IBC and UBC, 400 in the Beverly Hills area (near gymnastics and tennis), 290 near the airport (near basketball, cycling and weightlifting), 145 in Pasadena (equestrian and football), 130 in Long Beach (four sports), 95 in the Anaheim region (handball, modern pentathlon and wrestling) and 78 near Lake Casitas (canoeing and rowing). ABC Radio took rooms in downtown Los Angeles, in Hollywood and in Long Beach.

Other broadcasters had a strong interest in the Hollywood area, close to the International Broadcast Center. Groups which signed agreements at an early date generally had better opportunities to choose their accommodations. The European Broadcasting Union reserved 774 rooms, most of which were in the Hollywood area. Network Ten from Australia used 231 rooms and the Australian Broadcast Commission (radio) used 22. Japanese broadcasters reserved 102 rooms and the OIRT group was the other user of more than 100 rooms with 114. Reservation of rooms near the IBC was difficult because of the limited number of rooms in the area. If suitable accommodations located in the IBC area were not available, the preferred second choice (in some cases, first choice) was the downtown Los Angeles area. The following describes the location of the rooms used by foreign broadcasters:

Broadcaster hotel room distribution

Area/Hotel	Rooms	Rates
Downtown Los Angeles: (861/53.2 percent)		
Ambassador Hotel	147	\$136
Hyatt Regency Los Angeles	2	170
Hyatt Wilshire Hotel	292	111
Los Angeles Hilton Hotel	320	124
New Otani Hotel and Gardens	100	119
Hollywood area and adjacent: (564/34.9 percent)		
Holiday Inn/Hollywood	268	105
Holiday Inn/Van Nuys	12	86
Hyatt on Sunset	209	111
Park Sunset Hotel	26	70
Sheraton Universal Hotel	49	124
Lake Casitas area: (8/0.5 percent)		
Casa Sirena Hotel	8	84
Long Beach area: (9/0.6 percent)		
Golden Sails	9	90
Los Angeles International Airport area: (6/0.4 percent)		
Los Angeles Airport Hilton and Towers	6	116
West Los Angeles/Beverly Hills area: (168/10.4 percent)		
Beverly Wilshire Hotel	168	218
Total	1,616	

Some broadcasters arranged their own housing, and a few rooms (15) were reserved in the downtown Los Angeles area through the Press Operations Department's housing section.

Groups with larger blocks of rooms were able to have these allocations turned over to their control under a series of contract assignments from the LAOOC. The hotels then dealt, under contract, directly with the broadcast organizations for payment and actual room assignments. Most other broadcast organizations arranged payment prior to their arrival in Los Angeles and were able to move through the accreditation/finance/housing processing station at the Main Press Center with little trouble.

Overall, the housing placement program was successful since most of the broadcasters were able to stay close to the IBC or in the downtown area. The LAOOC was able to accommodate most of the special requests for rooms near particular venues such as in Long Beach or in Ventura County near Lake Casitas. The assignment of the

LAOOC's contracts with the hotels established a direct link between the innkeeper and the client and proved beneficial for each of the groups which participated.

32.04.5 Transportation and parking

Along with housing, broadcast groups worried about transport more than any other subject. Fears of congestion which would keep commentators or technicians outside stadiums close to the beginning of their broadcasts, caused them to evaluate carefully their requirements and the LAOOC's proposed system of transportation. Although promised a comprehensive transport system by the LAOOC, broadcasters were concerned about transport across an area as large as Southern California in view of some difficult experiences at past events. Several broadcast groups made preliminary reservations for large numbers of private rental cars as an insurance measure against an LAOOC-provided transport system which might not serve their needs as they desired.

Since the host broadcaster indicated that it would have its own system of transport for its commentators and technical staff, attention was focused solely on the needs of foreign broadcasters. The necessary elements of transport for broadcasters included: hotel to IBC transport, IBC to Main Press Center, IBC to venues and Main Press Center to venues. Each of these systems was evaluated by the LAOOC, which was committed to providing an effective system of transportation for news media at no cost to the users.

The least attractive system for the LAOOC to provide was between the IBC (or hotels) and the venues. Since it was anticipated that some 3,600 written press would be transported to the venues on a regular basis as opposed to slightly more than 1,000 commentators (most foreign technical staff remained at the IBC), the LAOOC determined that an IBC (or hotels) to venues shuttle system would make little sense and be lightly used if at all. Rather, it made more sense to establish

15

the major service hub at the Main Press Center to service all venue transportation needs and to increase the frequency of the shuttle between the IBC and MPC. Broadcasters reacted strongly against such a system, believing that it would penalize broadcasters because of their location in Hollywood and would cost valuable time in transit to the more important venues: athletics/boxing and Exposition Park, gymnastics/tennis and UCLA Village and the swimming/diving/synchronized swimming and village complex at USC.

The compromise between the two positions included a steady shuttle from the IBC to the MPC, service from the hotels to both the IBC and MPC and special service from the IBC directly to the aforementioned major venues. Transport to all other venues would require riding to the MPC to pick up the shuttle system based there for transport to the venues, unless private vehicles were used. This system design was well received by broadcasters who received details of the system initially in February 1984 in the LAOOC publication "Facilities for Journalists, Volume 7" and additional explanation at the April 1984 meeting of the OBAC in Los Angeles.

The hotel systems moved broadcasters from LAOOC-designated broadcaster hotels to the IBC or the MPC since buses going to both destinations were available at nine hotels serving the great majority of broadcast personnel. Broadcasters staying at hotels or other accommodations that they arranged themselves were on their own to pick up the LAOOC's media transport system at any of its scheduled stopping points. The buses served hotels as follows:

15 Television monitors assist broadcasters in delivering play-by-play commentary at rowing and canoeing.

Television and Film Operations

Broadcaster hotel transport service summary

Hotel	Rooms	Service points
Ambassador Hotel	147	IBC and MPC
Beverly Wilshire Hotel	168	IBC and MPC
Holiday Inn/Downtown	15	IBC and MPC
Holiday Inn/Hollywood	268	IBC and MPC
Holiday Inn/Van Nuys	12	No service
Hyatt on Sunset	209	IBC and MPC
Hyatt Regency L.A.	2	MPC only*
Hyatt Wilshire Hotel	292	IBC and MPC
L.A. Airport Hilton & Towers	6	MPC only*
L.A. Hilton Hotel	320	IBC and MPC
New Otani Hotel & Garden	100	IBC and MPC
Park Sunset Hotel	26	IBC and MPC
Sheraton Universal Hotel	49	IBC and MPC

*Used MPC-IBC route

Service was provided on non-air-conditioned school buses from 14 July to 15 August to the IBC and from 26 July-13 August to the MPC. It was expected that broadcaster transport requirements to the MPC between 14-25 July would be handled by the MPC-IBC connector route since most of their work would be at the IBC. The capacity of the school buses was reduced from 52 adults to 40 for purposes of the media transport system since many of the broadcaster passengers carried bulky briefcases and equipment with them to the sites. The hotels-to-IBC service in the downtown area (Ambassador, Holiday Inn Downtown, Hyatt Wilshire, Los Angeles Hilton and New Otani) operated from 0600-2400 hours in the period of 14-26 July and 14-15 August. Service was hourly, with additional service on the half-hour from 0630-0830 and 1730-2130. From 27 July-13 August, service was increased to 24 hours per day with service on the hour (except for 1100, 1300 and 1500-no service), and additional half-hourly service from 0530-0830 and 1730-2130. No buses ran at 1100, 1300 or 1500 hours since it was expected that all personnel would be working at the venues during those times. Travel times from almost all of these hotels averaged 12-27 minutes.

The hotels-to-IBC service for the Hollywood area accommodations ran from 0600-2400 hours from 14-26 July and 14-15 August. Service was almost the same as for the downtown hotels, with hourly service and half-hourly additional service between 0630-0830 and 1730-2030. No service was offered at 1100, 1300 or 1500 hours. From 27 July-13 August, service increased to around the clock, with hourly service (except at 1100,

1300 and 1500) and half-hourly additional service between 0530-0830 and 1730-2130. Included in this system were the Holiday Inn/Hollywood, Hyatt on Sunset, Park Sunset, Sheraton Universal and the Beverly Wilshire Hotel in Beverly Hills. Travel times were swift, averaging 12-30 minutes maximum.

The hotels-to-MPC route for broadcasters ran from 26 July to 13 August only. Hourly service for all designated broadcaster hotels to the MPC was available from 0600-2400 on 26-28 July and 13 August. Around the clock service was available from 29 July-11 August, with hourly service provided at all times except 1100, 1300 and 1500 and additional half-hourly service from 0530-0830 only. Special service because of the Closing Ceremonies was available on 12 August, with hourly service available all through the day and additional half-hourly service from 1330-1630 and from 2230-2330. Travel times from the downtown broadcaster hotels took only 10-14 minutes, while travel times from Hollywood area hotels to the MPC averaged 25-35 minutes.

The IBC-to-MPC connector route was run from 14 July-14 August. From 14-26 July and on 14 August, this shuttle ran from 0630-2330, with hourly service, plus on the hour service from 0700-4900. Travel times averaged 25 minutes. Return shuttles from the MPC-to-IBC ran on a parallel schedule one half-hour later: hourly service from 0700-2400 and half-hourly additions from 0730-0930.

The IBC routes to the venues included a line to the Exposition Park and USC areas and a second line from the IBC to UCLA. With so many major events taking place in these locations, it made sense to provide service for what would probably be capacity or near-capacity ridership. The Expo Park/USC line ran from 14 July-14 August, although it stopped at USC only (for coverage of the village) from 14-27 July and on 13-14 August. Service in this early period was every two hours from 0800-2000 and took 45 minutes to arrive at USC. The return was faster, taking only 30 minutes to return to the IBC. From 28 July to 12 August, the Exposition Park stop was included. Service was on the hour from 0600 to 2200, with a special late bus at 2230 nightly. Travel times to Expo Park were about 45 minutes, with an additional ten minutes required to get to USC. Service on 5 and 11 August began at 0500 and special half-hourly service was instituted on 28 July and 12 August for attendance at the Opening and Closing Ceremonies.

The line from the IBC to UCLA was determined by the schedule of events there as well with service to the UCLA Village provided every two hours from 0800-1900 and a last bus scheduled at 1930 daily from 14-28 July and on 13-14 August. Travel times were about 35-40 minutes each way. From 29 July-12 August, bus service was hourly beginning as early as 0630 and as late as 2200, with a return bus usually following 30 minutes later.

The bus depot at the IBC consisted of eight stops along Gordon Street, with one for the IBC-MPC connector, two for the venue/village services and five lines for hotel service. A total of 45 buses were dedicated to IBC transport.

Overall, the media transport system was very well received by broadcasters. The dependability of the service, especially with regard to arrival times, made it almost ideal for commentators and others who were not burdened with heavy equipment. Toward the end of the Games, broadcasters who had been riding in personal cars began using the bus system with frequency since it was easier than driving to the venue and parking.

There were transport needs which could not be met properly by the bus transport system. Most obvious was the large number of broadcaster ENG (electronic news-gathering) crews which used small, portable cameras along with video-tape recorders and generally consisted of three to four persons. These crews moved from site to site and were most often used for athlete interviews in formal interview and mixed zone areas and for segments which showed the announcer(s) against a chosen background. Access to vehicle parking was crucial for these crews because segments were taped and the crew moved to the next site while changing batteries, tapes and other items during transport.

The LAOOC agreed to establish a priority parking program for broadcasters with these ENG crews especially in mind. Broadcasters were interested in both access passes (allowing drop-off and pick-up, but no stationary parking privileges) and stationary parking passes and the needs for each rights-holding group varied greatly. With the number of such passes limited and considerable debate over the distribution of passes among broadcasters, it was announced at the April 1984 OBAC meeting that the LAOOC would provide to the broadcasters, at no charge, a limited number of stationary parking passes in a separate lot, the distribution of which would be settled among the broadcasters themselves. Broadcasters who had requested passes under the LAOOC's purchasing program for all media, had their

requests deleted from the lists so that priority for the remaining passes was given to written press. Access passes were thus not available to broadcasters, who used the stationary parking passes only as provided by the LAOOC. The number of passes granted for broadcaster use at each site were:

Broadcaster venue parking allocations

Sport/Site(s)	Number
Archery	8
Athletics/Boxing	132
Baseball	4
Basketball	30
Canoeing/Rowing	38
Cycling	41
Equestrian	28
Fencing/Volleyball/Yachting	50
Football	33
Gymnastics/Tennis/UCLA Village	73
Handball	19
Hockey	17
Judo	18
Modern Pentathlon	10
Shooting	5
Swimming/Diving/USC Village	67
Water Polo	14
Weightlifting	28
Wrestling	27

These passes were turned over to the broadcasters through the IBC and the distribution was handled there.

Broadcaster requests for vehicle rentals through the LAOOC were few. All broadcasters were sent a facilities questionnaire in mid-1983 to ascertain their interest in renting items such as vehicles from the LAOOC's official rental car agency, at a preferred rate. Those interested in doing so, forwarded their requirements along with pre-payment to the LAOOC and cars were picked up in Los Angeles upon arrival. Two broadcast groups rented a total of three cars including two full-size cars and one station wagon.

32.04.6 World broadcaster camera positions

Although ABC provided vision and sound from nearly all sports at the Games, many of the other rights-holding broadcasters needed camera positions from which to supplement the multilateral program feed with their own pictures. To assist these broadcasters, the LAOOC set up designated

“world broadcaster camera platforms” at many of the sites. The purpose of the platforms was to allow additional broadcaster coverage from points reserved on dedicated platforms which would not be taken up by non-rights holding broadcasters, press photographers, spectators or others. Conversely, by setting up these platforms and limiting the use of these areas to broadcasters only, it prevented blockage of photographer camera angles or spectator sight lines. World broadcaster platforms were numbered and the reservation process was handled through the IBC booking office. Identification of the group with reservations on the platforms was handled by an armband system, with distribution also taking place through the IBC booking office. Positions (and armbands) were available on a per-session basis at each sport, with three persons making up each “crew.” Armbands for each day were color-coded. Thus, at athletics, there were 16 positions available for three persons each for two sessions per day on most days, requiring a total of 96 armbands in the color of the day. In total, 3,882 armbands were fabricated. All of the armbands read “TV Crew” on them and had a two-letter code for each sport (e.g., “AT” for athletics). World broadcaster camera positions included the following stations for the various sports:

Archery

Two positions behind the men’s range and elevated behind the seating area.

Athletics

Twenty positions in all, including eight against the Coliseum rim directly overlooking the finish line area. A raised platform looking down the home straightaway was constructed behind the seating area at the Coliseum’s east end, with room for four positions; another four positions were available on a platform built overlooking the backstraight. Three positions were located on top of spectator tunnels in the west end and the final position was available on the top of the existing press box, overlooking the middle of the infield. Not more than 16 positions were ever booked here. For the start of the marathon at Santa Monica College, a special platform for four cameras was available overlooking the starting line.

Baseball

No dedicated positions were reserved and ENG crews used the press photographer positions in the wells on each baseline.

Basketball

Two camera positions were available on a platform high above the sideline, with a view of the entire floor.

Boxing

Five positions were available, each placed roughly in line with the center of the ring. Four were placed on the same side as the commentator booths: two high and two low. The other position was a high-up view from the opposite side.

Canoeing/Rowing

No dedicated positions were available here. ENG crews could use press photographer positions on the ABC houseboats along the course or on the shoreline opposite the finish. A position was also available beyond the finish line, looking into the path of the boats on the course.

Ceremonies (Opening and Closing)

Fifteen positions were available in the Coliseum. Eight were on a platform located on the rim of the stadium overlooking the finish area of the track. One position was located on the press box roof and the final six were scattered over existing spectator entry/exit tunnels in the closed end.

Cycling

Five positions were available in the Velodrome, all on a platform behind the spectator bleachers and overlooking the entire track from about its midpoint. One dedicated position overlooking the finish line was available at Mission Viejo for coverage of the individual road races, although many spots were available along the course at ground level. Press photographer positions along the course were used for the team time trial on the Artesia Freeway.

Equestrian

Five positions were available at Santa Anita, three of which were elevated positions overlooking the mid-point of the competition area. The two other positions were on the ground level at two corners of the jumping area. Positions at Fairbanks Ranch were located all along the course.

Fencing

Press photographer positions were available for use during the preliminaries, which were difficult to shoot because all of the pistes were on the same level and no crews were allowed near the competition area. For the finals in the Terrace Theatre, two positions were available near the back of the seating area on the orchestra (floor) level. These positions had a good view of the entire stage.

Football (Rose Bowl)

Eight positions were available, each on top of a spectator entry/exit tunnel. Four positions overlooked the midfield area and four others were located behind the endlines.

Gymnastics

Four camera positions were located on existing entry/exit points overlooking the entire floor.

Handball

Two camera positions were available for preliminary matches at California State University at Fullerton. Both overlooked the entire court from roughly the midpoint line. For the final at The Forum, a similar midcourt platform was available for two cameras.

Hockey

Two camera positions were available overlooking the mid-field line on top of the existing press box.

Judo

Two positions were available overlooking the midpoint of the tatami.

Modern Pentathlon

Press photographer positions were used and were located all over the area and along the sideline for the swim event.

Shooting

Press photographer areas were used at all the ranges, with the best possibilities for coverage on the skeet and trap ranges. Ceilings covering almost all other ranges made filming very difficult because of the resulting lack of lighting on the competitors.

Swimming/Synchronized Swimming

Ten camera positions were available on the main platform built high up behind the south side bleachers. These positions were moved along the platform for synchronized swimming. No positions were available for diving; press photographer positions, all of which looked directly at the diver, were used.

Swimming/Water Polo

Two positions were available, one overlooking the pool from behind one end line and on top of the adjacent poolhouse building and the other on a platform high above one sideline and overlooking the entire pool from the midfield line.

Tennis

Press photographer positions were used, with space available at court side and on the concourse level overlooking the entire center court.

Volleyball

Two camera positions were available overlooking the entire court from the concourse level’s existing press section.

Weightlifting

Three camera positions were available at the back of the hall, looking directly into the face of the lifter.

Wrestling

Two camera positions were available, located on a platform which overlooked the center mat.

Yachting

Press photographer positions on special boats were available. Eight of these boats carried four persons each and ten boats were available in all. Sign-up in the venue press sub-center was required.

These camera positions were successfully used by a number of broadcasters. Although use of the small, portable ENG camera was the rule, one broadcaster installed one large studio camera each at athletics and gymnastics.

32.04.7

World broadcaster liaison at the IBC

The LAOOC stationed a small group at the IBC to handle broadcaster questions and provide information gathered by the LAOOC. All results were output at the LAOOC’s IBC office, and supplemental information material compiled at the Main Press Center was also available at the same station.

The LAOOC’s manager of world broadcasting was present at the IBC with a small support staff. Representing the Television Operations Department, he also supervised the on-site presence of the LAOOC’s other staff from Health Services, Technology and Transportation.

The Television Operations office was open from 0800 to 2400 and was on-call during the remaining hours. Meetings were held daily with all broadcasters (usually at 1400 hours) to share ideas and questions about various matters of concern to the broadcasters. The LAOOC office was open from 4 July to 13 August.

The Television Operations Department was present at the IBC to facilitate the needs of the broadcasters. The daily meetings were the principal vehicle for this, and the response of the LAOOC was dependable, if not always fully satisfying to the broadcasters. The main areas which concerned the broadcasters as judged from the daily meetings included commercialization, security and scheduling.

Television and Film Operations

The presence of commercial logos, marks and symbols on clothing, equipment and other items caused substantial concern for broadcasters. Specific problems occurred at boxing and rowing but were eventually resolved. Little could be done about oversized identification marks on competitors' uniforms, but inappropriate identification marks were removed from equipment which was under the control of the LAOOC.

Security and access control complicated broadcaster entry, especially in the pre-Games period prior to competition after venues had been completely secured. Inconsistencies in access controls among venues required individual discussions with staff from each venue every time a difficulty was encountered.

Scheduling was a tremendous problem for broadcasters who had purchased satellite transmission time between specified times. Late starts in several sports meant that some of those events could not be shown in their entirety since the finish time would run past the end of the broadcaster's purchased satellite transmission period, and overtime was not available because of time blocked by other broadcasters. In other cases, although a session started on time, the finish was substantially delayed, often for reasons beyond the LAOOC's control. For example, in one sport, the competition directorate of the International Federation completely re-structured the session only minutes before it began, with the result that it ran more than an hour longer than scheduled. Close cooperation among the broadcasters, federations and Organizing Committee is required to minimize or prevent altogether such occurrences. For broadcasters, the ultimate result of scheduling problems is either thousands of dollars in additional overtime costs for satellite transmissions or the loss of the end of particular sessions of a sport.

32.04.8 Other services provided by the LAOOC

A myriad of other services was provided to broadcasters by the LAOOC. Among these were: equipment and furniture at the IBC, health services at the IBC, assistance in hiring local staff, special results services in the venues and purchase of tickets.

The LAOOC provided a limited amount of furniture at the IBC for use by broadcasters at no charge. Included were 1,200 straight-backed side chairs, 120 folding tables (each 30 inches wide by 72 inches long) and 32 60-inch diameter round tables. These were used by IBC-based broadcasters in their own office areas. Gift packages were also provided to the broadcasters on the same basis as for the written press. Some confusion was caused by the distribution pattern of these packages, since personnel who were not accredited at the Main Press Center or failed to pick up their gift bags at the time of accreditation were unhappy. A

secondary distribution at the IBC eventually corrected this. Manual typewriters were also provided to organizations with offices in the IBC on the same basis as made available to those working in the Main Press Center. A total of 250 typewriters were available for IBC users, including 200 in English, 20 in French, 10 in Russian and 20 in Spanish. A few groups wished to rent electric typewriters with LAOOC assistance and a favorable rate was arranged for the rental of a total of 36 machines, 28 of these in English, with others in French, German and Italian. Health care services at the IBC were provided on a 24-hour basis by the LAOOC in an existing location for first aid service.

The LAOOC provided broadcasters with assistance in recruiting local staff, mostly college-aged men. These individuals were used mostly as drivers and messengers, although a few performed office duties such as receptionists or typists. A total of 76 persons were placed and each was paid on an hourly basis. One broadcast group withdrew its request upon arrival in Los Angeles and new positions had to be found for the people scheduled to work with that broadcaster. In the future, some precautions should be taken to prevent such unfortunate occurrences.

In order to give the broadcast media the fastest result service possible under the LAOOC's existing system, a special result service was set up in the venues. Results channels were not available in the venues on the television monitors in the broadcaster commentator booths, thus requiring delivery of printed results produced by the LAOOC. In order to meet the immediate "on-air" need for results during live transmissions, it was determined that a faster method of delivery of results was necessary than could be expected from the already planned results service, which forecast delivery of results within ten minutes after official approval. The procedure used at the larger venues included placement of a results area within the venue commentator booth group for immediate compilation and delivery of the results to the broadcasters only. Because of the relatively small number of commentator booths present (typical was 44 at gymnastics), this was manageable. Equipment included: a small table-top photocopier with a speed of 11 copies per minute, a high-speed telecopier (30 second transmission time), an Electronic Messaging System (EMS) terminal and high-speed printer. The procedure was generally that a completed result or start list was telecopied from the central results preparation area to the broadcaster results area as soon as

available. This copy was inspected for clarity and any additional information such as a revision number was handwritten if necessary by the attendant for the broadcaster results area. This page was then photocopied and distributed. Back-up for the telecopier came from the EMS terminal and printer, to which results were sent electronically within seconds following the completion of an event. The relevant results sheets or start lists were output from the EMS and photocopied as they were available and distributed to broadcaster commentator booths.

The combination system of telecopier and EMS terminal was present in eight venues and a secondary system with an EMS terminal and printer, but no telecopier, was used in nine others:

EMS terminal/printer with telecopier	Commentator booths
Athletics (3)	74
Basketball	28
Boxing	29
Gymnastics	44
Swimming/Diving/Synchronized swimming (2)	45
Volleyball	20
Weightlifting	14
Wrestling	22

EMS terminal/printer without telecopier	Commentator booths
Canoeing/Rowing	29
Cycling	23
Equestrian	18
Fencing	12
Football	20
Handball	10
Hockey	14
Judo	16
Water polo	8

No special system was used at other venues including: archery, cycling road and team time trial races, equestrian three-day event (cross-country portion), modern pentathlon, shooting, yachting or for the demonstration sports of baseball and tennis. Results service in these venues was the same as for the written press, i.e., delivery of the printed sheets output from the LAOOC's main results System.

Results service at the IBC included a full-scale results output station and large photocopiers for mass distribution. In addition, telecopier links with the Main Press Center were used to provide supplemental information produced at the MPC for distribution to the broadcasters. The LAOOC arranged for 90 EMS terminals and 30 printers for broadcast organizations which were placed at strategic points within the IBC.

The LAOOC also made tickets available for purchase by broadcasters. Most of the broadcasters took advantage of this and were able to secure tickets for use by their executives and guests. In some instances, non-working commentators or crew members used these seats.

32.04.9 Analysis of world broadcaster liaison

The LAOOC provided a modest but important program of services for world broadcasters. Those groups which purchased exclusive rights from the LAOOC found everything they needed to do their work in Los Angeles. The LAOOC did its best to assist broadcasters with their pre-planned needs as well as additional requirements which became apparent only during the course of their broadcast operations.

In the future, the following points should be noted:

- Broadcasters were highly successful in Los Angeles. Record audiences watched the Games which were televised at all hours of the day and night. With more interest than ever shown by viewers, it is important that organizers do what they can to assist broadcasters with their work at the Games.
 - A good liaison person for production matters needs to be designated by the Organizing Committee soon after the sale of rights is completed to any broadcasting organization. Although the Press Operations Department worked closely with broadcasters in the planning period, the Television Operations Department had the responsibility for and was effective in coordinating services for the broadcasters during the Games period. Press Operations did not have a liaison at the IBC, having given up that role to the Television Operations group, yet the broadcasters felt that they were receiving less in service because of the absence of an organizer-partner with whom they had worked previously. This can be avoided by having a clear liaison point with whom the broadcasters can develop confidence at an early stage.
- The LAOOC's IBC liaison office performed steadily during the Games period. The most important functions of answering questions and solving intra-LAOOC difficulties which hampered broadcasters were performed well. In the future, it may be worthwhile to provide a larger staff which has greater responsibility for the well-being of broadcaster personnel in all phases of their experience in the host city. It is not surprising that the LAOOC services which worked best for broadcasters were the ones which were offered in the IBC lot itself: health services, technology and transportation. Following this guide, better results can be obtained in the areas of accreditation, gift distribution and housing if they are handled at the IBC.

- Information about events and people in the host city are important to the broadcasters. Great interest was shown in the torch relay as it neared Los Angeles. Other events which are not related to the Games are interesting to broadcasters if they are visual in nature and bring the viewer to better understand the people and culture of the site where the Games are and will take place.

The IBC was successful because its tenants were successful. With the success of the Games now dependent upon the international impact they make, organizers cannot afford to dismiss the Games' broadcast center as a technical jungle. The Organizing Committee must make responsible efforts to provide support services to broadcasters which will enable them to do their work more completely and efficiently. For the most part, the LAOOC fulfilled this requirement and provided good services, especially in the areas of information services, results and transportation.

32.05 Television operations for non-rights-holding broadcasters

In addition to the many broadcast organizations which purchased broadcasting rights to the Games, there were a large number of broadcast organizations which did not acquire broadcast rights for the Games, but still intended to cover them. The LAOOC dealt with these non-rights-holding broadcasters under the Olympic Charter accreditation category of "EF".

In the Charter (1978 Provisional Edition), an allocation of 100 accreditations was made available for television and newsfilm crews which prepare coverage for the news programs of their client networks or stations. Their ability to cover the Games was carefully circumscribed so as not to interfere with the exclusive rights purchased by other organizations which broadcast over the same territory. These so-called "EF" broadcasters were allowed to show (that is, to actually broadcast) not more than three reports per day of not more than three minutes each, separated by an interval of not less than three hours and presented during the course of a regular news program in which news reporting was the main element. This celebrated "three by three" rule was amended in 1980 to three reports per day of not more than two minutes each, but since the 1978 Provisional Edition of the Charter was applicable to the Games of the XXIIIrd Olympiad, the three-by-three rule was used.

It became clear that applications for these "EF" accreditations would come from countries in which broadcasting competition was intense. This included notably the United States, since most other countries were either represented by consortiums of all

broadcasters within that country or by single broadcasting networks which operated without any competition. Applications for accreditation from television networks or stations, television producers or filmmakers and all others wishing to film or record the Games for any visual use were considered under the "EF" category. Virtually all of the applications for the 100 "EF" accreditations were received by January 1984, and the distribution process was begun. The LAOOC, faced with applications for 548 credentials, determined that the most important factor in the distribution of accreditations was the coverage area of the entity applying. "EF" accreditations were thus distributed to two types of organizations: news-gathering organizations with an international group of clients and United States networks which serviced their own national newscasts as well as individual stations across the USA. Although competition among television organizations in some other countries was strong as well, no accreditations were granted to others because of liberal use rules established by the rights-holders in those nations.

Once the distribution of accreditations was accomplished, the specific regulations which applied to such credential-holders had to be developed. While it was clear that not more than three reports per day of up to three minutes each could be shown, it was unclear whether "EF"-accredited broadcasters should be able to enter stadiums to record their own coverage. The LAOOC worked closely with ABC, the rights-holder in the United States, to help develop guidelines for the U.S. broadcasters accredited in the "EF" category which allowed suitable access to gain coverage, but did not compromise the rights purchased by ABC.

After discussions with the non-rights-holding broadcasters in the U.S. who had been selected for accreditation in the "EF" category, it became obvious that none of them wished to infringe on ABC's rights, especially regarding the broadcasting of competitions themselves. "EF"-accredited broadcasters were primarily interested in access to the interview zones of the venues where athlete interviews would take place, to the interview zones of the Olympic villages and to the Main Press Center for information and access to the news conferences held there. Given this direction, a set of regulations was issued by the LAOOC and ABC in July 1984, which allowed access for "EF"-accredited persons to the Olympic villages on the same basis as all media (using the 200 passes

available at the UCLA and USC villages to enter the interview zones), some venue interview areas and to the Main Press Center on an unlimited basis. Interviews and other non-competition coverage compiled at these sites could be shown on any regular-scheduled program in which news is an element, although perhaps not the primary element, on an unrestricted basis. Such coverage could not be shown on special programs about the Games.

Regarding competition coverage, ABC agreed to allow rival broadcasters in the United States to show competition highlights using ABC's coverage only (as recorded off-the-air by the broadcaster wishing to show it) of events which ABC had already telecast or which were more than 48 hours old and which were presented after ABC had completed the whole of its Olympic broadcasts at 0200 Eastern time. These highlights had to be shown in the course of regularly-scheduled news-reporting programs in reports which were not more than three minutes in length, were separated by an interval of not less than three hours and which were shown not more than three times per day. A credit to ABC for the use of the video competition highlights was required.

Access to the venues was limited to the interview zones of those sites where the interview rooms were located outside of the venue itself. It was felt that entry to the venue proper and the attendant physical ability to shoot competition footage on the way to an interview zone located within a venue might prove too tempting. Thus, the interview sites for athletics, gymnastics, hockey and swimming were open for "EF"-accredited persons because those interview areas were located outside the venue entry points and offered no view of the field of play. Access to training sites was the same as for all media, and all "EF"-accredited personnel were welcome to use the LAOOC's media transport system and/or apply for the purchase of parking credentials. Since many of the "EF"-accredited broadcasters were concentrating on colorful Games stories outside the competitions themselves, it was noted that the restrictions applied only to those areas controlled by the LAOOC and that the many activities taking place in public areas were not restricted from coverage (or broadcast) by the exclusive rights held by ABC.

During the Games period, it was determined that it would be helpful for commentators of "EF"-accredited organizations to be given accreditation which would allow their entry into stadiums and facilitate their descriptions of the events which took place there. Such commentators were identified and issued "EF" credentials, the same as given to journalists from the print media. ABC also relaxed the rules regarding access to interviews late in the Games when no problems

regarding the use of unauthorized material had surfaced. "EF"-accredited crews were allowed to enter the venues for the men's basketball final and the men's and women's volleyball finals. Crews were again allowed to tape interviews only and were admitted to the venue only after the competitions themselves had ended.

Overall, "EF"-accredited organizations which planned their coverage carefully were able to achieve satisfactory results. Some groups were able to acquire office spaces in areas adjacent to the villages, providing a permanent base of operations for the Games in close proximity to the athletes. This made athlete contacts easier and gave these organizations an opportunity to keep close track of village events. Others arranged for rooftop space on buildings around Los Angeles to record panoramic views of the venues and villages. All of the "EF"-accredited broadcasters were pleased with the many news conferences held at the Main Press Center, and several installed permanent audio and video lines into the main interview room there. In addition, these broadcasters covered numerous side stories about the Games which were sometimes as interesting as the Games themselves. In the future, organizers may wish to compile lists of events which are taking place in the pre-Games period for use by these broadcasters, who showed interest in various events in Los Angeles during the Olympic period, whether related to the Games or not.

32.06 Radio

32.06.1 Sales of exclusive rights

Although the 1978 Provisional Edition of the Olympic Charter provided for the sale of radio rights, exclusive rights for radio had never been sold for any Games prior to the Games of the XXIIIrd Olympiad until agreements for exclusive rights, covering Australia, the 16 OIRT countries and the United States, were made. Where exclusive rights were not sold, radio rights were available on a non-exclusive basis at no charge to any party wishing to provide audio coverage of the Games.

The original agreement to sell exclusive radio rights was limited to the United States. In a portion of the "Responses to Questionnaires from International Olympic Committee and International Sports Federations", which later became part of the contract between the IOC and LAOOC, it was stated that broadcasting of the Games would be assured by the award of television and radio (U.S. only) rights.

However, the responses also stated that "radio rights may be sold with the approval of the IOC", leaving open the possibility that additional radio rights could be sold.

Radio rights in the United States were awarded to the ABC Radio Networks in November 1981 for a total payment of \$500,000, including \$200,000 for radio rights and another \$300,000 for support services of the LAOOC. ABC agreed to perform the role of host coordinating radio broadcaster and incorporated this requirement into the planning for the International Broadcast Center immediately after the rights agreement was reached. The agreement also contained a provision which allowed other U.S. broadcasters to originate radio broadcasts, whether live or on tape, from the venues in not more than three reports per day, each report being not longer than three minutes and separated from all others by an interval of not less than three hours.

ABC's radio rights did not include Spanish-language rights, which were sold to Westwood One, a national syndicator of Spanish-language radio programming, in early 1984 for \$100,000.

Exclusive radio rights were combined with television rights in sales to Australia and the OIRT countries. In the September 1982 agreement with Australian Network Ten, a total of \$10,600,000 was paid for exclusive television rights, and exclusive radio rights were also included. The exclusivity was limited, however, to 48 hours following the completion of an event covered in the programming. The Olympic Charter provisions regarding news gathering also applied, incorporating the "three-by-three" rule into radio broadcasting as well as television. These rights were later sold by Network Ten to the Australian Broadcasting Commission. Exclusive rights in the 16 mostly Eastern European OIRT countries was included in the February 1984 agreement. Exclusivity in those countries was subject only to the news-reporting provisions of the Olympic Charter.

The sales of radio rights were highly successful for the LAOOC. Although additional funds were not raised by the limited sale of rights outside the U.S., a total of \$600,000 was received from ABC Radio and Westwood One. Moreover, the radio coverage of the Games in the United States was expanded substantially—not only by ABC, but also by the many competitor networks which provided alternative coverage on a reduced basis in accordance with the rules regarding exclusivity. It may be possible to encourage such added coverage by the

sales of radio rights in other countries in the future, provided the circumstances are proper to provide increased interest as in the United States in 1984.

32.06.2 Special operations for radio broadcasters

Special operations for radio broadcasters were instituted by both the LAOOC and the host broadcaster for the Games.

As host broadcaster, ABC arranged for commentary positions (against payment) as requested by broadcast organizations for radio commentators. In addition, technical facilities were made available at the IBC, including a special line to monitor and record for broadcast all news conferences held at the main interview room of the Main Press Center.

The LAOOC supported sound broadcasting with special facilities at all venue sites and with specially-arranged commentary positions in some of the venues. At all sites, the LAOOC arranged to have special multiple-output audio patch boxes in all venue interview rooms for direct recording of all athletes brought into the formal interview areas as well as the questions asked of each person. Each patch box had 16 outputs with impedance from each available for either microphone (150 ohms) or line (600 ohms) levels. Only one box (16 outputs) was provided at some sites with a maximum of six (96 outputs) provided at the main interview room of the Main Press Center. In addition, all formal interview sessions at all sites and the Main Press Center were tape recorded and available for playback (and recording) by media requiring sound clips.

The LAOOC was asked by the EBU to provide special commentator assistance. Aware of the cost of fully-equipped radio commentator positions from ABC, the EBU asked if the LAOOC would provide reserved spaces in the tabled seat area of the press seating sections of some venues for the installation of telephones and equipment for broadcasting via telephone lines for some of its radio broadcasting teams. This approach saved money but did not give the commentators using such positions the advantage of television monitors at their desks or the special results

service planned by the LAOOC for the broadcast commentator area. The LAOOC agreed to reserve such positions, which were available at no charge for the reservation of the tabled seats involved, so long as a private telephone was in fact ordered for installation in the press seating area of the venue concerned. The "telephone commentary positions" consisted of two seats each, and 61 of them were reserved in 21 different venues. The largest single number requested was six at the shooting site at the Prado Recreational Area, with the lowest number, one, at four different sites. Where no press seating area was available, as at cycling (team time trial), modern pentathlon, shooting and yachting, the telephones were installed in the press sub-center for that venue.

32.06.3 Special regulations for non-rights holding radio broadcasters

Since exclusive rights had been sold in the United States especially, regulations to guide non-exclusive broadcasters had to be developed. The LAOOC worked closely with ABC Radio to develop such guidelines in order to give non-exclusive broadcasters an opportunity for satisfactory coverage of the Games while protecting the exclusivity purchased by ABC. These guidelines were completed and distributed in mid-1982.

The basic guideline was that non-exclusive U.S. radio broadcasters were able to broadcast live or taped reports which were originated in any of the venue sites not more than three times per day, with each report lasting not longer than three minutes, separated from the other two by an interval of at least three hours and broadcast in the course of a bona fide radio news broadcast.

Regulations accompanying the basic guideline noted that radio broadcasters were not limited as to the amount of material which could be gathered for broadcast, so long as the broadcasts themselves carried not more than the three allowed reports in the prescribed format. Further, no restrictions were placed on the broadcast of material gathered from the Olympic villages or from the main interview room of the Main Press Center. Interestingly, material gathered from other areas of the Main Press Center was subject to the restrictions on venue-originated reports, since radio broadcasters could conceivably broadcast (live) commentaries from the television monitors installed for media use there. Venue parameters were defined as 100 or more yards from the outer perimeter of indoor sites like The Forum and 500 or more yards from the outer perimeter of outdoor sites such as the Los Angeles Memorial Coliseum and thus included not only

commentaries compiled from the seating areas of these stadiums, but also interviews in the venue mixed zones or formal interview areas. Violations of the regulations were grounds for revocation of accreditation.

Careful planning was undertaken by numerous U.S. radio organizations to comply with these regulations and still provide suitable coverage for their audiences. Several groups installed private telephones and transmission lines but were keenly aware of the restrictions against the broadcast of more than the allowed number of reports. No incidents requiring the suspension or revocation of accreditations were reported.

Australian radio groups which were faced with restrictions in view of the exclusivity enjoyed by the Australian Broadcasting Commission worked closely with them to obtain suitable information for their own use. Unfortunately, several instances of infringement occurred, resulting in the suspension of two accreditations and an agreement on the retention by the original holder of a third after a pledge not to infringe further.

32.07 Film operations

32.07.1 Concept and development of the official film project

The "Official Film of the Games" is required under the Olympic Charter. The Charter provisions require that the film must comprise shots of each sport and the Opening and Closing Ceremonies. The LAOOC, aware that such films were not only required to be produced, but also that many had been produced at a loss to the organizing committee involved, was determined not to experience the same fate.

Thus, the requirements for production of the official film required a producer of merit and, for what is believed to be the first time, a fee for the right to distribute the film world-wide. The LAOOC found a willing partner in 1982 and concluded an agreement with Twentieth-Century Fox Film Corporation, which paid \$1 million in total for the exclusive right to distribute and show the film. The LAOOC agreed not to grant any other film rights or to permit filming by other entities which

did not already have specific permission (in the Olympic Charter or otherwise) to produce a film about the Games. Fox later selected award-winning sports documentarian and historian Bud Greenspan as producer and director. Having covered seven Olympic Games beginning in Helsinki in 1952, Greenspan brought a wealth of experience to the project, as well as numerous awards for his work which includes *"The Olympiad"* series which has been seen in more than 80 countries and *"Wilma,"* a television drama based on the life of triple gold-medalist Wilma Rudolph of the United States.

After planning for production of the film had commenced, Fox withdrew its interest in the film in favor of Greenspan's own company, Cappy Productions. Cappy completed the film and distribution was arranged on a worldwide basis by an independent distribution company.

32.07.2

Official film operations

The Olympic Charter requirement which demanded shots of each venue required Cappy to spread its resources thinly over the entire area in which the Games were held. However, at each site, it was able to capture not only the performers in competition but also the drama, excitement and unique character of Los Angeles during the Games period.

The accreditation of Cappy personnel included 157 people: 20 administrators and production personnel, 124 technical staff and 13 journalists and researchers. Pre-Games planning by the LAOOC and Cappy endeavored to keep the space requirements for both camera positions and compound areas as modest as possible. To this end, Cappy agreed to a maximum number of accredited persons in each venue at a single time. The highest total was predictably at athletics (54), while the lowest was at judo (12).

Facilities for shooting at each site differed, depending upon the number of agreed positions and the particular competitions taking place on that day. Care was taken to be sure that filming positions did not interfere with the operations of the host broadcaster. In addition, Cappy was allowed to place cameras in the press photographic position area on a first-come, first-served basis. Cappy personnel on the field level were all identified with bibs marked "Official Cinematographer."

Requirements for camera positions, compounds and other space needed for production offices, storage and supply areas were as follows:

16

Archery

Two camera positions, one on the field level, a 30-foot recreational vehicle, one truck and an automobile provided support.

Athletics

Twenty-three different camera positions were identified, including five on the field level and two additional cameras on the infield itself. Three 12-foot by 45-foot trailers were used for production support and were located in the LAOOC's venue management compound. For the marathons, three positions were identified on the field level at Santa Monica College, 11 more along the course and three on various vehicles accompanying the runners.

Basketball

Three positions were identified, with one elevated position and two at the court level. Storage space inside the venue was used.

76 An official film production crew shoots cyclists on them field of the velodrome.

Television and Film Operations

Boxing

Four positions were used, with one at ringside and the other three elevated. The necessary support space was located inside the Sports Arena.

Canoeing/Rowing

Four positions were used, all on the shore at different points on the course. Two recreational vehicles and one car provided the necessary storage and support space.

Cycling

Four positions were available, with one on the infield. A 40-foot-square fenced area was used as a compound. Positions at the finish line and along the course were used for the individual road races at Mission Viejo and the team time trial event on the Artesia Freeway. A recreational vehicle and one car were used for support at these sites.

Equestrian

Three positions were used, with two on the ring level. Storage space was located inside the venue. Arrangements at Fairbanks Ranch included six positions along the course, with support from two recreational vehicles and two trucks.

Fencing

Three positions were used for finals only, with two in the stage wing areas. Storage was arranged inside the venue and combined with volleyball.

Football

Five positions were available, including two on the ground level behind the end lines and two more in the lowest section of spectator seats (which were not sold). Two recreational vehicles provided support.

Gymnastics

Five positions were used, with three on the floor level in press photographer areas. Special care had to be taken to ensure that the cameras were as quiet as possible so as to keep from disturbing the competitors. Storage space was arranged inside the venue.

Handball

Coverage of the final matches only was planned, with two court level positions and one elevated position. Storage space arranged inside the venue for basketball was used.

Hockey

Four positions were employed, including three on the field level. A trio of vehicles, recreational, truck and car, was present for support.

Judo

Only two positions were used, with one on the tatami level. Storage space was located inside the venue.

Modern Pentathlon

Not more than two cameras were located here at any one time and they utilized the press photographer positions. One recreational vehicle and an equipment truck were used for storage and support.

Shooting

A single camera occupied the best available positions on the ranges. Support requirements included one recreational vehicle and a truck.

Swimming

Five positions were used for swimming and synchronized swimming, with Cappy using space in the press photographer area on the deck level. Positions for diving totaled three, with two on the deck level. Cappy arranged for office and storage space independently with the University of Southern California.

Swimming/Water Polo

Four camera positions were used, with three on the deck level. Support vehicles included two recreational vehicles.

Volleyball

Four positions were used, with three on the floor. Office and storage space was found inside the Long Beach Convention Center complex and combined with fencing.

Weightlifting

Three positions were used, including one at the side of the lifting platform looking into the faces of the competitors and another roaming between the warm-up area and a position behind the competitors at the side of the platform. Two trucks and a car were used for support.

Wrestling

Two of the three camera positions were located on the floor level. A recreational vehicle and one truck were used for office and storage space and additional space was used inside the venue.

Yachting

One camera was used to cover pre-race preparations and an agreement was reached with the film crew of the International Yacht Racing Union for specific coverage on the water.

32.07.3

Operations of other film concerns

Although the LAOOC tried to limit filming as much as possible, there were several other groups which did film the Games. These groups had to be coordinated carefully, inasmuch as they also desired shooting positions in the same general areas as ABC, other world broadcasters, Cappy Productions and press photographers.

International Federations were specifically given the right in the Olympic Charter to make a technical film for use in coaching clinics, seminars and the like. Only a few federations appointed their own crews, although several reached agreements with Cappy to shoot for them. Technical films were organized by the International Federations for archery, hockey, volleyball and yachting. Because of their federation-approved status, these filmmakers were able to occupy preferential positions, but this did not prove troublesome since each of the sports concerned had ample room to accommodate such additional requirements.

The Bio-Mechanical Sub-Commission of the Medical Commission of the IOC organized bio-mechanical cinematography in athletics, gymnastics and weightlifting. This group used high-speed cameras (up to 500 frames per second) and a technical staff of nine persons to operate at the three sites. At athletics, seven camera positions on the grass area surrounding the track were used during different days for different events. All were operated by remote control and operators were not needed except to change film. At gymnastics, coverage included the vault for men and women. A head-on view and side view at the take-off point was recorded by two cameras which were specially encased in order to prevent noise from disturbing the competitors. At weightlifting, both head-on and side views were recorded using cameras mounted on tripods and elevated to stay out of the way of spectator sight lines. The crew was provided with one access pass for drop-off and pick-up at all sites and one parking pass for weightlifting. Parking privileges for the Coliseum were unavailable, and the filming team leader had his office at UCLA, eliminating the need for additional parking there besides his own. No problems were encountered with this project.

Some miscellaneous filming was done by various entities, none of which required substantial supervision by the LAOOC.

32.07.4 Reflections on Olympic films and filmmakers

For the most part, the efforts of filmmakers were successful in Los Angeles. The official film and technical

films by federations and the IOC Medical Commission proceeded without much difficulty after careful planning had produced a clearly understood operating plan for each group. In the future, organizers should consider the following when formulating policies regarding film:

- Requirements from the Olympic Charter must be factored in first. The production of an official film is a undertaking requires large amounts of space for cameras, compounds, people and storage. Layout of camera positions must take into account the other important users, including the host broadcaster, other broadcasters, IF technical films and press photographers. Ticket manifests for each site must be evaluated in view of each of these groups before becoming final.
- Pressure from the organizers is necessary to keep materiel and people from all types of film crews at a minimum. Additionally, it is important to recognize that not every request for filming can be granted. The LAOOC turned down a large number of requests for various types of filming, most of which was for commercial programming which would have infringed on the exclusive rights granted in the agreement for the official film. However, some of the requests that were turned down were from National Olympic Committees, which have no rights under the Charter to make films but have done so in the past. The LAOOC asked such entities to make arrangements with Cappy Productions for their needs, if possible. The success of the film projects in Los Angeles was directly attributable to the LAOOC's ability to minimize the number of crews shooting at the Games in total, as well as the number of filmmaking personnel who were allowed at any one site at a time.
- The need for access by technical film crews and bio-mechanical filmmakers is sure to arise. Organizing committees must poll each federation carefully and work closely with the IOC Medical Commission to keep such projects at a manageable level, both for the organizer and the technical filmmaker. Special facilities must be thought out in advance as well, such as the sound attenuation equipment for the bio-mechanical cameras at gymnastics or special power for recharging of batteries between sessions of other events. Careful planning of needs will prevent last-minute frustrations which can often spoil an otherwise well-conceived project.

33

33.01

Concept and goals

The primary objectives of the LAOOC Ticketing Department were to establish the policies, procedures and methods to meet the following goals:

- Ensure a fair and equitable distribution of approximately eight million available tickets
- Ensure favorable public and press relations
- Maximize attendance and revenue potential

The Ticketing Department was directly responsible for:

- All ticket sales including sports and the Olympic Arts Festival
- Development and implementation of ticketing marketing plans
- Development and implementation of ticket packaging concepts
- Order form design, text, printing and distribution
- Order form distributors and printers for tickets, order brochures and forms
- Bank (lock box) processing
- Establishment of ticket prices and venue scaling
- Ticket revenue and expense projections and budgets
- Special sales allocations, negotiations and sales
- System design, development and implementation
- Ticket design and printing
- Ticket distribution
- Venue seating manifests
- Vendor selection
- Resolution of ticket purchasers' problems at all sports and Olympic Arts Festival sites

Ticket orders for the 1984 Games were processed through a centralized computer facility located in Los Angeles. Order brochures were available at approximately 3,300 outlets of a major national retailer, Sears Roebuck and Co., as well as at 200 branches of First Interstate Bank in Southern California and Manufacturer's Hanover Trust in New York City.

Ticket orders were accepted through a mail order system that began in June 1983 and continued through April 1984. Approximately 331,000 orders were received from the United States general public and processed by the mail order operation. Additionally, special ticket orders from NOCs, sponsors, official hotels and other special sales groups were processed during the same time period. All ticket inventories, including allocations for Olympic Charter-required seating for the media and the Olympic Family, were maintained on the central computer.

A two-phase mail order ticketing process was used. During the first phase, ticket orders were recorded and space was reserved for each requested event by price scale. Orders were also

placed on waiting lists during this phase. The second phase, which commenced in early 1984, included loading the actual seating manifests for each venue into the system, assigning seats and printing tickets. Physical distribution of the tickets was made from May to July 1984.

In addition to the major functions of order processing and ticket printing, the computerized system supported customer service, accounting and management information reporting functions.

33.02

Development and overview of the ticketing system

The ticketing system was designed over a three-year period following several basic assumptions. The most important of these was that most of the tickets to the Games would be pre-sold by mail. The ticket sales and distribution program was based on a mail-order procedure, with order forms widely available to the U.S. public, where the greatest number of sales would take place. The ticketing system was prepared to respond to order forms returned after the distribution of the ticket order brochures in June 1983.

Domestic general public ticket order forms were sent to a post office box and then processed through First Interstate Bank's lock box operation. Each order was reviewed by bank personnel who affixed an arrival sequence number to each order. Order payments (by check, money order or credit card) were separated and deposited into an LAOOC bank account. All orders were grouped into batches and sent to the LAOOC data center for entry into the computerized system.

Tickets were sold on a first-come, first-served basis with one notable exception. For each over-subscribed event where more orders for a specific event were received than seats available, a random selection was held for each over-subscribed event to determine which orders would be filled for those events. This ensured that all customers had a fair and equal chance to purchase tickets to the most popular events. To be eligible for the random selection, the order had to be received by 15 August 1983, approximately 60 days after brochures were first available.

Random selection applied only to a customer's first choice. Those orders not selected were filled, if possible, by second or third choice events. Random selection was done on an event-by-event basis and did not affect other choices on an individual order. A waiting list was maintained for first choice events not filled through random selection. In subsequent months, many of these orders were filled from tickets that became available through unused sponsor and NOC allocations.

Ticket requests for special sales were also processed through the computerized ticketing system. These included:

- NOCs (including tickets for resale to foreign general public)
- Sponsors, suppliers, licensees and television broadcasters
- Official hotels

Ticket allocations were developed for each of the eligible special sales groups. Individual allocations within each group were comprised of a representative share of all events and all price scales. At the option of each special sales buyer, the allocation was modified to the purchaser's individual requirements. A purchaser was not required to buy his entire allocation but was allowed to purchase a percentage of the total. This meant that if a purchaser wanted 50 percent of his allocation, he received 50 percent of each of the original allocations for each event included in the original package. Payment was due in early 1984 and no sales were made on consignment. Seat locations were sprinkled throughout the venues with no accommodations made for group seating.

The general progress of the ticketing plan was as follows:

- Philosophies and goals defined November 1981
- Conceptualization of system completed January 1982
- Marketing strategies developed November 1982
- Programming commenced December 1982
- Detailed system design completed March 1983
- Brochure distributors selected March 1983
- Pricing completed April 1983
- Order brochure printed May 1983
- Mail orders accepted June 1983
- Preliminary inventory allocations completed (U.S. general public, NOCs, sponsors, etc.) October 1983
- Random selection completed October 1983
- Initial special sales allocations distributed November 1983
- Ticket design completed December 1983
- Acknowledgements and refunds mailed December 1983
- Venue capacities finalized March 1984
- Broadcaster camera and commentator booths finalized March 1984
- Seat assignment commenced March 1984
- Waiting list processed March 1984
- Remote football tickets available for sale at major retailer April 1984
- Ticket printing commenced April 1984
- Ticket delivery (U.S. Postal Service) commenced May 1984
- Ticket sales and information centers opened in Southern California only June 1984
- Ticket printing and delivery completed July 1984
- Ticket Faires held July 1984
- Tickets sold at venues August 1984

33.03

Ticket marketing and sales

33.03.1

Marketing and pricing program

The primary marketing assumption was that a large demand existed for Olympic tickets throughout the United States. Consequently, the LAOOC's objective was to make order brochures available throughout the United States to anyone interested in applying for tickets. No advertising was done since radio, television, magazines and newspapers did a superb job of notifying the general public of the procedures for ordering Olympic tickets. A news conference was held on 13 June 1983 announcing the ticket ordering procedures, events available, prices and ordering instructions. Seven million brochures were available on 14 June 1983 at approximately 3,500 retail establishments in the United States as well as at banks in Southern California and metropolitan New York City. Five million brochures were picked up and the LAOOC received approximately 279,000 orders within 60 days.

Marketing activities through the end of 1983 consisted of ticket update news conferences. Orders through the mail were not accepted after 1 May 1984. On 7 June 1984, nine remote ticket and information centers were opened throughout Southern California. There were approximately one million tickets available for sale over-the-counter at these centers and a news conference was held in early June announcing the openings. A minimum amount of newspaper advertising commenced in mid-June and continued throughout the Games. This advertising consisted of quarter-page ads in local newspapers and were generally sport specific, announcing ticket availability and stating the locations of the ticket centers. Advertising for the remote football locations consisted of radio, television and newspaper advertising and promotions with local businesses.

Ticket prices ranged from \$3 to \$95 for sporting events and \$50/\$100/\$200 for Opening and Closing Ceremonies. The average ticket price for sporting events was \$17. Approximately half of the eight million available tickets were priced at \$10 or less.

To arrive at these prices the LAOOC researched ticket prices for prior Olympic Games and other premium sporting events held throughout the world. Attendance figures for prior Olympic Games were used to assist in determining event popularity. Ticket prices for preliminary events were lower than for semifinal and final events. Events known to be very popular were priced at the high end of the price scale. The objectives in pricing in this manner were two-fold: to make the Games affordable for everyone by including tickets priced at \$10 or less for each sport, and to generate sufficient revenues to support Games operating costs.

Approximately 10 percent of the tickets for every sport were offered for sale as season tickets. A season ticket guaranteed the purchaser the same seat at every session of competition in

- 1 An out-of-luck spectator tries to get a ticket.
- 2 The LAOC announces the Olympic ticket mail order system at a news conference on 13 June 1983.

Obstructed/blocked seats		160,000	2.1
Complimentary		55,000	0.7
Contingency		160,000	2.1
Unsold tickets		1,189,000	15.3
Total seating capacity		7,759,000	100.0

a given sport. Season ticket packages were seldom sold at face value (i.e., number of events multiplied by event price) but were sold at a premium or discount depending upon the popularity of the sport. Season tickets for 14 sports were sold at premium rates, while season tickets for handball, hockey, modern pentathlon, shooting and football were offered at a discount. Season tickets for archery, fencing and judo were offered at face value.

33.03.2

Public sales in the USA

The sale of Olympic tickets to United States consumers began in June 1983, when the LAOOC unveiled the details of its mail-order sales program. The key to the program was the ticket information brochure and order form.

Brochure

The mail order brochure was a comprehensive 36-page document which included a schedule listing each event by day and session time, a description of each sport, a map of all venue locations, a detailed description of the ticket mail order rules and procedures and an order form with return envelope. Seven million brochures were available at no cost to potential customers at First Interstate Bank in Southern California, Manufacturer's Hanover Trust in metropolitan New York and Sears, Roebuck and Co. stores throughout the United States.

In order to properly identify the owner of each order, the customer was required to fill in certain customer information, such as, social security number and mother's maiden name, in addition to listing desired events, ticket quantity and first, second and third choices. Orders were non-transferable.

A six percent Los Angeles city 1984 Olympic Games distribution tax was added to every order. In addition, a \$1 non-refundable handling charge per first choice ticket (or season ticket) was charged.

The LAOOC went to great lengths to allow the largest number of purchasers possible to obtain tickets to the most

popular events. Limits were established on the number of tickets which could be purchased to 75 of the nearly 370 event sessions, based on expectations of demand for those events:

- Premium events had a limit of two tickets per event code per order form. A total of 30 events in five sports (basketball, boxing, gymnastics, swimming and diving, and volleyball) plus the Opening and Closing Ceremonies were identified as premium events.
- Semi-premium events had a limit of four tickets per event code per order form. There were 45 events identified as "semi-premium" in a total of six sports (athletics, basketball, boxing, gymnastics, swimming and diving, and volleyball).
- No limit was established for the other events. However, the LAOOC reserved the right to limit these events to insure a fair distribution of tickets. After demand was assessed, several additional event codes were limited based on the demand in order to allow a fair distribution of tickets. There were no limits on the total number of tickets that could be ordered on each order form. However, all large orders were manually reviewed to ensure a fair distribution.

A combination of computer processing and manual review was used to detect orders exceeding established limitations. One order form per household was allowed to be entered in the random selection process.

Order processing

The LAOOC ticketing system processed public orders in accordance with the following rules:

- Customers could indicate up to two other choices for each event requested.
- The system attempted to satisfy a customer's first choice event selection.
- If the first choice was not available at the requested price scale, the

system substituted the next lower price scale for the event, if available.

- If the first choice could not be filled in any price scale, the system attempted to satisfy the customer's second choice.
- If the second choice was not available at the requested price scale, the system attempted to satisfy the customer with a lower scale price ticket for the same event. If the second choice could not be filled, the above two steps were repeated for the customer's third choice.
- Customers also indicated if they were willing to be placed on a waiting list. If it was found that no choice could be filled and the customer wanted to be placed on a waiting list, the order was placed for the unfilled first choice events. Orders were processed from an event's waiting list in order number sequence (based on receipt).
- If a customer was placed on the waiting list for a first choice event and a second or third choice was available, the order remained in a waiting list status for the first choice with a confirmed reservation for the second or third choice.

At the time mail orders were first received, in the summer of 1983, the LAOOC was uncertain of the actual number of tickets (on an event-by-event basis) which would ultimately be available for sale to the United States general public. Consequently, a smaller number of tickets was committed to the general public in the initial ticketing process than was ultimately sold. The uncertainties in available inventory were caused by many factors including allocations for National Olympic Committees, sponsors and other special sales groups including Olympic Family requirements. In addition, the seating capacity was unknown for several venues at the time of the initial ticket processing.

On an event-by-event basis (for each price scale) a waiting list of limited size was created. The size was based on an analysis of each venue's seating capacity and inventory allocated to the various special sales groups. When the system was unable to fill a customer's first choice the order was placed on a waiting list status if list allocation was not full. Orders remained on the waiting list until additional inventory became available. In early 1984, when venue capacities were known and special allocations were better defined, tickets were made available for purchase by customers on the waiting list. In instances where there were more tickets available than were held on the waiting list, tickets were sold through other channels. In the reverse situation, where there were more customers on the waiting list than available tickets, refunds were made through the mail order system.

After random selection was completed and all orders received during the initial ordering period were processed, the customer was sent an acknowledgment form which indicated the status of his order. The acknowledgment included: events received and price scale, events not received, events placed on the waiting list and a financial reconciliation of the order. Refunds were processed in December 1983 for

orders requiring them. After the random selection process occurred, customers could submit as many additional orders as they desired. To facilitate this, mail-order customers were sent an updated ticket brochure listing the remaining events and price scales available. A total of 300,000 updated ticket order brochures were printed and distributed.

After the waiting list was processed in March 1984, a second acknowledgment was sent to affected orders. In spring of 1984, all customers were sent an acknowledgment re-confirming their order status.

Season tickets

A season ticket reserved the same seat for all sessions of a specific sport and were offered for all sports. They were available in every price scale, although season ticket prices were usually higher than the combined face value of tickets for each session of a sport. Season tickets were categorized as premium, semi-premium or non-premium and were subject to the same limits as applied to other ticket orders. Inventory allocations for season tickets were established for each sport and approximated 10 percent of total venue capacity. If those allocations were over-subscribed during the initial mail-order return period (first 60 days after order brochures were available), season ticket orders were filled on a random selection basis similar to the treatment of other over-subscribed events.

In addition, approximately 10,000 all-day passes were available for each day of athletics. A day pass entitled the purchaser to attend both the morning and afternoon sessions on a given day using the same ticket. A pass to all the competitions in the equestrian three-day event could also be purchased.

Space reservation

When orders were filled in 1983 and early 1984, venue seat locations were not yet entered into the computerized ticketing system. Consequently, a customer whose order was filled was guaranteed a ticket but not a specific seat location. This concept was called space reservation. Subsequently, when venue seating manifests were entered into the system, specific seats were assigned to each order matching the space previously guaranteed. The best seats were assigned to the lowest customer order number.

As part of the manifesting process, the venue was divided into sections from 20 to 200 seats depending on venue size. Each section was classified in descending order from best to worst. Seating assignments were made by section, with each seat within a section considered equal for assignment purposes.

Adjacent seats were assigned where orders for more than one ticket were requested so long as there were adjacent seats available. When adjacent seats were no longer available, orders were split, but this happened to fewer than two percent of the orders.

Ticketing

Customer service

Personnel for customer service were located at the LAOOC computer facility and responded to telephone and written inquiries. The computerized ticketing system supported this function through an on-line inquiry capability which allowed customer service personnel to respond to customer questions immediately.

Customer service personnel were not allowed to modify customer orders based on telephone conversations. All customer requests for changes of any kind were required in writing. Customer change requests were reviewed by supervisory personnel before and after any changes were made. Acceptable changes were generally limited to address changes and order corrections because of errors in data entry.

Non-routine customer service inquiries were referred to the customer research department for resolution. Their recommendations were also reviewed by supervisory personnel prior to implementation.

Refunds resulted from several circumstances: inadvertent overpayments due to customer error, inability to fill an entire order and order cancellations. The computerized ticketing system calculated the amount due based on events received and/or placed on a waiting list. A refund or invoice was generated where the amount calculated differed from amount paid. Refunds were mailed to customers who paid with cash or money order.

Charge card refunds and credits were processed by the respective charge card company.

The customer service center began with 24 stations staffed 12 hours per day by a total of 40 people. Nevertheless, the center was overwhelmed by calls in the 60 days after ticket brochures were available. After that, the volume of requests lessened substantially until May of 1984 when the LAOOC prepared to open its remote ticketing centers.

Customer response results

The interest in Olympic tickets shown by the U.S. public was remarkable. Approximately 279,000 mail orders were received by 15 August 1983, the deadline for inclusion in any random-selection process for events which were oversubscribed. By the time acknowledgements were mailed to purchasers in November, 123 of the 367 event sessions had been sold out completely, including all sessions of gymnastics, swimming (including diving and synchronized swimming) and tennis, in addition to the Opening and Closing Ceremonies. Total ticket sales at that point were approximately 2.1 million.

The LAOOC announced in late March of 1984 that almost 600,000 tickets had been added to the inventory for public sale and they would be able to fill 70 percent of all ticket requests which had been held on waiting lists.

Flow of ticket sales

	14 June- 15 August	16 August- 1 May	May	June	July	August	Total
Mail order	2,100,000	1,300,000	(N/A)	(N/A)	(N/A)	(N/A)	3,400,000
Remote tickets	(N/A)	(N/A)	(N/A)	160,000	200,000	30,000	390,000

N/A = not available							

On 17 April, the organizers announced that sold-out sessions outnumbered sessions with tickets available. Of the revised total of 368 event sessions, 186 were completely sold out and 182 had tickets remaining. All tickets to all sessions of cycling, fencing and judo had been sold. Overall, ticket sales passed the three million mark with 1.4 million available for sale to the U.S. public when the LAOOC prepared to shift to over-the-counter sales after the close of the mail order ticket purchase program on 1 May 1984.

33.03.3

Ticket sales late in the pre-Games period

About 1.4 million tickets to non-premium events in 16 sports were still available in June 1984. Therefore, on 7 June 1984, nine Olympic Ticket and Information Centers (also known as Remote Ticketing Centers) were opened in major shopping malls throughout Southern California.

The centers had three main functions:

- q Sell Olympic event tickets which had not been sold through the mail-order system
- q Sustain the Olympic image with the public
- q Provide information concerning the Games, transportation and related Olympic programs

The centers occupied retail store areas within shopping malls. These store areas were donated by the malls and the LAOOC paid only operational costs, including utilities.

Customers obtained ticket order forms as well as information on other Olympic programs at the information booths. They would then go to the ticket ordering tables to fill out order forms, using the information provided by a ticket availability board on the wall or an inventory listing at the tables. After filling out the form, customers went to the ticket counter where the order was processed. Payment was by cash or credit card. Personal checks were not accepted.

The centers were operational from 7 June to 11 August 1984. Tickets were sold through a computerized system using two or three IBM personal computers and ticket printers known as spitters at each center. The operating hardware at each center consisted of IBM personal computers, personal computer-compatible dot-matrix printers and BOCA Model 7666 ticket printers. Six centers were equipped with three units each while the remaining three had two units each.

Ticket inventory for each personal computer was allocated through the main computer and each had a separate inventory. Problems occasionally arose with customers who became unhappy when one computer sold out its allotment of a specific event while the computer next to it or one at another ticketing center still had the inventory available.

Inventory updating of the personal computer disks was done on a staggered basis. This resulted in personal computers at centers with inventories that varied depending upon when updating occurred.

Each night a courier picked up the daily sales journals (computer disks) from the centers and returned them to the main computer facility, along with any returned or voided tickets. The sales journals were used to delete available inventory from the IBM System 38 sub-inventory. Since 24 disks were sent each night, they had to be carefully controlled.

A total of 399,600 tickets were sold through the ticket centers. A different ticket stock was designed to fit the spitters which could not accommodate the large size of the stock used for the mail order tickets.

When the Olympic torch arrived in Southern California, large crowds began forming at each center, causing waits of between four and five hours. An order took approximately five minutes to process. With three computers per center, 36 customers could be processed per hour or an absolute maximum of 400 customers per day. In spite of this, the system was reliable and allowed many last-minute buyers to obtain Olympic tickets.

In July 1984, the LAOOC still had more than 100,000 tickets remaining to high-demand and premium Olympic events. These tickets became available as a result of cancelled or modified special sales ticket allocations and were made available to the general public through two Olympic Ticket Faires.

Tickets for the Olympic Ticket Faires came from a variety of sources: the boycotting nations; National Olympic Committees and corporate sponsors who took less than their full allocations; tickets allocated to, but not used by, the patron program; and venues with increased seating capacity from that which was initially planned.

The first ticket faire (Ticket Faire I) was held 20-24 July at Santa Anita Park in Arcadia. This Faire had the greatest number and largest assortment of tickets available. To sell remaining tickets, a second ticket faire was conducted 31 July through 2 August at Hollywood Park. Hollywood Park was also the location for off-site sales of boxing and athletics events from 6-8 August.

Forty thousand Southern Californians who had previously ordered Olympic tickets through the mail order system were invited to attend the first three days of Ticket Faire I. Invitations were mailed to those randomly selected from the computer file and were non-transferable except to a family member residing at the same address. On all other days, no invitation was required to purchase tickets at the Ticket Faires.

To provide an equitable opportunity to all attendees, tickets were allocated across the three days so that those attending on the third day had similar access to those who attended the first day.

From 20-22 July, admission to the Ticket Faire was by invitation only. Each invitation specified a two-hour time period during which the person invited would be admitted to the Faire.

Two thousand people per two-hour segment were invited the first day since it was used as a dress rehearsal to work out any operational problems. On the second and third days 3,500 to 4,000 people per two-hour segment were invited. On the first three days approximately 25 percent of those invited attended. On the last two days of the Faire, when no invitation was required for admittance, 8,000 to 10,000 people attended per day.

U. S. ticket sales breakdown

Description	Number of tickets sold	Percent
Mail order sales	3,400,000	75.1
Remote ticket centers	390,000	8.6
Venue box offices	347,000	7.7
Contracted ticket centers	260,000	5.7
Ticket faires	120,000	2.7
Other	8,000	0.7
Total	4,525,000	100.0

Once admitted to the Ticket Faire, the customer received an information sheet describing rules for ticket purchases. Purchases of premium and semi-premium events were limited in the same way mail orders had been. Non-premium event purchases were not limited.

Customers received information at the Faire from three sources:

- Ticket information counter
- Roving information specialists
- Public information booth

Signs above the ticket windows informed customers of the sport and the specific dates, sessions and price scales available. The signs were hand printed and were adjusted as needed.

There were 70 to 80 active ticket windows. Each window carried tickets for one sport only, but most windows had multiple sessions or price scales available.

The selling area was divided into two sections: premium tickets and non-premium tickets. Premium tickets were for high-demand sports or sports with only a minimum number of tickets available. Approximately 80 percent of the selling windows were devoted to tickets for those events.

All ticket sales were by cash or bank cashier's check only. Credit cards, personal checks and traveler's checks were not accepted because of the inability to verify authenticity.

Ticket Faire II was held at Hollywood Park from July to 2 August 1984 to sell remaining tickets and to meet the unexpected last-minute demand by the public for tickets to Olympic events.

Ticket selection was more limited at Ticket Faire II than at Ticket Faire I. However, attendance was almost as high and ranged from 8,000 to 10,000 people per day.

The Olympic Ticket Faires were very successful in meeting the late demand for Olympic tickets. At Santa Anita, almost 30,000 people attended. Combined with the second ticket faire at Hollywood Park, a total of 110,000 tickets were purchased.

33.03.4 Ticket sales during the Games period

During the Games, tickets to many Olympic events were still available. These tickets were sold at the nine ticket information centers throughout the Games, the Olympic Ticket Faire at Hollywood Park 31 July to 2 August and at 10 sports venues during their individual competitions.

Day of event as well as advanced ticket sales were available on site at baseball, basketball, equestrian, football (four sites), hockey, modern pentathlon and shooting.

A major effort was mounted to assist people with information on which tickets were still available and where they could buy them. The customer service center at the LAOOC's computer ticket facility was fully staffed 18 hours a day from 0600 to

2400 hours every day from 1 July to 12 August. In addition, an emergency telephone bank was installed in the LAOOC office building at UCLA to assist last minute ticket buyers. A total of 50 telephone lines were staffed by 75 people during the first two weeks of July.

33.03.5 Sales outside the United States

Sales to foreign countries and NOCs were handled by the Ticketing Department's special sales division. Tickets were sold in each country through its NOC or its agents. Orders with a foreign return address received through the United States postal order operation were rejected and sent back to the person with a referral to their NOC for tickets.

Ticket allocations were made to each recognized NOC and the LAOOC dealt directly with the NOC regarding ticket sales. However, several NOCs designated a travel agent or other authorized ticket agency to negotiate for and sell their allocation.

A questionnaire was sent out to each NOC in December 1982 requesting its ticket desires and certain other information including number of visitors and athletes anticipated. Of the 150 questionnaires mailed, approximately 60 NOCs responded. Not surprisingly, those that responded were the same ones who sent the largest delegations to the Games.

Allocations were determined by taking into account the following:

- Overall number of available tickets by event
- Number of tickets requested by each NOC
- Capacity of each venue

Each NOC which returned the ticket allocation request form was sent a detailed ticket allocation in late 1983. The NOC could purchase its entire allocation or a percentage across all sports. Any NOC could request modifications to its allocation to better meet its specific needs. Most of the large purchasers took advantage of this opportunity. Payment was due when the order was finalized. No tickets were available to an NOC for consignment sales within its country.

Many NOCs requested further negotiations once they received their official LAOOC ticket allocations. The NOC primary negotiation points were the following:

- To increase or decrease the number of tickets in individual sports based on popularity within each country
- To have an even number of tickets for each day (for use in setting up travel and tour packages)

The LAOOC evaluated all requests for changes in ticket allocations. If inventory was available and requests were reasonable, ticket allocations were revised to better accommodate each NOC's specific needs. All allocations and changes were approved by the president of the LAOOC and the vice president of ticketing.

A 10 percent deposit was required by 31 December 1983 to confirm an NOC's ticket allocation. The remaining 90 percent was due by 31 March 1984. NOCs which did not pay their ticket balances on time usually forfeited their allocation; a few NOCs did suffer this penalty.

6

As part of the LAOOC agreement with each NOC, no sales were to be made outside of the respective country. This restriction was designed to protect NOCs and their agents from competition from other countries and also to reduce the number of tickets requested for speculative purposes.

In June 1984, all NOCs were informed of the dates and procedures for picking up their ticket allocations in Los Angeles. Each NOC was sent half of an identification card which authorized an NOC-designated representative to pick up the tickets at the LAOOC Ticket Distribution Center. The LAOOC kept the other half of the identification card to facilitate certification of the representative.

A customer service representative was assigned to each NOC to assist and monitor the NOC's verification of its ticket allocation.

While it is impossible to know how successful the LAOOC was in restricting sales between countries, some instances where NOCs traded tickets with other NOCs were reported. Some NOCs specifically purchased tickets for resale to other NOCs, and during the Games, tickets originally purchased by foreign NOCs were sold to the American public through third parties contacted by the NOCs.

Notes:
 (1) The following 29 NOCs countries received 200 or fewer tickets: Bahrain, Barbados, Bhutan, Cameroon, Cayman Islands, Chile, Costa Rica, Ecuador, Greece, Guyana, Haiti, Ivory Coast, Libya, Malawi, Malaysia, Mali, Monaco, Mozambique, Nepal, Panama, Romania, Seychelles, Swaziland, Tanzania, Uruguay, Virgin Islands, Western Samoa, Yemen Arab Republic and Zambia.
 (2) Non-participating countries did not receive ticket allocations These included Bulgaria (whose initial allocation was 1,032), Czechoslovakia (752), Ethiopia (96), German Democratic Republic (140), Hungary (1,868), Poland (408) and USSR (4,480).

33.03.6

Sales to sponsors and others

All ticket sales to LAOOC sponsors and other groups were managed by the special sales division. These groups included LAOOC sponsors and suppliers, foreign television broadcasters and official Olympic hotels. These groups were allowed to purchase tickets following the same general guidelines and procedures as the NOCs. All groups were allocated tickets spread across all sports and price scales.

Each company or purchaser filled in a ticket request form and negotiated any differences between its requests and the LAOOC allocation, exactly as the NOCs did. All allocations required full payment when allocation negotiations were completed. All sales were final and no adjustments were made after payment.

Verification and pickup procedures for these special sales groups were identical to those used for the NOCs.

Ticket sales to these groups included:

- Official Olympic Hotels; 90,000
- LAOOC sponsors; 585,700
- LAOOC suppliers; 14,300
- Television broadcasters; 9,000

33.03.7

Olympic Patron Program

The Olympic Patron Program was conceived to allow up to 100,000 youth, senior citizens and physically challenged persons who might otherwise be unable to participate in the Games to attend as guests of the LAOOC Amateur Athletics Foundation. The program was also designed to provide the best available seating on a guaranteed basis to those persons joining the patron program.

The program enabled each patron to receive two tickets per day to events of his choice. Preferred parking was also offered along with an assortment of gifts, invitations to receptions and other special recognition programs. Patrons donated a minimum of \$25,000 for each package.

An upper limit of 2,000 patrons was established based upon availability of top scale seats at smaller venues. Although this figure was not a sales goal but rather an absolute upper limit based on seating capacity and program exclusivity, a more realistic upper limit would have been 1,200. The final number of patrons was 684. Had the program attracted substantially more patrons, the LAOOC's ability to provide personalized services would have been severely hampered.

Marketing strategies were understated with no advertising or overt marketing techniques employed other than invitations to participate via a select mailing program. Most subscriptions resulted from word-of-mouth communications.

Marketing activities included:

- Mail solicitations to approximately 75,000 persons using select mailing lists (early 1983)
- Personal promotion and speaking engagements by key LAOOC officials (continuous)
- Bimonthly newsletters (early 1984)

- Two hundred thousand engraved invitations mailed to sponsors, existing patrons, suppliers and selective mailing lists (spring of 1984)

Initial patron subscriptions were received in December 1982 with the bulk of the patron programs pledged by the summer of 1983.

Patron subscriptions were reserved with a deposit of \$5,000 per subscription. Instructions for ticket selections and an invoice for balance of payments were mailed in December 1983. The patrons were asked to make their ticket selections and remit the balance of payment by 31 December 1983.

Subscriptions and ticket orders were accepted until 1 June 1984. Approximately one-third of the patron subscriptions were held by individuals; two-thirds were reserved by corporations. Approximately 80 percent of the patrons were located in the Southern California area.

A coordinated program of services was provided for patrons. At events where more than 100 patrons were in attendance, patron service representatives, uniformed and trained as hosts or hostesses and working in conjunction with the venue protocol staff, were assigned to augment and upgrade ushering in the venue. They distributed daily results programs and served as liaisons whenever necessary on behalf of the patrons with ticketing, protocol or other matters.

The LAOOC Amateur Athletics Foundation, a nonprofit organization, was created to administer the patron-funded guest attendance program. The program provided funds for tickets, transportation and supervision for disadvantaged youth, senior citizens and the physically challenged.

The LAOOC Youth Services Department made all determinations of recipients of tickets. That department also arranged for the ticket distribution, transportation, scheduling and supervision for those groups who attended the 1984 Olympic Games as beneficiaries of the Olympic patron program.

On an individual level, patrons were provided with car parking privileges for all sports sites for which they had tickets, including venues in the Exposition Park/USC area. Special receptions were held for patrons prior to the Opening and Closing Ceremonies and buses were provided for transport to those events. Each patron was also presented with an assortment of useful gifts, including binoculars, a cap, seat cushions, T-shirts and a limited edition pin. Patrons were also presented with a souvenir Olympic torch.

33.03.8

Olympic Family Ticketing

The Olympic Charter (Rule 48 of the 1978 provisional edition) required that free seats be reserved for the Olympic Family (persons accredited in categories "A-G") in all venues.

Historically, the number of seats reserved at each venue had been determined by estimating the maximum number of Olympic Family members that might use them, by following limited guidelines as set forth in the Charter and by reviewing data from prior Games. At previous Games, Olympic Family members gained access to the venues and the seats reserved for them through the use of their accreditation badges for most events. No tickets were required. This policy resulted in empty seats during preliminary events and overcrowding during high-demand finals.

Olympic Family ticketing provided seats to the Olympic Family at all venues for all sessions. This included the sizing of the Olympic Family stands and their placement, the determination and dissemination of policies regarding the use of the seats and the distribution of Olympic Family tickets during the Games. Venue Management was responsible for managing these seats during the events.

In order to achieve the objectives of adequately providing seats as called for by the Olympic Charter, avoiding overcrowding of the stands and maximizing seat usage, three issues were addressed:

- The sizing of the stands
- Access control for the venue and stands
- Alternate usage of unfilled stands

Originally, a plan was prepared whereby all Olympic Family seats for all events would be ticketed. Under this plan, access control would have been very simple. A consistent policy of requiring everyone to have a ticket would eliminate any confusion in trying to determine which persons needed tickets for which events. Additionally, unused seats could be allocated to other persons by physically distributing the unused tickets.

The plan to ticket all Olympic Family members for all events was evaluated as too restrictive because it was impractical to require all Olympic Family members to pick up tickets on a daily basis. Historically, Olympic Family members made decisions on which events to attend on the day of the event. The system proposed would have required distribution of tickets on the day prior to each event.

In the end, it was determined that:

- Seats at the Opening and Closing Ceremonies were provided for all accredited "A", "B", "C", "D" and "G" persons on a ticketed basis. Tickets were provided for approximately two-thirds of the accredited press. However, no seats were allocated to athletes or coaches in the Opening Ceremonies, since they were expected to participate. Seats (tickets) were available for athletes and coaches for the Closing Ceremonies.

- For sports events, access to the venue and to the Olympic Family stands did not require a ticket for Olympic Family members except for selected high-demand events. A total of 33 events in eight sports were identified as high-demand and required certain "B", "C" and "G"-accredited persons to pick up complimentary tickets. The sports and number of event sessions identified as high-demand included: athletics (one session), basketball (five), boxing (four), cycling (one), football (one), gymnastics (seven), swimming (six), swimming and diving (four), and volleyball (four). A brochure explaining the Olympic Family complimentary ticketing system was available to all accredited persons.
- "A"-accredited Olympic Family members did not need tickets for any sports event.
- "B" category; all "B"-accredited persons were permitted access to venues via their accreditation badge only for most events. For the high-demand events, access to the venue and seating required complimentary tickets, except for "B"-accredited members of International Federations who were allowed access and seating without a ticket in the venue of their own sport.
- "C" category; for the high-demand events only, access to the venue and seating required complimentary tickets. Chefs de mission and assistant chefs gained access to a venue through the athlete entrance and did not need a ticket if an athlete from their country was competing during that particular session.

Ticketing

- "D" category; all "D"- accredited persons (technical officials and members of the various juries) were permitted access to the venue and seating without a ticket at the venue(s) of the sport in which they were involved. Complimentary tickets for other events were not available to them.
- "E" category; "E"- accredited media were required to have tickets to gain access to the venues for a limited number of high-demand events only as determined by the Press Operations Department.
- "F" category; all "F"- accredited persons (athletes and team officials) were permitted access to the venue and seating without a ticket at the venues of the sport in which they were involved. Complimentary tickets were available at the villages and were required when visiting other venues. "Fx" - accredited (extra) officials were admitted to the venues at which they were participating as coaches and the like, but were not entitled to obtain complimentary tickets for other sports.
- "G" category; all "G"- accredited persons were permitted access to venues with a badge only for most events. Complimentary tickets were required for high-demand sessions only.
- "J" category; all "J"- accredited persons (IF executive board members) were permitted access to the venue and seating in the B-stand without a ticket at the venue of their own sport only. They were not entitled to obtain complimentary tickets for other events.

Olympic Family tickets for all sporting events were distributed on a first-come, first-served basis at the Biltmore, UCLA Village and USC Village. Distribution of tickets (when necessary) for journalists was handled by the Press Operations Department at the Main Press Center.

Each Olympic Family member was entitled to one complimentary ticket per day which had to be picked up by the Olympic Family member or an authorized designee. The designee was required to show an authorization card to obtain a ticket. These Olympic Family tickets allowed general admission to the specific stand, but no seats were reserved.

Olympic Family ticket stock was the same as sports ticket stock but was altered to distinguish it from general public stock. Olympic Family ticket stock stated clearly that appropriate accreditation was required along with the ticket for admission. In an attempt to foil any possibility of re-sale of such tickets to misinformed or uninformed members of the public, Olympic Family tickets were stamped "not for sale" in bright red ink.

Individuals granted U.S. Secret Service or U.S. State Department protection were permitted access to the G-stand if space was available.

Olympic Family had reserved the following number of seats in each stadium for each session. In general, Olympic Family members were not required to obtain actual tickets for admission to events, but could enter stadia by presenting their accreditation badge. However, for some high-demand events, persons in accreditation categories B, C and G were required to pick up tickets. Individuals with category A accreditation were only required to obtain tickets for the Opening and Closing Ceremonies, while D-accredited competition officials could enter their own sport's

arena without a ticket, but were ineligible to obtain complimentary tickets as available to the B/C/G categories. E-accredited news media did not have to obtain tickets for any events except both ceremonies, men's basketball final and both sessions of boxing finals. Those with F-category accreditations could enter the stadium of the sport they were involved in only and were ineligible to obtain complimentary tickets.

Stand categories and occupants:
 Stand A: Members of the IOC and guests.
 Stand B: IOC commission members, staff and IF/NOC/OCOG officers.
 Stand C: NOC chefs de mission and attaches.
 Stand D: Competition officials and juries.
 Stand E: Press, radio and television representatives.
 Stand F: Competitors and team officials.
 Stand G: Guests of the organizing committee.

Notes:

- (1) D-accredited officials in Boxing had 20 seats reserved for them inside of the field of play area.
- (2) Figures above include only seats which were available for sale; Olympic Family and press/radio/TV seating. Non-public areas such as on the field of play or in press boxes are not included.
- (3) Press/radio/TV seating shows only the number of saleable seats which were used and do not reflect actual capacities for media use. See the seating tables in sections 23.11 (press) and 32.03 (Radio-TV) for actual seating capacities after installation of equipment and tables.

Ticket allocations and distribution for pre-selected high-demand events

**33.03.9
Olympic Arts Festival ticketing**

The Olympic Arts Festival (OAF) ticketing system was handled via a modified version of the computerized system designed to process Olympic sports tickets. While the OAF staff was responsible for the artistic aspects of the Festival as well as all the attendant business and logistical arrangements, the Ticketing Department was responsible for ticketing all Festival performances. This included processing mail orders, filling customer requests, processing refunds, printing and distributing tickets and operating box offices at all performance venues.

The starting point for the OAF system was the sports ticketing system as it existed in January 1984, which was when the Ticketing Department commenced work on the OAF. The basic difference in the two systems was the number of price scales per event (six for OAF, four for sports) and that no random selection process was included in the OAF sales system.

In mid-January 1984, the Olympic Arts Festival order brochure was released to the general public. As a result, there was not only a large influx of orders but also written and verbal queries from the public. The existing customer services group handled all customer inquiries and problems.

Event codes were not included in the OAF order brochure, therefore, each order item on each order form required hand coding with a two-digit event code.

Allocations were set for the following categories for each of the more than 350 performances:

- General public
- Complimentary (company and venue)
- Co-producers
- LAOOC board of directors
- LAOOC patrons
- LAOOC sponsors
- Physically challenged
- Press, radio and television
- Protocol (coordinators, IOC, IF, NOC)
- Kills (unusable seats)
- House holds
- Contingency

Unlike sports ticketing, OAF had no random selection for over-subscribed events. Space was reserved first for people who ordered predefined packages and then on a first-come, first-served basis for non-package orders.

OAF mail order sales were cut off on 1 May 1984. An agreement was made with TicketMaster which allowed it to sell all the unsold OAF inventory except tickets for the Royal Opera of Covent Garden and Hollywood Bowl events, which were returned to other organizations.

TicketMaster operates numerous ticket sales locations in Southern California. Inventory and sales are controlled on a central computer with each outlet gaining access to the main computer through telephone lines.

Ticketing

All orders that had a balance due were routed to the Ticket Distribution Center (TDC) rather than being sent directly to the customer. Customers then went to the TDC, paid their balance and picked up their tickets. On 10 July all orders where no payment had been made were reclaimed by the LAOOC and a notice to this effect was sent to the customers. Notice had previously been sent to customers with a balance due giving them one week to get their tickets. The remaining balance due orders were reclaimed on 19 July. Reclaimed tickets were counted, reconciled and categorized as "deadwood" (past the date of performance) or tickets available for resale. When appropriate, tickets for resale were given to TicketMaster or returned to OAF venue box offices for sale.

33.04 Ticket printing and distribution

33.04.1 Overview of ticket printing

The LAOOC developed a unique system for processing orders which represented a departure from the prevailing practice of producing pre-printed physical tickets whereby each individual order had to be filled by tedious and error-prone manual methods.

The new approach, for the first time, combined modern computer technology with the latest developments in printing technology. The result was the printing of custom tickets for each order.

Ticket printing involved the following steps:

- Preparation of Olympic ticket stock
- Receipt of computer print tapes which contained all ticket orders
- Processing of the print tape through custom ticket printer
- Inspection and auditing of the tickets produced
- Stitching (stapling) of tickets
- Cutting tickets
- Stuffing tickets into envelopes
- Application of registered mail labels
- Packaging of tickets for shipping
- Accounting for all tickets printed, packaged and shipped
- Registered delivery by the United States Postal Service

The remarkable feature of the LAOOC's ticket printing system was the ability to print customized tickets. After receipt of the raw, unprinted ticket stock, the computerized ticket printing machinery read information off of the print tape which allowed it to imprint the raw stock with the appropriate sport pictogram, session, day, date and time, price, event, location and seat assignment. For tickets ordered by mail, the tape also provided the purchaser's name which was imprinted in the lower left hand corner of each ticket. The print tapes allowed printing of eight tickets at a time, each of which was part of a different order. Thus, the orders of eight persons who had each purchased ten tickets were printed simultaneously on ten sheets of eight-ticket stock. The ten sheets were then cut to form the ticket package for each person. This ten-sheet print process was much faster than the conventional method of printing the 80 tickets involved individually.

The largest problem in the printing process was related to the receipt of print tapes from the computer center. The ticketing computer system, because of the complex sorting requirement of the print process, could not always create print tapes in advance of the completion of printing the prior tapes. This resulted in a start/stop type of print operation while waiting for more tapes to be produced.

Another problem inherent in the printing operation concerned the possibility of printing duplicate tickets. This could occur whenever it was necessary to restart the machine following a stoppage. Stoppages were fairly frequent because of paper jams or other causes. Extreme vigilance was necessary to detect the printing of duplicate tickets. In several instances duplicate tickets were discovered during the final audit process.

The final phase of the process required the application of registered mail labels to the ticket envelopes for delivery through the United States Postal Service. This process required large amounts of manpower and could not be mechanized.

33.04.2 Determination of the venue manifests

A venue manifest, or seating chart, was obtained from each of the existing venues. Manifests were created by the Architecture and Ticketing Departments for new venues. Seat kills due to camera locations, commentator booths and other obstructed views were recorded on the manifest. This project was completed by visiting each venue. Olympic Family seat locations were determined by analysis of prior Games attendance patterns and consultation with various LAOOC departments. The houses were scaled (seats assigned to price categories) based on existing scalings for similar events and natural physical divisions between seating in each venue. The manifests were then entered into the ticketing system with seat kills, Olympic Family and obstructed views appropriately marked.

10

After the manifests were entered into the computer, a printout was generated indicating each seat location in the respective venue. These printouts were then verified by visual inspection of every seat at every venue to ensure that the manifests were accurate.

Venue seating charts were prepared in booklet form and distributed to all special sales groups.

33.04.3 Ticket design

Tickets for prior Games were preprinted in advance of sale and normally included a different ticket stock for each sport or venue. Since the LAOOC's ticket system printed tickets to customer order, separate ticket stock for each sport could not be produced. Consequently, with the exception of the Opening Ceremonies ticket, all ticket stock printed through the main system was the same. Variable data was printed for each individual order and included sport,

9 Olympic mail-order tickets were delivered in a booklet form containing event tickets as well as Opening and Closing Ceremonies tickets.

10 Computer imprinted event tickets were generated on-site at Olympic Ticket Centers.

date, time, venue, seat location, customer name, customer order number, sport pictogram and event code. The ticket design included a festive rainbow tint to coordinate with the overall Look of the Games. Security features included a watermark imbedded in the ticket stock and a recently developed ink which disappeared when heat was applied. The color would disappear and then return to its normal state when the heat was removed. The latter anti-counterfeiting feature was significant since the ink was new on the market and had not been used commercially in the United States prior to the 1984 Olympic Games. Tickets were bound in a binder which was color coordinated with the tickets.

Separate ticket stock was designed for over-the-counter sales of football tickets for matches held at sites outside of Los Angeles. These tickets contained minimal security features since the LAOOC did not believe there was any economic benefit to the counterfeiting of these tickets. A third stock was used for Southern California Ticket and Information Center sales. The primary security feature contained in these tickets was metallic lettering which could not be copied by color-reproducing photocopiers presently on the market.

33.04.4

Ticket distribution procedures

The number of tickets produced for the mail order system was approximately 5,850,000 which included about 225,000 Olympic Arts Festival tickets.

Delivery of tickets was accomplished through the registered mail system of the United States Postal Service (USPS). Under registered mail procedures, delivery of mail is made to the designated person who must sign for receipt. If the letter carrier was unable to deliver the tickets, the process of notification and delivery was repeated. The Postal Service maintains a system for tracing mail that is reported lost and undeliverable. Undelivered tickets were returned to the LAOOC within 15 days.

Approximately 96 percent of all mail-order ticket orders were delivered through the registered mail system. About 3,100 orders were returned to the LAOOC as undeliverable, and were then distributed through the Ticket Distribution Center. Approximately 300,000 United States general public ticket orders were distributed by the USPS.

The basic procedure required the LAOOC to deliver the ticket packages from the printer to the main USPS facility in Los Angeles. Orders were then distributed through the registered mail procedures utilized by the USPS. With bulk orders, the LAOOC provided lists indicating the items included in each delivery to facilitate USPS handling of the large quantities without confusion.

The USPS agreed to process the orders and enter them into its system within 24 hours after receiving them. If a delivery attempt to an addressee was unsuccessful, a receipt was left in the mailbox requesting that the addressee come to the Post Office within five days to redeem the package. After the five-day period lapsed, a second notice was sent. After 10 days, the unclaimed parcels were returned to the LAOOC Ticket Distribution Center (TDC). For parcels that were mailed after 5 July, the return time was shortened by five days so that the non-deliverable packages came back to the Ticket Distribution Center in approximately 10 days. This registered mail system worked efficiently, with less than four percent of the packages returned to the Ticket Distribution Center.

The TDC was established as a will-call facility where the United States general public and special sales groups could obtain previously ordered tickets for both the Olympic Arts Festival and the Olympic Games, which for various reasons were not delivered directly to them. These ticket orders were comprised of undeliverable tickets, general public orders with balances due, special sales orders, orders processed too late to mail and reprinted orders.

The TDC also provided a location for customers to resolve ticketing problems. Problems commonly noted during TDC's operational phase were tickets received but not ordered, tickets ordered but not received, lost or stolen tickets requiring reprints and physically challenged ticket exchanges.

Tickets for venue ticketing operations were also distributed from this location. The TDC provided a central location from which contingency tickets, duplicate tickets and day of event sales tickets were distributed.

The TDC also provided a convenient ticket storage facility for various special projects. Tickets from ticket faires, for marathons and remote football sites, youth tickets and remote outlet ticket stock were all stored in the TDC vault and issued as needed.

Because of the nature of the function performed by the TDC, it was imperative that this operation constantly interact with several other departments. The Ticketing Customer Service and Public Information Departments were integral in informing customers that their orders were at the TDC. Additionally, the Ticketing Customer Service representatives were responsible for initiating reprint requests and maintaining communications with the TDC in an effort to relay information regarding anticipated customer order problems.

11

11 LAOOC ticket staffer checks inventory.

The TDC relied heavily on the customer research group to research and determine the resolution of ticketing problems. This was necessary since all of the order documentation was maintained at the ticketing data center and, therefore, problems had to be researched using this documentation. Customer research would inform the TDC whether or not ticket returns should be accepted. This group also researched original orders and payments for all problem orders.

The following process occurred for orders which were unable to be delivered to the customer:

- The undeliverable orders were returned to a post office box and retrieved from this box by a TDC employee.
- Orders were logged by the vault custodian and given to the data entry clerk at the TDC for input in the inventory listing.
- Once entered at the TDC, the list was sent to the Computer Center for entry, allowing two separate, perpetual inventories to be maintained independently.
- Customers were required to provide appropriate identification before picking up their order.

The process for balance due-orders was similar to that for undeliverable orders except for the following:

- The orders were sent to the TDC directly from the printer.
- The orders were accompanied by a manifest which detailed the order number, customer name and balance due.
- The customer was required to pay the entire balance due before the order was released.

Ticketing

The TDC staff assisted special sales groups (NOCs, sponsors, suppliers, hotels, foreign broadcasters, etc.) in verifying their tickets against a manifest or a ticket allocation. The process for these large orders was similar to that for the smaller general public orders except that all special sales orders were verified by the customer before the customer signed for the order. A TDC customer service representative was present at all times during the verification process. Physically challenged tickets sold at the Ticket Information Centers were also distributed through the TDC.

The TDC handled a total of 12,961 orders, including 398 general public balance due orders for the Games and 681 for the Olympic Arts Festival. A total of 175 special sales orders were handled there as well.

33.04.5

Ticket operations and types

Although the greatest number of tickets handled by the Ticketing Department were bound for the U.S. general public, the department had to handle a wide variety of ticket publics:

- General public sales in the United States
- Physically challenged seat sales in the United States
- Patron program sales
- Sales to the IOC, LAOOC sponsors and suppliers, National Olympic Committees, Official Olympic Hotels and television broadcasters
- Sales to venue and site owners who included the right to buy tickets in their rental agreements with the LAOOC
- Ticket users who did not pay for their seats: Olympic Family members, Olympic participants and press, radio and television personnel
- Ticketed seats which were not salable, including those blocked by television cameras, platforms and other devices

In order to be sure that difficulties with duplicate tickets or obstructed views were resolved promptly during the Games, representatives of the Ticketing Department were assigned to each site and had available a small number of so-called contingency tickets. Although a tiny percentage of the total number of seats at a site, the handful of contingency tickets was available to the ticketing representative to seat spectators who had obstructed views, broken seats or whose tickets had been stolen. Contingency tickets were spread throughout the stadiums in all price scales and were controlled solely by the venue ticketing representative.

A small number of tickets were reserved for the use of the senior management of the LAOOC in case of emergencies and were controlled through the office of the president of the LAOOC at the Biltmore Hotel. The number of tickets reserved for such use totalled less than one-third of one percent of all tickets available.

Venue ticket use summary

Event/sport	No. of sessions	No. of tickets available for sale	No. of tickets actually sold	Percent sold	Category A/B/C/D/F/G seats available	Category E seats used for press/radio/TV	Tickets distributed on complimentary basis	Seats blocked or otherwise unusable

Notes:

- (1) The above totals do not include the 160,000 contingency tickets, which were used by venue ticketing staff to replace lost tickets and the like; contingency tickets were spread throughout all sections and price scales.
- (2) Figures above include only seats which were available for sale; Olympic Family and press/radio/TV seating in non-public areas such as on the field of play or in press boxes are not included.
- (3) Press/radio/TV seating shows only the number of saleable seats which were used and do not reflect actual capacities for media use. See the seating tables in sections 23.11 (press) and 32.03 (Radio-TV) for actual seating capacities after installation of equipment and tables.
- (4) Complimentary tickets do not include "Day Passes" which were given to each Commissioner and were completely within his discretion as to distribution. Approximately 50 such passes were provided to each Commissioner for each session of his sport.

33.05 Summary

The LAOOC's goal was to make Olympic tickets available to the widest number of people possible in the fairest manner possible, regardless of the complexity of the systems required. Overall, this goal was achieved as millions of people attended Olympic events through the purchase of tickets via a rigorously-controlled mail order process and special sales division.

The unique ticket printing system also allowed the customized printing of Olympic tickets for the first time and speeded the process of production and mailing after allowing mail orders to be placed up to just 90 days before the Games began. The program for ticket delivery to purchasers and late pick-up at the Ticket Distribution Center gave all purchasers an easy opportunity to acquire their tickets, even at the last minute.

Although few are ever happy with any ticket distribution program, the LAOOC scored some notable successes in the ticketing area:

- Tickets were genuinely available to the general public in the United States in a manner which sought to and succeeded in allowing the maximum number of purchasers to obtain tickets to high-demand events. The decision to ignore the myriad of special interest groups which claimed first right to desired tickets resulted in a wider variety of

Olympic attendees than would otherwise have been possible—a benefit for both those who attended and the Olympic Movement in general, thanks to its exposure to many who would never have had the chance otherwise.

- Sales to hotels, NOCs, sponsors and television broadcasters required each to buy a package of events spread across various sports and events, rather than picking and choosing from the menu of events as had been done in the past. This also allowed more public participation in the Games, although each special sales group was able to work with the LAOOC to fine tune their ticket purchases.
- The LAOOC's Patron Program provided an option for those who wanted to absolutely assure themselves of the tickets of their choice and wanted to make a significant financial contribution which allowed thousands of physically challenged, senior citizens and youngsters to attend the Games for free.

The response of the U.S. public to the mail order ticket sales program was outstanding and the LAOOC was able to keep up with the rush of orders and provide timely acknowledgements, additional ticket availability information to mail order purchasers and the actual tickets for the Games beginning in June 1984. Tickets came to the public in June and July through the mails and were available over the counter at the nine ticket and information centers and at the Ticket Faires at Santa Anita Park and Hollywood Park.

The ticketing printing program was fully successful in allowing the LAOOC to accept orders until a very late date before beginning the production process. After tickets were printed and mailed, the Ticketing Department was well prepared for last-minute problems and questions with the special customer service telephone banks in July 1984 and the cadre of venue ticketing representatives who were ready to solve the minor ticketing questions certain to arise in any event of the magnitude of an Olympic Games.

Thanks to the automated processing and production systems and a determined program of fair distribution, the LAOOC was able to make the Games available to what turned out to be the greatest number of spectators in Olympic history.

1

34.01 Concept and goals

With an entire summer of success stories to choose from, it is difficult to single out one area of the 1984 Olympic Games as more successful than another. Even though the Los Angeles Olympic Organizing Committee envisioned the Olympic Torch Relay as an excellent means of generating enthusiasm for the Games and, as a fund raising project, providing a sports legacy for United States youth, it would have been impossible for even the most optimistic staff members to predict the overwhelmingly positive response by the U.S. public to the torch relay.

The concept of conducting a torch relay and using a flame prior to and during an Olympic Games is not a new one. The tradition of lighting the flame originated during the ancient Games in Olympia and was revived for the 1928 Games in Amsterdam when a giant flame was lit at the entrance to the main stadium and burned throughout the course of the competition. In 1936, a torch relay was initiated before the Berlin Games and subsequent organizers of the Games have followed that lead.

The LAOOC decided very early in its existence to undertake one of the more ambitious relays in history by beginning the run in New York City and traversing the United States over a period of more than two months. In early planning stages, the relay was expected to pass through each of the 50 states and capitals and District of Columbia in 84 days. The LAOOC hoped that by bringing the torch to all parts of the country the United States public would band together to support the Games and welcome the world's athletes. The new twist to the relay was the addition of the Youth Legacy Kilometer (YLK) program, a means to raise funds for existing youth sports programs through the sponsorship of designated kilometers along the relay route. The LAOOC envisioned the torch relay, if run successfully, to provide 84 days of positive publicity.

34.02 Development of the Youth Legacy Kilometer program

The idea for a Youth Legacy Kilometer (YLK) program first surfaced during a planning session in mid-March 1981. At that time, the only sure thing established about the torch relay was that there would be one.

Many ideas were proposed during that session, such as inviting established entities like the Young Men's Christian Association (YMCA), Boys and Girls Clubs of America, the Junior Chamber of Commerce (Jaycees) and individual sports federations to become partners in the torch relay, but their exact involvement was undecided. Other suggestions included sending the Olympic flame to each of the five competing continents and making the YLK program available to each country to raise funds for its Olympic athletes.

In mid-May 1981, a basic format for the torch relay took shape with the decision to fly the flame from Greece directly to the United States. It was proposed that the relay cover 10-12,000 miles over a four- to six-week period reaching as much of the country

2

- 2 An AT&T representative and LAOOC President Peter V Ueberroth (right) announce AT&T as the Official Sponsor of the Olympic Torch Relay on 9 June 1982.

and population as possible with the responsibility for the relay divided among three organizations (YMCA, Boy Scouts, Girl Scouts, etc.). The possibility of finding a corporate sponsor to provide uniforms and torches was suggested as was a separate torch-lighting ceremony at each Olympic venue.

Very little was decided regarding the torch relay or the establishing of the YLK program for more than a year following the first discussions since more pressing and immediate issues were being decided within the LAOOC. However, the program took a step forward in earnest on 9 June 1982 when American Telephone and Telegraph (AT&T) was named an "Official Sponsor of the 1984 Olympic Games" and also became the "Official Sponsor of the Torch Relay Run."

In September 1982, the LAOOC decided that AT&T would be responsible for relay route logistics and qualifying torchbearers. The idea of a cadre of runners was raised with the initial proposal including a 16-person cadre consisting of eight men and eight women. The LAOOC proposed that the marketing end of the torch relay become the responsibility of a triumvirate consisting of the YMCA, Boy Scouts and Boys Clubs of America. This would allow AT&T to concentrate on the logistical components of the relay, the triumvirate to coordinate the marketing of the YLKs and the LAOOC to oversee the project.

A month later, the plan was defined further. Sixty percent of the now proposed 16,000-17,000 mile (25,744-27,353 kilometer) route was to be covered by a cadre consisting of eight runners and eight cyclists, with the remaining 40 percent of the route designated as community kilometers. The community kilometers would comprise the fund raising portion of the project, and the torchbearers for those community kilometers would be selected during a "National Qualifying Day." Sixty-five percent of the community kilometers would be run by winners of different classes and categories of runners, 10 percent from winners of the handicapped races, 20 percent from those runners who completed a designated distance in a prescribed amount of time and five percent from handicapped participants who also had to complete a specified distance within time limits imposed. Those competitors who had completed the specified distance within the required amount of time would be eligible for a random drawing to complete the established quotas for their category. The LAOOC suggested that a "Council on American Youth Organizations" be formed to decide how to disperse the funds raised during the torch relay.

By January 1983, AT&T submitted a preliminary relay route and designated its Long Lines Division as the responsible entity for the torch relay. By this time, the idea of a national qualifying day was remote, and work was progressing toward signing contracts with the YMCA, Boys Club of America and Girls Club of America to help with the marketing of the kilometers and to become the recipients of a \$3,000 donation for each sponsored kilometer designated for their organization.

On 31 March 1983, the LAOOC Torch Relay Foundation was incorporated and organized for educational and charitable purposes in conformance with Section 501 (c)(3) of the United States Internal Revenue Code of 1954. The LAOOC was advised that if all the appropriate steps were taken, each \$3,000 contribution to the YLK program could be claimed by individuals and corporations as income tax deductions.

Final contracts were signed with the Girls Club of America (12 July 1983), Boys Club of America (13 July 1983) and the YMCA (18 July 1983), granting them the right to solicit members of the general public, including individuals, corporations, partnerships and other organizations to serve as sponsors of individuals who would carry the Olympic torch for certain kilometers of the relay. Funds from the Youth Legacy Kilometers would be divided; the parent organization would receive a small percentage and the local club

would receive a large majority of the donation. The LAOOC reserved the right to oversee the program, designate which runners would run which kilometers, collect all funds and provide a commemorative torch and appropriate runner's outfit. A fourth organization, the Special Olympics, was added to those organizations which qualified for torch relay funds in January 1984.

The YLK program was expanded in January to include organizations devoted to youth and sports, provided they met certain criteria:

- Each group must be active in training young people in sports and have access to available athletic facilities.
- Each group must have commitments for a minimum of 50 Youth Legacy Kilometers.
- Each group must be a charitable foundation in compliance with applicable laws.
- The group must not be primarily engaged in the training of athletes for either the Olympic or Pan American Games.

Throughout the planning stages of the torch relay, several different LAOOC staff members assumed responsibility for the development of the torch relay and YLK program. In May 1983, a director for torch relay operations was

hired to coordinate and refine the basic program which had already been developed.

The public announcement of the torch relay program was made exactly one year prior to the date of the Opening Ceremonies (28 July 1983) through major press conferences held in New York City and Los Angeles. The program had evolved from its early stages into one where any person or corporation who donated \$3,000 to one of the three (and later four) eligible organizations could carry or designate someone else to carry the torch for one kilometer. Senior management felt that this method of designating torchbearers allowed the largest possible cross section of people to become involved in the relay. All kilometers that were not sponsored were run by AT&T's cadre (no cycling).

Once the program was announced, the LAOOC followed with informational newspaper advertisements in major cities in the United States and also printed 500,000 information brochures for a mailing campaign. The LAOOC had anticipated that there would be great interest in the relay (and the Olympics in general) and expected a large response. However, for people located outside the Los Angeles area, the Olympics seemed a long time away, and the expected response did not materialize right away. To further complicate matters, the LAOOC maintained its policy of keeping the promotion of the YLK program to a minimum.

Because of the disappointing start of the YLK program, the torch relay staff embarked on a low-profile campaign to heighten the public's awareness of the relay. The LAOOC sent a staff member on a two-month tour of major cities to contact businesses, trade associations, community groups, athletic groups and individuals who might have an interest in sponsoring a kilometer in the relay. In addition, the staff member appeared on local television and radio talk shows and news programs to provide basic information regarding the YLK program.

At the same time, the LAOOC requested the help of its East Coast office in promoting the torch relay there. The East Coast office had the resources to contact many major groups whose headquarters were located in Washington, D.C. and influential political and business leaders to heighten efficiently the awareness level of large numbers of people.

In addition, the LAOOC targeted 26 key cities and set up task forces, composed of leading members of the community and youth clubs, to help generate YLK sponsorships in their communities. The LAOOC also relied heavily upon 30 and 60 second radio and television public service announcements to heighten the public's awareness of the relay and fund raiser.

The sales of YLKs began to pick up speed with a large portion of the YLK sales occurring during December 1983. The large volume of sales was attributed to corporations holding onto funds until the end of the fiscal year and to the continuously growing public awareness of the program.

However, just as the program was gaining momentum, the controversy between the Hellenic Olympic Committee (HOC) and the LAOOC erupted over the alleged commercialization of the torch relay. At first, sales slowed because of the uncertainty of the situation and its effect on the relay. But sales of YLKs soon gained momentum again as the Greek protest seemed to help the program by giving it more publicity than it had ever had before. The controversy served to provide the United States public a stand on what it perceived as a noble program. Last-minute purchases of the YLKs gave the program a final push resulting in a total of more than \$10 million in funds raised for charitable purposes.

34.03 Development of the relay route

When the director in charge of the torch relay was hired, he was instructed to make sure the torch arrived safely and on time in Los Angeles for the start of the Games. That one brief sentence belied the enormity of the logistics involved in doing exactly that.

The development of the relay route went through several stages, formats and revisions before the final route was established. Preliminary route work completed by the LAOOC called for the torch to pass from one end of the country to the other and through each of the 50 states and capitals as well as Washington, D.C. Once the torch progressed from the East Coast to the

state of Washington, an auxiliary relay would branch out to both Hawaii and Alaska. That particular route covered from 16,000-17,000 miles and required the relay to operate on a 24-hour basis, with cyclists carrying the torch for a portion of the relay to meet time constraints. The eventual relay route consisted of runners only and covered 15,000 kilometers (9,375 miles) and traveled through 33 states plus the District of Columbia.

AT&T, as sponsor of the torch relay, was responsible for planning the logistics. Since AT&T was involved in an antitrust action which threatened to divide its nationwide telephone system into smaller, regional companies, the torch relay presented an opportunity to show that no matter what the outcome of the antitrust suit, AT&T could still be portrayed as a nationwide communications network. Since AT&T already had an existing nationwide network with excellent resources, the LAOOC assumed it was the perfect sponsor for planning a nationwide run.

AT&T worked in conjunction with the LAOOC in planning the relay route and the support systems needed to supply a caravan of 30-40 vehicles for the 84-day trek across the country. An intricate plan detailing the route, the management and logistics of the relay was submitted to the LAOOC in the summer of 1983 for final approval. AT&T had relied upon its Pioneer group, a nationwide community service group consisting of AT&T employees and retirees who had been with the telephone company for at least 18 years, to assist in gathering all the details for the proposed route.

The LAOOC then consulted a California agency that specializes in presidential and political campaign advance work for a critique of the submitted plan. In early September 1983, the consulting firm responded with a 16-point letter of potential problems in the AT&T/LAOOC plan and suggestions to improve it to ensure the relay's success. Some of the more important points were as follows:

- Instead of structuring an elaborate organizational network with many chains of command, hire one person to coordinate all aspects of the relay and designate assistants as necessary.
- Utilize the AT&T Pioneers as a resource rather than a structure in charge of the relay. As an existing entity, the Pioneers had their own structure and chains of command which were totally unrelated to the torch relay. They were a tremendous resource that could best be utilized at the direction of the LAOOC.
- Hire a scheduler and advance personnel and utilize volunteers to pull together the details of the relay.

Since routes sketched on paper have no authority, people should be placed in the field to deal with the agencies and details of the relay.

- Staff who have authority during the relay should be full-time LAOOC staff members. Since blame and responsibility for problems encountered along the relay route are ultimately placed on the LAOOC, the LAOOC should retain its authority over the program and staff.
- The operations center should be at the headquarters of the LAOOC to allow the advance people the opportunity to deal directly with someone who has decision-making capabilities.
- The advance team should serve as public relations personnel. A separate press advance team would be expensive.
- The LAOOC should not rely on setting up the details of the relay over the telephone with people who are unproven, but instead should meet personally with key organizers in the field.
- Utilize the advance staff during the relay since the staff should already have a good working knowledge of the route. In addition, the advance people would gain experience as the relay progressed, making them more knowledgeable than a new volunteer at each point.
- Restrict liaison with police and all other authorities to the advance person or designee to lessen confusion when changes occur within the relay.
- Establish good, solid communications systems in addition to radio, including procedures to pass the relay from one advance person to the next using phone contact points, people to answer the phones and runners to relay messages.
- Hold paperwork to bare essentials such as maps and permits. A good scheduler should be able to make things happen over the phone.
- Decide as soon as possible the number of cadre and Youth Legacy Kilometers as well as the number carried by the physically challenged. Each change means more than just speeding up or slowing down the relay; it can mean an adjustment in schedule for everyone after the change and result in a logistical nightmare.

The advice of the consulting firm and the increasing awareness of time constraints caused the LAOOC to reevaluate its plans. After mathematically applying predetermined times to each of the kilometers along the relay

6

6 The parts of the torch.

route, it became apparent that the planned route just would not work. The torch would not arrive in Los Angeles in time for the start of the Games. Consequently, the originally-planned 50-state, 16-17,000-mile route was reduced to 33 states and 15,000 kilometers (9,375 miles).

The LAOOC then began to reevaluate all of the planning involved in the torch relay. In November and December 1983, the LAOOC recruited personnel to work as the field advance team. The relay staffs also met with AT&T to discuss production schedules of the support caravan vehicles. In December 1983, the LAOOC held training sessions for relay personnel and selected 15 advance personnel and four in-house schedulers.

The LAOOC implemented many of the suggestions of the consulting firm, including hiring a member of the firm as the relay route scheduler. During the first week of January 1984, 15 advance team members were sent out to begin the detailed process of trimming the route and making it workable and timely. Six advance team members were sent to the East Coast and nine were sent to areas on the West Coast. Each member was given a start point and a stop point by the scheduler and told to block a preliminary route. The advance staff drove along several different routes, converted miles to kilometers and converted kilometers

Torch Relay

into time at the rate of five minutes twenty-five seconds for AT&T cadre kilometers and eight minutes forty-five seconds for YLKs to determine how long it would take to get from point A to point B. Advance staff were only given specific start and stop points and a specified time period to cover the distance. Each staff member was responsible for finding the best route while avoiding interstate highways for safety factors. Routes along frontal roads or surface streets were preferred to allow as many people as possible the opportunity to line the streets to see the torch as it passed.

Advance staff were instructed to buy maps of the area and mark the preliminary route on the local maps. The advance workers were also instructed to obtain as much information about the preliminary route as possible such as obvious benchmarks to help the next advance person follow the correct route. In addition, gathering other information, such as the terrain of the route, was important in routing the Youth Legacy Kilometers. The LAOOC did not want to place someone physically incapable along a particularly difficult kilometer.

While mapping out the preliminary route, the advance team was also responsible for contacting and evaluating AT&T Pioneers and key officials in local areas who would be involved with either the paperwork or the organizational end of the relay along the way.

Once a preliminary block schedule was planned, the advance team member contacted the scheduler at the LAOOC to report the collected information. The scheduler, in turn, placed the data into a computer system and provided the advance person with updated information on the number of YLKs scheduled for the area. Every time a YLK was added to a portion of the relay route, approximately three minutes were added to the schedule.

The preliminary block schedule was completed 15 February 1984, as the advance staff traveling east and those traveling west met for the final kilometers in Steamboat Springs, Colorado.

After the completion of the block schedule, the second phase of the route work began with the assignment of regions to each of the advance team members. During this second phase, the details of the relay were added to the data assembled at the LAOOC. Each advance team member was given a map of the preliminary route and was responsible for accomplishing the following:

- Redriving the route to make sure it was satisfactory and checking particularly with the local Department of Public Safety to make sure no road construction was planned along the way during the torch relay

- Adding identifying details (benchmarks) to the driving instructions to make the route easier to trace
- Assigning YLKs to particular kilometers along the route, placing them in prime locations and away from any hazardous or problem areas
- Contacting additional personnel in the area who would be essential for the relay's success (law enforcement agencies, local government officials, highway department, Pioneer personnel)
- Identifying possible "event" locations for local celebration ceremonies

After the detail phase of the advance work was completed, the torch relay personnel assembled in Washington, D.C. to attend a planning meeting regarding the establishment of an advance office and to begin a trial run of the relay.

The trial run was planned as an exercise in logistics to make sure the planning and route work would be successful. The trial run consisted of 800 miles along a portion of the actual route from Trenton, New Jersey to Cleveland, Ohio and was timed so that the relay would pass through a specific area on the same day it would during the actual run.

For the most part, the trial run from 18-24 March was successful. The relay staff began to sense the impending popularity of the torch relay. Even though the LAOOC had not publicized the trial run, large crowds gathered at many spots where the torch passed by.

Several lessons were learned from the trial run. Changes were made in the timing of the relay and more detail was added to the schedule. Also, procedures regarding the changing of vehicles and staff were amended. And, most significantly, the structure of the torch was modified to make sure it stayed lit during the relay. First, the valve that emitted the flame was imbedded too deeply in the bowl of the torch. Originally, it was thought that sinking the flame valve into the bowl would protect it from strong wind, however, it did exactly the opposite. The wind tended to flow over the bowl and snuff out the flame with its force. The valve was later raised to almost the top of the bowl. The second problem involved the size of the torch feeder valve. This valve, which allowed the gas from the torch to escape, was too small and tended to clog easily. The valve was enlarged, solving the problem. Another problem was the type of propane used. Usually,

ceremonial torches burn for only a few minutes, but the relay torches were required to burn for a longer period of time (up to 50 minutes). Since normal propane gas contained impurities that tended to clog the torch and extinguish the flame, a switch to a purer, hospital-quality propane was made.

Also, several logistical adjustments in the relay were made after the trial. The time allowed for AT&T cadre kilometers was changed from five minutes twenty-five seconds to four minutes thirty seconds and YLK times were changed from eight minutes forty-five seconds to seven minutes. In addition, the number of benchmarks logged on the detailed schedule were increased from one per hour to one every 20-30 minutes. This allowed the relay staff to determine if runners were going too fast or too slow and to make adjustments accordingly. Another addition to the detail schedule was the notation of exactly where new vehicles or staff would be added along the route. This notation was necessary to help prevent confusion and to protect the relay staff from unauthorized vehicles and staff joining the procession.

After the trial relay was held, the advance personnel went into the field once again to begin pulling together the final details along the relay route. Approximately six weeks before the start of the relay, the advance staff began finalizing the assignment of YLKs, setting meeting places for YLK participants to pick up their uniforms, determining how many YLKs could be run in one day and where they should be placed and planning what kind of special events would take place in the major cities. Where possible, natural celebrations were taken into account in the timing of the relay. For example, since the relay was timed to arrive in Indianapolis just prior to the annual Indianapolis 500 automobile race, the torch led the parade preceding that event. In other cases, the torch relay was reason enough for celebrations, and the advance team worked in conjunction with local officials to plan appropriate ceremonies. Where possible, the torch was scheduled as the last part of the celebration ceremony. All final planning of the relay route was based on the assumption that the relay would stop for seven hours each night. Called "down time," this factor was critical in allowing the relay to make up for lost time, if necessary.

Specific requests from city governments were also taken into consideration. In Boston, city officials requested that the torch arrive after 0900 hours and leave before 1500 hours to prevent additional traffic problems. In all cases, traffic patterns and train schedules were considered in planning the route.

As final details were set, advance staff members called the LAOOC to pass them on to the scheduler. A final minute-by-minute schedule, which was compiled through the use of a computer, included information about each kilometer such as its location, terrain and who would run it. Additional information included in the schedule was the location of identifying benchmarks and the location where changes in staff and vehicles would occur.

As the start of the relay approached, relay staff members spent their time contacting YLK participants, local officials, AT&T Pioneer staff and key contacts to confirm details of the relay. One important piece of information obtained from YLK participants was the runners' medical history to aid in health services planning.

Pioneer staff helped obtain permits, contact local officials, locate overnight stop points and pass along information about uniforms and torch procedures to YLK participants.

Assigning YLKs became a serious problem for the relay staff. Although the LAOOC made it clear it would try to place YLK runners as close as possible to their requested location, it could not assign as many participants along streets in front of their homes or businesses as they envisioned. As a result, the LAOOC offered to refund the YLK sponsorship money to a few runners who did not accept their assignments.

34.04 Equipment and logistics of the relay

While the LAOOC field advance team was mapping out the relay route, AT&T was coordinating with GMC Trucks and Buick to plan and build the specially designed vehicles that would serve as a home for a total of more than 800 workers over the course of the relay. The LAOOC staff also coordinated with Turner Industries, Inc. to manufacture the torches, Levi Strauss to provide runner's uniforms and Converse to provide runner's shoes.

On 14 September 1983, Turner Industries, Inc. became an official supplier of the 1984 Olympic Games and was designated "Manufacturer of the Olympic Torch." Among some of the services provided by Turner were the design, engineering and testing of the original torch design, testing of the final design, fabrication of the prototype torch and all training and technical support necessary for the safe and proper use of the torch during the relay.

9

The design of the torch called for an overall length of 22 inches (56 centimeters) with a five inch diameter bowl. The torch weighed two pounds, two ounces (one kilogram) when empty and approximately three pounds when filled with propane fuel. It could burn up to 45 minutes, had a wind resistance of 40 miles per hour and could withstand a light rain. The ring, bowl, bezel, hilt and handle guard were constructed of aluminum with an antique brass finish. The ring was etched with the words "Citius, Altius, Fortius" with the Olympic rings etched between each word. The Coliseum peristyle and arches were etched on the bowl of the torch and the words "Los Angeles Memorial Coliseum" and the Olympic rings were etched on the peristyle. On the hilt, the words "XXIIIrd Olympiad Los Angeles 1984" were etched and on the handle guard the *Star in Motion* logo was etched on two sides. The handle was covered by three tan, leather panels of approximately five ounces which were zig-zag stitched and backed with hypon foam.

The relay caravan consisted of 37 vehicles. The core caravan traveling with the torch consisted of five vehicles, while 32 vehicles traveled alternate routes and provided support functions.

9 A community event coincides with the passage of the torch relay.

Torch Relay

12 The flame is carried through New York City on the first day of the torch relay.

13 A child carries the torch down a wide New York City boulevard.

14 A physically challenged torchbearer shows his pride in playing a part in Olympic history.

11

12

13

14

In planning the role for the support vehicles, it was assumed that the relay would be as self-sufficient as possible. Thus, sleeping and living quarters were necessary for 16 cadre runners, requiring four motor home vehicles housing four runners each. Vehicles were added for the drivers, and to serve as a kitchen and diner, a communications center, medical facilities and relay runner shuttles. Some of the vehicles were standard production line vehicles, while others were specially modified for use in the relay. While the vehicles differed in size from convertible cars to tractor-trailer trucks, they all were painted white and carried the official logo of the torch relay. In addition, each had the AT&T, General Motors Corporation (GMC) and Buick logos, special license plates, citizens band (CB) radios and an identification number ranging from one to 37. The cadre motor homes were specially designed to provide the runners with living and entertainment areas during their one-week shift along the relay route. Each motor home was 30 feet long, 7 feet 11 inches wide and 11 feet 6 inches high and not only provided living quarters for four cadre runners but also for two drivers. The cadre vehicles were divided into four sections: the driver area, the lounge area, the shower/toilet area and the sleeping/storage area. The drivers' area had seats for two drivers, two bunk beds which pulled out from above the two seats, two closets and two lockable storage areas for valuables. The passenger seat in the driver area swiveled around to face a roll-top desk which had a pull out writing surface and pigeon-hole storage area. The driver's side of the compartment contained all the main controls for the motor home including those for two generators that provided power for the entire motor home. Also included on the driver's side was an AM/FM radio and cassette tape system and a systems analysis center which was capable of checking water supplies, propane and battery levels. The lounge was designed as a recreation area for the cadre runners to spend their non-sleeping and non-running time. The lounge contained four chairs with a drop-leaf table, sink, microwave oven and refrigerator. Entertainment features included an AM/FM radio and cassette sound system, television, video cassette recorder, Atari video games and video cassettes. A selection of books and magazines was also available.

The toilet and shower areas were located in two compartments across the hallway from each other. The shower was a "sitzbath" type which required the user to sit and use the showerhead and cord for water. Users were urged to conserve water as much as possible since water supplies were generally refilled only once per day.

The sleeping/storage area contained four narrow, deep closets, four bunkbeds and four small lockable storage compartments. Sheets, blankets and a pillow were provided each week.

The cadre motor homes also served as storage space for four torches and a torch propane canister.

One of the more specialized vehicles included in the caravan was the emergency medical services vehicle. It was designed to serve as a moving ambulance and medical treatment center for caravan personnel and YLK runners. It was seven feet longer than the cadre motor home and was equipped with Citizen's Band and Ham-frequency radios and a mobile telephone. In addition to the standard facilities of each of the motor homes, the emergency medical services vehicle was equipped with a heart monitor, defibrillator, oxygen and suction equipment, ultra sound equipment, hydrocollator and whirlpool. The vehicle was staffed by a doctor at all times. Arrangements were made with local hospitals along the relay route, prior to the start of the relay, to accept patients who required hospitalization.

All meals were prepared and eaten on caravan vehicles. A 60-foot tractor-trailer equipped with a complete kitchen was used to store and prepare all meals for the caravan staff. ARA, Official Food Service Management Company, provided five employees to prepare meals. A second 60-foot tractor-trailer was used as a diner. It was equipped with four-person booths and self-service snacks and beverages were available whenever the vehicle was not moving. Caravan staff was scheduled for particular mealtimes to prevent overcrowding.

Additional vehicles in the caravan included:

- Communications; a GMC motor home housed the cadre leaders and the caravan communications equipment and served as the operations center and command vehicle. The motor home was equipped with CB and Ham-frequency radios, a mobile telephone and a small computer equipped with a 32 megabyte fixed disk, 512 byte memory and one floppy drive. The microprocessor was capable of handling four user stations (Teletype 5410 terminals) and had a printer.

- Lead car; a Buick convertible preceded the relay runners to establish the route and pace of the caravan. It was equipped with CB, Ham and business band radios. The lead car was driven by specially trained Pioneer drivers.
- Follow car; a Buick sedan which followed the security car was driven by Pioneer drivers and was equipped with CB and Ham radios.
- Security car; a customized Buick sedan was used by security staff who followed immediately behind the relay runner. The car was equipped with CB, Ham and business band radios.
- Mechanic; a GMC magna van was used to provide spare parts and tools that might be needed to repair vehicles. The van was driven by a truck mechanic who provided routine and emergency repair services.
- Shuttles; several types of shuttle vehicles were used to take cadre runners to and from their running assignments. Each vehicle was equipped with CB and Ham radios.
- Backup; two Buicks were used as miscellaneous shuttles and also served as back-up cars for security and the lead car. Both were equipped with CB and Ham radios.
- Public relations; two motor homes were used for public relations services. However, instead of sleeping and entertainment areas, the main compartment of the vehicles was equipped with full office facilities including typewriters, telex, photocopiers, telephones and telecopiers. The lounge area had extra seating and telephone space.
- Torch; extra torches were carried in a GMC panel truck which was equipped with CB and Ham radios.
- Sleepers; caravan personnel who either drove or traveled in a vehicle without sleeping facilities were housed in four sleepers which were identical to the cadre motor homes with the exception of torch storage areas.
- Dormitories; two motor homes were designed strictly for sleeping quarters with the lounge area replaced by beds to accommodate nine people.
- Advance; two vehicles, including a sleeper motor home and a nine-passenger van were used by staff who coordinated the next day's activities. Each was equipped with CB and Ham radios.

- Pioneer; a GMC suburban truck was used by the Pioneer day manager to coordinate all local Pioneer activities including making sure each Pioneer marshal was in place and had torches for the YLK runners.
- Film; a flat-bed truck was used for storing film equipment and for filming the torch relay.

With the tremendous numbers of equipment and personnel needed to run the torch relay, a simple, straightforward method of managing the relay was developed. A trip director, caravan coordinator, communications coordinator, Pioneer driver coordinator and cadre captain coordinated the logistics of the relay and ultimately were those with authority to make decisions.

The trip director position was staffed by an LAOOC staff member who was given the final authority regarding all segments of the torch relay. Areas of responsibility included serving as a liaison with the public, media, local government officials and other non-caravan personnel and functioning as the official spokesperson for the relay. The trip director position was staffed on a rotating basis.

The caravan coordinator was responsible for the internal operations of the relay. It was the caravan coordinator's responsibility to work with the Pioneer driver coordinator and cadre captain to make sure all caravan logistics, running schedules, driving schedules and meal schedules were planned to allow smooth progress of the caravan.

The communications coordinator was one of the few staff members who worked with the caravan the full 82 days. The communications coordinator was responsible for providing information on campgrounds, service stations and route problems and for generating computer printouts for use by the drivers and runners.

The Pioneer driver coordinator was responsible for helping the more than 450 Pioneer drivers make a smooth transition to their jobs. Approximately 40 new drivers joined the caravan each week making it necessary for a contact person to be designated. The coordinator position was rotated among specially trained Pioneer drivers who were responsible for passing out daily driver schedules, assigning drivers to their vehicles, checking with drivers on a daily basis to ascertain the condition of their vehicles, monitoring gas purchases and the credit cards used to make those purchases and conducting weekly Pioneer driver training sessions.

The concept of designating a cadre captain was the same as designating the driver coordinator. Each week new cadre runners joined the caravan

15
15 The torch is run through New York City in the rain on its first day.

making it necessary to have one person to coordinate runner schedules, conduct runner orientation, answer questions and serve as a liaison with the caravan coordinator.

The heart of the relay was the cadre of runners and drivers that were responsible for actually moving the caravan along the relay route.

Each week 16 new cadre runners reported to the caravan after attending a training and orientation session. Runners were expected to run four-mile segments two times per day. They either ran their legs alone or accompanied a YLK runner.

The cadre runners' week began on a Saturday when they reported to a hotel near the point where they would actually join the relay caravan. Runners were expected to report to their hotels no later than 12 noon, check in and then report to an orientation session that stressed the handling of the flame and torch. The same schedule applied to Pioneer drivers. Orientation began with both groups meeting together with specialized training following the general session. Once the four-hour training session was complete, both groups were urged to get a good night's sleep since both would be required to report to the caravan by 0530 hours.

During the orientation session, the cadre runners were given their official clothing which was provided by Levi Strauss. The clothing included:

- One rain suit
- One warm-up suit
- Three singlets
- Three pair of running shorts
- Two pullover leisure shirts
- Two pair of leisure slacks
- Five pair of running socks
- Two running caps

- One leisure cap
- One long-sleeved running shirt
- Two T-shirts
- One pair of running gloves
- One sport bag

In addition, Converse provided two pair of running shoes in advance of the relay to enable the runners to break-in the shoes. Runners were required to be in uniform at all times.

Driver's clothing was not as specialized and included the following:

- One rain jacket
- Four pair of leisure slacks
- Four pullover leisure shirts
- One leisure cap
- Two T-shirts

The caravan was organized into six clusters of vehicles, grouped according to function. The first cluster consisted of advance staff, the second consisted of Pioneer staff, the third was the actual core cluster that included the torch runner, the fourth was a group used for staging the relay and was located every 16 miles along the relay route and the fifth and sixth consisted of support functions such as sleeper vehicles, dormitories, kitchen and diner vehicles.

The clusters did not follow a single route but instead moved on different schedules according to function. While the core caravan traveled continuously from 12 to 20 hours per day, other clusters of vehicles remained stationary for periods of time and then traveled from one destination to the next via the fastest, most direct route.

The daily itinerary set by the LAOOC advance staff and schedulers was followed each day. A typical day began at 0600 hours when the first group of cadre runners began running. The 16-member cadre was divided into four equal groups and rotated throughout the day. One of AT&T's cadre ran every kilometer of the route since YLK runners were escorted by a cadre member during their run. Each cadre member ran four miles and then handed off to the next member of their group or a YLK runner. At the end of the group's shift (every sixteen miles), the fourth cluster of caravan vehicles would be waiting with a new cadre group to replace the previous one. This allowed approximately nine hours between each runner's first and second four-mile segment. During the nine hours between shifts, cadre runners could eat, sleep or relax in their motor home.

The actual core cluster (pilot car, lead/pace car, torchbearer, security, emergency medical services, tail car) began each day with the lead car setting the pace for the entire day. Staff in the pilot car consisted of a driver and representatives from local or

state police and a security advance staff member. Those in the pilot car consisted of a driver, the LAOOC advance person assigned to that particular day, the caravan director and the lead AT&T Pioneer. The LAOOC advance person was responsible for keeping the relay on schedule, while the Pioneer was present in the event route changes were required because of accidents, weather problems, natural disasters, security problems, etc. The local contacts were expected to have a good working knowledge of the area, enabling them to direct the relay along a detour, if needed. The runner followed the lead car while another security vehicle followed close behind. The EMS vehicle, staffed with a doctor, followed the security vehicle and was followed by a trail car which was usually a police patrol car.

The core was serviced by a number of shuttles moving cadre runners, drivers and all support staff between their assigned vehicles for active duty and the stationary clusters where breaks and meals were taken. The most important part of the core cluster's progress depended upon the staging process that was taking place several miles ahead throughout the day. As each runner completed a four-mile run, a shuttle picked up the runner for transport back to the stationary cluster. By the end of 16 miles, all four runners of a particular group had been gathered and shuttled back to their motor home. Meanwhile, a second shuttle dropped off the next group of cadre runners at four mile intervals to await the torch. The process continued throughout the day with each coordinator making sure drivers and support personnel switched shifts and were able to eat and sleep.

Each of the drivers, cadre runners and support staff were given daily agendas. However, all vehicles were equipped with CB radios for communications in case of unexpected delays or problems.

In addition, advance personnel who had mapped out the original route were divided into two groups during the running of the relay. Some of the advance team concentrated efforts on coordinating the events that occurred along the relay route while other members were assigned particular days. Those who were assigned particular days received a new assignment every seven to 10 days.

Personnel who worked events contacted local planners to coordinate events along time constraints and the arrival of the torch. This allowed event planners flexibility in their agendas without disrupting the schedule of the torch relay.

Advance staff who were responsible for particular days arrived in their location approximately one week before the arrival of the torch. Once

there, the advance staff personnel contacted city officials and local law enforcement agencies and coordinated with the Pioneers in the area. Advance staff members were also responsible for making sure YLK runners were contacted to verify times and locations where the runners were to report. Advance staff also made sure YLK runners had the proper uniforms and were instructed in the proper use of the torch. Distribution of the torches and uniforms were handled by Pioneer staff.

Each day before the start of the relay, all parties involved in the planning of the next day's relay double-checked details. The advance person, after discharging his responsibilities that day, departed for another section of the relay approximately one week ahead.

The relay relied heavily on the Pioneer personnel for local support services. Once the relay arrived in a particular location, the Pioneers were responsible for taking YLK runners to the correct position along the relay route and standing with the runners until the torch was placed in their hands.

The relay operated in the same fashion day after day, with staff rotating in and out of the relay on a weekly basis and local Pioneer staff providing services in their hometowns. The relay staff accomplished the original goals of taking the torch to a large portion of the U.S. population while delivering the torch to Los Angeles in time for the lighting of the flame in the Los Angeles Coliseum during the Opening Ceremonies.

34.05 Kindling of the Olympic flame at Olympia

The differences between the LAOOC and the Hellenic Olympic Committee (HOC) produced one of the biggest controversies surrounding the torch relay. The HOC, protesting what they felt was commercialization of the torch relay in the Youth Legacy Kilometer program, threatened to withhold the transfer of the Olympic flame.

The LAOOC signed its original agreement with the HOC on 22 June 1983. In the contract, the HOC had agreed to organize and stage the Olympic flame relay ceremonies and festivities in Greece. In addition, the ceremony was to take place between 3-7 May 1984, with the flame arriving at the Panathenean Stadium in Athens on 7 May at approximately 1800 Athens time. The HOC also agreed to assist the LAOOC delegation which would attend the kindling of the Olympic flame.

Although the LAOOC sent an official to Greece in July 1983 to discuss details of the relay and YLK program with Greek officials, International Olympic Committee President Juan Antonio Samaranch was notified on 27 November 1983 by the head of the HOC that it just learned that the LAOOC was conducting a fundraiser using the Olympic symbol and that the HOC felt this was totally inconsistent with Olympic ideals. The LAOOC, in turn, was notified by Samaranch of the HOC complaints. The complaint by the HOC touched off almost five months of negotiations, proposals and counterproposals over the traditional kindling of the Olympic flame and its transfer to the Organizing Committee for the start of the torch relay.

The controversy reached a critical point in early February 1984 just prior to and during the Olympic Winter Games in Sarajevo. Numerous articles appeared in Greek newspapers recounting a meeting between the mayor of Olympia and a representative of the LAOOC. The articles erroneously stated that the LAOOC would raise \$57 million by selling the Olympic flame for advertising purposes.

Representatives of the LAOOC and HOC met in Sarajevo to try to resolve the differences concerning the YLK program, however, no settlement was reached and negotiations intensified during March and April. A final accord was reached just days before the kindling ceremony. The following is a synopsis of events leading up to the kindling ceremony:

- 9 March; an Associated Press story out of Greece quoted the mayor of Olympia at a press conference, "If American organizers want the flame they will have to come and light it themselves." Meanwhile the LAOOC sent a telex to the HOC stating it would cease accepting contributions for the YLKs in the next few weeks and requested that the flame be transferred on 7 May from Greece to New York by electronic means. The LAOOC also suggested that a joint statement be issued to that effect on 13 March.
- 10 March; a *Los Angeles Times* story reported the LAOOC had requested that the traditional ceremony in Olympia be eliminated and the flame transmitted from Olympia to New York by laser. However, Greek officials continued to claim there would be no participation by the HOC unless the YLK sales were halted.
- 12 March; the LAOOC sent a telex to the HOC for its approval of proposed text for a joint press release announcing the settlement of the torch dispute. The announcement was scheduled for 13 March. The LAOOC was notified by the HOC that approval of the text could not be sent before 14 or 15 March since the matter must be discussed by the Plenary Session of the HOC.
- 13 March; the HOC informed the LAOOC that an extraordinary plenary session of the HOC was convened to discuss the text of the joint press statement. The HOC asked for "a small period of time in order to communicate with our competent authorities," but subsequent transmissions resulted in a breakdown of negotiations over the wording of the text of the release.
- 15 March; a new statement is forwarded to the HOC for approval. It read: "The LAOOC in consideration of the sensitivities of the Greek people, our friends and allies in the Olympic movement for years, and in consideration of the concern of the Hellenic Olympic Committee, has decided to call a halt to the charitable contributions in connection with the running of the flame in the United States. The Hellenic Olympic Committee will make every effort to ensure the smooth, traditional transfer of the flame." The LAOOC asked the HOC to consider the text at its next Plenary Session on 19 March and to reconfirm its intention to honor the Olympic Flame Agreement signed on 22 June 1983.
- 20 March; the agreed-upon press statement is released by the HOC and LAOOC.
- 21 March; the LAOOC's senior management received a telex from the HOC voicing concern that, "during your press conference of yesterday, you stated that with the accord of the Hellenic Olympic Committee, you will continue receiving contributions until the 10th of April." The LAOOC's response was that a wind-down period extending to 10 April would take place and that sales in New York and Los Angeles had already ceased.
- 22 March; HOC sent a telex to the LAOOC requesting clarification of statements made in the press conference of 20 March and demanded an immediate cease to the program.
- 23 March; HOC sent a telex to LAOOC stating it must have confirmation that YLK sales had been halted. LAOOC responded by stating that letters were being sent that day to all YLK locations instructing them to wind down operations and conclude solicitations for contributions.
- 26 March; HOC released the following, "In reply to a telex whereby the Hellenic Olympic

Committee demanded from LAOOC explanations concerning the alleged statement of the LAOOC representative at the press conference of March 20, 1984, the LAOOC confirmed to the Hellenic Olympic Committee by its telex of the 22nd March officially and positively that the LAOOC has already stopped accepting contributions." The HOC requested the LAOOC to issue the same statement.

- 23 April; LAOOC sent a telex to HOC outlining final details of the LAOOC delegation's arrival in Greece for the flame-kindling ceremony.
- 25 April; Associated Press reported that Segas, Greece's amateur athletics federation, had requested its athletes to refuse to participate in the torch relay from Olympia to Athens.
- 26 April; Associated Press reported that, "Greece's Olympic committee Thursday canceled arrangements for next week's traditional Olympic flame-lighting ceremony because of a dispute stirred by allegations that the Los Angeles Games are too commercial." The LAOOC received a telex from the HOC stating it had been forced to cancel the flame-lighting ceremony and it was up to the IOC to provide the flame.
- 29 April; *Los Angeles Times* reported that the Greek government had offered assurances that a flame would be sun-kindled in Olympia in time for the beginning of the torch relay.
- 30 April; LAOOC sent a telex demanding the return of the following items: 740 torches, 360 cannisters of propane, 1,000 uniforms, 800 headbands, 70 United States flags, 1,000 posters, 740 running certificates, 810 torch instruction booklets and 740 pair of Converse running shoes.
- 2 May; LAOOC officials notified a staff member who was to be attending a convention in Paris that he would be re-routed to Lausanne, Switzerland to receive a backup flame for the torch relay. The staff member received the flame from IOC President Samaranch and returned to New York via Paris.
- 3 May; Associated Press reported that the flame would no longer be transferred by telecommunications satellite from Greece to New York but transported instead in a lamp aboard an aircraft.

On 7 May 1984, the traditional ceremony for kindling the Olympic flame took place in Olympia, but was closed to the public. The ceremony, which traditionally had been attended by thousands, was limited to Greek, IOC and LAOOC officials and members of the press.

Torch Relay

Heavy security was present at the ceremonial site. After the ceremony, the flame was transferred by helicopter to Athens where a special White House plane on its maiden voyage transported LAOOC officials and the flame to New York, New York.

34.06 Relay operations

The torch relay began its 15,000-kilometer journey on a rainy morning, 8 May 1984 at the United Nations Plaza in New York City. Olympian Rafer Johnson hosted a short program before Gina Hemphill, granddaughter of 1936 Olympian Jesse Owens, and Bill Thorpe, Jr., grandson of 1912 Olympian Jim Thorpe, became the first of 3,636 torchbearers. About two hours after the relay began, the Soviet Union announced that it would not accept the invitation of the LAOOC to participate in the 1984 Games.

The news stunned the LAOOC staff, and observers wondered what effect the announcement would have on the relay. But the Soviet announcement seemed to have little effect on the large crowds that began to line the streets of their communities to witness the passing of the torch relay.

While enormous crowds turned out to see the torchbearers run, the support caravan and the relay support staff were at full speed putting into effect all the logistical details for the relay.

Back at the LAOOC administrative headquarters, members of the relay staff double-checked information received from each of the YLK runners and gathered new information from runners assigned to kilometers during the latter portion of the run. Approximately one month before each YLK torchbearer was scheduled to run his or her kilometer, the LAOOC sent a letter verifying the kilometer assignment (location), requesting medical information and instructing the runner to report to an assembly area wearing the official uniform. The letter also informed the YLK participant that a member of the LAOOC would be contacting them within five days of their scheduled run to verify last-minute details and give specifics regarding the assembly point.

The actual relay support staff began its week with a planning meeting which was attended by new cadre runners and Pioneer drivers reporting for their one-week shift. The runners and drivers were given instructions for the week during an orientation session conducted at an assembly hotel near their particular start point along the relay route.

The support caravan was allowed no closer than one mile to the core caravan, since a group of more than 30 vehicles would cause traffic tie-ups and cause additional problems and delays for the relay.

Operations continued as planned throughout the relay. More than 5,000 AT&T Pioneer staff members assisted with details such as obtaining permits and locating campgrounds in their hometowns and also lending valuable help by taking YLK runners to the correct position along the relay route. In addition, they assisted with distributing uniforms and instructing YLK runners in the proper use of the torch. LAOOC advance staff continued their role of providing a sound foundation for the caravan by preceding the relay by approximately one week and coordinating last-minute details before the torch's arrival.

The actual running of the relay proceeded smoothly throughout the 82 days. The logistical success of the relay not only is attributable to detailed planning but also to a fair amount of good luck. While bad weather, traffic and unexpectedly large crowds caused some delays for the relay, no major problems occurred, and the earlier

decision by the LAOOC to allow seven hours of down time per night allowed the relay enough flexibility to stay on schedule.

The torch relay being a tremendous logistical success was overshadowed by the relay's tremendous success as a promotion of the Olympic spirit. The LAOOC originally endeavored to bring the torch to as many people in the United States as possible and allow those who would not be able to witness the Games in person the opportunity to feel a part of the Games. It succeeded.

It is estimated that at least 25 percent of the United States population witnessed a part of the relay either in person or on television. The relay passed through the District of Columbia and 33 states (New York, Connecticut, Rhode Island, Massachusetts, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Ohio, Michigan, Indiana, Illinois, Kentucky, Tennessee, North Carolina, Georgia, Alabama, Mississippi, Arkansas, Missouri, Kansas, Oklahoma, Texas, New Mexico, Colorado, Utah, Idaho, Washington, Oregon, Nevada and California). It also passed through 41 of the United States' largest cities and more than 1,000 smaller communities. Crowds were estimated at 700,000 in New York, New York; 200,000 in

16

17 The torch relay is almost ready to start at the United Nations Plaza in New York City.

17

Chicago, Illinois; 200,000 in Dallas, Texas; 250,000 in Salt Lake City, Utah; 500,000 in Seattle, Washington and more than 2,500,000 in the Los Angeles area.

The relay was also successful as a fund raiser. A total of \$10,950,567.68 was raised and distributed as follows:

YMCA	\$ 3,894,713.46
Boys Clubs	\$ 2,838,423.83
Girls Clubs	\$ 799,914.17
Special Olympics	\$ 2,317,995.25
Others	\$ 470,036.97
Interest	\$ 629,484.00 *
Grand Total	\$ 10,950,567.68

*Note: Interest funds were distributed among the beneficiaries

Although the total monies generated and the crowd numbers were impressive, the significance of the torch relay can only be completely understood through some of the hundreds of stories generated along the relay route.

Perhaps the most retold story, and the one that seemed to capture the ideals and spirit of the Olympic Games, involved a small town in Kentucky. The torch relay had been delayed that day by a series of thunderstorms and consequently arrived at its final destination several hours late. Although it was after hours, the 2,000 residents of Pineville had stayed up to greet the members of the relay and catch a glimpse of the torch. Because of the bad weather and the late hour, the relay staff had expected a few stragglers to remain. The staff was surprised by a street full of residents holding candles and flashlights to light the way for the caravan.

Many other memorable moments were generated by the relay participants themselves. When the LAOOC decided to make the Youth Legacy Kilometers available to anyone who contributed \$3,000 to charity, it expected the runners to be a representative portion of the population and not just the athletically elite. The idea was a success. Kilometers of the relay route were run by people from four years of age to those in their nineties, former Olympians, businessmen, children who had worked to earn money for their kilometers, wheelchair-bound people, blind people and those with serious or debilitating diseases. For many of these torchbearers, the running of one kilometer represented a physical challenge as great or greater than any experienced by the athletes during the Games. Thousands of people in the Los Angeles area were moved to tears as

one young boy who had a seriously disabling disease struggled to cover the final steps of his kilometer and fell into his mother's arms exhausted, yet exhilarated, by his experience. His determination and courage provided inspiration and an understanding of the Olympic spirit to observers along the relay route that many will remember as long as they live.

34.07 Review of the results of the torch relay

The 1984 torch relay was an overwhelming success. The LAOOC achieved its two goals of bringing a portion of the Olympics to the citizens of the United States who would not be able to see the Olympics in person and providing a legacy for existing U.S. youth sport programs.

In its final form, the 15,000-kilometer relay was the longest in history, passed through 33 states and the District of Columbia, 41 major cities and more than 1,000 smaller communities and utilized 3,636 torchbearers (3,436 YLK runners and 200 AT&T cadre runners). It is estimated that at least 25 percent of the United States population witnessed the torch relay either in person or on television.

The Youth Legacy Kilometer program generated funds totaling more than \$10 million which were distributed to YMCAs, Girls Clubs of America, Boys Clubs of America and the Special Olympics. The \$10,950,567.68 in contributions is the largest single-event private youth sports fund raiser in the history of the United States and was accomplished despite a late start and self-imposed promotional constraints.

The LAOOC overcame numerous obstacles to achieve its goals for the torch relay including problems with planning the logistics of the relay and satisfying international sensitivities. The LAOOC, in conjunction with AT&T, the "Official Sponsor of the Torch Relay Run," overcame a late start and a lack of understanding regarding the magnitude of the logistics involved in conducting the relay to plan the final route and arrange for support materials in less than one year. The LAOOC staff recommends that a much earlier start be considered for a relay the length of the one conducted during 1984.

The LAOOC relied heavily on an advance staff of 15 who worked with volunteer AT&T Pioneer personnel along the relay route to plan the logistics of the services and for arranging for the support vehicles utilized during the relay. Hiring the advance staff and relay schedulers as part of the LAOOC permanent staff proved a wise move and provided the solid groundwork that allowed the relay to function as successfully as it did.

18

19

The relay resulted in 82 days of positive publicity and encouraged national support for the Los Angeles Games. The relay became more than just a means to transport the flame from one end of the country to the other, it served as an inspiration to those who watched and participated and helped generate and foster the Olympic spirit and ideals.

18 Children line the streets to watch the torch relay.

19 Former American football star O.J. Simpson carries the torch in Los Angeles.

Torch Relay

Torch Relay facts and figures

Date & Site Kindled:

7 May 1984, Olympia, Greece

U.S. Start Date:

May 1984

U.S. Start Point:

United Nations Plaza, New York, N.Y.

First Torchbearers:

Bill Thorpe, Jr. and Gina Hemphill

Last Torchbearer:

Rafer Johnson

Total Torchbearers:

3,636

Distance:

15,000 kilometers

Number of Youth Legacy Kilometers:

3,436

States on Route:

33 plus District of Columbia (New York, Connecticut, Rhode Island, Massachusetts, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Ohio, Michigan, Indiana, Illinois, Kentucky, Tennessee, North Carolina, Georgia, Alabama, Mississippi, Arkansas, Missouri, Kansas, Oklahoma, Texas, New Mexico, Colorado, Utah, Idaho, Washington, Oregon, Nevada, California)

Number of Cities:

41 with population of 100,000 or more plus more than 1,000 smaller communities

Corporate Sponsor:

American Telephone and Telegraph (AT&T)

Torch Manufacturer:

Turner Industries

Description of Torch:

Constructed of spun aluminum with an antique brass finish. Leather handle has name band for engraving name. Torches were numbered sequentially and inscribed with the Olympic motto, Citius, Altius, Fortius. The 22-inch (56-centimeter) torch weighed two pounds, four ounces (one kilogram) and was fueled by hospital-quality propane which could burn up to 50 minutes. The flame was wind resistant up to 40 miles per hour and could also withstand light rain.

Funds Raised and Distributed:

\$10,950,567.68 distributed to charitable organizations working with youth, including the YMCAs, Special Olympics and the Boys Clubs and Girls Clubs of America.

Torch Relay history

□ 1928; the Olympic flame is first used during the modern era. The flame is kindled in Amsterdam, Netherlands and burns at the entrance of the main stadium throughout the duration of the Games of the IXth Olympiad.

□ 1932; the flame is kindled in Los Angeles and burns atop the Coliseum throughout the Games. This is the last time that an Olympic flame is kindled at the site of the Games.

□ 1934; the IOC ratifies a flame relay from Olympia, Greece, site of the ancient Games, to the site of the host city.

□ 1936; at the urging of professor Carl Diem, founder of the Graduate School of Sports in Cologne, a torch relay is inaugurated preceding the Berlin Games. Following the ceremonial lighting of the torch in Olympia, the relay crosses seven countries in 12 days using 3,000 torchbearers to run the 5,758 kilometers (3,570 miles). The final torchbearer is Fritz Schilgen.

□ 1948; the flame travels by torchbearers from Olympia to Athens where it then travels by sea to Dover for the London Games. The 3,160-kilometer route takes 13 days and utilizes 1,531 runners. The final torchbearer is John Mark.

□ 1952; for the Helsinki Games, the torch is carried by 3,372 runners from Greece through Denmark and Sweden before arriving in Finland. The 25-day journey covers 7,870 kilometers. The final torchbearer is Paavo Nurmi.

□ 1956; the torch is carried by Greek runners from Olympia to Athens and then is transported 33 hours by air to Australia where a 4,528-kilometer relay takes place. The Melbourne relay uses 3,180 runners during a 21-day period. The final torchbearer is Ron Clarke.

□ 1960; the flame is run from Olympia to the Greek port of Piraeus where it is taken by ship to Sicily. The eight-day relay to Rome takes 1,200 torchbearers to cover the 1,532-

kilometer route. The final torchbearer is Giancarlo Peris.

□ 1964; for the Tokyo Games, the flame is flown from Athens to China. During the 49-day relay, 101,473 torchbearers carry the flame 7,487 kilometers. The final torchbearer, Yoshinori Sakai, is chosen to symbolize a new beginning. He was born in Hiroshima on the day the atomic bomb was dropped.

□ 1968; a torch relay held in conjunction with the Olympic Winter Games is initiated in Grenoble. For the Games of the XIXth Olympiad in Mexico City, the relay traces the route of Christopher Columbus from Spain to the new world. The flame travels from Olympia to Athens utilizing torchbearers and then is shipped to Italy, Spain and Veracruz where 17 swimmers bring the torch ashore. The 13,536-kilometer relay is completed in 50 days with 2,278 torchbearers. The final torchbearer, Enriqueta Basilio, is the first woman to light the Olympic torch.

□ 1972; seven thousand torchbearers participated in the 29-day, 5,758-kilometer relay which passes through the sites of two previous Olympic Winter Games. The final torchbearer is Gunter Zahn.

□ 1976; the Montreal Games usher in the era of modern technology as the flame is carried by runners from Olympia to Athens, but then its energy is transmitted by satellite to Ottawa where the transmitted signal ignited the torch. The torch was carried from Ottawa to Montreal in four days. The final torchbearers were two 16-year-olds, Sandra Henderson and Stephen Prefontaine, who later married.

□ 1980; for the Moscow Games, 4,500 runners travel 4,864 kilometers through Bulgaria and Romania into the Soviet Union. The 29-day relay concludes as Sergei Belov lights the Olympic flame in the main stadium.

□ 1984; the 15,000-kilometer relay is the longest in history and utilizes 3,636 runners in 82 days. The relay begins in New York, N.Y. and passes through 33 states and the District of Columbia. The relay raises \$10,950,567.68 for youth sports programs. The final torchbearer is former Olympic decathlon gold medalist Rafer Johnson.

35

35.01 Area of responsibility

The transportation effort for the 1984 Olympic Games was a particularly challenging one. Olympic housing, competition and training sites were located as far north as the University of California at Santa Barbara, as far south as Fairbanks Ranch in San Diego County, as far east as Prado Recreational Park in San Bernardino County and as far west as the Pacific Ocean, along which the men's and women's marathons were run.

The LAOOC had the responsibility for transporting athletes, coaches and other team officials, members of the national and international media, scorers, timekeepers and other international sports officials, and various Olympic dignitaries during the Games. To accomplish this, it utilized approximately 840 school buses, 150 other buses, 1500 sedans, wagons and passenger vans, and 800 miscellaneous trucks, trailers, cargo vans, motorcycles, all-terrain vehicles, and electric carts. Development of the detailed plans to accomplish these objectives took well over two years.

Over time and through several reorganizations, the department came to be organized into two groups, Finance and Human Resources, and five operating divisions:

- Athlete Transportation
- Media Transportation
- Fleet Operations
- Special Services
- Venue Management

35.02 Athlete transportation

In July 1982, the LAOOC entered into a sponsorship agreement with ARA Services, Inc. (ARA) pursuant to which ARA agreed to provide food management services for the Olympic Family and transportation management services for the athletes. Under the transportation provisions of the agreement, ARA provided planning and management services to the LAOOC using a cadre of experienced transportation management specialists. During the planning phase (July 1982 to 11 July 1984), ARA provided approximately 15 full-time personnel. An additional group of approximately 15 senior managers were called upon as needed. During the operations phase (11 July 1984 through 15 August 1984), ARA provided 17 full-time managers and five others as needed.

Under the terms of the sponsorship agreement, the LAOOC bore all costs of the athlete transportation system, except the payroll and out-of-pocket expenses for ARA's donated personnel.

The scope of the athlete transportation system began with the transport of athletes, coaches and related team officials from the various national delegations from Los Angeles International Airport (LAX) to one of the three Olympic villages. The system also transported athletes each day from villages to competition and training sites and back. Once the athletes' stay was concluded in Los Angeles, they were transported back to LAX.

35.02.7 Arrival/In-processing link

The athlete transportation system at LAX was responsible for transporting the athletes from their arriving terminals to the Olympic Arrival Center (OAC) for accreditation and then on to the three villages. To accomplish this, two sub-systems were developed: a loop shuttle and a village system.

The loop shuttle ran at 10-minute intervals around the circle (World Way West) on the arrival level at LAX, making stops at designated pick-up points at each airline terminal. Upon completing a loop, the vehicle would proceed to the OAC where it would drop off first its passengers and then the baggage, which would be put in the baggage holding area. This part of the athlete system accommodated all Olympic Family members needing to go to the OAC for accreditation. A fleet of 13 transit buses was used for the shuttle. Athletes arriving at the Bradley International Terminal in groups of more than 20 were escorted to the OAC by an LAX transporter bus.

On the regular loop shuttle, baggage was put on the vehicle with the athletes. On the transporter, baggage was transferred to the OAC by a contracted baggage handling service.

The village component of the transportation system provided transport from the OAC to USC, UCLA and UCSB. The buses to UCLA and USC left at 30-minute intervals during peak periods between 0600 and 2400 hours, or on demand during off-peak periods. This system operated 24 hours a day, as did the loop shuttle, and transported up to 600 passengers in one 90-minute period. Security was preserved in this system by the screening of athletes and their baggage prior to boarding. There was a security guard on each bus, and all passengers who rode the buses were considered "sterile" and were admitted to the villages without additional security screening.

The buses used to serve the villages were highway coaches with 36 reclining seats. These coaches were selected for their luggage-carrying capacity rather than for the comfort of the passengers. However, because of the surprisingly large amount of baggage, much of which should have been sent as cargo rather than as checked baggage, the bus system had to be supplemented by five-ton trucks, two on the inbound operation and up to 10 on the outbound operation. The large amounts of excess baggage were, in many cases, the result of money-saving arrangements made between the various NOCs and their national carriers. Had the department known the extent of this "heavy" baggage, all transportation systems would have been supplemented with more cargo handlers and vehicles, and would have been prepared to divert much of it to the LAOOC cargo department. To avoid this, future organizers should enforce strict parameters regarding the size, weight and nature of athletes' baggage.

Those athletes going to UCSB were transported via recliner coaches from a Santa Barbara-based company contracted for this service. It ran approximately every two hours from 0600 to 2400 hours, or as demand warranted.

Approximately one week before the end of the Games, representatives from the LAX athlete system relocated to USC and UCLA to help coordinate the village departure process. Working with NOC Services and village transportation managers, the coordinators obtained, in advance, departure information, particularly each team's special needs regarding extra baggage and cargo. With this advance planning, the departure operation went smoothly, despite the fact that it took only three days to move out what took over two weeks to move in.

35.02.2 System design criteria

From the outset, the LAOOC objective was to design an efficient transportation system that met the needs of the athletes and made full use of buses and drivers. With that as a general objective, a system was designed based on a scheduled service, rather than one based on demand.

The service was planned according to projections on the number of athletes requiring transportation by venue, day and time of day. The projections resulted from extensive discussions with the Sports Department staff over a year and a half. Knowing these projections would not be completely accurate, demand service was also provided. The purpose of the demand part of the system was to respond to unexpected numbers of athletes requiring transport and to provide back-up buses if buses ran late.

Within any venue or training site, the athletes' needs for transportation varied within a 24-hour period and from one day to the next. Therefore, the fixed schedules were developed to provide service at irregular intervals. For example, buses may have been scheduled to leave at 0700, 0730, 0800, 0830, 1200, 1300, 1800 and 1900. This design utilized fewer resources and was less costly. It did, however, require that athletes be more careful in pre-planning their trips to be consistent with the published timetables.

Another major design feature was direct routing. Recognizing that some locations were far away, and wanting to minimize the amount of time athletes spent on buses, routes were designed without intermediate stops. This route design also made it easier for drivers to learn the routes quickly, thereby minimizing the chance of a driver getting lost.

35.02.3 Vehicle allocations and rental

School buses were selected for most of the Olympic Family transport because, with school out of session during the summer, equipment and trained drivers were readily available.

Early in 1983, it was roughly estimated that it would take 535 buses to operate the athlete transportation system. In the estimate, 20 percent of the route buses were employed as demand buses and 10 percent were spares. Those numbers were confirmed when preliminary schedules were completed in December 1983.

Once the quantity was identified, providers for the athlete system buses had to be found. ARA agreed to provide 329 school buses. The Los Angeles Unified School District (LAUSD) agreed to provide an additional 509. Of the ARA buses, 245 were assigned to the UCLA operation, and 225 of the LAUSD buses were assigned to the USC operation. Both leases were "bare bus" leases, under which the LAOOC found its own drivers and bore its own operating expenses. The LAOOC paid a basic rental fee for each bus, plus a per mile fee for each mile driven. The ARA and LAUSD buses went through an extensive inspection and repair program to ensure that they were ready for the Olympic project.

1 Buses are the primary mode of transportation for athletes and news media during the Games.

2 A bus awaits athletes to transport them from the Olympic Arrival Center at Los Angeles International Airport to their respective villages.

3 The Japanese delegation arrives at USC.

Transportation

At UCSB, the LAOOC contracted with a small local operator who had transit and recliner type coaches. These buses were used for transportation from UCSB to LAX and back, and from UCSB to Lake Casitas and back.

35.02.4 Routing and scheduling

The LAOOC employed two retired router-schedulers from the Southern California Rapid Transit District (RTD) to develop comprehensive route books to be used by drivers in the athlete system. Initial drafts of two or three alternate routes were developed for each trip. These drafts were reviewed in detail with the Los Angeles Department of Transportation (LADOT), the California Highway Patrol (CHP), the California Department of Transportation (Caltrans) and the Los Angeles Police Department (LAPD). Representatives of these agencies gave valuable feedback regarding the most appropriate routes to take and specific parts of the freeways and surface streets to avoid during the Olympic period. The development of the routes, which were kept confidential at all times, took place over approximately one year. Some changes in venue sites and venue access dictated last-minute changes in routes.

As part of developing the final route sheets, experienced charter drivers who knew the Los Angeles area were used to field-check each route by bus for errors in street names and street directions. This was done to make sure no drivers got lost during the Games.

The scheduling group was responsible for gathering and analyzing the requirements for all projected athlete trips to competition and training sites. This project, begun in October 1982, involved interviewing commissioners and sports managers from each sport. In February 1983, sports managers provided detailed information on a questionnaire and worksheet, including daily competition and training session start times by sports and the required athlete arrival and departure times. The excellent communication developed between senior sports department and athlete transportation management resulted in an efficient operation that tailored bus service to the athlete's needs. Some examples of that efficiency:

- Bus service was reduced during off-peak training times.
- Training site openings were staggered from nearest to furthest as village occupancy increased.
- Selected training sites were dedicated to the nearest village.

□ Bus capacity was set at 40 athletes per bus, but modified to 26 per bus (one per bench seat) for basketball, wrestling and weightlifting because of athlete size, and cycling, fencing and archery because of the bulk of accompanying equipment.

□ Each team competing in baseball, basketball, football, handball, hockey, volleyball and water polo was assigned to its own bus when traveling to competition.

Revised and updated information was also gathered in January and February of 1984, when sports commissioners were asked to review existing planning documents. On 1 March 1984, corrections were incorporated into the system.

After analyzing the needs of the athletes and consolidating similar trips from more than one sport to the same destination, the scheduling staff was responsible for developing specific schedules for each of the 33 days of service—a task unprecedented in prior Games. To keep track of the daily requirements from two villages and 57 sites, a computer software package called OATS (Olympic Athlete Transportation System) was created for use on an IBM-XT Personal Computer.

In most cases, the buses were scheduled to arrive at training sites about 15-30 minutes before training started and to depart soon after the session ended. Buses were scheduled to arrive at competition venues between one and two hours prior to competition and leave up to one and one-quarter hours after the session ended. Spectating athletes were scheduled to arrive approximately one and one-half hours before each event and depart shortly after the conclusion.

The following is a sample UCLA Village athlete bus timetable for the sport of weightlifting. Since Loyola Marymount University (LMU) was the site for both training and competition, weightlifters had only one bus schedule to refer to in their respective village bus timetable. Other sports had bus schedules to the competition venues as well as all of their respective training sites.

Each sport required a complete timetable for buses scheduled to depart from the UCLA and USC Villages.

Athlete bus time table for weightlifting

Sport/Site	UCLA schedule		Travel time durations and earliest/latest	
	Depart UCLA	Arrive LMU	Depart LMU	Arrive UCLA
Weightlifting/ Loyola Marymount Univ.	14 July—5 August 2—9 departures daily		25 min. average 0655-1740

July 28 (Opening Ceremonies)	0750 1020	0815 1045	1105 1330	1130 1355
29—31 July	0740	0815	1105	1130
1—2,4—5 August	0655 0740 1020 1105 1250 1325 1455 1510 1705 1740	0730 0815 1045 1130 1315 1350 1530 1545 1740 1815	1150 1230 1335 1410 1600 1630 1830 2015 2100 2135	1130 1255 1400 1435 1635 1705 1905 2035 2120 2155
3 August	1020 1250 1510 1740	1045 1315 1545 1815	1335 1605 1835 2100	1400 1640 1910 2120
6—8 August	1020 1105 1250 1305 1455 1510 1705 1740	1045 1130 1315 1330 1530 1545 1740 1815	1150 1335 1350 1600 1630 1830 2100 2115 2130	1215 1400 1415 1635 1705 1905 2120 2135 2150

Toward the end of the planning phase, the department was grateful that the scheduling effort had begun early. During planning, sports managers became sensitive to key transportation scheduling concerns that reduced the overall cost to the system in dollars, drivers and buses; while transportation had the detailed background necessary to plan for such unique cases as the movement of cyclists' bikes with the athletes, the need for all boxers to arrive at the same time for weigh-in, and the need for transportation plans for yachting "reserve days" in cases of unsuitable weather. The excellent rapport between the LAOOC sports department and athlete transportation greatly enhanced the service for the athletes.

During the Games, most sports training sessions were established in 90-minute or two-hour intervals, which permitted time for one bus and a driver to make round trips to the site. However, it did not adequately serve the needs of the athletes. Because athletes' personal training needs varied before and during competition, consideration should have been given to providing hourly bus service to training sites.

Transportation

35.02.5

The start-up period

The purpose of the five-week start-up period was to become operationally ready by 14 July, the first day of service to the athletes. The major emphasis was on personnel training during this period of time. A general orientation was held for the 1,550 personnel in the athlete system to generate excitement and enthusiasm. Detailed job descriptions, purposely left out of the general orientation, were addressed in a series of smaller training workshops grouping personnel according to job classification. Each individual received approximately 16 hours of in-the-class training on topics pertaining to the Olympics in general and his or her job in particular.

During the final week prior to the opening of the villages, two dress rehearsals were conducted. The first, at UCLA on 10 July, was a mock-day created to include trips to all training and venue sites. Service was similar to Games operations, with one notable exception: passengers. A tabletop discussion was conducted the next day to evaluate results of the exercise. On 12 July a similar dress rehearsal was conducted at USC and a small scale dry-run at UCSB. The dress rehearsals were particularly helpful because they represented the first time the system was operated using the

detailed operating schedules. The period was also helpful in understanding the technology requirements of the athlete bus system. There proved just enough time for proper installation of all equipment prior to 14 July.

35.02.6

The operating period

From 14-27 July all movements were training trips. The first two weeks of service were extremely helpful to the operators and users of the system. It enabled the staff to work out any last-minute problems and also enabled the athletes to understand how the system worked and to become familiar with timetables and loading areas. It had been a long-stated policy to adhere closely to the printed timetables, and this policy was indeed followed.

The bus dispatching procedures represented a significant departure from normal bus operating procedures. Normally, once a bus is dispatched from the yard, the yard remains in radio contact with the bus and all control of the bus remains at a dispatch center in the yard. During the Olympics, a bus

would leave the yard and proceed to the village where the primary dispatch center was located. Each village had a separate dispatch tower overlooking the loading area. As a result of this fundamental difference in dispatching concepts, a number of dispatching procedures were incorporated.

In-transit security personnel from the LAOOC and from the Los Angeles Sheriff's Department were also located in the transportation towers. Each athlete bus had a radio-equipped, unarmed, private security guard aboard. In addition, Sheriff's vehicles escorted certain buses carrying teams deemed to have high-risk profiles. Decisions were made in the towers as to which buses were to be escorted. Patrol units were assigned to buses, usually only a few minutes prior to departure, and began the mission when the bus exited the village gate. The mission continued until the athletes were safely returned to the village. Finally, each bus entering the village was carefully examined by private security, both inside and outside. This was done after the passengers were unloaded but prior to the bus proceeding to the loading area to pick up passengers for its next trip.

On 28 July athletes from UCSB and UCLA were moved en masse to the Coliseum area in caravans of 10-12 buses for Opening Ceremonies. A shuttle system to the Coliseum was operated for the USC athletes.

By 29 July, the opening day of competition, the system had settled down and the athletes were using it comfortably. For the next 16 days the service was relatively uneventful. Demand buses were used often. There were some unexpected demands, primarily to accommodate athletes who had missed their scheduled bus and were in danger of missing the competition. The decision was made to use buses rather than sedans for this service in order not to eliminate an incentive for athletes to miss their buses and then be driven to their destinations in greater comfort. There were no athletes who missed a competition because of transportation.

During the week of 7 August, Transportation began moving passengers to LAX for departure. The bulk of the departures took place on 13 August, the day after Closing Ceremonies. On 15 August, buses transported the last passengers to LAX. In total, the athlete transportation system made approximately 46,860 trips.

5

35.02.7

Passenger information

Because the athlete transportation system was primarily based on schedules rather than on demand, it was essential that athletes, coaches and other team officials have the correct schedule information. The primary source of this information was the athlete transportation timetables. Printed in English and French, these timetables contained a listing by sport and by date of each individual departure and arrival time for scheduled bus service between 14 July and 13 August. In addition to the published schedules, each timetable contained the following:

- A village map highlighting the athlete bus terminal, loading areas and information kiosk
- A competition and training sites map showing all bus destinations identified by bus line number and indexed by sport
- A representation of the bus loading area describing the loading spot assignments for each destination

Generally, buses to a given destination always left from the same loading spot. A timetable was distributed to each athlete, coach, trainer and chef de mission upon arrival at the village. Clarification on the use of the timetable was available 24 hours a day by telephone or in person at the athlete transportation plaza kiosk. One kiosk at each village was staffed by trained personnel, each of whom had language proficiency in three or more languages. Information could also be received from the customer service supervisor at the NOC services center. Late changes were detailed in the village newspaper which contained complete day-to-day, event-by-event schedules. Sports information personnel and commissioners also notified the chefs and team managers of changes. Passengers were aided at the transportation plaza by 20-foot by 30-foot billboards depicting loading spot locations. Indexed by sport, destination, and bus line numbers, athletes located the loading area by referring to the board.

35.02.8

Summary

Overall, the athlete transportation service for the 1984 Olympic Games was a tremendous success. From the outset, the objective was to design an efficient transportation system that met the needs of the athletes while also being cost effective. As a result of two years of extensive planning, buses ran on time and not one athlete missed his competition due to bus breakdowns or delays. Los Angeles was also blessed with mild weather, and traffic was abnormally light which complemented the entire operation. Overall, the athlete system encompassed 132,399 driver hours (more than 15 man-years), 102,587 additional staff hours (another 11.7 man-years) and covered 1,032,317 miles (1,651,707 km).

35.03

Fleet operations

The fleet division of the Transportation Department was responsible for the allocation, inventory and maintenance of nearly 2,500 vehicles used during the Games. The division not only managed cars, station wagons and vans, but also all-terrain vehicles, cargo and passenger carts, motorhomes and motorcycles. The division was also responsible for the motorpool at the villages which provided vehicles and drivers to the respective delegations.

35.03.1

inventory control operations

Inventory control was responsible for identifying the LAOOC's overall vehicle requirements, securing arrangements to meet the requirements and issuing and collecting vehicles to and from the appropriate users.

In the months preceding the Games, transportation staff worked closely with the fifty-six LAOOC departments to determine their vehicle requirements and to categorize these requirements into one of three levels of need:

- Mandatory; essential for performance of assigned responsibilities
- Assures success; not essential, but would help assure the success of assigned responsibilities
- Perquisite; purely an employee benefit

A vehicle assignment report was compiled from this data which enabled the department to analyze the total vehicle requirements, by type of vehicle, week-by-week through the Games. The department then compared these requirements against the resources available from the LAOOC's sponsorship and supplier contracts. If shortfalls existed, plans were made for alternative arrangements.

The vehicles utilized by the LAOOC came from three sources-sponsors, suppliers and rental companies. The approximate number of vehicles from each of these sources was as follows:

- Buick Motor Division; 400 sedans and station wagons
- Budget Rent-A-Car; 995 sedans, station wagons and vans
- GMC Truck and Coach Division; 100 trucks and vans
- Miscellaneous truck rental companies; 185 trucks and vans
- Suzuki Motorcycles; 342 motorcycles and 110 all-terrain vehicles
- Murray Bicycles; 50 bicycles

A vehicle inventory control and reservation system was developed to track vehicles from initial delivery,

6

6 Golf carts in use at the UCLA Village

7 Athlete bus loading area.

7

Transportation

through assignments and transfers and to return. The control and inventory system monitored the following major functions:

- Receipt of vehicles from various vendors
- Transfer of vehicles to the motorpools
- Assignment of vehicles to individuals, departments or venues
- Return of vehicles to the respective source

Immediately preceding the Games, the total vehicle inventory jumped from approximately 500 to nearly 2,500. The large majority of vehicle assignments were temporary Games assignments. Each village, venue and motorpool vehicle was assigned from the Vehicle Distribution Center. The village transportation managers, the venue transportation managers and the motorpool managers were responsible for coordinating the transfer of vehicles from the Distribution Center to their respective village, venue or motorpool and for daily dispatch of the vehicles.

Each motorpool filed daily reports to the inventory control center at LAOOC headquarters, where computerized tracking of the motorpool vehicles was done. The inventory control center made vehicle transfers as required.

Every attempt was made to retrieve vehicles as venues began to close. Until 12 August, this was accomplished by appointment. The first week following the Games was devoted to the return of rental vehicles and Budget vehicles which were no longer required for operation. Emphasis was placed on rental vehicles, to minimize out-of-pocket expenses, and on Budget vehicles because the lease agreement in the sponsorship contract expired one week following the Games. Approximately 90 percent of the cars and 50 percent of the trucks were returned to their respective sources during this period. Nearly all vehicles were returned the following week. A lack of complete and accurate

information due to unrecorded vehicle transfers and the reluctance of staff members to return assigned vehicles, prolonged the process.

Below is a summary of the vehicle sources and demands by type of vehicle by month.

Categories

- I Mandatory
- II Assures success
- III Perquisite

Where demands exceeded available inventory, additional vehicles had to be obtained in the local rental market.

35.03.2

Airport fleet operations

The fleet operation at the Los Angeles International Airport was responsible for transporting persons with accreditation levels "A", "B", "C", "D", "Fx", "G" and "J" to their respective accommodations. Using approximately 60 volunteer drivers, and up to 48 vehicles, members of the Olympic Family were transported to 140 different hotels and other non-village housing located from Coto de

Caza in southern Orange County to Santa Barbara.

The operation employed a fleet of sedans, station wagons, and passenger vans and supplied additional services in four cargo vans and two 5-ton trucks.

The fleet system worked on almost a complete demand basis, as arrival information for individuals was not precise enough to determine in advance the number of vehicles going to the various destinations. Many of the vehicles were dispatched directly to curbside to transport those not being accredited at the Olympic Arrival Center (OAC) (badge categories "A", "B", "G"). Other vehicles transporting those non-village residents accredited at the OAC (badge categories "C", "D", "Fx", "J") were dispatched from a secondary dispatch operation outside the OAC.

The fleet operation also covered for the media transportation system between 2200 hours and 0800 hours from 14 July to 28 July. After 28 July, the fleet operation transported members of the media service from the airport to the Main Press Center on an as-available basis.

In addition to supporting the other motorpools at USC, UCLA and the Biltmore, the LAX fleet had the responsibility of coordinating and storing the guns required for the shooting and modern pentathlon competitions. These weapons were not allowed in the village so they had to be stored near the airport until the daily pickup from the venues occurred.

35.03.3 Motorpool operations

During the Games, five motorpools managed the fleet vehicles assigned to qualified members of the IOC, the International Federations and the National Olympic Committees and LAOOC personnel. Each motorpool included management and a group of drivers to operate the vehicles. The locations included the following:

- The Biltmore Hotel; managed the vehicles assigned to members of the IOC, NOC presidents and secretaries-general and IF presidents and secretaries-general.
- UCLA Village; managed the vehicles assigned to each of the NOCs in residence at the village.
- USC Village; managed the vehicles assigned to each of the NOCs in residence at the village.
- UCSB Village; issued pool vehicles as necessary to meet demand of NOCs in residence.
- LAOOC headquarters; assigned vehicles to staff members entitled to permanent cars, and issued pool vehicles as necessary to meet demand.

The facilities at each location varied due to the availability of space and physical restrictions at each site. Each facility consisted of a dispatch area and a driver's lounge. No facilities were available at any of the motorpool locations to permit fueling or washing of the vehicles. Light maintenance was done on site to the extent that facilities permitted.

The method of operations at each site was dictated by the physical configuration and the service level designed for the primary user group. This varied from the Biltmore operation, which provided a call-up service, to the meet and greet service at the villages and LAX to self-service at the LAOOC headquarters.

The hours of operation varied, depending on the needs at each site. At the Biltmore and the villages, the motorpools operated a dispatch function between 0700 and 2200 hours daily. The LAX motorpool operated in conjunction with the arrival and departure schedules of the Olympic Family, which was effectively a 24-hour per day operation.

Dispatch tickets were completed upon issuance of a vehicle to a delegation or individual. The dispatch ticket showed the vehicle in use, the driver assigned and the length of use. From the dis-

patch tickets, equipment and volunteer driver availability were determined. Any change in the information on the dispatch ticket necessitated the processing of a new ticket. When a job was finished, the dispatch ticket was closed, and the driver and vehicle were re-entered in the pool.

Each motorpool was staffed by a combination of paid and volunteer employees. The management and operational personnel were paid, while the drivers were volunteer. Staff size was based upon the expected demand for service and the number of vehicles assigned to each location.

In selecting volunteer drivers, the LAOOC looked for the ability to assimilate into a wide range of situations with people of diverse backgrounds, cultures, and customs. Volunteers with foreign language skills were a preferred choice. Driving histories were checked with the California Department of Motor Vehicles in order to screen out those with poor driving records. Drivers were uniformed and had access to lounge areas, lunches and beverages. All volunteers were required to provide a minimum of eighty hours of service.

Vehicle allocation by accreditation level

Code	Service provided
"A "	Each IOC member and director was provided a dedicated sedan and driver.
"B "	NOC presidents and secretaries-general were entitled to utilize the vehicles and drivers allocated to their respective NOC. Each IF president and secretary-general was provided a dedicated vehicle and driver.
"C "	The chefs, assistant chefs and attaches were provided transportation from the allocation assigned to their NOC.
"D "	IF technical officials and juries were provided transportation by venue management for their respective sports.
"E "	Provided solely by the media transportation system.
"F "	Athletes and team officials were provided transportation from their NOC's allocation or the athlete transportation system.
"G "	No transportation assigned by the LAOOC.
"J "	Provided transportation consistent with the services given to the "D" accredited individuals.
"K "	No transportation provided.
"L "	Vehicles assigned sparingly and by function or position only.
"O "	Bid cities were each assigned one vehicle with a driver. OCOG delegations were assigned one vehicle with a driver. All other "O" accredited personnel were not provided LAOOC vehicles or drivers.

301-400	6	3	0	3
401-500	7	3	0	4
501+	8	3	0	5

*One vehicle assigned and one additional based upon available resources.

along the routes of the athlete transportation system, the media transportation system and special services. In the event of a collision or mechanical failure of a bus with passengers, a cover bus would be dispatched to the site. Upon arrival of the cover bus, the route driver, security guard (for athlete buses) and the passengers would transfer to the cover bus and proceed to their destination. The driver of the cover bus would remain with the bus until the bus was repaired or towed from the location. The route driver would retain the cover bus until the route bus was returned to its home yard.

In theory, no bus was more than 12 minutes away from help while on its Olympic route. In practice, the response time was not as quick, but the system worked very effectively. Fleet maintenance headquarters were located at the South Gate yard, together with the communications center. The communications center was designed to facilitate the response of repair personnel to vehicles involved in traffic collisions or experiencing mechanical difficulties. There were four radio operators per shift, monitoring five radio frequencies and numerous telephones. Light maintenance was performed on passenger vehicles at each of the motor pools. These facilities were staffed 24 hours a day throughout the Games to perform minor repairs as necessary.

Minor automobile repairs were handled by LAOOC personnel on site. More extensive repairs required the vehicle to be transferred to an authorized automobile dealership for warranty service. The majority of vehicles supplied by Budget Rent-A-Car and all of the vehicles provided by Buick were under warranty. After a few days of operation, it was learned that the vast majority of problems were due to failures in either the electronic ignition or fuel system. Both of these mechanical problems required sophisticated

testing equipment which was not available to LAOOC maintenance personnel. Vehicles with these problems were towed for warranty service.

Vehicles such as all-terrain vehicles and motorcycles were handled by LAOOC motorcycle repair personnel. As repairs became necessary, a motorcycle repair person was dispatched to the venue or village. In the event that a repair could not be effected at the location, the vehicle was taken to an authorized repair center. For vehicles such as golf carts, all maintenance and repairs were done by the supplier of the vehicle.

The LAOOC made arrangements with towing companies prior to the Games. All responses were very prompt since LAOOC problems were given priority service by the towing companies.

The majority of buses leased by the LAOOC were Crown school buses. A parts agreement was made with Crown Coach Corporation to supply an initial inventory of Crown parts and the option to purchase additional parts on demand. Arrangements were also made with other parts dealers. Parts from the initial inventory and those purchased were charged against a bus and ultimately to the bus supplier.

Two systems were designed for fueling buses. The first was a wet hose system used by airlines to fuel aircraft. Vehicles using this system would park in their designated spot and be fueled by a dispensing truck that traveled down the rows of vehicles.

The second system was stationary tank fueling. The bus yards utilizing this system were equipped with above-ground fuel tanks. Each bus passed by the fuel tanks on its way to its assigned parking space.

9 The bus terminal for news media at the Main Press Center.

35.03.4 Olympic Family vehicle allocation

The number and type of vehicles allocated to each NOC were based upon the delegation size.

The remaining Olympic Family members were assigned vehicles and drivers, based upon accreditation levels and specialized transportation need.

35.03.5 Maintenance operations

Maintenance operations were responsible for fueling, cleaning and maintaining all fleet vehicles used by the LAOOC. To enable the rapid repair of mechanical problems, five bus repair facilities were established: the Veteran's Administration yard (servicing UCLA Village buses), the South Gate yard (servicing USC Village and special services buses), the Bell yard (servicing the MPC buses), the IBC yard (servicing the IBC buses) and the LAX yard (servicing LAX buses). The largest of the yards-Veteran's Administration and South Gate-accommodated 260 and approximately 400 buses respectively.

To reduce the possibility of significant delays in transporting members of the Olympic Family to their destinations, a system was designed for 26 strategically placed "cover" buses

For other vehicles, a fuel voucher system was established with the Atlantic Richfield Corporation (ARCO). The vouchers were issued to vehicle drivers by the motorpools and the venue transportation managers. Each voucher had a \$35 limit and was good for the purchase of fuel and oil only. Pick-up trucks equipped with 140-gallon fuel tanks, electronic pumps and dispensing nozzles fueled the motorcycles, all-terrain vehicles and other vehicles which could not leave the venues or villages. These trucks had daily scheduled routes and functioned well for their intended purpose.

35.04 Media transportation

Media transportation was responsible for providing free, convenient and dependable transportation to 8,700 accredited international journalists and broadcasters to hotels, villages, venues, the Main Press Center (MPC) and the International Broadcast Center (IBC). Any individual with a Games credential was entitled to ride the media transportation system as well, and many found the system convenient for their use.

The goal of the media transportation plan was to provide a transport system for the journalists which would meet their requirements and keep them from renting cars and requiring parking spaces. Such a plan would reduce traffic generated by media-related vehicles and alleviate the confusion of foreign media trying to negotiate the Los Angeles area freeway and street system.

35.04.1 Arrival/In-processing link

The first responsibility of the media transportation system was to transport all journalists and photographers from the airport to the Main Press Center for accreditation. This service was important because it gave journalists their first impression of Los Angeles and the Organizing Committee. A questionnaire was sent to NOCs in June 1984 requesting arrival times and flight numbers, if available. Journalists responded individually by letter or telex to the Organizing Committee. This information helped to determine exact arrival patterns and the appropriate number of buses needed to greet arriving journalists at LAX. The system, using a fleet of 14 school buses, maintained 30-minute departure intervals from 0800 to 2200 hours, from 14 July through 28 July. Between 2200 and 0800 hours, service was provided to members of the media by the fleet operation. Media arriving in Los Angeles after that period made

their own transportation arrangements to the MPC or used the LAOOC's LAX fleet if available. Journalists staying in downtown hotels were also transported to LAX from their respective hotels from 12-15 August simply by making a reservation at the transportation information desk at the MPC. A total of 905 media chose to use the free shuttle to LAX. Hotels used by media in the area surrounding LAX offered their own courtesy shuttle service.

35.04.2 Competition and training support

Transportation support for the media to competition sites, villages and training sites were based on a few rough parameters and then modified significantly for individual days of competition.

Most journalists arrived prior to the start of any session and left well after they had filed their reports at the venue sub-center. Some photographers preferred to arrive approximately two hours prior to the start of the session, while most print journalists required roughly two hours after a session to file their reports. Also taken into account was the need for some journalists to leave in the middle of an event and require transport to another.

The transportation service reflected the number of media expected at each venue, as determined by the number of seats in the press areas at the sites as well as the timing of the competition sessions. It made little sense to service venues that had long breaks between sessions or were closed. Conversely, busy venues needed frequent service over long periods of time.

The system schedule featured continuous, shuttle-type service to the larger venues and occasional service to the smaller ones. The composite at night shows the longest hours recorded during all days at a particular site; for example, transport from the MPC to the baseball venue at Dodger Stadium ran 1330-2200 hours on four days, 1030-1900 hours on three days and 0730-1600 hours on one day, but is shown as operating from 1030-2200 hours, the longest service period typically offered.

Travel times

Site	Schedule	Duration and earliest-latest
Archery: from MPC from El Dorado Park	8-11 August only Departures 3 times daily Departures 3 times daily	50-60 minutes 0700-1330 1345-1930

In addition to the basic venue service, a small venue-to-venue system was developed for the southern venues, operating on only those days when events took place at those venues.

The schedules were printed in a special handbook for media, and updated versions were available on the Electronic Messaging System (EMS). The system also included demand service. This element of the program provided coverage for passenger overloads. Overload service was pre-scheduled where the need for more than one bus was predicted. Otherwise, additional drivers and buses were available as needed. The passengers quickly learned more buses were furnished at peak passenger times than the timetable indicated, and therefore they could depend on the system getting them to their destinations on time.

The buses used were non-air-conditioned school buses, which proved satisfactory given the generally mild weather experienced during the period. Journalists expressed the opinion that air-conditioned buses were needed for rides of more than one hour. The school buses usually carried 52 adults, but the expected capacity was lowered to 40 in view of the bulky equipment carried by many members of the media.

A total of 250 school buses carried journalists, with 191 assigned to the MPC for primary and back-up duties, 45 to the IBC and 14 to the LAX area and later to the venue-to-venue service in the southern venue area. In all, an estimated 196,580 passenger trips-110,000 between the MPC and the venue sites-were made, with capacity reached only near the end of the Games. The bus system proved so efficient and reliable that many journalists who had rented cars and paid for parking preferred to take the buses, and left their cars at their hotels or at the MPC. At the end of the Games,

almost 7,000 persons (about 80 percent of the media members accredited) were using the buses regularly.

Journalists also had riding privileges at no cost on the regularly-scheduled buses of the Southern California Rapid Transit District (SCRTD). These privileges did not extend to the SCRTD's specially-arranged Olympic bus routes that carried spectators from remote lots to the event sites.

35.04.3 Broadcaster transport and parking

Broadcasters for the Games worried that the transportation system provided by the LAOOC would not meet their needs and that the area would be hopelessly congested with traffic. Several broadcast groups made preliminary reservations of large numbers of rental cars as an insurance measure against an LAOOC transportation breakdown.

The host broadcaster indicated that it would have its own system of transportation, so the LAOOC focused solely on the needs of the foreign broadcasters. The LAOOC was committed to providing an effective system of transport at no cost to the broadcasters for necessary service, including hotel to IBC transport, IBC to Main Press Center, IBC to venues and Main Press Center to venues. Rather than providing a link between the IBC and the venues, the LAOOC decided to establish its major depot at the MPC and to increase the shuttle frequency between the IBC and MPC. Broadcasters felt this service would cost

valuable time in transit to the more important venues: athletics/boxing at Exposition Park, gymnastics/tennis at the UCLA Village and swimming/diving at the USC Village.

A compromise was reached, offering a steady shuttle from the IBC to the MPC, service from the hotels to both the IBC and MPC and special service from the IBC directly to the major aforementioned venues.

Service was provided on non-air-conditioned school buses from 14 July to 15 August to the IBC and from 26 July to 13 August to the MPC. The broadcaster transport requirements to the MPC between 14-25 July were handled by the MPC-IBC connector. Bus capacity was set at 40 adults as many of the broadcasters carried bulky briefcases and equipment.

The following is a summary of the broadcaster bus service:

Hotels to IBC / downtown area

Duration: 12-27 minutes

Date: 14-15 August, 14-26 July

Frequency: Hourly service, 0600-2400
Additional half hour,
0630-0830, 1730-2130

Date: 27 July-1 3 August
0000-2400 (except 1100, 1300,
1500)

Frequency: Hourly service,
additional half hour service,
0530-0830, 1730-2130

Hotels to IBC / Hollywood area

Duration: 12-30 minutes

Date: 14-26 July, 14-15 August

Frequency: Hourly service,
0600-2400 (except 1100, 1300,
1500)
additional half hour service,
0630-0830, 1730-2030

Date: 27 July-1 3 August

Frequency: Hourly service,
0000-2400 (except 1100, 1300,
1500)
additional half hour service,
0530-0830, 1730-2130

Hotels to MPG / down town area

Duration: 10-14 minutes

Date: 26-28 July and 13 August

Frequency: Hourly service
0600-2400

Date: 29 July-11 August

Frequency: Hourly service,
0000-2400 (except 1100, 1300,
1500)
additional half hour service,
0530-0830

Hotels to MPC / Hollywood area

Duration: 25-35 minutes

Date: 12 August

Frequency: Hourly service,
0600-2400
additional half hour service,
1330-1630, 2230-2330

IBC to MPC connector

Duration: 25 minutes, return trips ran on parallel schedule half hour later

Date: 14-26 July and 14 August

Frequency: Hourly service
0630-2300

Date: 27 July-1 3 August

Frequency: Hourly service
0030-2330 additional half-hour
service, 0600-0900, 1800-2400

IBC to USC area

Duration: 45 minutes

Date: 14-27 July, 13-1 4 August

Frequency: Every two hours
0800-2000

IBC to Expo Park area

Duration: 45 minutes

Date: 28 July-1 2 August

Frequency: Hourly service
0600-2200, last bus at 2230
(except 5 August and 11 August
beginning at 0500).
Half hour service for Opening and
Closing Ceremonies

IBC to UCLA

Duration: 35-40 minutes

Date: 14-28 July, 13-14 August

Frequency: Every two hours
0800-1900, last bus

Date: 29 July to 12 August

Frequency: Hourly service
0600-2200, last bus at 2230

In order to meet the needs of the broadcaster ENG (electronic news-gathering) crews who moved from site-to-site to film segments in formal interview and mixed zone areas, a priority parking system was established. The number of stationary parking passes granted for broadcaster use at each site were:

Site/Sport(s)	Number
Archery	8
Athletics/Boxing	132
Baseball	4
Basketball	30
Canoeing/Rowing	38
Cycling	41
Equestrian	28
Fencing/Volleyball/Yachting	50
Football	33
Gymnastics/Tennis/UCLA Village	73
Handball	19
Hockey	17
Judo	18
Modern Pentathlon	10
Shooting	5
Swimming/Diving/USC Village	67
Water Polo	14
Weightlifting	28
Wrestling	27

Overall, the media transport system was well received by broadcasters. The dependability of the service, especially with regard to arrival times made it almost ideal for commentators

and others who were not burdened by heavy equipment. Toward the end of the Games, broadcasters who had been riding in personal cars began using the bus system, as it was easier than driving to the venues and parking. Rental of cars by broadcasters were few. Two broadcast groups rented a total of three cars.

35.04.4 Vehicle rental

The LAOOC worked with its official rental car agency, Budget Rent-a-Car, to make automobile rentals available at reasonable rates for the media. Even though the LAOOC preferred to have media ride the bus system, it was clear that some media would require private vehicles. Twenty-nine cars were rented by 12 agencies. All cars were picked up at Budget's Los Angeles International Airport lot and were returned there. The breakdown of rented vehicles is as follows:

- Three agencies rented four compact cars
- Ten agencies rented 19 full-size cars
- One agency rented three station wagons
- One agency rented three vans

Budget Rent-a-Car staffed a booth at the MPC from 14 July to 15 August. Cars were available for rent, at preferential rates, to media possessing a valid driver's license in their country of origin, a passport and either a cash deposit or valid credit card. While the LAOOC did not provide any journalist or press agency with vehicles on a complimentary basis, a taxi stand was set up at the MPC for journalists' needs.

35.04.5 Parking for the media

Even though most media indicated they would not rent vehicles in Los Angeles, it was recognized early that there would be a shortfall of available parking space at the villages and venues. Due to the fact that the LAOOC had to pay for the parking it used at many of the venues, it was decided to charge media for parking. This was done through the agency facilities and journalist accreditation questionnaires. In the interest of administration, only all-sessions parking was available for the various sports offered, although a sport day-pass had been considered. Because of the anticipated administrative burden, making passes for almost every sport available on a daily basis was rejected. Only at the Main Press Center was this plan used, where journalists could buy a pass for a single day or buy a pass for the 32 days that the Main Press Center was open.

Parking was offered at all sites except for the Exposition Park area (athletics and boxing), UCLA Village area (gymnastics/tennis/UCLA Village) and the USC Village area (swimming/USC Village). In all three locations, the number of spaces available indicated clearly that no spaces would be available for journalists, and thus, none were offered. Many press agencies indicated that their real need was for pick-up and drop-off only. This requirement for access was met with the "Access Pass" which allowed cardholders into or near the LAOOC's bus turnaround at the venues.

Not surprisingly, parking demand was greater than supply, and priorities were set for distribution in June 1984:

- First priority went to photographic media which included most of the foreign requests.
- Second priority went to specialized media whose accreditation did not allow them access to the MPC or to ride the media transport system.
- Third priority went to general media from foreign nations.
- Fourth priority went to United States media.
- Fifth priority went to non-exclusive television news film crews, whose accreditation allowed them only into the interview areas of the athletics, gymnastics, swimming and hockey venues.

Parking passes were arranged at no charge for photographic organizations which had signed photographic service agreements with the LAOOC, including the International and National Olympic photo pools and the LAOOC's documentary and other service groups.

Parking passes for journalists were originally distributed from an incomplete set of requests. During the pre-Games period, many journalists complained that they had paid for parking but had been denied parking passes even though passes were plentiful. The complaints were resolved on a one-to-one basis prior to the start of the Games.

Those who purchased passes were issued cards after accreditation at the distribution desk in the Main Press Center. No maps were issued but most of the users had little difficulty finding the proper parking locations once at the venue site.

At the Main Press Center, 1,724 day parking passes were sold at \$10 each, and 525 season passes were sold at \$300 each for the 32-day period from 14 July–15 August.

35.05 Venue management

The venue management division of the Transportation Department was responsible, in conjunction with local public transportation and law enforcement agencies, for the development, public dissemination and implementation of traffic management

Media parking allocations (by sport)

Site/Sport	Cost	Allocation	Requested	Granted
Access Passes	\$250	199	331	199

50 shuttle bus spaces from remote lots

Transportation

plans for the Olympic villages and competition sites. Venue transportation management also had the responsibility of managing the venue specific fleets, including sedans, wagons, vans, motorcycles, carts, etc. This responsibility encompassed the transportation of the respective technical officials between their hotels and competition sites.

Each site was managed by a venue transportation manager (VTM), who had dual reporting responsibility. The VTM reported on a transportation basis to a senior transportation manager (STM), and on a venue basis to the Venue Director.

35.05.1

Village and venue operations

The venue management division was responsible for developing

transportation plans for each village and venue. In the fall of 1982, a concerted effort was undertaken to design the transportation flows at the Olympic villages. A decision was made early that only athlete transportation buses would be allowed into the villages (along with necessary delivery vehicles). No Olympic Family vehicles were to be allowed, in order to minimize pedestrian/vehicular traffic and to maintain a high level of security. After much debate, it was decided to erect towers high above the loading area in each village. The towers enabled LAOOC transportation, LAOOC security, and Los Angeles County Sheriff management staffs to maintain visual observation of the bus flows in and out of the loading areas.

At the venues, transportation planning teams designed the parking layouts, giving preferential treatment to the Olympic Family and the media.

Preferential parking was also provided for staff, except at certain locations where staff shuttles proved necessary.

Public parking was controlled by the LAOOC at seven of the 18 different sites where competition was held. The public parking design was prepared by staff from System Parking, Inc., the official supplier to the LAOOC for parking planning and management services. For Olympic Family and media parking, conservative estimates were used in order to allow for unanticipated demand. This proved to be insightful, as the parking areas at many key sites were stretched to capacity on the last two or three days of competition.

Detailed operations plans were developed for each functional area at each site. These detailed plans, developed in most cases by the venue transportation manager, described the number of staff required to handle each

parking lot or each transportation function, the placement of those people required and how the transportation function would operate.

35.05.2 Parking pass design and distribution

In order to adequately control the parking lots, the LAOOC developed a system of color and letter designated parking passes. Every attempt was made to keep the system as simple as possible so that parking attendants could implement the controls without tying up traffic.

Olympic Family members had purple parking passes with an "X" designation. The "X" pass allowed vehicles to park in any Olympic Family parking lot at any of the villages, venues or training sites and at the Biltmore garage.

The aqua colored "Z" parking pass was a "super" pass that allowed access to any lot controlled by the LAOOC. Approximately 50 of these passes were issued to top LAOOC managers.

Staff parking passes were yellow with either a pictogram of the appropriate sport or a letter designation such as "MPC" for the Main Press Center. Staff parking permits were not valid in the Olympic Family lots and, in the cases of Expo Park/USC, UCLA and Long Beach, were valid only at the remote parking areas.

Venue specific parking passes for guests, patron ticketholders, press and others were magenta with the sport pictogram or letter designation of that site. The venue specific parking pass either had no date designated, in which case it was good for the entire period of the Games, or was date specific.

Parking pass distribution for on-site staff was the responsibility of the venue director, who in most cases delegated it to the venue transportation manager. In some cases fewer passes were given than staff employed and the venue director or the venue transportation manager decided which staff could park and which staff had to form carpools, ride the bus or make other arrangements.

The distribution of multi-site parking passes was retained by transportation management. Rather than make an exhaustive study or analysis to determine parking needs, the department took requests and analyzed each case on its own merits. This seemed to work well, and did not overflow the staff parking lots.

The parking pass was designed to be highly visible to the parking attendant. The parking passes were approximately four inches wide by eight inches high. The letter or number designation was bold in black and provided a high degree of visibility. The pass was either affixed to the lower left corner of the windshield or the rear view mirror. In retrospect, the LAOOC should have designed greater distinction between the shades of parking pass colors.

35.05.3

Venue specific vehicles

In order to meet the transportation requirements of International Sports Federation officials, a number of vehicles were assigned to each venue under the management of the venue transportation manager (VTM). The vehicles were housed on-site overnight and generally were parked in a secured area, usually in the athlete bus compound during off-peak hours. Volunteer drivers were recruited and were retained under the management of the VTM at each site.

The VTM then scheduled the vehicles and the drivers to ensure that the sports officials were transported from nearby hotels to the venue. However, the commissioner had the flexibility to designate other uses for the vehicles. The number and type of vehicles

10

assigned depended on the requests made by the commissioner or site manager. Vehicles were requested from the Transportation Department and sedans, station wagons, vans, trucks, motorcycles and all-terrain vehicles were assigned on an as-available basis. In general, almost all requests for vehicles by departments and venues were met.

35.06

Special services

It became evident in the early planning stages of the Transportation Department that there would be many requirements for transport that would not fall under the athlete transportation, media transportation or fleet systems. This "all other" category became the special services section of the Department.

The three major categories of service offered by special services were:

- Employee and spectator shuttles from remote parking sites
- Cover buses
- Staff and Olympic Family movement

35.06.1

Employee and spectator shuttles

At three village and/or venue complexes, namely Exposition Park/USC, UCLA and Long Beach, there was insufficient on-site parking for staff, thus making remote parking by shuttle necessary.

For the Exposition Park/USC operation (including staff from the USC Village, swimming, athletics and boxing), the LAOOC leased a vacant 63 acre parcel of ground. The LAOOC graded this area, added gravel and compacted the site to make it suitable for parking operations. There was capacity for approximately 5,500 automobiles, but it never exceeded 90 percent of capacity. Approximately 40 special

service transit buses were used for this operation, which ran 24-hours per day.

At UCLA, to accommodate staff from the UCLA Village, tennis and gymnastics, LAOOC leased nearby real estate from the U.S. Veterans Administration. The space leased accommodated 2,000 parked automobiles. The operation of the shuttle was contracted to the Santa Monica Municipal Bus Lines which performed extremely well. Approximately 15 buses were required at peak time.

In Long Beach, to accommodate volleyball, fencing, and yachting staff, parking for approximately 1,200 cars at one lot and 400 at another lot was leased from the City of Long Beach, which was also responsible for the transit operation.

In general, it was far superior to have a turn-key shuttle operation than to lease buses, hire the drivers and maintain the vehicles. The two turn-key operations took far less management time and attention, though admittedly they were much smaller in scope.

35.06.2

Cover buses

Special services operated a fleet of 30 buses which provided 24-hour coverage of 26 points along roads and highways scattered throughout greater Los Angeles. If a media, athlete or other special services bus broke down on the road or at a remote venue, the driver would radio the dispatcher.

10 Athlete buses line up at a venue.

11

11 Even buses are decorated in Festive Federal graphics during the Games.

The dispatcher, in turn, would call or radio cover dispatch, which would promptly dispatch a cover bus and driver from the nearest cover bus location so that passengers could be on their way within minutes. With these 26 cover locations, a cover bus was never more than 12 minutes drive time from any location served by Olympic buses. This system worked very well.

35.06.3 Staff and Olympic Family moves

Special services operated a fleet of 80 buses that could be ordered by LAOOC departments and venues for a myriad of purposes. Buses needed over and above that amount were chartered on a daily basis from private bus companies. Each LAOOC department was "billed" through internal journal entries for its bus use.

Trips involving athletes were a major exception to the general special services philosophy of transporting Olympic Family members where they wanted to go. For several reasons, the LAOOC was not comfortable bearing the responsibility for groups of athletes who were moving outside secure, Olympic areas. Therefore, the department helped athlete groups charter their own buses and make their own payment arrangements.

Typical requests filled by special services included the following:

- Transporting Technical Officials from hotels to venues, and to both official (e.g., Ceremonies) and non-official (e.g., dinner at the Commissioner's house) functions
- Training/orientation trips for all sizes and types of groups visiting venues and villages
- VIP movement of officials from the headquarters hotel (the Biltmore) to official Olympic functions, such as the opening of the 88th Session or the pre-Opening Gala
- Daily movement of venue bands and medal presentation teams to venues from various gathering points
- Transport of Olympic Arts Festival performers
- Transport of Opening and Closing Ceremonies performers (up to 9,000 people) from gathering points to rehearsals and performances

The idea of centralizing all official bus moves through one office had its advantages, but other departments tended to make unreasonable demands and there was little incentive to hold down costs. In retrospect, it may have been better to prepare each department and venue in advance with the ability to call outside bus companies for their own needs, and to take the cost from their individual budgets.

Special services was able to provide good service, given all the venue and village requests, with the least amount of resources among the Transportation Department. Not enough time was allowed for this division to develop fully before having to go operational, and the division as a whole was staffed with personnel having little transportation background because the most experienced people had already been placed in the athlete and media systems.

35.07 Transport services for the public

The LAOOC was responsible for coordinating with local public transportation and law enforcement agencies in the development and implementation of traffic management plans for the Olympic villages and competition sites. Transportation planners were fortunate that the competition sites selected by the LAOOC were wide spread. In addition, the competition schedule was developed with a view toward minimizing conflicts between spectator traffic and background commuter traffic.

35.07.1 Cooperation and planning of traffic control

Interagency coordination was a major contributing factor in the success of transportation services during the Olympic Games. Meetings were conducted on a regular basis to identify potential areas of congestion that could result in service delays for buses and autos on freeways, surface streets and around venue sites. The following agencies formed an Advisory Group on Olympic Transportation in November 1982 and were involved in the coordination efforts for the Games:

- California Highway Patrol
- California Department of Transportation
- Commuter Computer
- Los Angeles City Department of Transportation
- Los Angeles County Road Department
- Los Angeles Police Department
- Los Angeles Olympic Organizing Committee
- Los Angeles County Sheriff's Department
- Southern California Rapid Transit District (SCRTD)

Each agency was responsible for developing a transportation plan to alleviate traffic congestion during the sixteen-day period of the Games. The major concerns addressed in the overall transportation plan were traffic controls and preferential treatment for Rapid Transit District buses. The group was able to incorporate viable options into the final spectator transportation plan due to the coordination efforts between all of the agencies.

The LAOOC supplied information regarding venue parking capacities and event timing to the Olympic Advisory Group for development of goals for public transit's share of the spectator transportation effort. This share was referred to as the "mode split." The venues at Exposition Park, UCLA, and Long Beach were assigned the highest targets (40% to 55%) since it was known that there would be a parking shortfall and little additional vehicle capacity would be available on the roadways in each area. Target mode splits ranged from five percent to 25 percent at other venues. The mode split targets and spectator capacities at each of the Olympic venues are listed on page 831. Also included is the parking capacity for general public spectators at each venue.

The venues at El Dorado Park (1,600), Lake Casitas (3,400), Coto de Caza (3,500) and swim site (1,800) and Prado Recreation Area (1,800) were not serviced by special RTD bus lines and the spectator parking capacity for each is noted in parentheses above.

After the overall mode split targets were determined, further refinements within the overall targets were used to develop patronage estimates and vehicle requirements for the three types of service: shuttle, express, and park/ride.

- Shuttle Services; seven shuttle routes served venues at Exposition Park, UCLA, Loyola Marymount, Dodger Stadium and the Rose Bowl. The service offered nearby parking and surface street transportation for buses with standing loads.
- Express Services; six express lines consisting of freeway bus transportation connecting two major centers were operated from one downtown Los Angeles bus terminal. These lines were designed to transport passengers to the following Olympic sites: UCLA, Forum, Long Beach Arena, Anaheim Convention Center, Santa Anita, and the Rose Bowl.
- Park/Ride Services; park and ride services consisting of long distance transportation with seated loads and fewer trips than shuttle service per bus, were offered from six parking facilities located in each geographic sector in Los Angeles County. Of the eleven routes operated, six served the major venues at Exposition Park, two lines operated to UCLA, two lines served Long Beach and one served Anaheim.

It was estimated that 50 percent of the Olympic ridership would be carried by shuttle, 40 percent by park and ride and express and 10 percent on the regular

system. The assumed distribution of service and estimated patronage was then used to predict manpower and vehicle needs. Traffic control planning quickly centered around the Coliseum/Exposition Park area.

In order to facilitate the movement of the RTD and charter buses to that area, a traffic management plan was developed for the surrounding five miles. It was readily seen that RTD buses would be unable to travel from the parking locations for shuttles and park-and-rides to the Coliseum area and return for further trips unless some priority were given to buses at freeway exits and on surface streets. Therefore, Caltrans designated the freeway off ramps nearest the Coliseum as "bus only" during the time of the Games. Bus priority streets were established in the surrounding area so that buses had dedicated exclusive lanes in both directions entering the area. Parking restrictions were placed into effect and local traffic was diverted at major intersections. To finalize the priority treatment of buses, the LAOOC constructed two bus terminals immediately adjacent to the Coliseum.

The traffic management plan for Exposition Park was tested in its entirety on 2 June 1984, when the freeway off-ramps were closed to all traffic except buses, the streets were converted to bus priority operation and the transit terminals were tested for the first time in conjunction with the California State High School Track & Field Championships. The test demonstrated that all elements of the plan worked and that the plan as a whole provided an integrated and smooth traffic flow.

At UCLA, a smaller scale version of the Exposition traffic management plan was put into effect. A shuttle operation was established with frequent service to the UCLA Village, gymnastics and tennis. Dedicated bus lanes and loading space was provided for the loading and unloading of the buses. In addition, UCLA pre-sold parking to tennis and gymnastics ticketholders as the university retained control of many parking lots on campus.

The Olympic Advisory Group was confident that the Olympic traffic management plans would work with the cooperation of the local public. Every effort was made to inform the public about the importance of altering regular transportation habits. A series of seminars sponsored by the Los Angeles Chamber of Commerce, the Central City Association and other business groups were held where the heads of several of the key transportation departments presented the traffic management plan for Exposition Park, the area that potentially could have had serious congestion. Business leaders were

informed that they could assist the transportation effort for the Olympic Games by considering the following:

- Converting to four-day work weeks during the two weeks of the Games
- Encouraging people to use public transit
- Staggering the start time of employees who worked 10 hour days
- Encouraging vacations
- Minimizing non-essential business travel
- Supporting the conversion of Admission Day (a state holiday) from 10 September to 6 August for 1984 only
- Not using flex-time for those employees on eight hour days, since early departures would place their employees in the middle of the Olympic-related traffic

Commuter Computer produced a packet of information which was distributed throughout Southern California. It contained transportation options which would be more convenient for their employees and which would help traffic during the Olympic Games.

In order to direct Olympic spectators to their sites and to manage traffic most effectively, a series of Olympic traffic signs were designed and placed on the freeways and streets of Southern California. After considerable negotiation, LAOOC was successful in convincing Caltrans, LADOT and other independent cities within Southern California to utilize the Olympic colors of magenta and aqua with a unique format for the signs, rather than the agencies' standard colors and formats. LAOOC provided \$172,000 to Caltrans to produce and erect freeway exit signs directing spectators to the appropriate exits for the Olympic venues. LADOT, under the city's contract with LAOOC, fabricated and installed street signs utilizing either the single sport pictogram or the *Star in Motion* for multi-sport sites. LAOOC contracted for the production of street signs for the independent cities, including one original and three replacement signs for each sign location. The independent cities agreed to install and maintain the signs on the streets within their area. The freeway signs were the first element of the Look of the Olympic Games to become prominent in Southern California.

On 10 June 1984, the special Olympic section of "Home Magazine" in the "Los Angeles Times" featured

Olympic-related transportation hints, advising spectators to ride the bus to Olympic events and the general public to alter its normal transportation patterns.

Finally, immediately prior to the Games, LAOOC produced and mailed to all ticketholders a ticket buyers guide providing detailed directions to each Olympic venue. The guide again emphasized bus transportation when going to the Exposition Park and UCLA areas.

35.07.2 SCRTD Olympic programs

The Southern California Rapid Transit District, operating in the county of Los Angeles, provided service to all major Olympic venues during the Games. Service in the greater Los Angeles area was provided via a special network of 24 bus routes. The 11 park/ride, six express and seven shuttle routes which comprised the Olympic bus system operated as a separate system from the 253 regular line services.

During the 16-day Olympic period, ridership on the 24 special lines totaled 1.13 million boardings. Daily ridership was lowest on 1 August with 15,747 and highest on 11 August with 132,454 riders. The ridership carried on Sunday 11 August exceeded the average weekday boardings for bus transit systems in Cincinnati, Ohio, Orange County and Santa Clara, California, all of which have bus fleets of similar size.

The original projection of RTD was to carry 3,040,000 riders during the Olympic period. Although lower than projected, the actual ridership was very close to the estimated proportions by service type. Ridership was split between the three service types as shown below:

Ridership by service

Type of service	Actual share %	Projected share %	Boardings
Park/Ride	39	40	438,578
Express	11	10	127,311
Shuttle	50	50	564,528
Total			1,130,417

Several reasons have been given for the lower ridership:

- RTD developed the target mode splits based upon all venues being filled to capacity, plus five percent for support staff and non-ticketed spectators. Capacity crowds materialized only at Opening Ceremonies and during event finals despite the record number of tickets sold.
- The April 1984 estimates of 40 percent day passes for Coliseum events were exceeded due to the last minute ticket availability on the local market. The September 1983 and February 1984 RTD estimates assumed a complete turnover of spectators between morning and afternoon sessions.

- The projection by Caltrans of an overall increase in base traffic (between between five and seven percent) did not materialize. Actual traffic was down between two and three percent until the last days of the Games. The lighter than anticipated traffic congestion around many venues enabled parking to be available at rates much lower than anticipated. It permitted a family of four to travel by car and park at a cost less than traveling by special Olympic service.

The original estimates called for RTD to use a maximum of 481 scheduled buses. Actual deployment varied on a daily basis, however, and the maximum number actually scheduled on any given date was 472. The extent of the variances ranged between four and 46 percent.

RTD used a reservation system on park/ride lines which enabled them to prepare schedules in advance, disperse and allocate demand into 20-minute periods throughout the day. Approximately 190,000 reservations were sold for use during the 16-day period. Actual park/ride patronage levels, however, were about 20 percent higher than reservations. The influx of passengers was handled without changes to the operating plan. Express and shuttle demand was more difficult to anticipate, and RTD decided to operate the service primarily on a "subject-to-order basis." The complexities of the Olympic events schedule and the uncertainties surrounding the actual patronage levels to and from events dictated that RTD operate a bus system that would allow maximum flexibility in responding to demand.

The Olympic service schedule design parameters called for a minimum spread of service of two hours prior to the beginning or end of each event, plus the required travel time from the terminal to the venue. Buses were scheduled around these design parameters, usually in groups of five, and operated on a subject-to-order basis out of each division. This operational technique allowed RTD to modify service levels between Olympic routes and rapidly respond to sudden changes in patronage levels.

The following charts illustrate RTD ridership by type and destination:

Transportation

Daily boardings by service type

Date	Park/Ride	Express	Shuttles	Totals
28 July	29,964	2,286	27,691	59,941
29 July	11,063	7,792	17,964	36,819
30 July	10,555	6,135	13,282	29,972
31 July	9,262	6,381	15,843	31,486
1 August	3,617	5,264	6,866	15,747
2 August	9,530	5,102	11,576	26,208
3 August	37,364	10,884	46,595	94,843
4 August	38,394	9,373	6 1,088	108,855
5 August	39,107	10,513	53,376	102,996
6 August	42,242	9,839	49,129	101,210
7 August	1 1,939	5,477	13,218	30,634

Anaheim	51,373	4.5
Totals	1,130,417	100.0

35.07.3

Traffic in Los Angeles during the Games

Traffic on Los Angeles freeways was surprisingly light during the Olympic period. Traffic experts point to a number of small factors rather than one primary influence as the cause of less congestion. Each small factor combined to chip away at the relatively small excess of traffic that it takes to push a freeway system beyond capacity and into congestion.

The results during the period indicate a certain amount of flexibility in the freeway system that was previously unrecognized. Traffic planners relied on regular transportation system management techniques, but applied them more effectively than ever before, to combat one of the most potentially serious problems facing the Games. The various transit agencies coordinated their efforts closely for the first time and demonstrated that the region is not one car length away from hopeless congestion.

The extraordinarily light freeway traffic was caused not by a reduction in traffic

volume due to many people staying home watching television, forming carpools or riding Olympic shuttles, but by a shift in the apex and duration of the commuter traffic peaks. In fact, the 24-hour traffic volumes went from two percent to three percent below normal just before the Games to five percent above on the Friday before Closing Ceremonies.

The "flattening" of the rush-hour peaks was made possible by a combination of factors. Chief among those factors was a change in the work week schedules at many of the businesses in Los Angeles. Some companies started work earlier or later than usual or in a few cases shifted to a work week of four 10-hour days. These changes helped stretch the "rush hours" over longer periods and cut the number of cars on the roads at any one time. The result, combined with prudent scheduling of Olympic events, enabled the freeways to carry up to five percent more cars than usual, while at the same time slashing the volume of traffic traveling less than 35 miles per hour by 86 percent.

Another major contributing factor was a 14 percent reduction in truck traffic during the peak commuting periods. During the Games, trucking companies, with the consent of their customers, were able to make deliveries at night or early in the morning hours. This kept approximately 5,000 trucks or the equivalent of 25,000 private vehicles off the freeways during rush hours.

The following summarizes the alterations that took place in Los Angeles during the time of the Games which contributed to the free flow of traffic:

- Staggered hours; employers altered working hours by starting to work earlier or later in the day. Some businesses operated a four-day work week.
- Business traffic changes; truck shipments were shifted to off-hours and employers cut back on business-related trips such as sales calls and meetings. Companies rerouted business vehicles to avoid heavily congested areas.
- Special RTD bus service; 18 percent of Olympic spectators went to events by bus—far less than expected but a significant factor, nevertheless. Shuttles carrying people to the Coliseum area eased the congestion in the busiest area.
- Commuter traffic thinned by Games attendance; 65 percent of the Olympic tickets were sold to Southern Californians which helped smooth out rush hours. A large number of spectators were taken out of the early commuter flow and put into the later Games-bound traffic.
- More one-way streets; two major streets near the Coliseum area were made one-way which effectively added an additional freeway from the downtown area to the Coliseum. Left turn lanes were eliminated which made for less delay and fewer accidents.
- Expanded Police and Highway Patrol coverage; an additional 700 Highway Patrol officers were brought down from Northern California to supplement the 900 already here. More patrol cars, helicopters, and four trucks were brought in to speed the removal of stalled cars and clear up accidents.
- Ramp metering and ramp closures; 198 ramps on seven freeways were metered throughout the day rather than just during peak commute periods to minimize congestion from merging traffic. The Coliseum area was equipped with special freeway off-ramps and bus-only lanes which prevented buses from interfering with out-bound traffic.
- Reduced maintenance and changed signals; new construction and freeway maintenance was suspended during the Games to keep all lanes open. Some lanes were added to two freeways to reduce congestion when motorists slow near construction areas. Human spotters and electronic sensors near the Coliseum area enabled use of 120 remote controlled traffic signals to control the flow of traffic. Rather than restrict the flow, these signals allowed engineers to order a string of green lights to drain congested streets.

- Rerouted commuter traffic; commuting routes by motorists were changed to avoid the freeways during the Games.

- Factory closures; a small number of factories actually shut down operations during all or part of the entire 16-day Olympic period.

Transportation services for the public during the Olympic period were a complete success mainly because of the planning and cooperation among law enforcement and traffic management agencies. This sound working relationship enabled Olympic spectators to transport themselves or be transported safely, quickly and without undue delay to all events throughout Southern California.

35.08

Transportation management

35.08.1

Recruitment and training of staff

The human resources section of the Transportation Department was responsible for the recruitment, training, placement, orientation and training of almost 7,000 Games staff.

In late January 1984 a series of meetings was held to develop a staffing plan for each of the five operating divisions. These plans included both job categories and the estimated number of employees for each job category.

Even prior to these meetings, the department realized that many transportation job categories would require specialized expertise, including bus drivers, mechanics and dispatchers. For this reason, and because the central LAOOC recruiting process was somewhat overwhelmed, the department had already been investigating the use of a temporary employment agency to assist in the staffing efforts.

Discussions had been held with several companies, and by January 1984 it had become apparent that Thomas Temporaries of Irvine, California would be selected.

The role of Thomas Temporaries was limited to the recruitment of skilled transportation Games staff. Two other large groups, volunteer car/van drivers and unskilled transportation workers, were handled separately.

Recruitment

The recruitment efforts were divided into skilled transportation personnel, volunteer car/van drivers and unskilled transportation personnel. In each case, the four LAOOC Games staffing centers were the center of activity during Transportation Department recruitment.

Skilled transportation personnel

Thomas Temporaries interviewers were assigned to each center, and candidates were directed to the centers by Thomas Temporaries recruiters. In addition to placing interviewers at each staffing center, Thomas Temporaries traveled to school districts throughout the state in order to recruit skilled transportation personnel. School districts were identified early on as an obvious source of qualified personnel, since they run large bus systems during the school year and many employees are available during the summer.

In anticipation of attrition both prior to and during the Games, Thomas Temporaries had been asked to recruit at least 25 percent over the projected requirement for each position, except bus drivers where the target was 33 percent above projections.

Early estimates of employees needed were regularly refined, so that the target changed over time. In virtually every case, the early estimates were lowered as needs were better defined over time.

Thomas Temporaries was responsible for reporting weekly on its recruitment and screening process. The following reflects the number of employees to be recruited by Thomas Temporaries and includes the additional overage for attrition:

Thomas Temporaries Projected number of employees

Job title	Number needed
Mechanic	159
Parts Clerk	36
Shop Supervisor	36
Truck Mechanic	7
Auto Mechanic	40
Fluid Checker	40
Fueler	51
Mechanic's Helper	65
Motorcycle Mechanic	11
Field Coordinator	69
Personnel Supervisor	105
Safety Coordinator	39
Baggage Handler	36
Cleaner/Helper	61
Traffic Attendant	211
Assistant Dispatcher	152
Staff Check-In	11
Staging Coordinator	12
Village Gatekeeper	12
Yard Gatekeeper	44
Communications Coord.	70
Scheduler	27
Truck Driver	0
Bus Driver	2,653
Other Bus Driver	147
Bookkeeper	21

Clerical	32
Data Entry Clerk	78
Office Administrator	12
Secretary	98
Asst. Yard Dispatcher	194
Customer Service Rep.	104
Information Agent	63
Pedestrian Control	20
Loader/Dispatcher	732
Loading Coordinator	122
Total	5,570

On 9 July, Thomas Temporaries began tracking attrition. By the end of the Games, only 120 employees had not fulfilled their commitment due to either resignations or terminations. However, the Transportation Department created a total of 185 new positions during this period. From 9 July to 12 August, a total of 305 individuals were placed from the pool created to handle attrition.

Volunteer car/van drivers

Recruitment of volunteer car/van drivers took many different forms. Since the staffing centers were a focal point for the local public seeking Games positions, the department solicited the support of the staffing centers in filling LAOOC volunteer car/van driver positions. A concerted effort was made to inform staffing center interviewers of the unique characteristics of this position. These individuals were responsible for transporting IOC dignitaries, IF officials and NOC representatives to sites all over Southern California. However, the drivers were usually not accredited to enter the venues and, consequently, had to wait for their passengers. Although most transportation positions were paid, these were not, since it was felt that the close contact with Olympic officials would be quite motivational. Through many speaking engagements, on-site training sessions, mailers, desk-top job aids and meetings with staffing center managers, the necessary information was disseminated.

Much coordination took place with the Volunteer Services, Language Services and host/hostess departments concerning available applicants.

Letters were sent to volunteer drivers who participated in the LA83 events. Emphasis was placed on language qualified individuals, where possible.

The total number of drivers who actually worked during the Games was approximately 1,250. Attrition was light and the drivers worked well as a group.

Unskilled transportation personnel

The department relied exclusively on the staffing centers to fill these positions, utilizing applicants from the general pool. Approximately 1,200 staffers were hired to fill such positions as baggage handlers, cleaner/helpers and parking lot attendants.

In retrospect, the department began its recruitment and selection effort far too late, which resulted in enormous pressure as the Games approached. It is recommended to future organizers that recruitment and selection efforts begin at least nine months prior to the start of operations.

Orientation and training

A series of general orientation sessions were planned in order to acquaint all transportation personnel with the department and its various rules and procedures. An equally important goal was to instill enthusiasm and excitement as each staff person prepared to "play a part in history." Each division head conducted his or her own orientation session.

LAOOC management elected to make attendance at the various orientation sessions voluntary rather than mandatory, in order that the department would not be required to pay staff for their time at the sessions. Therefore, the timing and invitation process was critical. Each operating division scheduled orientations on the weekends in order to attract as many people as possible. A standard letter was sent out via computer to all Games staff. The staffing centers also distributed orientation schedules to those newly hired. Because the hiring process was ongoing up to and through the orientation dates, notification was augmented by Thomas Temporaries during placement. Finally, during the week prior to each session, management telephoned all participants at night and used a scripted message to encourage attendance. The notification process was extremely successful, since it resulted in a 75 percent attendance factor.

Handling disciplinary actions and terminations

During the Games, a great deal of time was spent assisting the various field locations in documenting disciplinary actions and processing terminations. Thomas Temporaries was kept informed of all resignations and terminations so that replacements could be secured, if needed. As a rule, termination reports were submitted over the Electronic Messaging System, and payroll was informed of all the information needed to remove someone from the system. Records were kept which detailed each employee's name, social security number, final hours, address, last day worked, and reason for termination.

35.08.2

Traffic Coordination Center

Early in the transportation planning effort, it became clear to the LAOOC and the various public agencies involved that a single, central source of information about local traffic conditions would greatly facilitate LAOOC traffic operations and public traffic management during the Games. The California Department of Transportation (Caltrans) has an ongoing operation in downtown Los Angeles which is the focal point for traffic information and control for the greater Los Angeles freeway system. It was the logical site for the central Games facility, which came to be known as the Traffic Coordination Center, or TCC.

In addition to Caltrans, the Los Angeles Department of Transportation, the Los Angeles Police Department-Traffic Division, the California Highway Patrol, the Southern California Rapid Transit District and the LAOOC were represented at the TCC. During the Games, local traffic information was fed into the TCC by various sources, including each agency's radio system, telephones, television monitors on freeways, public television and radio, helicopter observation, and reports from spotters placed on buildings overlooking important points.

The LAOOC representative at the TCC monitored all incoming information and joined discussions regarding alternative responses to various traffic incident reports-responses which varied from no action to emergency action. As the condition and response became clear, the staff member kept appropriate LAOOC transportation centers informed. Direct telephone lines were installed between the TCC and the various transportation centers to speed these calls.

The role of the LAOOC representative was not to tell transportation centers what to do-that was for the respective managers to decide. Rather, the staff member's job was to pass on clear, concise reports and to provide regular and reliable updates.

Though background traffic was surprisingly light during the Games, the freeways did experience their normal complement of accidents and breakdowns. Timely and accurate information from the TCC about these incidents proved extremely helpful in rerouting vehicles as necessary and maintaining the timeliness of the various transportation programs.

35.08.3

Transportation operations center

Just as the need was recognized for a central repository of traffic information, the LAOOC also recognized the need for a central transportation command office during the Games. In establishing such a facility, which was called the Transportation Operations Center, or "Trans Ops," all LAOOC departments and venues were informed that a single phone call would reach the Transportation Department command structure for immediate action. Trans Ops was located at the Marina Center in the same room as the LAOOC Operations Center.

The long operational period—9 July through 15 August—necessitated the establishment of a duty roster of senior transportation managers to staff Trans Ops 18 hours a day. The duty roster also included a staff person to help answer telephones, page the managers and run miscellaneous errands. Demand for this function became so great during the Games that a second individual was scheduled for much of the day.

Any significant incident which came to Trans Ops during the day was handled by the duty officer, who contacted senior Transportation Department and LAOOC officers as necessary to report and/or resolve the incident. Incidents affecting departments other than Transportation were immediately reported to the Operations Center.

The operation of Trans Ops was a success in that incidents were handled quickly and efficiently by the duty officers. It proved to be a very wise idea to locate Trans Ops with the Operations Center, as communication with other LAOOC departments was virtually instantaneous. Staffing Trans Ops only 18 hours per day was never a problem since Operations Center personnel covered the 0000–0600 hours period.

35.09

Summary

The effort necessary to plan, organize and implement transportation services for the 1984 Olympic Games presented a tremendous challenge to the LAOOC. The responsibility encompassed transporting athletes, coaches, media, officials and various Olympic dignitaries to venues and coordination with public agencies regarding spectators. The department successfully met all of its goals and the diverse needs of the various groups through tremendous cooperation between its five operating divisions as summarized here:

Athlete transportation

The athlete transportation service for the 1984 Olympic Games was a huge success. Buses ran on time and athletes did not miss competition due to transportation problems.

The department was successful in realizing its original goal of operating an efficient system which met the needs of the athletes but did not result in excessively underutilized buses. The actual cost of the entire system was less than projected. More important, however, was the substantial positive feedback received from athletes and coaches who used the bus system.

Fleet system

The utilization of motorpool vehicles was well planned and managed. It is recommended, though, that on-site operations for all motorpools begin at least seven days in advance of actual operations. This lead time will ensure proper training and familiarization with all vehicles. The morale of the volunteer driver was difficult to maintain throughout the Games. Some delegations befriended their drivers while others treated them poorly, and access rules to venues for the drivers was not clearly defined. It is recommended, therefore, that if volunteer drivers are used, the venue and village access rules must be understood by all parties to avoid disappointed staff.

The inventory control aspect of the fleet system functioned well, but due to the eventual size of the operation had a difficult time keeping up to date with all of the vehicle transfers. Far too many vehicles were assigned to departments or venues, in general, rather than to an individual in particular. As a result, no one person felt accountable for the vehicle and recovery was made more difficult. Many vehicles were also returned with low mileage which indicated underutilization. Improved management of the vehicles probably could have reduced the total numbers of vehicles ordered.

The use of motorcycles and all-terrain vehicles (ATVs) in the vast majority of cases was ill-advised. The vehicles rarely had any functional application, and in almost every case where there was a legitimate use, the vehicles could have been replaced with a small pick-up or sedan.

Press transportation

The press transportation system provided dependable, on-time transport for members of the media between press hotels, the Main Press Center and all venues. The service was almost flawless from the user's standpoint. However, journalists would have preferred more information about the system in the months preceding the Games. This information would have allowed better planning by visiting journalists, and in many cases, media would not have rented vehicles. Los Angeles was fortunate to have mild weather during the Games, so the fact that transport was provided in non-air-conditioned buses was never an issue.

The press system effectively accomplished its goal of providing convenient transport for the media while also keeping a majority of press related vehicles off the road. The system alleviated the need for media to navigate throughout Southern California to find the spread-out venues while it also reduced the required parking spaces at each site.

Venue management

The venue management aspect of the total transportation effort was substantially advanced in the design phase of each venue.

At each venue, parking demand and vehicle flow was forecast through the venue development process. At each site, it was up to the transportation manager to hire and train the staff to implement the plans. In most cases parking demand was correctly estimated although some sites were stretched to capacity on the last days of competition.

Venue management also had the responsibility of implementing the parking pass system. The universal system used for all venues and villages proved effective and efficient.

Special services

The special services section of the Transportation Department became the "catch-all" for any requirement that did not fall under the athlete, media or fleet transportation systems. Operating a fleet of 80 buses and an equal number of daily rental buses operated by contractors, the system primarily was utilized for large group moves of Opening and Closing Ceremonies performers, Olympic Arts Festival performers, and VIPs to special functions.

Although any venue had the right to call upon special services, most did so without regard for cost. It might have been more cost-efficient if department and venue managers were given the authority to call upon outside bus companies for special needs.

Although special services was given the least amount of resources within the Department, it was able to provide good service to all villages and venues.

Public transportation

Interagency coordination was a major contributing factor in the success of the transportation services for the public during the Games. An Advisory Group on Olympic Transportation was formed to develop public transportation plans for each venue based on venue parking capacities and the timing of events. The Rapid Transit District's spectator bus operation was an overwhelming success. The service accommodated over one million spectators safely, quickly and without delay. The service contributed to the moderate traffic levels on local freeways during the Games. Traffic in Southern California was abnormally light due to the effective planning and implementation between local traffic management and law enforcement agencies which added to the success of all aspects of Games transportation.

There were many other factors as well that contributed to the free flow of traffic. Local businesses staggered their work hours and rerouted business traffic. Some businesses closed down altogether, and others encouraged carpooling. Local freeway on-ramps were monitored, other ramps were closed and some streets were converted to one-way only. The CHP and LAPD increased personnel and vehicles and routine maintenance was suspended on the freeways. The result of these factors produced a flattening of the rush-hour peaks in traffic and resulted in remarkably little traffic congestion.

Conclusion

The transportation program for the 1984 Olympic Games, like the Games themselves, was successful beyond anyone's greatest expectations. The department had its share of operating problems though, including breakdowns, late trips and minor accidents. However, sufficient extra time was built into the schedules, and back-up systems worked effectively enough so that not a single problem had a major adverse impact on a user or the Games.

Local transportation planners will view the 1984 Games as an example of what can be achieved with good planning, effective communication and outstanding public cooperation.

36

Uniforms

36.01 Concept and goals

The uniform program provided for the integrated appearance of all LAOOC staff during the Games. The distinctive uniforms identified Olympic Committee staff to guests, visitors and a worldwide television audience. The uniforms were compatible with and complementary to the overall Look of the Games of the XXIIIrd Olympiad. Since the competition received a considerable amount of television and photographic coverage, the appearance and colors of the uniforms "on camera" were of foremost concern. Uniform color and design were also an integral part of the security program.

The uniform program was designed to provide a distinctive and consistent visual identity to various management and staff functions. To this end, both colors and clothing styles were selected on the basis of practicality in the various work situations.

The ultimate goal of the program was to provide a uniform to every paid and volunteer staff member associated with the LAOOC. The uniform program was directed at enhancing the festive spirit and Look which was the essence of the Los Angeles Olympics.

36.02 Development of the uniform program

The provision of uniforms for the staff of the Games was envisioned in the earliest planning stages. Levi Strauss & Company (Levi's) was one of the first corporate sponsors of the LAOOC and began work on clothing designs and fabric colors that would be compatible with the Festive Federalism Look of the villages and venues. Their assignment, in 1982, was to design uniforms for the XXIIIrd Olympiad which would be on the leading edge of fashion in 1984.

The LAOOC's agreement with Levi Strauss & Company required Levi's to produce uniform designs which could then be presented for discussion with the Organizing Committee. Levi's began this process in 1982, after receiving information from the LAOOC on the different types of uniforms necessary according to the various levels of authority and visibility desired.

The initial design program developed by Levi's reflected the design of its own product line, which was important for manufacturing purposes, since Levi's wanted to produce the uniforms itself. The designs submitted showed substantial departures from Levi's regular commercial products, however, and indicated a flexibility in manufacturing which proved beneficial in the incorporation of the Festive Federal color scheme. The overall

program emphasized a vibrant, youthful look which was naturally applicable to sports and sporting events. In mid-1982, Levi's previewed an overall color scheme, which was approved at the time, but was prior to the development of the Games color palette. The LAOOC had specified 34 different kinds of uniforms, and the color scheme submitted by Levi's accounted for various combinations of those colors for the required number of styles. The differences between the 34 uniform styles were confusing, however, and the distinctions between color diminished because of the multitude of combinations. Levi's also submitted a written description of the garments to be used for each group.

Later in the same year, Levi's refined its concepts and produced a series of drawings in a presentation of the different types of uniforms planned, using the colors previously approved. The drawings displayed what was basically a red, white and blue color scheme that stood out more sharply in the drawings than in the previous descriptive material and proposed color swatches. Moreover, the drawings showed a series of designs which were felt to be too informal for the nature of work being done by the personnel who would be wearing the

uniforms. While the LAOOC board of directors and some senior management were envisioned to be in blazers and slacks, many of the operating managers at the sites were conceptualized in open-necked sport shirts, and most other personnel were to wear combinations of T-shirts and pants made out of blue jeans-type fabrics. Otherwise, the styles were attractive in their use of color and avoided an "off-the-rack" appearance-an important factor since a uniform was one of the few perquisites available to the mass of personnel who would be involved with the operation of the Games.

The Levi's-originated garment styles proved fully satisfactory, and the only real changes were made in the application of color. The reduction of uniform styles was absolutely necessary, since the manufacturing specifications according to style and number had to be submitted in June of 1983, when fabric was ordered. This date was well before the Organizing Committee had developed hard data regarding the number of personnel to be used in each of the various positions during the operational phase. By reducing the number of styles to 11, a reasonably accurate fabric order was made. The final assignment of styles to levels of personnel was made in April 1983, with the exception of uniforms for security personnel and those involved in Games ceremonies. The style and the number of uniform elements assigned to each person was

determined by the number of days and hours per day the individual would be required to wear them. Levi's determined the distribution of sizes based on industry sales history.

36.03
Uniform styles

36.03.1
Uniform styles for general use

The actual uniform components consisted of six major groups over the 11 different styles agreed upon by the LAOOC and Levi's. These groups had individual variations in color and style which made them distinct for certain purposes, but not dramatically different than other uniforms of the same group.

The six major groupings included:

- Management-blue blazers and gray pants
- Host/Hostess-blue blazers and blue pants
- Service personnel-
 - Out of public view; green with gold shirts and green pants
 - Off the field of play; blue with gold shirts and blue pants
 - On the field of play; orange with gold shirts and gold pants
 - Medical personnel; white with gray shirts and white pants

3 LAOOC management personnel wore a traditional powder blue blazer with a short-sleeved white dress shirt (men) or blouse (women) accented by grey slacks (men) or skirt (women).

- Support personnel—
 - Out of public view; white shirt with green trim and green pants
 - Off the field of play; white shirt with gold trim and gold pants
 - On the field of play; white shirt with orange trim and orange pants
- Novelty sales personnel-white shirt with magenta trim and aprons
- Food sales personnel-magenta smock and cap

Specific characteristics of the uniform types and distribution were as follows:

Management personnel

Management personnel wore a traditional blazer in powder blue, gold or orange that was provided along with a short-sleeved white dress shirt (men) or blouse (women) and gray slacks (men) or skirt (women). The blazers were tailored and fully lined and were center vented; blazers were made of 100 percent square-weave polyester. Blazers also featured patch pockets with covering flap and had brass buttons bearing the *Star in Motion*. An identifying patch with the *Star in Motion* was sewn onto the left chest.

The slacks or skirts were also of 100 percent polyester and used a square-weave design. The shirts and blouses were made of 65 percent polyester and 35 percent cotton and were short sleeved and three-quarter sleeved, respectively. They had a button-down front and collar and the white body color was overlaid with a thin-lined, multicolor tattersall pattern.

4

5

4 The two-toned service uniform came in combinations of green with gold, blue with gold, orange with gold and white with gray.

5 The uniforms for support personnel came in three color combinations and included a lightweight windbreaker-type jacket, crew-neck shirt, denim pants, a cap and a pair of shoes.

Neckties for men were mainly aqua in color, but also featured small, decorative shapes in keeping with the festive federal design. Women were issued single-color magenta bow ties. Management uniform hats were straw-like in appearance and color with a narrow Panama-type brim and three-quarter-inch wide magenta hatband. Shoes for men were gray and made of leather and were laced in a pattern similar to most popular athletic shoes. Women were issued gray slip-on espadrilles.

The standard uniform kit for management included two blazers, three shirts or blouses, two skirts or pairs of slacks, two ties, one hat and one pair of shoes.

Host/Hostess personnel

Host/Hostess personnel wore a uniform that was a variation of management's. Blue blazers were issued for both men and women, but with powder blue slacks or skirts and a solid white shirt or blouse with aqua-colored front pocket and epaulets. Men only were issued ties, and both men and women were issued management-style shoes. Hats were blue, billed, round sport caps with front snap for the bill. Hostesses were issued a two-compartment carrying bag, which was gray in color.

Standard issue included two blazers, three shirts or blouses, two skirts or pairs of slacks, two ties for men, one bag for women, one hat and one pair of shoes.

Service personnel

Service personnel wore the third uniform type. These uniforms were issued in several different color combinations that denoted specific departments. These uniforms were unisex in style and included a short-sleeved knit pullover shirt with snap closures, lightweight sport pants with elastic waistbands and lightweight windbreaker-style jackets. All of these garments were made of 65 percent polyester and 35 percent cotton. The shirts were imprinted with the Games logo on the left chest while the jackets included a similarly-styled patch sewn onto the left front. Caps were included and were two-toned in color and featured a short bill.

These uniforms came in combinations of colors which featured a dominant color for the jacket, pants and the body of the shirt. A secondary color was added to the side of the shirt and used as trim on the jacket and pants. There were four color combinations: green with gold (service personnel in non-competition or non-spectator areas), blue with gold (in-stadium personnel such as ushers), orange with gold (personnel stationed on the field of

play) and white with gray (medical personnel). Standard service uniform issue included one jacket, three shirts, two pairs of pants, one cap and one pair of shoes. Shoes were a standard athletic-shoe design, using a padded canvas material and were white in color with magenta trim.

Support personnel

Support personnel uniforms were issued in three different color combinations and included one lightweight windbreaker-type jacket, three crew-neck shirts in white with contrasting color bars on the shoulders, two pairs of pants made of denim material in appropriate solid colors, a cap, and one pair of service-personnel-type shoes. The color of the jacket complemented the contrasting color of the shirts and the solid-colored pants.

Color combinations included green with white shirts (support personnel out of public view), gold with white shirts (in public view, but off the field of play) and orange with white shirts (on or around the field of play).

Novelty sales personnel

Novelty and souvenir concession personnel were issued white crew-neck shirts with magenta trim and aprons with tie-strings and visors. The aprons were magenta in color. Standard issue included two shirts, two aprons and one visor.

Food sales personnel

Food concession personnel were issued magenta-colored smocks which tied in the back. The smocks were made of 65 percent polyester and 35 percent cotton and had a logo patch sewn onto the left chest area. Standard issue included two smocks and one magenta-colored cap.

36.03.2

Uniforms developed for specific requirements and uses

The six groupings and 11 styles used for most of the uniformed personnel at the Games did not cover all situations. In a number of instances, additional styles were developed or special uniform pieces had to be obtained to meet various requirements. Most prominent were the special uniforms noted above for LAOOC security personnel and personnel involved in the Opening Ceremonies, Closing Ceremonies, and the award presentation ceremonies. In addition, a large number of uniforms had to be specially prepared for officials.

Sports officials of the International Federations (IF) required uniforms for their roles as competition management. In order to maintain the consistency of the Look on all persons and things in public view, the LAOOC wanted to uniform all IF officials who were visible inside the stadiums and on the fields of play. In the past, officials have worn management-style outfits, such as blazers. The LAOOC determined that this was appropriate

for competition judges, managers, officials, starters and the like. Although federation officials had traditionally been outfitted in red jackets at prior Games, the LAOOC management-style uniforms featured orange blazers in keeping with the field-of-play color scheme. Federation officials, who were not present on the field of play itself, wore yellow-gold blazers to maintain the color pattern for in-stadium personnel outside of the field areas. The ordering of these uniforms (fabric was ordered in June 1983) was complicated by the fact that few IFs actually knew the number of officials who would be assigned to the Games and even fewer federations could give any breakdown as to sizing requirements or the ratio of male to female personnel. Nonetheless, ordering, which was based on data from past Games and some educated guessing, was successful as serious shortages did not develop. There was some confusion over those officials who were not nominated by the International Federation of a particular sport but were added as supplementary officials by the USA national governing body. Some of these officials who filled federation-mandated posts were uniformed at the direction of the IF concerned. Others were not uniformed at all. Future organizers had better determine beforehand which officials are to wear uniforms and which are not.

International Federation regulations dictated the special uniform requirements for certain officials. Although usually quite simple, these requirements had to be planned for, since they could not be met by using garments from the 11 uniform styles used for staff or those used for IF competition management. For example, on-court officials in several of the team sports required black-and-white striped shirts. Ballboys and ballgirls at the tennis venue wore appropriate sportswear, including shorts. Deckside officials for swimming and water polo were uniformed in all white. Limited quantities of these types of garments were needed and Levi's was often able to supply such items out of its normal lines of clothing. In some cases, ready-made garments which met the appropriate specifications were simply purchased from another source (referee's shirts), or were created by altering existing uniform garments (cutting off pairs of slacks and hemming them to make shorts). It is important to get these special uniform requirements early to ensure that they are procured in time for the Games.

Continuous revisions were made to the uniform program until early 1983. Program revisions involved coordination among LAOOC designers developing the Look, a Los Angeles-based clothing designer and Levi's. During this time, colors were modified to coordinate with the Look, uniform categories were reduced from 34 to 11 and a more formal appearance using the Levi-originated "blazer" look, was designed for all classes of management.

The design of the uniforms for the private security officers was done by the LAOOC vice president for security. The purpose of the design was to present LAOOC security with a distinctive and identifiable look that was non-threatening yet authoritative. The khaki outfit with blue belt and blue beret served that purpose.

The outfits for the performers involved in Opening and Closing Ceremonies were unique to fit their specialized needs. Considerable latitude was given to the Ceremonies staff in the selection of costumes. Levi's created special designs for some of the larger groups, such as the choir, but in a number of cases, the uniforms were custom-designed and produced in small quantities by wardrobe manufacturers in Los Angeles.

Shoes, provided by Converse, were designed after final uniform approvals had been given. They were intended to coordinate with the various uniform styles and be comfortable. The shoes for management staff were as formal

as possible, while the balance of the employees were outfitted in more casual recreational shoes. All designs were specially made by Converse for the LAOOC. A total of 60,000 pairs of shoes were finally provided for use during the Games.

36.04 Manufacture of the uniforms

The manufacturing of the uniforms for the Games of the XXIIIrd Olympiad was by Levi Strauss & Company at its own facilities. Wherever possible, uniform components were produced in facilities which were designed for that type of production. The blazers, for example, were made in garment plants which normally produce coats for Levi's, thereby minimizing any investment by Levi's in additional production facilities. Levi's facilities offered a practical solution to security needs in as much as the garment industry is normally quite security conscious about its own designs. The same care was taken with the uniforms produced for the LAOOC.

Production began during the summer of 1983 and continued through April 1984. A large warehouse in the southwest United States was used for uniform storage until May 1984 when shipment to Los Angeles began.

36.05 Uniform Distribution Center

The Uniform Distribution Center (UDC) was a large warehouse near the main headquarters of the LAOOC. The UDC was managed by LAOOC staff personnel and operated by employees of Levi's.

The UDC distributed approximately one-half of the uniforms worn by staff during the Games. Satellite centers were established to handle the uniform requirements of personnel at the University of Southern California, Santa Barbara/Lake Casitas, Harvard, Annapolis and Stanford. In addition, bulk distribution of uniforms was provided for marathon course marshals, parking lot attendants, security staff, food and novelty concession workers, village food service workers, housekeepers and other third-party contractors. This was accomplished at locations close to or at the work sites.

Uniform distribution began on 17 June and continued through 12 August when all operations closed down. Remaining stock was moved to the main distribution center by 15 August. The LAOOC purchased all remaining uniform inventory as well as excess inventory produced by Levi Strauss & Company.

36.05.1 Facility requirements

A considerable effort was made to find an appropriate site for the distribution of uniforms. The LAOOC sought a site with 70,000–100,000 square feet of

flat, warehouse space which had little or at least flexible partitioning inside, so that a plan for the most convenient processing flow could be designed without difficulty due to the physical configuration of the space available. It was also important to find a location which was relatively central to the venues and, thus, the Games Staff. The LAOOC felt it was important to find a distribution point in an attractive, non-industrial area since the acquisition of uniforms was one of the initial Olympic experiences encountered by the Games staff, and a pleasant surrounding would make a far better impression on the permanent employees and volunteers than a barren industrial site. Air-conditioning was also an important factor since many warehouse facilities in the area were not so equipped. A suitable site was found in late 1983, well in advance of the necessary time for designing an interior plan and accepting the manufactured uniform inventory.

The main Uniform Distribution Center (UDC) was located in a warehouse at 5353 Grosvenor Boulevard, Los Angeles, about two miles from the LAOOC headquarters. It contained approximately 70,000 square feet of open space partitioned for various

10

uses and was available between 1 May and 31 August. Security and fire protection systems were operational 24 hours a day during the LAOOC's occupancy.

A total of 29,907 individuals were issued uniforms at the UDC between 17 June and 7 August. The uniforming of staff for the remote venues in Santa Barbara, Palo Alto, Cambridge and Annapolis was accomplished at separate distribution centers, each of which required one LAOOC uniform coordinator and one member of the Levi Strauss & Co. management team to oversee operations.

LAOOC management at the three remote football locations, Stanford, Harvard and Annapolis, took special care to inform their staff of the dates and times of uniform distribution. As a result, approximately 85 percent of the staff was accommodated at each of these sites for first requests; 75 percent of the exchanges were handled during the first uniform distribution period. The Santa Barbara area staff encountered scheduling difficulties because a lack of communication created lengthy delays. Only 45 percent of the staff at Santa Barbara were given uniforms during the first distribution period; an additional 40 percent completed the process during the second distribution period. By the conclusion of the second distribution, 75 percent of all the exchanges had been accomplished.

The total number of staff given uniforms at each remote site was as follows:

Location	Staff uniformed
Stanford	750
Harvard	650
Annapolis	650
Santa Barbara	1,500

A minimum of 4,000 square feet of warehouse space and two dressing areas of 300–400 square feet each were required in each remote uniform distribution center. Staff scheduling was based upon a processing rate of 50 persons per hour. Four hours of each distribution period were allotted to uniform changes.

36.05.2 Loading of the inventory

The shipment of uniforms for the Games of the XXIIIrd Olympiad was scheduled to arrive in Los Angeles in May and June. The actual loading of uniforms into the UDC took place during the second week of June 1984. The inventory accepted by the LAOOC was as follows:

Category	Quantity (each)
Men's management blazers	7,202
Women's management blazers	1,218
Host blazers	694
Hostess blazers	12,824
Men's management slacks	7,202
Women's management skirts	1,218
Host slacks	694
Hostess skirts	2,824
Men's management shirts	11,593
Women's management blouses	1,937
Host shirts	1,119
Hostess blouses	4,476
Men's management ties	8,731
Women's management ties	1,528
Management hats	3,760
Host/Hostess hats	2,065
Host belts	387
Hostess bags	1,652
Men's service jackets	12,198
Women's service jackets	8,134
Men's service shirts	50,907
Women's service shirts	33,943
Service pants	44,756
Service hats	21,928
Men's support windbreakers	7,470
Women's support windbreakers	4,976
Men's support shirts	25,053
Women's support shirts	16,701
Men's support pants	12,262
Women's support pants	8,174
Support staff belts	20,196
Support hats	10,218
Concession aprons	23,732
Concession hats	11,866
Men's novelty shirts	1,260
Women's novelty shirts	840
Novelty aprons	2,100
Novelty visors	1,200
Shoes (pairs)	60,000

Loading for uniform distribution at the four remote sites was accomplished according to the following schedule:

- 1 May; detailed schedules and operating plans were sent to the four remote distribution sites from the LAOOC uniform distribution manager. Included were sizing forms which were to be completed by each staff member to be given a uniform.
- 21 May; remote distribution site locations had been determined based upon the operating plans from the LAOOC headquarters.

- 1 June; completed sizing forms along with three sets of name labels were returned for each person to be given a uniform. These were arranged in alphabetical order. Maps identifying the location of the distribution centers were included in the uniform vouchers mailed to each employee or volunteer.
- 8 June; the uniform distribution manager at the LAOOC headquarters sent the individual uniform vouchers by courier to each remote site for local mailing. The voucher served as the entry permit and listed the date, time and location for each staff member to report for fitting. Scheduling was done so that groups arrived at fifteen minute intervals.
- 12 June; vouchers were mailed to each person to be given a uniform at each remote site.
- 14–19 June; the uniforms were selected and packed in Los Angeles according to the sizing information submitted from each remote site.
- 20 June; uniforms were shipped to Stanford, Annapolis and Harvard from Los Angeles.
- 21 June; the Stanford remote uniform distribution center was set up. LAOOC and Levi's personnel relocated to the site.
- 22–23 June; uniforms were distributed at Stanford. By the end of the second day, uniforms to be exchanged were packed for shipment to Los Angeles, paperwork was completed and exchange information was telephoned to the LAOOC headquarters.
- 24 June; the Annapolis remote uniform distribution center was set up. LAOOC and Levi's personnel arrived and took care of last minute details.
- 25 June; uniforms were distributed at Annapolis. Stanford exchanges were shipped from Los Angeles. The remote uniform distribution center at Harvard was set up.
- 26 June; Annapolis uniforms to be exchanged were packed for shipment to Los Angeles, paperwork was completed and exchange information was telephoned to the LAOOC. Organizing Committee and Levi's personnel arrived at Harvard and settled remaining problems. Exchange uniforms arrived at Stanford.
- 27 June; uniforms were distributed at Harvard.
- 28 June; Harvard uniforms to be exchanged were packed for shipment to Los Angeles, paperwork was completed and exchange information was telephoned to the LAOOC. Annapolis exchanges were shipped from Los Angeles.
- 29 June; exchange uniforms arrived at Annapolis.
- 30 June; Harvard exchanges were shipped from Los Angeles.
- 1 July; exchange uniforms arrived at Harvard.
- 3 July; uniforms were shipped to Santa Barbara.
- 4 July; the Santa Barbara remote uniform distribution center was set up. LAOOC and Levi Strauss & Company personnel arrived and settled last-minute details.
- 5–7 July; uniforms were distributed at Santa Barbara.
- 8 July; Santa Barbara uniforms to be exchanged were packed for shipment to Los Angeles, paperwork was completed and exchange information was telephoned to the LAOOC.
- 11 July; exchange uniforms were shipped to Santa Barbara and received.

**36.05.3
Procedure for obtaining a uniform**

With tens of thousand of people requiring uniforms and a finite stock of each style, size and type on hand, it was important to make sure that those personnel who were not entitled to uniforms did not get them. Moreover, it was equally crucial to develop a scheduling system to bring the thousands of personnel to be uniformed to the Uniform Distribution Center (UDC) in an orderly manner and sufficiently distributed over time to allow a smooth processing flow.

The LAOOC's device for accomplishing both of these functions was the uniform voucher. A uniform voucher was printed for each employee or volunteer in the Games staffing system. Because uniforms were assigned by position (management, service, support and the like), the Games staffing system computer program was able to issue automatically vouchers from a person's job application. Vouchers were distributed at venue orientations

12

11

11 Chrome yellow blazers made IF officials on the field of play highly visible.

12 Employees and volunteers stopped at a series of garment distribution areas to gather various pieces of their uniforms

Uniforms

beginning 2 June 1984, and included the employee's name, job code, uniform type and location of the staff member's Games assignment, as well as directions to the appropriate UDC and a date and time for uniform pick-up. All recipients were advised that they had to appear at the UDC at the designated date and time stated on the uniform voucher, with the voucher and a photograph for identification purposes to obtain a uniform. Security was maintained at the UDC at all times and proved effective against theft. A telephone bank, established to answer questions, consisted of four incoming lines staffed by two persons for an average of twelve hours per day after the distribution of uniform vouchers had begun. Because the telephone number was listed on the individual voucher, many people who were unable to report to the UDC at the listed time, called the telephone bank to request permission for late arrival, new appointments or instructions if they had already missed their issue date. The telephone bank answering staff recorded each call on a form and issued new appointments, if necessary. There were many questions about the type of uniform to be issued and some voucher holders called in to renounce their Games staff assignment and asked the telephone bank staffer to inform the appropriate personnel coordinator.

When an LAOOC staff member arrived at the Uniform Distribution Center, he was met by a member of the security staff and instructed to show his voucher and picture identification before proceeding further. A procedure for handling lost vouchers had been developed and was initiated at this point.

When an employee or volunteer appeared claiming to have lost his uniform voucher, he was handed a lost voucher form. The staff member was asked to enter his name, address, application number, start and end dates, job code, title and work location on this form. Once he had finished filling out the form, he was directed to an LAOOC uniform staff member for verification. This was accomplished by a computer terminal which was linked to the Games Staffing Department computer. The individual's identity and all appropriate information was verified through this computer check, including whether a uniform had already been issued to the person.

Once these checking procedures had been completed, an authorizing signature was entered on the lost voucher slip and that person was sent through the UDC in the normal manner.

The uniform voucher system worked well because the Games staff cooperated with the procedures. A large number of special cases did develop, however, which had to be handled individually. Most of those special circumstances involved additions to the Games staff made after the printing of the vouchers. Also, there were many special requests by LAOOC department or venue managers and sports commissioners for upgraded uniforms for some of their staff (i.e., from service-level uniform to management style).

Once an employee or volunteer had been admitted to the Uniform Distribution Center, he was directed to a "safety net" room. At this point all information was checked against a master list and any last minute corrections were made before the uniform could be issued. Accreditation pictures could be taken at this point, if necessary, if the person concerned had not already taken the proper steps toward the issuance of a Games accreditation badge. As such, the UDC acted as a last chance opportunity for accreditation of Games personnel. Department personnel coordinators were usually on duty when groups of that department's Games staff came through the UDC to catch anyone who had not completed pre-Games accreditation procedures.

After passing this "safety net", the staff member proceeded to the uniform check in point, where he presented his voucher to an LAOOC uniform center employee who selected the correct uniform pick-ticket based upon the uniform code indicated on the voucher. These pick-tickets were color-coded and indicated the type of uniform to be worn and the number of garments to be issued. The person's application number was written on the pick-ticket and the uniform voucher was stapled to the back of it for auditing at check out.

Staff then instructed the person to follow the appropriate color coded line on the floor of the UDC to obtain his uniform.

Waiting time increased immediately prior to the Games when the workload reached its peak, necessitating a separate procedure for International Federation officials and other guests needing uniforms. Each of these individuals was sent, upon verification at the security entrance, to a location at the rear of the main UDC which was also used as a management exit. At this point, he was required to show his LAOOC-issued badge which indicated either a "B" or "D" accreditation and, then, once verified, proceeded to a

14

13 Bright and attractive uniforms were designed to complement the Look of the Games and to give a favorable "OR camera" appearance.

14 The khaki and blue uniforms for the private security force were distinctive.

special check-in desk where previously printed uniform vouchers for persons from his IF were filed. Once the uniform voucher was matched to the individual, he was issued a pick-ticket kit for the appropriate uniform style and completed the uniforming process in the normal manner.

Once a person began the uniforming process, he was directed to a series of garment distribution areas located within the Uniform Distribution Center. The previously mentioned color coding was used to direct employees and volunteers and aid in overcoming any communications problems for some international visitors. At each garment distribution location, the employee presented the pick-ticket to a representative of Levi Strauss & Company for garment selection. Based upon the information contained on the pick-ticket and the size provided by the employee, a garment was provided for the person to try on in a fitting room provided for this purpose. Private dressing rooms were not provided, only group dressing areas. This was noted specifically on the voucher and all staff were advised to wear appropriate undergarments for trying on uniforms. Once the proper size was determined, the employee or volunteer was given the appropriate number of garments based on the pick-ticket information. If alterations were required, the garments were sent to another area of the UDC where alterations were made. Meanwhile, the employee or volunteer continued the garment selection process at the next location. Altered garments were available at the check out area of the Uniform Distribution Center.

Once the employee had secured all of the components of his uniform, he proceeded to the uniform check out area where his pick-ticket and uniform voucher were checked and all garments were inspected to verify the accuracy and completeness of the uniform. Any altered garments were also picked up at this point and instructions of dress code and care of clothing were distributed. During the bulk of the uniform distribution process, alterations were processed in a timely manner without undue delays. As the Games approached, and the volume of activity increased, delays began to occur and a separate procedure was developed to handle alterations for International Federation officials and other guests. Garments requiring alteration which belonged to the IF officials and guests were marked

with their hotel or village location at the time they were taken for alteration. The garments were delivered the same day by LAOOC staff to the bell captain at the designated location to complete the individual's uniform. The bell captain would then advise each official that his uniform had arrived, or, if the IF concerned had an office at that hotel, the bell captain would advise the office to inform the official concerned. Unfortunately, this procedure did not always work and some officials were outfitted twice by mistake. Later, LAOOC officials coordinators from each sport were asked to make arrangements to have alterations picked up at the UDC and delivered to the officials to ensure delivery.

The most unexpected alterations were uniforms for pregnant women. Although foreseeable, this possibility was not taken into account in the ordering process, but was easily handled in the alteration phase.

36.05.4 Operations of the UDC

The Uniform Distribution Center was open from 17 June 1984 through 7 August 1984. It was operational 86 hours per week, open every day during the period except 4 July. Hours of operation were:

Monday, Tuesday, Wednesday	1015-2100
Thursday, Friday	0815-2230
Saturday	0800-2230
Sunday	0815-1900

During its 51 days of operation, the UDC processed 29,907 individuals. An average of 586 people per day were processed, with a low of 19 on 29 June and a high of 1,425 on 12 July. The five days prior to the opening of the villages had the highest number of individuals processed, with 5,432 persons receiving uniforms for an average of 1,086 per day.

During the first period of activity, prior to the opening of the villages, Main Press Center, Olympic Arrival Center and the start of the transportation system from 22 June-4 July, most of the personnel uniformed were from those sites. An average of 850 people per day was processed. In the following two weeks prior to the Opening Ceremonies on 28 July, mostly venue-related personnel were scheduled to come through the UDC. An average of 540 people per day was processed during this period. The UDC was open for 11 days during the Games (28 July-6 August), but the activity decreased to 86 people on the final day. It is worthwhile to note that the last sport to begin competition on the Games program was Archery on 8 August.

15

16

17

15 A variety of sizes were available to LAOOC employees and volunteers and fitting rooms were available to try on garments before leaving the UDC.

16 An alterations service was provided for proper fitting of uniforms.

17 Color-coded floor tape helped direct staff to various uniform pick-up points at the UDC.

36.05.5 Response to adjustments in the issuing period

It was known from the outset that with the long lead-time necessary to produce the number of uniforms needed for the Games and the continuing changes being made in the staffing levels that some provisions would be needed for last minute adjustments in uniform needs requirements.

A decision was made that certain components, notably shirts and pants, could be used to facilitate last minute uniform needs. As a result, the orders for these items were higher than other uniform elements. The concept was that with extra shirts and pants, uniform combinations could be adjusted and the number of units of each component could be reduced to provide for increases in staff without materially effecting the overall uniform look. In practice, changes were required. The sizing of LAOOC staff did not match the pre-determined sizes of Levi's. This created a heavier than expected demand for alterations and, ultimately, a decision was made to reduce the number of garments given to staff members. Most commonly, this reduction came in the form of fewer blazers or slacks/dresses to staff members.

In addition, the LAOOC hired approximately 30 percent more staff than had been anticipated at the time of the fabric order in 1983. Rather than not give a staff member a uniform, however, the reduction in the number of garments distributed proved to be an adequate solution.

It should be noted that when uniform distribution began on 17 June, each staff member was issued a full wardrobe regardless of the venue assigned and without regard to the number of days to be worked. Further, persons who were assigned to more than one job category were issued one complete wardrobe of the uniform style most appropriate to perform all of the jobs assigned—usually the highest level uniform style available. As an example, a person assigned to work as a driver and as a host was given a host uniform. These procedures, along with the increase in staff size and some unexpected staffing characteristics, caused a shortage of some uniform styles. In particular, male host uniforms

were scarce since it had been estimated that 20 percent of all hosts would be men, but the actual percentage was closer to 30. The reduction in the number of garments issued were made by issuing fewer garments of each type in the wardrobe to persons working at venues with a shorter operating period. This caused some discontent among staff members because the reduction in garments took place midway through the overall distribution process, leaving some staff members with full wardrobes and others working at the same venues with only half as many garments.

Moreover, numerous instances of uniform "grade creep" occurred, elevating secretaries and other administrative personnel from service or support uniforms to management-style uniforms at the request of LAOOC department or site managers or sports commissioners. This caused a shortage of female management uniforms, as the expected female management uniform percentage of 25 percent grew to 40 percent in actual practice. The requirement for additional female management-type uniforms might have been foreseeable when one considers the importance of the appearance of receptionists, secretaries and aides for senior site managers and commissioners. In addition, experienced administrative support personnel who had been part of the Organizing Committee for two years or more often become "battlefield generals" at the venue sites due to their superior knowledge of the operational plans for that site. Not surprisingly, senior site or sports management often requested that these people be issued management uniforms. One result of these adjustments in distribution was an increase in the number of cleanings or launderings that some staff were required to provide for their uniforms. All laundering of uniforms was the responsibility of the wearer as the collection, separation and redistribution of uniforms would have required additional personnel, and facilities at every site.

36.06 Summary

In general, the uniforming of the LAOOC's Games staff, including the appropriate officials from the International Federations, went smoothly. Although there were difficulties, they were anticipated for the most part. The uniforms were well-used by the staff, were easily identifiable and blended with the colorful Look of the Games. In the future, organizers should note the following points:

- The uniform material and colors served their purposes well, but were not without criticism. The polyester material, chosen because of its wrinkle-free characteristics, performed very well, almost always looked fresh and required no ironing, which is essential because of the long work hours at many sites. However, the all-polyester clothing was extremely hot to wear at some of the outdoor venues. A blend of polyester and cotton might have been cooler and would not have lost its wash and wear quality or its smart appearance.
- All Games staff seemed pleased to wear the uniforms, especially after seeing senior management of the LAOOC at all of the sites wearing them. It is crucial to set an example for all staff in the first days of the operational period by wearing the uniform properly and proudly, no matter what style it is.
- While a uniform dress code was established for all staff, there were some variations at certain venues. Because the all-polyester neckties for men were quite warm to wear, for example, they were made optional at the yachting venue. These minor redefinitions of the dress code caused no major problems and were important in making the staff more comfortable. It should not be lost on any organizer that uniforms must be comfortable as well as functional.
- The LAOOC and Levi's created a very simple but effective system for the various uniform styles. The 11 styles chosen provided wide flexibility in ordering and an ability to compensate for ordering errors at the time of delivery. Nevertheless, it was noted that a uniform style that defined an intermediate level of authority would have been welcomed. In addition, it

was difficult to know by the uniform style which management-clad individuals were actually the senior managers of the LAOOC. Even a slightly different blazer denoting senior managers and commissioners would have been helpful for staff and visitor alike.

- More attention should have been paid to ensuring equity between functions and job titles and the uniform style assigned. Little consistency between sites was present as to the style assigned to individuals who were ostensibly performing the same job. A single line of authority, which determined the assignment of uniform types for all jobs from initial assignment through any changes or exceptions, would have helped resolve the inconsistencies.
- At the time uniforms were issued, a tracking system for each size in a particular uniform style would have been helpful. With such a system, it would have become apparent early in the distribution process which garments were being issued in greater numbers than expected and what changes needed to be made.
- The processing plan for the UDC worked extremely well. The relatively uncomplicated voucher system was generated by the already existing Games staffing system and the color-coded pathway through the UDC was simple and quick. The site was centrally located for most of the people who were processed there and ample parking was available.

The uniforming program was successful because of a relatively simple set of styles combined with a manageable number of variations and a simple, effective processing plan. Perhaps the greatest tribute to the popularity and success of the uniform program was after the close of the Games, when the excess inventory of uniform items was placed on public retail sale. Thousands of people from the general public, most of whom were not members of the Games staff, descended upon the uniform counters and almost all items were sold out quickly.

37

Venue Operations and Administration

37.01 Concept of venue operations as contrasted with sports competition management

Under the supervision of the commissioner, the management of a competition site was divided into two parts: sport management and venue management.

Sport management was concerned with those aspects of the venue which dealt with the field of play and other competition-related functions; including:

- Athlete services, including training and warm-up areas and transportation
- Competition operations, including arrangement of the field of play, procurement of equipment, selection and assignment of International Federation sports officials and awards ceremonies
- Competition support, including the work of the LAOOC's competition staff, program for the opening and closing of competition sessions and public address and scoreboard functions
- Results operations, including start lists, intermediate statistics and final results

Venue management was concerned with the coordination and control of all service functions outside of the field of play. These services, provided by individual departments, supplied indirect support for competition itself and direct support for all non-competition areas, especially those for spectators:

- Concession operations
- Food services for athletes, officials, staff and VIPs
- Medical services for athletes, press, public and staff
- Public information
- Spectator services including ticket takers and ushers
- Transportation and parking for athletes, officials and staff
- Waste management

The overall management of a venue was the combined effort of both the competition staff and the management staff. To accomplish this, representatives from the venue management staff and competition staff formed a venue management team.

37.02 Physical layout of the venues

37.02.1 Early development

Until the summer of 1983, two types of preliminary operating plans were being developed throughout the Organizing Committee:

- Sport-specific planning by each commissioner that focused on the competition aspects of the sport, such as the field of play, training facilities, the recruitment of competition staff, as well as the recruitment of venue management staff.

- Departmental planning by each central, functional department (such as food services and transportation services). The departments focused on operations at each of the venues.

A great deal of time was expended in coordinating this planning. A commissioner had to review plans with as many as 30 departments, while each department plan was reviewed by as many as 28 commissioners.

This resulted in substantial inconsistencies from the plans of one commissioner to another and department plans which were unrelated to those of other departments. At a certain point, three types of problems emerged to make detailed planning and final preparation for the Games increasingly difficult. They were:

- Inconsistent policies across venues due to the differences among the Commissioners
- Inconsistent policies within venues due to the lack of communication among departments
- A slow planning process was developing as department heads and commissioners waited for data or policy decisions

As a result, it was decided to form a new department to integrate departmental and sport-specific planning at each venue.

37.02.2 Venue development process

A central department was created to act as product managers for every venue and to prepare one plan per venue which:

- Was consistent with LAOOC policy and budget constraints
- Had overall policies consistent with those of other venues
- Monitored all departments to keep policies consistent within each venue and coordinated department efforts
- Allowed the venue to operate properly in the physical sense. All departments agreed on an adequate amount of working space in an appropriate area within each site
- Was completed in time to allow implementation and construction. If data was not available, this department would make assumptions, where necessary, to complete the plan

- Was agreed to by all key participants where possible, and in all cases, was adhered to by all participants

That department was known as the Venue Development Department and was formed in July 1983. Its mandate was to produce a venue development plan for every sport, village and support site by the end of 1983. Plans would be produced jointly by venue development staff and venue staff, would use input from all departments and would be distributed to all departments.

The contents of the plan would be binding. Once LAOOC senior management had approved the plan, all participants had to live with it. This would enable construction, hiring, materiel acquisition and other planning to proceed without delay. Additionally, because the Venue Development Department produced all plans, consistency would be achieved at all venues.

The Venue Development Department started in July with a vice president and 17 staff members transferred from various departments of the Organizing Committee. The staff grew to 24 in August when two venue development teams were assembled. These teams served as a testing group to produce the first two venue development plans. Each team included a team leader, two or three team members, a project architect and an administrative assistant who was shared with another venue development team.

By the end of September, the department had established itself. It had a staff of 41 and its methodology for the production of venue development plans had been completed. The staff grew steadily and, at its peak in November and December, was comprised of 51 persons. In January, staff size decreased as plans were finalized, and was reduced to 29 in February as all venue development plans for competition sites were completed. Staff size continued to decrease during March, April and May as venue development plans for support sites were completed.

The process to produce a venue development plan was divided into four phases:

- Introduction
- Departmental input
- Venue design
- Production, department head approval, and presentation

The introductory phase was divided into two stages. First, the team gathered background information on the sport and the facility. To gain that information, the venue development team met with the commissioner and other venue staff to discuss the venue development process and gather preliminary data. Existing operating and site plans were discussed and reviewed and a tour of the site was made. Second, the team produced contract and sport summaries and design criteria.

A contract summary itemized the most pertinent points of all contracts affecting LAOOC use of the venue, including those between the LAOOC and venue ownership and management. Any outstanding issues were noted.

A sport summary was produced by a team member with the help of the departmental staff for that sport. The sport summary covered the specifics of the competition, expected number of entries, team sizes, rules, and other specific procedures to be followed during Olympic competition. It would also include a scenario of a typical day of competition-athletes arriving at the venue, going to the athlete warm-up area, competing, cooling down and returning to the athlete rest area.

Design criteria was a four-part analysis of:

- A design day, which was an approximation of what was expected to be an average day during the competition period in terms of spectator attendance, the number of athletes competing and spectating, and the number of Olympic Family present
- A peak day where all sessions were assumed to be sold out
- An hour-by-hour breakdown of the design day estimating the number of athletes, team officials, staff and spectators on site for any given hour the venue was open for operation
- Spectator attendance estimates for every day of competition

The major sources of information used to arrive at design criteria were the Ticketing and Spectator Services Departments. All public spectator and Olympic Family attendance figures were revised by the venue development team to include a "no-show" factor which was based on information from past Games and estimates from venue staff familiar with the spectating patterns of the particular sport.

Design criteria were very important as they were used by the team architect to size the venue and by the manpower planning coordinator to test the reasonableness of staffing requirements. For example, the number of staff estimated to be on site at any one time determined the size of the staff lounge and staff parking requirements; the number of spectators estimated to enter the venue at any one time determined the size of the spectator entrance, as well as the required

1

2

3

- 3 A plan of the athlete village at the University of California, Santa Barbara.

4 A spectator shops for Olympic souvenirs.

number of turnstiles, ticket takers and ushers; and the number of Olympic Family estimated to be on-site at any one time determined the size of the Olympic Family lounge.

The second phase, departmental input, was divided into two stages: first, gathering information from the departments having a presence at the venue; and second, producing assumption sheets for every department. A team member submitted questionnaires to each department requesting information concerning its operation, space and equipment needs and expected staffing requirements at the venue.

The LAOOC support departments from whom assumption sheets were necessary for the venue development process are listed below:

- Accommodations
- Accreditation/Access Control
- Architecture/Construction
- Awards Ceremonies
- Community Relations
- Corporate Relations
- Design
- Finance (including Internal Audit)
- Food Services
- Government Relations

- Health Services
- Human Resources
- Language Services
- Material Logistics
- Olympic Family Services
- Press Operations
- Public Information
- Security
- Spectator Services (including concessions, ticket collection, ushering and waste management)
- Sports/Competition Management
- Technology
- Ticketing (including patron and spectator sales)
- Transportation/Parking
- TV/Film Operations
- Youth Services

Once the questionnaires were completed and returned, the team members could begin writing assumption sheets for each support department to summarize the information given. The assumption sheet contained a brief description of each department's responsibilities and operating plans at a venue, along with its space and equipment requirements and expected staffing needs.

Due to the complexity of planning required for the departments of transportation, technology and ticketing, these departments submitted detailed plans rather than responding to questionnaires. The transportation plan contained the methods and routes by which each group (athletes, press, spectators and staff) traveled to the venue, parking arrangements and capacities, and special considerations for peak days.

The technology plan listed the types and quantities of equipment at the venue, such as telephones, pagers, Electronic Messaging System (EMS) terminals and printers, radios, photocopiers, word processors and personal computers. A seating plan itemized the total number of seats available for general sales, special sales and Olympic Family. It also detailed the number of seats lost due to obstructed views or camera positions. Charts were included which showed the location of each category of seats. Writing assumption sheets was a critical part of the venue development process. The production of assumption sheets accomplished the following:

- Tested and improved departmental operating assumptions and space and equipment requirements to be sure that each department could produce optimal results while using minimum required space, staff and equipment.
- Compared all assumption sheets so that no functions were duplicated, covered only partially or omitted altogether.

- Ensured conformity on key LAOOC policies.
- Made sure that the venue worked physically. For example, the number of turnstiles, concession stands, restrooms and telephones had to be adequate to service the anticipated number of spectators and that adequate parking was available for staff and Olympic Family.

If additional information or explanation was needed, or if plans conflicted with LAOOC policy or venue constraints, a team member arranged an interview with the department head. Where issues could not be completely resolved within the venue development timetable, the venue team made the best assumption and moved ahead, updating the assumption sheet when the issue was resolved. This commitment to finishing plans on time, even if all needed data was not available, was one of the most important factors of the Venue Development Department operation. As much data was gathered as possible and inter-departmental consensus reached, but only until the venue development plan was due. At that point, decisions were made by the Venue Development Department, based on the available data.

The third phase of the process was the design of the venue.

First, the space program and manpower plan were written from information gained from the assumption sheets. The space program was produced by the team architect, and summarized all information regarding each department's physical requirements at the venue, including requests for types and amounts of space, furnishings, technology, and required adjacencies to other departments. This would be used by the architect as the basis for the site schematic, and also by the Technology and Material Logistics Departments.

A manpower plan was produced by the Venue Development Department's manpower planning coordinator. The coordinator reviewed and summarized each department's estimated staffing requirements from the assumption sheets and scheduled a manpower planning review meeting with a venue development team member and representatives from the venue and support departmental staff. Because the manpower planning coordinator produced manpower plans for all venues and villages, inconsistencies involving job titles were minimized and staffing was kept to a minimum. The completed manpower plan was a summary of all venue staff requirements, including paid, volunteer and contract personnel, by department and by position within each department. The plan also included an organizational chart.

Second, the architect produced a site schematic, a Look plan and budgets for each. The site schematic incorporated decisions and changes made during the venue development process and included boundaries and entrances,

training and competition areas, office and work spaces, parking and transportation systems, hosting facilities, access zones and flows of athletes and spectators.

The venue development team, venue staff and architect spent several days producing a decorative Look plan, based on site schematics, and within a predetermined budget limit for each site. The Look plan specified the type and quantity of Look items such as flags, banners, sonotubes, fence fabrics and tents.

The site schematic and Look plans were reviewed and revised until the venue development team, architect, and venue and departmental staff were satisfied. The team architect then finalized the site schematics and produced the construction and Look budgets. The construction budget itemized the cost of all permanent and temporary physical changes planned at a venue and included the larger Look items and restoration costs. The Look budget itemized the cost of all other (smaller) Look items.

The fourth phase of the process was the production of the venue development plan itself, department head approval of their respective sections and presentation of the plan to the executive operations committee.

First, based on all information gained through the process, the venue development team wrote the following summary sections of the venue development plan:

- Executive summary; an outline of key venue data such as location, dates of operation, seating capacity, budgets, recently resolved (or still unresolved) issues and characteristics which differentiated the venue from others. The summary provided the first-time reader with quick, basic facts of the venue.
- Facilities summary; a detailed physical description of the venue, including fence lines and entrances (spectator, staff, press, Olympic Family and athlete), training sites (if any) and temporary items such as trailers or tents, office and work areas, parking and transportation operations and lounges or hosting areas.
- Major issues and resolutions; a concise discussion of important issues which were resolved during venue development, or which the venue development team was unable to resolve. For each issue, the alternative solutions were presented, along with the one selected and the reasons for that selection.

- Income estimates; an estimate of venue revenues from ticket sales, novelties and concessions and parking fees, if applicable.
- Implementation and construction schedules; timetables indicating when and by whom key activities would be performed between the time of the venue development plan and the time of the Games.

Second, completed sections of the venue development plan were reviewed one final time with respective department heads to obtain their suggestions, resolve any problem areas between departments and obtain their preliminary approval of the plan. If a department's concern could not be resolved in this review process, a one-page dissenting report detailing the conflicts was prepared by the department and included in the plan.

The final step in the venue development process was the presentation of the entire plan by the venue development team leader to the executive operations committee, composed of all or some of the following: the LAOOC executive vice president/general manager, vice president of venue development, vice president of support operations, vice president of architecture, director of security, commissioner (for a sport) or vice president/Olympic villages and the village administrator and anyone invited by the above group. The team leader used site schematics to illustrate the venue, showing the location of each support department, parking, spectator and athlete flow and other items. The above group listened to the presentation, spent several days reviewing the copy of the plan and returned comments to the venue development team. The comments were then addressed in a follow-up presentation, and when all open issues were resolved, the venue development plan was approved by the executive operations committee and became final.

The sections in a typical venue development plan, listed in order of presentation were as follows:

- Executive summary
- Facilities summary
- Sport summary
- Contracts and contract summary
- Major issues and resolutions
- Design criteria
- Departmental assumption sheets
- Transportation plan
- Technology plan
- Manpower plan
- Space program
- Seating plan
- Income estimates
- Construction budget
- Look plan and budget
- Implementation and construction schedules
- Site schematics

The time line for the production of a venue development plan varied depending on the complexity of the plan, however, a typical production schedule follows:

Steps	Time line
Phase I—Introduction	
Background Information	Days 1-2
Contract Summary	Days 2-3
Sport Summary	Days 2-3
Design Criteria	Days 2-3
Phase II—Departmental Input	
Departmental Input	Days 3-9
Assumption Sheets	Days 6-13
Transportation Plan	Days 10-12
Technology Plan	Days 10-12
Seating Plan	Days 10-12
Phase III—Venue Design	
Space Program	Days 11-13
Manpower Plan	Days 12-14
Site Schematic	Days 14-17
Look Plan	Days 14-17
Construction/Look Budgets	Days 16-18
Phase IV—Production, Department Head Approval and Presentation	
Summary Sections and Preparation of the Venue Development Book	Days 16-18
Approval of Department Heads	Day 19
Presentation to Executive Operations Committee	Day 20

The venue development process proved to be very successful, as the approved venue development plans became the actual operational guidelines of the Games. With the completion of these detailed reports, the fabrication and procurement of needed materials, the recruitment of staff and the fine tuning of departmental operating plans began. The plans helped ensure that all venues and departments were ready in time for the Games.

The following factors were found to effect the success of the venue development process:

- The venue development process needed to be clearly introduced and explained throughout the Organizing Committee. Because planning had previously been more decentralized-commissioners and departments each had done their own planning-the transition of moving to a more centralized planning and issue resolution structure was somewhat awkward. Department managers considered themselves experts in their area and feared that the venue development department would make unilateral decisions. The venue development start-up period could have been smoother had all involved people been more confident that the venue development department would avoid making unilateral decisions and would make every attempt to reach a consensus.

- Team leaders were extremely important to the success of the venue development process. Their ability to make logical decisions, communicate and negotiate with numerous departments and direct and supervise team members ultimately determined the quality of their venue development plans.
- Coordination between the Architecture/Construction Department and the venue development department was extremely helpful. The venue development process was much more efficient when project architects became full-time members of the venue development team.

The venue development process ended late in January 1984 and the department became known as planning and control. The planning function of the department continued producing venue development plans for the support sites such as the Main Press Center, the Biltmore Hotel, the Uniform Distribution Center and training sites. In May, venue development plans for these sites were completed and staff were assigned special projects. These included an analysis of security requirements and athlete and staff food service requirements.

The control function of the department was responsible for reviewing requests made by support departments to modify approved venue plans. A document control manager supervised the administration and processing of all modification requests and personally approved or denied each request. If the request was approved, the plan was updated and the requesting department was notified. The majority of modification requests involved manpower; some involved construction. The size of the staff was approximately 15 during the planning and control phase.

37.02.3 Operations in the Games period

Once "venuization" – a process by which venue-oriented teams were formed for the Games period – occurred, venues became autonomous operations under the control of the commissioner. Each venue had to be a self-contained unit with its own services such as medical, health and food. The commissioner's primary objective was to make the Games work. The public's perception of the venue and the overall Games had to be one of a smooth, functioning, integrated event. Therefore, one of the commissioner's major tasks was to integrate the services provided by each of the departments at the competition sites.

However, the commissioner's responsibilities and authorities with regard to each department operating at his venue varied. With some departments, the commissioner had complete authority and responsibility to appoint key managers and make all arrangements. With other departments, the commissioner coordinated and integrated the services, equipment and staff provided by LAOOC central departments into the overall venue operation. Managers from existing LAOOC support departments were assigned to the venue team with the commissioner's concurrence. These managers brought to the venue team extensive knowledge of their area which was needed in planning and operations at that venue.

Months prior to the Games, commissioners held meetings with their venue management team and support department management staff who were assigned to their venue. Much time was spent during these meetings defining departmental responsibilities. Generally, the commissioner coordinated with the following LAOOC central departments for services: accommodations, accreditation and access control, ceremonies, concessions, construction, corporate relations, finance, government relations, health services, language services, material logistics, press operations, public relations, security, technology, television/film, ticketing, transportation, uniforms and youth services.

The commissioner was personally responsible for the following services and appointed key staff to make all arrangements: competition support, community relations, facility coordination (extent of involvement of the venue owner's management staff), maintenance, personnel, VIP services and protocol.

Two exceptions were food service and security. The commissioner did appoint a venue food service manager, but this person implemented a pre-arranged food service plan. The LAOOC Security Department was fully responsible for security at the venue, without input from the commissioner.

The commissioner was encouraged to question anything and everything planned at the site. The commissioner was free to propose changes and achieve consensus with departments impacted by the changes. If the departments did not agree with the commissioner, the commissioner's vice president and the department's vice president decided the issue.

Although the commissioner had overall responsibility for the operation of the venue, each commissioner designed his role in the management structure of the venue: chief executive officer, chief operating officer, host to the International Federations (IFs) and VIPs, competition specialist or venue operations specialist. Any of these roles was fully acceptable as long as competent staff was recruited to handle the remaining functions.

At most venues, however, the commissioner functioned as chief executive officer and delegated the operational responsibilities to the venue manager. This allowed the commissioner time to play host to the International Federation, one of the commissioner's most important functions and one which generally could not be delegated. Because each commissioner had worked closely with the IF for his sport since the time of appointment, the International Federation officials came to trust him with the direct responsibility for the operation of that sport. Thus it was necessary for the commissioner to work closely with the IF during the Games period, since it turned to him for assistance in the staging of the competition itself.

37.02.4 Role of venue management

The commissioner was responsible for assembling and defining the roles of the venue management team. As mentioned, however, at most venues the operational responsibilities were delegated to the venue manager, who in turn, delegated responsibilities where appropriate.

The venue management teams differed from venue to venue, but generally consisted of the following: commissioner, venue manager, assistant venue manager(s), administrative assistant and clerical staff.

Venue management was responsible for educating departments about the needs and responsibilities of other departments. Because venue management was familiar with all areas of the operation, they were able to clarify areas of responsibility for the various venue department heads. This was particularly important just prior to the Games when venue sites and teams first became active on the sites themselves. Several departments turned to venue management as their prime contact for liaison with other departments on the site and for guidance on overall policies.

It was important for venue management to communicate on a regular, daily basis with all service departments within a venue. This included competition management and existing facility management, if any. It became apparent that venue management and competition staff had to work closely with each other and be aware of each other's activities in order to operate the venue smoothly.

37.03 Services in the venues

37.03.1 Administration and management

Venue management was responsible for the coordination of all service departments at the venue. These services included, but were not limited to, concession operations, public information, medical, security, spectator entry, ushers and waste management.

Methods of coordinating the operations of the service departments varied from venue to venue. At some, daily status report forms requested policy decisions, noting any major problems and other observations. These forms, however, were more effective for record-keeping purposes, rather than a method of communications. Problems noted tended to need immediate attention and were usually cleared up by the time the form was submitted. Other venues had meetings on a daily basis that were attended by all department heads. Each department head would give a brief report which focused on exceptional situations and problems that had occurred the previous day, rather than on a straightforward report of events.

Venue management was called upon often by the service departments and many of the problems required an immediate solution. For this reason it was helpful for the venue management office to be centrally located within the venue. Additionally, the delegation of authority from the venue manager to the assistant venue managers proved very effective, as the venue manager was not always immediately available.

37.03.2 Concessions: Food and souvenirs

The organization and management of all spectator food concessions and nonconsumable merchandise sales was the responsibility of the LAOOC Spectator Services Department. At the venues, these functions were to be managed by the commissioner and the venue management team, with strong staff support from the spectator services group. This degree of staff support varied from venue to venue depending on the management style of the commissioner and venue management.

The research and development for food and beverage concessions began in July 1983 and could be divided into two categories: venues with existing concessions and venues without concessions. Where no concession service existed, the agreement between the venue and the LAOOC placed the responsibility for providing concession services on the Organizing Committee. Finding competent concessionaires to provide these services within a short period of time proved to be a difficult task.

In August, September and October 1983 bid specifications and food service plans were developed for those venues that did not have existing concessionaires. Detailed plans for the number of service structures and layouts were formulated. A commission payment structure was determined, based on attendance projections, difficulty of service and number of event days. An invitation to bid on these concessions was sent to potential candidates in early November. Completed specification packages from candidates were required by 31 January 1984, and the final selection was made by the first week in March.

In August 1983 a food and beverage concession symposium was held with the fifteen existing concessionaires to discuss issues such as continuity and high quality of service desired at all Olympic venues, use of sponsor products, menu selections and pricing, sale of alcoholic beverages and the Look of the Games. The LAOOC had an indirect relationship with existing concessionaires whose agreements were with respective venue owners from whom the LAOOC had contracted a rental agreement. Such agreements included the use of the site's existing concessionaire.

During April and May 1984, another series of meetings were held with newly contracted concessionaires to discuss the use of sponsor product, menu, souvenir cup program, sale of alcoholic beverages, equipment, paper goods program, uniforms, financial controls and accreditation.

The menu developed for facilities that would have LAOOC-contracted concessionaires included some unique products with a health image to upgrade typical American concession fare. Some attempt at variety was built into this menu in the form of a line of cold sandwiches. Sponsor products were integrated into the standard menu, if not already part of existing concession menus. Although existing concessionaires offered additional items, the following menu was generally available at most sites:

Concession menu	Price
Hot dog	\$1.50
Submarine sandwich	3.00
Ham and cheese sandwich	3.00
Turkey sandwich	3.00
Roast beef sandwich	3.00
Vegetarian pita sandwich	2.50
Yogurt cup	1.00
Potato chips	.75
M&MS/Snickers	1.00
Frozen fresh fruit bars	1.00
Chocolate chip ice cream sandwiches	1.50
Fresh fruit cup	1.50

The ham and cheese, roast beef, submarine and turkey sandwiches all included four ounces of meat and were served with lettuce on a kaiser roll, except for the submarine sandwich, which was served on a five-inch long Italian-style roll. The hot dogs were each one-sixth pound all-meat weiners. Available condiments included catsup, mayonnaise, mustard and sweet pickle relish. Snack item specifications required ice cream sandwiches of three ounces each, fruit bars of 3.5-4 ounces, fruit cups of five-six ounces and yogurt in eight ounce cups. Potato chips were sold in bags weighing 1.25 ounces each, M&Ms were sold in the 3.03-ounce bag size and four-ounce Snickers candy bars were available.

Two weeks before the start of the Games, Spectator Services conducted a seminar for all venue concessionaires, both existing and contracted. All aspects of operations were discussed, concession coordinators who would be working with concessionaires at the venues were introduced, and instructions in the completion of the daily stand report form used at each concession stand were given. Overall, it was hoped to inject a touch of Olympic fever into the group.

In general, Spectator Services succeeded in achieving a higher level of service and presentation than is the norm at sporting events. The larger, more experienced concessionaires seemed to be better able to handle the pressure of operating during the time of actual competitions. A handful of the newly contracted concessionaires lacked experience which hurt them in their Olympic operations.

Although overall food and beverage sales were good, the following factors could have benefitted concessionaires' operations and financial outcome:

- More up-to-date information on spectator attendance. Some concessionaires overestimated attendance based on sell-outs. It was noted that despite the sale of all tickets for a particular session, a number of ticket holders did not come, decreasing actual attendance from capacity levels. In addition, concessionaires needed to be informed as to venue spectator capacities, as opposed to capacity figures which included seats for Olympic Family, staff and spectator athletes, who obtained food service from other sources.

5

5 First Aid Tents

- The LAOOC policy of only allowing beer to be sold where there was a current license and history of previous sales impacted overall profitability. This was especially true at the outdoor sites, because beer is almost universally sold at professional sporting events in the United States. For example, beer sales were very strong at the velodrome, and no adverse incidents from its consumption were reported.
- The LAOOC decision not to use wandering food vendors in the spectator seating areas during competitions proved costly in terms of lost sales and customer convenience. The design of the spectator seating areas at many of the venues discouraged the spectators from going out once they were seated, so spectators stayed in their seats throughout the competition session.
- Beverage-only lines may have increased sales, particularly at the outdoor venues.

Food and beverage sales (not including baseball, yachting and Exposition Park) totaled in excess of \$10,000,000 for the sixteen day period of the Games. With paid attendance of approximately 4,800,000, per capita sales were about \$2.08. The number of contract staff to operate food concessions in all venues totaled 7,900.

Novelty concessions were contracted with a single joint venture corporation, MCA Corp. and Facility Management, Inc. (MCA/FMI) in February 1984. MCA/FMI handled the development, coordination and sale of all novelty and program merchandise.

Venue Operations and Administration

Once the contract was signed with MCA/FMI, meetings were held with project architects, construction managers, venue managers and spectator services personnel to familiarize all sport commissioners with the operation and to request space and other operational needs. In the following months, stands and trailers were located on site plans and move in dates were scheduled. MCA/FMI then began producing individual operating plans for each venue that included detailed move in and strike schedules and an actual daily operating schedule.

During the Games, a total of 1,200 MCA/FMI staff operated concessions at the venues. Each morning, prior to business, stands were stocked at the venues and merchandise displays were set up. Stands were restocked, if necessary, and cash was transported during off hours. At the end of each day, merchandise was returned to storage and money was turned in.

Overall, the novelty sales operations ran smoothly. Merchandise sales (including programs) totaled in excess of \$9,400,000 (excluding Exposition Park). With paid attendance of approximately 5,200,000, per capita sales were about \$1.80. The LAOOC decision to create new designs for items sold at the time of the Games was a good one. The strongest selling items were event-specific T-shirts, pins, buttons and posters and non event-specific flags, caps and visors. Earlier selection of a contractor would have permitted a more concentrated effort toward selection of commemorative sport specific items to be sold at individual venues. Items such as commemorative-design swim suits, baseballs and soccer balls may have contributed greatly to overall sales figures. This proved to be true at archery where commemorative arrows sold very well, and at cycling where water bottles were in demand.

The daily results program, the Olympic Record, was sold for \$3 at all venues. The four-color cover, high quality program contained results for all events of the previous day and the start schedules for the day of purchase. The program did not sell as well as anticipated which may have been due to excellent local newspaper coverage, but sales did increase once track and field events were in full swing. Total sales at all venues were approximately \$1,184,000.

The following table gives the food and souvenir sales (novelties and programs) and attendance at the 23 venues and Opening and Closing Ceremonies.

<i>Sport</i>	<i>Attendance (turns tile counts)</i>	<i>Food and beverage sales</i>	<i>Souvenir sales</i>
Archery	25,396	\$ 35,918	\$ 75,975
Athletics	1,037,374	2,942,031	1,655,556
Baseball	385,290	N/A	570,945
Basketball	363,579	950,487	896,078
Boxing	227,741	757,792	392,365
Cycling	33,570	112,069	201,834
Equestrian	272,824	925,060	891,650
Fencing/Volleyball	280,367	703,412	875,079
Football			
Rose Bowl	658,586	1,181,686	743,130
Stanford	464,972	439,207	205,910
Harvard	107,014	108,706	57,401
Annapolis	114,956	145,252	84,206
Gymnastics	144,509	243,895	333,596
Handball	49,147	122,409	89,210
Hockey	150,807	265,972	198,312
Judo	23,911	28,782	43,715
Modern Pentathlon	16,125	26,765	52,461
Rowing/Canoeing	71,314	49,487	254,012
Shooting	23,067	58,980	88,310

Water Polo	73,080	98,497	212,869
Tennis	30,603	108,051	91,560
Weightlifting	41,462	51,362	130,829
Wrestling	91,817	181,676	295,574
Yachting	N/A	5,584	24,659
Ceremonies	164,419	361,938	475,996

The LAOOC recognized that the Olympic Games demanded a much higher level of service than normally provided at sporting events. To show their commitment to this, the positions of volunteer concession coordinators and assistants were created to monitor the on-site venue concession operations. Concession coordinators were visual evidence to the concessionaires that the LAOOC was indeed serious about the level of service they provided and the appearance of their stands. Concession coordinators were also in a unique position to assist concessionaires on-site and make sure no obstacles were placed in their way that would impede their performance or level of service. They acted as a liaison between the concessionaires and the LAOOC's venue management.

Concession coordinators did not have an extensive food service or novelty sales background. Thus, potential confrontations over the running of the concession stand between the concession coordinator and the concessionaire were avoided. The coordinators attended four training sessions with concession coordinators assigned to facilities in the same general geographic area. The concession coordinators would then be familiar with neighboring Olympic venues and could theoretically be in a position to cover for a coordinator at another site in the event of an emergency. The training program included sessions in general instruction in food and beverage concessions and novelty and souvenir sales, combined

with Electronic Messaging System training. All concession coordinators also attended at least one on-site orientation to familiarize themselves with locations of all concession stands and the products sold. Once venue assignments were made, concession coordinators also attended individual venue staff meetings.

Overall, the concession coordinator's responsibility was to see that all concessionaires operated in a way that was consistent with the high standards set by the LAOOC. They also made sure that concessionaire records were properly kept.

The concession coordinator program was excellent. The performance of the 67 volunteers was superior.

37.03.3 Medical services

Spectator care stations were available at all venues for use by spectators, press and staff. The primary focus was to provide emergency medical attention so that spectators could be treated and returned to the stadium to watch the Games, or be stabilized prior to transport to a hospital. The level of care provided was a physician managed advanced life support system which is the optimum level available outside of a hospital.

The location and number of stations needed was evaluated on a site-by-site basis. There was at least one spectator aid station at each venue and more at venues with large numbers of spectators. A minimum of 400 square feet was needed for a spectator aid station. This included a registration/waiting area, a treatment area and an observation area which had a minimum of four cots. All spectator aid stations were air-conditioned which was extremely important at outdoor venues. Each station was equipped with a toilet, handwashing facility, refrigerator, television and locking cabinet for drug storage. All spectator aid stations met full outpatient facility standards.

The spectator aid stations were located in highly visible areas, identified by name and the symbol of the American Red Cross. There were also appropriate directional signs to the nearest spectator aid station within the venue. Also, medical personnel were highly visible in their gray and white uniforms with the American Red Cross symbol.

Medical care provided to spectators was always directed by a physician. A licensed physician referred to as the Chief Medical Officer (CMO) was assigned to each venue. The CMO directed and was medically and legally responsible for the medical team at the venue.

Staffing criteria for spectator medical care was as follows:

- One physician per site with 3,000 or more spectators. At sites with more than one spectator aid station, a minimum of two physicians were on duty at all times.
- One emergency care nurse per station.
- One first aid coordinator per site.
- First aid personnel: one team of two persons for up to 8,000 spectators; one additional team for each additional 8,000 spectators. In some locations, this number was increased owing to the nature of the site or other consideration.

At venues with a seating capacity or expected attendance of less than 10,000 spectators, an emergency care nurse and first aid coordinator were under a physician's standing orders to administer appropriate medical care, with the understanding that a physician from the athlete sports medicine station was immediately available and could be reached by radio. At venues with a seating capacity or expected attendance of 10,000 or more, a physician was on staff at the station itself.

The emergency care nurse, under the CMO's supervision, was responsible for the management of drugs and medications, including controlled substances. They were also responsible for documenting patient treatments, medications and procedures administered.

The first aid coordinator, under the CMO's supervision, was responsible for the management of all spectator aid personnel on-site. The first aid coordinator was certified in advanced first aid.

At venues with large numbers of spectators and particularly at an outdoor event, first aid personnel patrolled the spectator area to monitor minor problems and direct more seriously ill or injured spectators to the aid stations. First aid personnel (EMT-I) were recruited, screened, trained and placed by the American Red Cross. There were a total of 361 at all venues. Ambulance service was available at all sites. Additionally, air ambulance service was available at Lake Casitas, Coto de Caza, Fairbanks Ranch and at the Coliseum. Each ambulance was equipped with a switchable hand-held radio which could be tuned to the medical frequency at each venue.

The difference between the level of service provided at the Games and other spectator events was that the Olympic program was managed by physicians and nurses who were able to diagnose medical problems rapidly. Spectator events in the U.S. are usually serviced by emergency medical technicians or paramedics who are only used for acute care cases and crisis-level intervention. Another variation from normal operations was the concept of walking teams which proved helpful in dealing with large groups of people. General use of the walking teams prevented the first aid stations from becoming overcrowded. The walking teams were able to keep the crowds comfortable and calm by treating small first aid problems on the spot and recognizing more serious problems for further treatment. Their presence generated much goodwill.

During the Games, the personnel at the spectator aid stations were able to handle all medical cases that came to them. The use of emergency physicians and ACLS (Advanced Certified Life Support) nurses ensured that the highest possible level of care was available. The field teams of American Red Cross personnel were able to manage the many minor problems at the venues, especially at outdoor events, thus leaving the physician and nurses free to manage the more complex medical problems. This unique multidisciplinary approach was effective in preventing medical problems from escalating and in the treatment of the more severe cases.

Coordination between venue management and venue medical staff helped make the program successful. It was important for the first aid coordinator to have a good working relationship with all venue management personnel. Inviting first aid coordinators to pre-game venue management meetings was extremely important in developing these roles. Additionally, first aid personnel needed to develop relationships with security personnel and ushers to carry out their responsibilities such as being able to move freely in and out of arenas, to make arrangements with security to carry victims out of stands and to coordinate communications.

The results of the program were extraordinary. Out of a total of almost six million spectators, there were no deaths or full cardiac arrests during the 30-day period, and only 200 to 250 people were transported to hospitals. There were approximately 3,800 physician managed cases and 10,000 extended visits to the spectator aid stations. The spectator aid teams coped very effectively with various situations and were able to identify major problems quickly. The vast majority of spectators (50,000) were treated by first aiders and returned to their seats.

37.03.4 Public information

The LAOOC's public information group operated facilities for the convenience of the spectator public. At least one information kiosk was situated at each Olympic venue except Dodger Stadium, where the information booth was handled by Dodger management. At the cycling road race at Mission Viejo there was no formal facility, but there were 10-15 volunteers along the route with signs designating themselves as public information officers. Information kiosks were four-sided conehead booths approximately 30-feet tall, making them very visible amongst other structures. Their color was information yellow, the internationally recognized color for information.

Volunteer coordinators were recruited to staff information booths, and to assume management responsibility for individual venue operations. After extensive training, these volunteer venue coordinators worked with Public Information staff to design plans for venue operations. Plans were based largely on experience gained through participation in the 1983 pre-Olympic events sponsored by the LAOOC. A standardized information manual was prepared for each venue, outlining emergency, community and LAOOC information and policies, along with non-Olympic related resources and agencies that might prove to be of benefit to the visiting public. Additions and alterations to the manual were made by the coordinator at the individual venues.

Coordinators reported to both venue management and the centralized public information operation at the LAOOC's administrative headquarters at the Marina Center. Communications between the Marina Center and the venue coordinators were conducted on a regular basis via a schedule of mandatory telephone check-ins, and

6

6 An information kiosk outside Pauley Pavilion.

required daily EMS reports from the venues. Information collected by Marina Center public information management was also distributed to the venues via EMS.

Each information kiosk was staffed by two volunteers supervised by a coordinator. Where deemed necessary, language-skilled personnel were recruited to disseminate information. To supplement the language capabilities at the kiosks, all information kiosks were equipped with telephones to communicate with the information phone bank at the Marina Center.

LAOOC policy precluded the distribution of printed materials other than officially licensed or LAOOC generated publications at the venues. Therefore, provisions were made to train volunteers staffing venue operations to deal verbally with data including;

- Location of facilities within or near the venue
- Specific information regarding the competition, teams and athletes
- Emergency and critical information (police, fire, medical help, location of service stations, etc.)
- Information regarding community services or tourist attractions
- General Olympic and LAOOC program information (schedules, tickets, Olympic Arts Festival, etc.)

An example of venue-specific information developed by the coordinators to suit the need at their sites was at archery. Because many questions were asked concerning the competition, a target mat, target and all attendant equipment were set up in the public information booth. Public information staff conducted continuous lectures and demonstrations of the equipment. This effort was an overwhelming success and contributed immensely to the success of the event from the spectator's point of view.

7

8

7 Ushers assist spectators at a venue

8 A decorated scaffold tower brightens up the venue.

Public information kiosks also performed the lost and found service for the venue. Custody of items of significant value, such as cameras, watches and jewelry were turned over to the security office for safekeeping. At all venues, procedures for coordinating this activity were developed in conjunction with security and venue management. Lost children who were brought to the public information booth, were taken to the first aid tent.

37.03.5 Security

The objectives of the venue security function were to provide a safe environment for participants, officials, members of the Olympic Family, spectators and employees of the LAOOC, and to maintain order and protect the integrity and spirit of the Olympic Games at all sites.

Venue security was a blend of local law enforcement and private contract security. The LAOOC Security Department coordinated with 56 different law enforcement agencies in the state of California. The degree of success in the area of security of the Games was brought about in part by the activities of LAOOC Security Department in coordinating the total law enforcement effort.

The law enforcement venue command post utilized a location near the LAOOC's venue security office to direct the activities and staffing of law enforcement personnel. The enforcement commander maintained radio communications with agency personnel, with his agency's command post, or with the law enforcement central command post, according to that agency's established procedures.

A venue security office, located within the restricted venue management area of the venue, was in operation during all hours beginning with the opening of the venue for training. The security office was staffed at all times by the venue security manager or his designee, who maintained constant communication by radio or telephone with LAOOC's central security operations center. The venue security office was located adjacent to, or in the proximity of, the venue management office so that the venue security manager could work closely with other venue management.

The LAOOC Central Security Operations Center (CSOC) operated on a 24-hour basis to command and coordinate the general operations of security at all venues. The central security operations center monitored all security operations and provided a decision-making and problem-solving process for all security questions. The majority of problems, however, were solved at the venue level without escalation to the CSOC.

The task of hiring private security was turned over to three independent guard companies which then subcontracted parts of the hiring to two smaller guard companies, bringing the total involvement of companies to nine. In total there were 12,000 private security officers hired and trained to secure the villages, venues, transportation system and training sites. A 33 per cent attrition rate was estimated. Private security was trained in the following subject areas: Olympic security overview, report writing, legal matters, crowd management, accreditation procedures, radio procedures, wearing of the uniform, metal detection device use, law enforcement coordination with private security, post orientation, anti-terrorist awareness, powers of arrest responsibilities, roles of the police and private security, interrogation procedures, use of force, searching procedures and media relations.

All private security officers were uniformed, but not armed. The LAOOC-designated uniform consisted of a blue beret with hat piece badge, tan security officer shirt and trousers, blue belt with gold colored buckle and black shoes. Responsibilities of the private security within the venues included examining accreditation badges and serving as backup to access control personnel, walking fence line perimeters, managing crowds and managing vehicle entry for deliveries. The number of security officers was based on factors such as venue size and location.

Law enforcement personnel were armed police officers both in uniform and plain clothes. They fulfilled law enforcement roles under the direction and control of the law enforcement commander. Private security personnel were not utilized in any law enforcement role, unless acting under the direction of law enforcement personnel. At the venues, 24-hour coverage was provided by 636 law enforcement officers working regular shifts and an overnight shift.

The joint effort by LAOOC security central operation, the venue security manager, other venue management, law enforcement agencies and private security made the individual venue security operations successful. The concept of blending law enforcement and private security proved to be sound and workable.

37.03.6 Spectator control

Spectator control consisted of ticket taking and ushering services at the venues.

The LAOOC Spectator Control Department was responsible for the planning and implementation of a spectator control program. A venue coordinator at each venue acted as a liaison between the LAOOC Spectator Control Department and Venue Management.

Ticket takers were located at turnstiles adjacent to the spectator entry gate. When a spectator entered the turnstile,

the ticket taker checked their ticket for the correct date and session, detached the ticket stub, and gave the spectator the rest of the ticket to keep. At the end of each session, ticket takers took a ticket count and balanced it against their turnstile count. This information was recorded by the ticket taker for each session.

Ushers were located in and around each seating section and assisted spectators to their assigned section, row and seat. Ushers watched that no unauthorized persons entered the bleachers. Additionally, ushers were available to guide spectators to bathroom facilities and concession stands and give them general facts about the venue.

It was found during the Games that a ticket taker can process approximately 1,000 spectators per hour. At large outside venues one ticket taker per 150–200 spectators was required. Spectator control staff (ticket takers, ushers and supervisory staff) at venues totaled 2,762. Of these, 2,015 were volunteers, 237 were paid LAOOC staff, and 510 were contract staff.

At the venues, the Spectator Control Department had to coordinate with several departments, such as ticketing and security. For example, the Spectator Control Department checked the number of spectators who entered through the turnstile against the number of tickets taken, but internal auditing procedures were done by the ticketing department. Additionally, any spectator problems either inside the venue such as two people having tickets for the same seat, or outside the venue such as a handicapped spectator having a ticket for a regular seat were taken care of by the on-site ticketing department representative. Security was needed to back-up ticket takers or ushers having problems with unhappy or unauthorized spectators. Good communication channels were necessary and if not established early by venue management, there was substantial potential for misunderstanding on policy, procedures and authority between departments. However, few incidents were reported and, in general, the ticket collection and ushering functions proceeded smoothly.

37.03.7 Parking and transportation

Each venue was managed by a venue transportation manager, who had dual reporting responsibilities. The venue transportation manager reported on a transportation basis to a senior transportation manager, and on a venue basis to the venue director. Each of the four senior transportation managers were responsible for four to six venues.

Through the venue development process, parking demand was forecast for each venue. The venue transportation planning team designed the parking layout, giving preferential treatment to the Olympic Family and the media. Preferential parking was also provided for staff, except at Exposition Park/USC, UCLA and Long Beach where staff shuttles were necessary.

Staff from the USC Village, swimming, athletics and boxing parked in a vacant 63 acre parcel of ground, which was leased and upgraded to make it suitable for parking. There was capacity for approximately 5,500 automobiles. Approximately 40 special service transit buses running 24 hours per day were used to transport staff.

Staff from the UCLA Village, tennis and gymnastics parked in nearby space leased from the U.S. Veterans Administration. The space could park 2,000 automobiles. The operation of the shuttle was contracted to Santa Monica Municipal Bus Lines. Approximately 15 buses were required during peak times.

Staff from the Long Beach venues (volleyball, fencing and yachting) parked at the World Trade Center lot in Long Beach which accommodated 1,200 cars and a former department store lot which accommodated 400 cars, both of which were leased from the city of Long Beach.

In order to provide adequate control of parking lots, the LAOOC developed a system of parking passes using different color and letter designations, according to the category of the user.

- Olympic Family members' parking passes were purple in color with an "X" designation. The "X" pass allowed vehicles to park in any Olympic Family parking lot at any of the villages, venues or training sites or in the garage adjacent to the Biltmore Hotel.
- Top LAOOC managers had parking passes which were aqua in color and bore a "Z" designation. This pass allowed parking in any lot controlled by the LAOOC.
- Staff parking passes were yellow in color with either a pictogram for the relevant sport or a letter designation such as "MPC" for the Main Press Center. Staff parking permits were not valid in the Olympic Family lots and, in the cases of Expo Park/USC, UCLA and Long Beach, were valid only at the remote parking areas.

- Venue specific parking passes for guests, patron ticketholders or others were magenta in color with the sport pictogram or letter designation of that site. The venue specific parking pass either had no date designated, in which case it was good for the entire period of the Games, or was date specific.

A small number of spaces in the Olympic Family lot for (purchased) press parking were designated at most venues, with a limited additional number of spaces for rights-holding television broadcasters. The LAOOC's media transportation system offered the primary press transport service to all venues at no charge, and drop-off areas were reasonably close to the press entrance or the press sub-center.

Parking pass distribution for site-specific staff was the responsibility of the venue director, who in most cases delegated the task to the venue transportation manager. In some cases, fewer passes were given than staff employed and the venue director or the venue transportation manager made the decision of which staff could park and which staff would have to either carpool, ride the bus or make other arrangements.

Distribution of multi-site parking passes was retained by transportation management. Staff requiring multi-site parking issued a request to the transportation management who analyzed each request individually.

The parking pass was designed to be highly visible to the parking attendant. The parking passes were approximately four inches wide by eight inches long. The letters or numbered designations were bold in black and provided a high degree of visibility. The pass was either affixed to the lower left corner of the windshield or hung from the rear view mirror. In retrospect, greater distinction between the shades of parking pass colors would have been more effective.

A number of vehicles were assigned to each venue under the management of the venue transportation manager. These vehicles were to meet the transportation requirements of International Sports Federation officials. The vehicles were housed on-site overnight and generally were parked in a secured area, usually in the athlete bus compound during off-peak hours. Volunteer drivers were recruited and were retained under the management of the venue transportation manager at each site. The venue transportation manager was then responsible for scheduling the vehicles and the drivers to ensure that the sports officials would be at the venue on time. In general, IF officials were transported from nearby hotels to the venue. However, the commissioner had the flexibility to designate other uses for the venue-specific vehicles.

Public parking was controlled by the LAOOC at seven of the 18 different sites where competition venues were located. The public parking design was prepared by staff from System Parking, Inc., the official supplier to the LAOOC for parking planning and management services. Conservative estimates were used in order to allow for unanticipated demand. This proved to be insightful, as the parking areas at many key sites were stretched to capacity on the last two or three days of competition.

Detailed plans were developed for each venue. These detailed operating plans, developed in most cases by the venue transportation manager, described the number of staff required to handle each parking lot or each transportation function, staff deployment, required equipment such as flashlights, cones, delineators and reflective vests and the manner in which the transportation function would operate.

The operating plans included the scheduling of personnel including rest and meal breaks, insurance reporting procedures, loss prevention, public relations and included a telephone directory of key venue managers and public agency contacts.

To monitor athlete transportation, a loader/dispatcher was assigned to each venue. The loader/dispatcher monitored the arrival and departure of athlete buses and communicated problems to zone dispatchers located in the village. The quantity of athletes arriving and departing the venue was noted to ensure that the athletes' transportation needs were being met.

37.03.8 Waste management

Waste management at the venues was accomplished through a contract with Waste Management, Inc. which supplied both the planning and operation of waste collection and hauling.

An analysis of each venue was carried out to determine if each facility and its existing waste removal contractor had sufficient capacity for the additional Olympic activity. If additional service—either maintenance or hauling—was needed, additional contracts were negotiated. In most cases, particularly at college locations, the existing maintenance department was used.

Venues without existing waste removal contractors were handled directly by Waste Management. Additionally, at all times during the Games, Waste Management provided extra vehicles for emergency service.

**Venue Operations
and Administration**

9 This scaffold marks the pedestrian entry point.
10 Concession stands at Exposition Park.

9

10

Contracts were based on trash quantity predictions ranging from .50 to .75 pounds of trash per spectator which proved to be accurate.

Waste Management used a total of 19 trucks to service the following venues: Coliseum, UCLA, USC, Sports Arena, Rose Bowl, Exposition Park and the Shrine Auditorium food preparation site.

A breakdown of the quantity of waste hauled and stadium capacity for the venues serviced by Waste Management follows:

Site	Pounds	Attendance (turnstile counts)
Exposition Park	275,000	2,400,000*
Los Angeles Memorial Coliseum	601,100	1,037,374 (Athletics) 164,419 (Ceremonies)
Los Angeles Tennis Center/ Pauley Pavilion/UCLA	116,300	175,112
Los Angeles Memorial Sports Arena	320,000	227,741
Swim Stadium/USC	108,000	304,028
UCLA Village	646,700	3,684**
USC Village	778,000	5,689**

*Assumes 150,000 people per day for 16 days
**Total village population, includes athletes and team officials

During the Games, venue management provided good supervision and few large problems were encountered. A total of 2,660 contract staff were utilized to staff all venues and villages.

37.04 Special projects

37.04.1 Exposition Park

Exposition Park was designated to be a center of Olympic activity and served three venues—the Coliseum (athletics), the Sports Arena (boxing) and the Swim Stadium at USC. The park property totals 133 acres and contains four museums, a rose garden, the Sports Arena and the Coliseum as well as large open areas. The park is bordered by Exposition Boulevard to the north, Figueroa Street to the east, Vermont Avenue to the west and Martin Luther King Boulevard to the south.

The practical need to operate an activity and entertainment center such as Exposition Park was apparent for several reasons. The athletics competition schedule dictated that the audience leave the stadium: a period of three hours was usually scheduled between sessions. It was estimated that a peak crowd of more than 80,000 people could enter the park between the morning and afternoon sessions and the surrounding neighborhood did not provide any other major attractions

that could have accommodated that number of people. Even when the Coliseum was filled, there were still ten to twenty thousand people enjoying the activities in the park.

Additionally, given the scattered nature of the Olympic venues, the park provided a central place where people could go to feel the general ambience of the Games. Though it was impossible to actually count the number of people present, 150,000 people in the park on any one given day was not unusual.

The number of people viewing events in the Coliseum (92,000 twice a day) and Sports Arena (16,000 twice a day) required that careful transportation planning be part of any program. In order to facilitate the movement of the RTD and charter buses to the Exposition Park area, a traffic management plan was developed for the area and the surrounding five miles. The plan consisted of the following:

- Freeway off ramps nearest the Coliseum were designated as bus-only off ramps during the period of the Games. The Vermont Avenue exit from the Santa Monica Freeway and the King Boulevard exit from the Harbor Freeway were so designated.
- Vermont Avenue from Washington Boulevard (just north of the Santa Monica Freeway) to King Boulevard near the Coliseum was designated a bus priority street. Similarly, King Boulevard was designated as a bus priority street from Broadway (just north of the Santa Monica Freeway) to Vermont.
- LAOOC constructed two bus terminals immediately adjacent to the Coliseum. A permanent transit facility was constructed on the east side of the Coliseum between the peristyle entrance and Figueroa Street. This facility was constructed by creating a short roadway connecting North and South Coliseum Drive within Exposition Park and provided a bus-only loop entered from the intersection of 39th and Figueroa. Loading spaces for 20 buses were provided at the east transit terminal.

- A temporary transit terminal was constructed on the west side of the Coliseum immediately west of Menlo Avenue between 39th Street and Leighton Street. Buses entered at the south end of the terminal from Leighton Street and exited at the north end via 39th Street. This terminal consisted of three lanes of 10 loading spaces each, for a total of 30 bus loading spots.
- Jefferson Boulevard between Vermont and Figueroa was restricted to automobile access. To facilitate automobile traffic Figueroa and Flower Streets were converted to a one-way operation.

During the Games, the traffic management plan worked extremely well. Buses received priority treatment and were able to handle the number of passengers who rode buses due to the parking shortage in the area. All Park parking lots not used for operations and storage were dedicated to charter bus parking.

The Olympic Look was heavily used in the park to create a fair-like atmosphere. As well as providing uniquely designed concession facilities, the LAOOC decorated the park with over 100 banners and nearly as many painted sonotubes used as markers and in colonnades.

Approximately 70 trees were installed to decorate North and South Coliseum Drive. Five special murals, each 50 feet in length and designed by artist Jon Van Hamersfeld were hung on the back of Coliseum concession stands which faced the park. Eighty-four thousand potted flowers were placed in the park, often in patterns resembling stars and rings. Pavement painting was added to both Coliseum Drive and State Drive.

Decorated scaffold towers were erected at four public entry points—off Martin Luther King Boulevard at the Sports Arena, off Figueroa Avenue between the Aerospace and Afro-American Museums, off Exposition Boulevard east of the Rose Garden and the largest, 135-foot high, at the intersection of Menlo Avenue and 39th Street, just to the northwest of the Coliseum. A fifth scaffold entry tower was erected at the VIP/Olympic Family entry south of the Coliseum on Hoover Street. Pedestrian spectators were directed by signs and fence graphics to pass through or by these towers for entry.

A gateway statue by artist Robert Graham was installed to commemorate the 1984 Games, and the plaza in front of the peristyle was renovated with benches and planting areas in time for the unveiling on 1 June 1984.

Spectator services in the park included food and novelty sales, public information, entertainment and first aid. These services began opening in a phased sequence at 0700 hours and closed at approximately 2200 hours daily.

One hundred and eight 10-foot-square specialty tents were distributed in groups of one to five throughout the park to house novelty and refreshment concessions. They were provided with power, lighting, counters and signage. The majority of the stands were located on Coliseum Drive.

Nine concession coordinators, all LAOOC volunteers, managed the contracted concession personnel, numbering almost 1,000. The concession coordinators' responsibilities included: food and novelty stands, checking prices, verifying opening and closing times, monitoring all operations, enforcing park rules and regulations, observation of Park activities and informing unauthorized vendors of violations.

The food sales were divided between a centralized facility (the Food Bazaar) and numerous (60) tent kiosks distributed throughout the park. A limited menu on a high volume, fast turnover basis was served. The bazaar area was projected to serve 6,000 people per hour and the choices were limited to five different cold platters, chips and soft drinks. All of the cold platters were prepared off-site and delivered to the bazaar area. The Bazaar itself was located in the parking lot north of the bus loop and south of the State Museum. Under three 40-foot-square tents supported by a 110-foot-high aqua tower were five serving counters. A service yard housed five storage trailers. The addition of 46 (20-foot) square tents with sonotube legs and valances were placed in clusters near Coliseum Drive and provided picnic table seating for nearly 2,000. The LAOOC also distributed 400 concrete benches throughout the park. Overall, the food and beverage concession operation was successful. Over the 16-day period, approximate sales at the individual concession stands and the Food Bazaar were \$589,496 and \$223,598, respectively. Revenues from food sales may have increased from beverage-only service lines.

Venue Operations and Administration

Novelty concessions included licensed products sold by 31 LAOOC licensees and by MCA/FMI. Total merchandise and program sales over the 16-day period were \$2,079,308. The types of novelties sold included:

- Sport bags and caps
- Beach towels
- Jewelry
- Balloons
- Bumper stickers
- Crystal
- Stationery products
- Character watches
- Key chains
- Cloisonne pins
- Flags and pennants
- Ceramic mugs
- Belt buckles
- Posters
- Playing cards
- Stamps

A more extensive public information program was planned for Exposition Park than at any other site. Information staff serviced the spectator needs for the Coliseum and Sports Arena as well as the arriving and departing Swim Stadium spectators. Approximately 9,000 questions per day were answered and approximately 30 percent of the questions required responses in languages other than English.

Nine public information kiosks were placed throughout the park. Two kiosks were located at the west side of the park to handle the majority of the spectator arrivals via public bus transportation. Two booths were located near the main entrance of the Coliseum and another near the main entrance of the Sports Arena. Five booths were located near the main street boundaries—Figueroa and Exposition.

Exposition Park was the only venue to use paid public information staff. A total of 66 employees were used; 22 were paid. Thirty-nine were language qualified as follows: bilingual, including: Spanish, ten; French, ten; Japanese, five; German, four; Chinese, four; Italian, two; Dutch, one; Portuguese/Romanian, one; Sign Language, one; Swahili, one.

The entertainment program made a significant contribution to the overall image of the park. The initial concept for entertainment in Exposition Park was to provide a pleasant atmosphere during the periods between the morning and afternoon sessions of the events taking place at the Coliseum, Sports Arena and USC Swim Stadium. This atmosphere of celebration not only kept the visitors amused but, together with the decorations and souvenir and food kiosks, produced an extension of the spirit of the Games of Los Angeles. The entertainment was later expanded to include a two-hour period following the Coliseum's evening session to accommodate spectators waiting for buses and a two-hour period following the Coliseum's morning session to accommodate spectators eating at the Food Bazaar.

The entertainers themselves were chosen from a large pool of talented groups and presented an excellent mix of entertainment which well-represented the multi-ethnic culture of Los Angeles. The program was organized in a short time frame with a modest budget. The format included wandering entertainers performing during daytime hours throughout the park and in the rose garden area. Sixty groups totaling 714 performers gave 127 performances over the 16-day period. The types of performances can be divided into six broad categories as follows:

- Classical/semi-classical music; five groups
- Dance; 17 groups
- Ethnic/traditional music; 16 groups
- Jazz; 13 groups
- Mime/juggling; seven groups
- Other (Marching Drill Team and "Signing" to Music); two groups

First aid was available to provide emergency health care for Exposition Park visitors. Two first aid tents were equipped and staffed to take care of any level of individual problems with off-site response capability for any major multi-casualty incident.

Additional spectator services included:

- More than 400 restrooms and 60 coin-operated (pay) telephones available for public use.
- Sponsors and related organizations had facilities on Coliseum Drive. The U.S. Postal Service had three—24 foot x 26 foot modules and an outdoor cancellation area. AT&T put up a prefabricated calling center. American Express moved in a redecorated drive-in bank. The U.S. Treasury built a specially designed kiosk to sell Olympic coins. Additionally, LAOOC sponsor Anheuser-Busch exhibited their Clydesdale horses northeast of the Rose Garden.
- Four new facilities were planned by the Los Angeles county Museum of Science and Industry in addition to the refurbishment of their existing galleries and exhibits: a new Aerospace Museum, the nation's only Afro-American museum, and a Space Garden featuring a historic look at airplanes and spacecraft and the IMAX theater.

Security at Exposition Park was provided by both private security and law enforcement as at other venues. During the pre-competition period in Exposition Park, there were nine security guards working during the day shift and 18 guards working the evening and midnight-to-early morning shifts. As Exposition Park became

Olympic in appearance, deployment of guards increased to 85 on the day and evening shifts and 45 on the graveyard shift. The Los Angeles Police Department Exposition Park Task Force deployed officers on six overlapping shifts reaching a peak of 78 officers at 1500 hours daily. Security at the park worked well and no major problems were encountered. Even with the enormous volume of people present at any one time in the park, there was no mass crowd behavior. The mood of the people was relaxed and accommodating.

37.042 Services for the physically challenged

The LAOOC's goal was to allow physically challenged individuals—athletes, as well as spectators—every opportunity to share in the excitement of the Games. To accomplish this, the LAOOC obtained approval to include a women's 800-meter and men's 1500-meter wheelchair exhibition event in the Olympic program. Additionally, a variety of steps were taken by the LAOOC to ensure that the physically challenged enjoyed equal access to the Games of the XXIIIrd Olympiad.

The first of these steps was the establishment of the Handicapped Services Department in June of 1983. The department opened with a director who was assisted by the Occupational Therapy Department of Daniel Freeman Memorial Hospital in Inglewood, California. In addition, the director consulted with several other sources such as the Occupational Therapy Association of California, the LAOOC Advisory Commission for Disabled Persons with Disabilities, representatives of the physically challenged community in state, county and local government and local non-profit groups which offer assistance to the physically challenged. It was in cooperation with these qualified groups that the LAOOC developed and enacted policies designed to ensure that the Games were accessible to the physically challenged.

The Ticketing Department, with the assistance of the Handicapped Services Department, developed policies for physically challenged seating to meet the requirements of Title XXIV of the California Administrative Code for both ambulatory and non-ambulatory persons. The LAOOC added wheelchair seating space, wherever possible, at venues which pre-dated the code provisions. Seating for the ambulatory was provided throughout all price selections at each venue in easily accessible seats; non-ambulatory, or wheelchair seating, was located in one specific area at a price equivalent to the lowest ticket price for that session. At most venues, attendant seating for those persons accompanying wheelchairs was side-by-side and folding chairs were provided. One attendant was allowed per wheelchair.

Due to the interest of wheelchair-bound spectators to view the wheelchair exhibition races, overflow seating on the field of play level was offered to the Thoroughly Confident Drill Team and spectating wheelchair athletes.

One of the major responsibilities of the Handicapped Services Department was the evaluation of each of the 23 venues for handicapped accessibility. The Handicapped Services Department reviewed each venue during the venue development process. The director of the department and staff from the Occupational Therapy Department of Daniel Freeman Memorial Hospital reviewed each site plan with the architect and toured the site. In addition, the Advisory Commission for Disabled Persons made an independent review of many of the venues and submitted a report of its findings to the handicapped services director. Areas evaluated included vehicular access and parking, accessibility to seating, concessions, toilets and telephones and the placement of signs displaying the international symbol for the disabled.

Although competition sites constructed by the LAOOC, specifically the Velodrome and the USC Swim Stadium, were easily accessible for the physically challenged, accessibility at some of the other venues was found to be difficult or impossible. This was particularly true at venues which pre-dated Title XXIV of the California Administrative Code. To correct this, construction modifications were made to include the installation of ramps or portable lifts. While most of these modifications were temporary, permanent modifications were made at California State University at Fullerton (handball) and East Los Angeles College (hockey). At Fullerton, ramps were built to make the main entry of Titan Gymnasium accessible. At East LA College, the stadium was modified to accommodate the physically challenged by providing seating and accessible restroom facilities. Additional ramping and telephonic modifications for the hearing impaired were also added in other areas of the campus.

Where existing provisions were judged insufficient for LAOOC needs, additional restroom facilities (portable), telephones and parking spaces were added.

The following table gives the seating capacity and the number of wheelchair seats at each venue.

Sport/Site	Seating capacity	Wheelchair seats
Archery: El Dorado Park	4,500	45
Athletics: Coliseum	92,800	150
Baseball: Dodger Stadium	57,300	76
Basketball: The Forum	17,500	28
Boxing: Sports Arena	5,700	54
Cycling: CSUDH Velodrome	8,500	42
Equestrian: Santa Anita	33,500	65
Fencing: Long Beach Convention Center	3,000	26
Football: Rose Bowl	103,300	48
Harvard	30,500	21
Annapolis	30,000	24
Stanford	84,900	36
Gymnastics: Pauley Pavilion/UCLA	10,800	16
Handball: CSU Fullerton	3,400	15
Hockey: East LA College	20,500	30
Judo: CSU Los Angeles	4,400	19
Modern Pentathlon: Coto de Caza	7,500	52
Rowing/Canoeing: Lake Casitas	10,000	53
Swimming/Diving/ Synchronized Swimming: USC Swim Stadium	17,200	56
Water Polo: Pepperdine University	5,000	20
Tennis: Los Angeles Tennis Center/UCLA	8,800	20
Volleyball: Long Beach Arena	12,000	24
Weightlifting: Gersten Pavilion/LMU	4,200	42
Wrestling: Anaheim Convention Center	7,300	20

On occasion, security requirements created logistical problems for the physically challenged. For example, at Opening Ceremonies, the additional security required for U.S. President Ronald Reagan's attendance created a situation where the area for handicapped individuals was on the opposite side of the Coliseum from where they entered. Because construction modifications could not solve these types of problems, it was decided that the Handicapped Services Department should develop a volunteer program which would offer further assistance to the physically challenged.

A volunteer coordinator was added to the Handicapped Services Department to recruit, orient, train and schedule volunteers. Recruitment was accomplished by means of a letter of invitation directed to the major Southern California rehabilitation facilities to reach allied health personnel currently working with the physically challenged. Training sessions were held at Casa Colina Hospital, Rancho Los Amigos Rehabilitation Center and Daniel Freeman Memorial Hospital to instruct volunteers on LAOOC policies and procedures, venue specific

information, sensitivity training on the various disabilities and the mechanics of orthopedic equipment. Volunteers wore the blue and gold uniform also worn by ushers, with the addition of a magenta armband displaying the international symbol for the disabled. The number of volunteers needed was determined by the number of wheelchair seats per venue which ranged from two to ten per venue. There were a total of 185 volunteers.

Each volunteer had multiple venue assignments and was accredited accordingly. A flying squad of three individuals were used to trouble-shoot and respond to venue-specific problems as they developed.

Volunteers provided physically challenged individuals with assistance with venue ingress and egress, emergency sign language interpretation, concession needs and restroom access. At the outdoor venues, such as swimming, volunteers offered wet towels because of the heat and provided hats for shade. Volunteers

11

12

were located between the handicapped parking areas and wheelchair seating area. A total of 35 wheelchairs were distributed among the venues for the volunteers' use in assisting physically challenged individuals from the parking area to their seats.

The LAOOC also recognized the need to develop a guide which would provide the physically challenged community with the information necessary to help them make the appropriate decisions regarding their functional mobility at the Olympic venues. The LAOOC Handicapped Services Department, again in conjunction with Daniel Freeman Memorial Hospital and the Occupational Therapy Association of California, developed such a guide. At the same time, Daniel Freeman Memorial Hospital developed and published a brochure entitled, "Access Able L.A.: A Guide for the Disabled," which contained information and resources regarding accessibility to a multitude of sites around and about L.A. (including entertainment, motels, shopping, restaurants and other points of interest.) It also contained information regarding wheelchair repair, medical supply stores, transportation, car rentals with hand controls and other travel related needs.

11 The first and third place finishers of the 1500-meter wheelchair exhibition event.

12 Physically challenged athletes at the USC Village.

Venue Operations and Administration

This collaborative effort by Daniel Freeman Memorial Hospital, the Occupational Therapy Association of California and the LAOOC was not only to inform the physically challenged, but also to elevate the awareness of the general population as to the needs and rights of challenged individuals.

A convenient pocket-size brochure entitled, "Physically Challenged Access," contained important facts about services available at all venues, an evaluation of each venue based on information gained during the venue development process, an introduction to the 1500-meter exhibition wheelchair race for men and 800-meter race for women, ticket information for the Games and the Olympic Arts Festival for both ambulatory disabled and wheelchair users, instructions on how to obtain the access guide developed by staff at Daniel Freeman Memorial Hospital and a freeway map showing all 23 Olympic sport venues. Telephone numbers for LAOOC public information, Daniel Freeman Memorial Hospital and for the deaf and hearing impaired were included.

Daniel Freeman Memorial Hospital printed 25,000 copies of the brochure and distributed 10,000 of them along with "Access Able L.A." The LAOOC distributed the remaining guides to physically challenged ticket purchasers. The access guide was also available at several local agencies which served the physically challenged. The Braille Institute received a copy for brailleing.

Guide instructions pertinent to all venues included:

- Trained volunteers would be at each venue to assist, wherever possible, persons with disabilities.
- Sign language interpreters would be available to the hearing impaired to assist in emergency communications.
- First aid stations and public information booths would be available at each venue. U.S. Post Offices at each venue would be ramped.
- Handicapped parking was available at every venue. It was recommended that arrival times be at least one and one-half hours prior to the start of the competition session.
- When attendant seating was located next to the wheelchair seating, only one individual was allowed to accompany each person in a wheelchair.

The one-page accessibility evaluation for each venue reviewed parking facilities, restrooms, telephones and water fountains at each site. Accessibility symbols were used for each of these four areas of consideration. If the symbol was present, it signified that State Building Code regulations regarding handicapped access had been satisfactorily met. If the symbol was not present, special information was listed describing the level of accessibility.

California State Building Code regulations for the four areas included:

- Parking; specially designated handicapped parking areas provided near the entrance to the facility with spaces measuring at least 12 feet in width.
- Restrooms; non-stair path leading to the restrooms, with corridors and entrances which are at least 32 inches wide. Stall doors must measure at least 32 inches wide and the stall itself must be at least 36 inches wide. There is at least 48 inches clear in depth in front of the toilet, allowing closure of the door behind an occupant in a wheelchair. Grab bars must be present and the sink height must be adequate to accommodate a person in a wheelchair.
- Telephone; the height of the coin slot must measure no more than 54 inches, and an open space measuring at least 30 inches by 48 inches in front of the telephone must be provided to allow access for a person in a wheelchair.
- Water fountains; there must be adequate knee clearance for a person in a wheelchair or water dispensers must be provided.

Only one of the venues, the Rose Bowl, met all of the above criteria. Two of the venues met three of the four criteria, and the remaining sites met only one or two of the criteria. An example of the venue evaluations in the physically challenged brochure follows:

"Titan Gymnasium: California State University, Fullerton

Parking is located on the East side of Lot B. This lot can be accessed from State College Drive. A curb cut is available at the northeast corner of the parking lot. The handicapped entrance and ramp are at the northwest corner of the building. Handicapped seating is on the floor in front of the bleachers at the northwest and southwest ends of the court. Attendants may obtain folding chairs from Handicapped Service volunteers in order to sit in the wheelchair seating area. The most accessible restrooms are located in the lobby just outside the northwest side of the competition court and handicapped portable toilets have been installed outside near the handicapped entrance to the building. Concessions are in the lobby and outside in the spectator area. Telephones are located adjacent to the westside entrances.

Water fountains are available in the lobby, but may be difficult for persons with disabilities to access."

Another collaborative effort to aid the physically challenged was the community-based shuttle service provided by the Good Shepherd Center for Independent Living, a South-Central Los Angeles organization. It provided the physically challenged community door-to-event shuttle service to the Coliseum, Sports Arena, USC Swim Stadium and The Forum. Shuttle schedules were arranged by a transportation coordinator added to the Handicapped Services Department. This service was exceptionally helpful and was well received.

By design, original ticket order forms did not include a place to note handicapped seating. When ticket acknowledgements were sent out, special instructions were given explaining the process to request a special seat and a form was included which requested the type of seat needed: wheelchair, wheelchair with aide or other and a place for explanation. It was noted that a copy of a doctor's certificate or equivalent might be requested by the LAOOC at a later date.

In March 1984, the LAOOC announced the addition of the first wheelchair events ever to be included in the Olympic Games and policies designed to ensure the physically challenged spectator access to the Games:

- The LAOOC would accommodate all reserved and wait-listed ticket requests received at that date for wheelchair spaces in all sessions. For sold-out sessions with wheelchair space still available, the LAOOC would review its files for wheelchair-bound applicants who failed to get tickets in the random selection process, and eligible customers would be notified that their orders can now be filled. Special seating would be provided for wheelchair users.
- The price of all physically challenged seating, both wheelchair and ambulatory, was set at rates equivalent to the lowest-price ticket for that session, and refunds were made accordingly.
- Parking for physically challenged spectators would be provided as close to the competition venues as possible, with parking attendant service at each venue to direct challenged spectators to special

parking areas; the word "wheelchair" would be printed on the tickets for individuals needing special parking.

- In addition to wheelchair spaces allocated through the mail-order ticketing system, about 1,000 wheelchair spaces were to be filled through the Olympic Patron Program. This program was created to provide a means for thousands of youth, senior citizens and physically challenged persons who might otherwise be unable to attend the Games, to go as guests of the LAOOC. Recipients were selected by the LAOOC Youth Services Department with the assistance of the Handicapped Services Department.

Tickets were accompanied by a "Ticket Buyer's Guide" explaining specific information for the physically challenged, such as parking, the availability of handicapped services volunteers and where to request a copy of the physically challenged access brochure. Tickets for wheelchair seating and accompanying aide seating were specially marked. The accompanying aide was required to have the specially marked ticket and was provided a folding chair by a handicapped services volunteer. Ambulatory physically challenged persons received specially marked tickets for assigned seats in easily accessible areas.

Because tickets were ordered so far in advance of the Games, conditions arose where spectators who did not request special wheelchair seating required it, and spectators who required wheelchair seating no longer needed it, and preferred a seat. When this occurred, venue management exchanged the spectator's ticket. The LAOOC did, upon request, issue a refund for the difference in cost between a seat and a wheelchair space.

It is recommended that original order forms have a place for a person to request a "wheelchair seat." This would allow easier identification and more time to be sure the correct tickets are received.

In summary, the combined impact of the services provided for the physically challenged spectator far exceeded the level of service found at almost any prior sporting event. Construction modifications, the volunteer program, the shuttle service, specialized access brochures and the quantity of physically challenged seating and parking afforded the physically challenged community an excellent opportunity to experience the Games first-hand.

38

¹ The LAOOC's youth archery program raises interest in a sport that is little known to most Southern Californians.

38.01 **Concept and goals**

The Los Angeles Olympic Organizing Committee's approach to youth programs in the Games of the XXIIIrd Olympiad differed significantly from those of past organizers in that an academic, cultural and sports program extending over a four-year period was offered to area youths rather than the usual three-week program centered around the Games themselves.

Previous Olympic organizers had developed International Youth Camps as part of the Olympic program, and had from 1,000 to 1,700 young men and women, aged 15–25, participate in a three-week-long program focusing on sports, cultural exchanges and activities and attendance at Olympic events.

In a radical break from a tradition that dated back to 1912, the LAOOC sought to expand the youth program offerings beyond the traditional three-week Youth Camp into a four-year series of programs designed to involve thousands of youngsters. Moreover, the LAOOC decided not to host a youth camp at all, but rather, put their energies toward long-lasting educational, cultural and sports offerings involving more than one million youths, aged 12–17, in activities that would bring the children into the Olympic movement well before the Games and would keep them interested in and motivated by the Olympic spirit both during and in the years after the Olympics.

The LAOOC presented its Youth Program ideas to the International Olympic Committee in Moscow on 16 July 1980, and received approval to initiate its plan. Following the Moscow IOC meeting, a Citizen's Advisory Commission on Youth Activities was chosen. It was composed of individuals interested in youth activities from city and county government, private agencies and school districts. The group was charged with completing an assessment of youth sports participation in Southern California.

The results of the assessment indicated that 90 percent of the youth surveyed engaged in baseball, football (soccer) or swimming, but that

participation was extremely low in other Olympic sports. The study also showed that once youngsters reached the junior high school level (age 12), organized sports activities existed only for a minority of elite athletes and that there was little or no organized activity for the majority of youth.

At this point, the goals of the Youth Programs Department became clear. A program would be developed to encourage youth to learn about the Olympics, to participate in Olympic-related activities, and most of all, to continue their involvement after the Games ended.

To this end, the LAOOC developed sports, educational and cultural programs targeted primarily for the 12 to 17-year-old age group. Programs were developed for sports which were lesser known in Southern California so area youngsters could understand the Olympic Games, identify with the athletes and begin to develop interest and expertise in a variety of sports for future Olympic Games participation.

The second goal of the program was to leave a legacy for youth activities in Southern California by donating sports facilities, equipment, educational material and teachers' guides to school districts, municipalities and private organizations.

The final goal of the Youth Programs Department was to enlist the financial help of sponsors to make all of the programs self-supporting.

38.02 **Development of the Youth Program scope**

38.02.1 **Patronage for existing programs**

The Los Angeles Olympic Organizing Committee decided to begin the Youth Sports Program in the spring of 1981 in connection with the ARCO Jesse Owens Games. The ARCO Games had been an existing national track and field program for 15 years and had drawn participants from neighborhood recreation departments, Boys and Girls Clubs and local schools. The LAOOC saw it as a model existing youth sports program because it already had a wide base of participation.

The concept of using existing, well established youth programs benefited both the LAOOC and the respective organization. The youth program was provided with immediate identification with the Olympics through LAOOC-sponsored programs which often included appearances by *Sam the Olympic Eagle* and former Olympians during competitions and awards ceremonies and the use of special promotional materials. The LAOOC benefited from the agreement by becoming involved with an already existing program and instantly exposing a strong youth cadre to the spirit, rules and traditions of the Olympics and Olympic sports.

In patronizing existing youth programs, the LAOOC became the catalyst that brought different agencies together for the advancement and growth of youth sports. The best example of such work occurred in football (soccer). Before the LAOOC became involved, two powerful youth soccer organizations existed in Southern California: the American Youth Soccer Organization and the California Youth Soccer Association.

There was a great deal of animosity between the two because one group had never been affiliated with the national governing body and the other had. The groups were organized independently of each other, but both drew competitors from the same areas in Southern California.

The LAOOC decided to host one tournament and invite teams from both organizations under the sanction of the United States Soccer Federation. In 1980, the first tournament was hosted but teams from only one organization competed. The second year, however, both groups participated and began a most successful three-year series of local and regional tournaments. During that time, more than 47,000 boys and girls were able to participate in an Olympic-related celebration, and the LAOOC was able to bridge the gap between rival organizations to benefit youth football.

A different goal was reached with the LAOOC's participation in youth swimming. Thousands of young swimmers have historically competed in recreational programs in Southern California for various city, county and private organizations. Most swimmers competed only during the summer months.

The LAOOC brought together six youth swimming organizations in 1981 and, with the McDonald's Corporation, hosted the first Olympic Youth Swim Meet. It was the first event where all youth swimming organizations in Southern California were invited to compete in one large swim meet. It also provided the framework for different agencies to combine their efforts to produce one event. Other goals of the swim program were to stimulate interest of the youth athletes on a year-round basis, to promote participation in the meet the following year and possibly inspire training for future Olympic Games.

The program was held annually for four years. The 1983 competition was the first swim meet held in the newly constructed Olympic pool at the University of Southern California.

38.02.2 **Sponsor support for new programs**

All of the Youth Program offerings were made possible through sponsorship agreements with various companies and corporations. Approximately one-half of the official Olympic sponsors agreed to sponsor youth activities as part of their commitment to the LAOOC. The agreed-upon credit for their youth involvement, in most instances, became the operating budget for the

2

appropriate unit of the Youth Programs Department. This helped the LAOOC realize the goal of eventual self-support for all of its youth programs.

Original Olympic sponsors were selected after careful research and, in most cases, only if they had a clear history of involvement with youth and/or community activities. Some corporations such as Coca-Cola, Converse and McDonald's already had extensive existing community programs and their LAOOC youth commitments merely meant adding the prestige and momentum of the Olympic Games to their ongoing youth programs.

Once the sponsorship was finalized, a representative of the Youth Programs Department met with the appropriate corporate representative to plan which sport or activity to sponsor and the terms of the sponsorship. In most cases, the sponsors did not have the capability of staging youth programs, so they relied on the LAOOC almost exclusively to organize and manage the events.

The LAOOC offered the sponsors high visibility without major advertising

expense, as well as the right to use the title of the program they were sponsoring for their own commercial advertising. For some corporations, such as Atari, Levi Strauss, Coca-Cola and Converse, the participants in the programs represented a primary age group in their market, hence their eager involvement. The image of the Olympic Games associated with their products was also positive for the sponsors.

The sponsors' involvement in each youth activity varied greatly, depending on the state of the program at the time the sponsor became involved. In football, teams, uniforms and the structure of the tournaments were already established. Therefore, the LAOOC and Coca-Cola decided to donate soccer balls, permanent goal posts and linemarkers.

Many of the youth programs had to be started from scratch. The LAOOC was firm in its desire to start youth programs in each of the Olympic sports and in cultural and educational areas as well.

A strong working relationship, begun in 1981 between the Easton Aluminum Company and the LAOOC, epitomized the kind of youth legacy that could be effected by such a partnership. Easton, a local manufacturer of archery shafts, funded the \$325,000 construction of archery ranges at the Cheviot Hills

Recreation Center (opened 24 April 1982) and at the Sepulveda Dam Recreation Area (opened 21 May 1983).

Once Southern California had the facilities, the Olympic Youth Archery Program started attracting youth. The LAOOC paid a local archery instructor to train adult volunteers at both sites and then set up the ranges so they could be run by these volunteer coaches. Designed to expand the level of participation in archery as it is practiced in Olympic Games, the program provided more than 7,000 youngsters with free instruction and equipment from 1981-1984. In addition, the groundwork was laid for the construction of one new archery range each year through Easton Aluminum.

A primary goal of the LAOOC's Youth Programs Department was to forge agreements that would prove mutually beneficial to both sponsors and the youth agencies, recreation departments or clubs. It was anticipated that this kind of successful, highly publicized involvement would nurture continuing support and interest from the sponsor even after the Games had ended and the LAOOC had ceased operations.

2 Sam the Olympic Eagle is a favorite of children of all ages at LAOOC-sponsored youth activities.

Youth Programs

3

4

5

3 A group of young boys and girls gather to learn techniques of running.

4 More than 70,000 pieces of art created by 100,000 children are part of the Olympic art program.

5 Children's art, such as shown here, was combined into collages to welcome athletes and visitors to Los Angeles.

Levi Strauss and Company underwrote the project and earmarked \$70,000 as a special awards fund to be divided among schools with the largest percentage of participating students. More than 70,000 pieces of art created by 100,000 elementary school children in Los Angeles, Orange and Ventura counties were judged by a panel composed of men and women active in the Southern California arts community. The panel selected the top students' works for inclusion in 15 large collages, each eight feet by four feet. Welcoming athletes and Olympic visitors to Los Angeles. Throughout the Olympic year, the collages were on display in prominent public places and at the Olympic sites. More than 11,000 individual artworks were given to arriving athletes as special welcoming gifts from the children of America.

First Interstate Bank chose to sponsor art competition for youth in grades seven through twelve (ages 12–18). More than 10,000 students in eleven western states submitted Olympic Sports illustrations in district, county and statewide competitions. Winners of the statewide competitions were forwarded to the LAOOC for grand prize competition and the chance to compete for \$12,000 in scholarship funds. The three grand prize winners' posters were reproduced and displayed with the children's art project winners throughout Southern California.

38.03.2 Band and drill team competitions

The LAOOC sponsored Olympic Youth Band and Drill Team competitions for 39 schools from 1982 through 1984. In 1984, high school entertainment units from Los Angeles, Orange, Ventura and Riverside counties competed for the coveted title of "Official Olympic Youth Band."

Each year the winning band and drill team had the opportunity to play at many pre-Olympic ceremonies and events, including the opening of the McDonald's Olympic Swim Stadium, the Murray/7-Eleven International Cycling Invitational and the dedication of the track at the Los Angeles Memorial Coliseum.

38.04 Educational programs

The educational programs developed by the LAOOC reached more than 500,000 students from 1981–1984. The offerings consisted of curriculum materials and workshops, Academic Decathlon competitions, the distribution of the "Olympic Youth Handbook" and an Olympic Encounter program.

38.03 Cultural programs

The cultural component of the Youth Program included art competitions and projects for children and teenagers, as well as band and drill team competitions for secondary school students.

In 1983, the Citizens' Advisory Commission on Youth Activities recommended that the LAOOC provide activities for all Southern California youth, not just the sports-minded. The recommendation became one of the strongest goals of the Youth Programs Department. The LAOOC tried to provide a well-rounded offering of programs and events that would touch the greatest number of youth, regardless of which school they attended, how well they did on the playing field or which musical instrument they played.

38.03.1 Art competitions and projects

As with other Youth Program elements, the cultural component used corporate sponsors to maximize its exposure and offerings.

Levi Strauss and Company was asked by the LAOOC to develop a community involvement project. Levi's chose to create a project that would bring the values of the "Olympic Spirit" to very young children and would benefit the school systems in Southern California.

The Levi's/LAOOC Olympic Children's Art Project was launched in February 1983, with the mailing of almost 10,000 packages of classroom materials to teachers who had requested them. Confined to grades one through six (ages 6–11), the packages detailed the history of the Games, cited outstanding examples of Olympic spirit drawn from past Games and integrated this information into the fine arts curriculum.

The goal of the educational offerings was to urge the schools to educate the students of Southern California about the Olympic Games and ideals of the Olympic Movement. The LAOOC wanted the youth community to become familiar with the general history of the Olympic Games and the Olympic principles of self-respect, mutual understanding and international friendship. The program received wide support from school administrators, curriculum specialists and teachers.

38.04.1 Curriculum enrichment materials and workshops

The LAOOC was able to capitalize on two projects previously funded by the United States Office of Education to benefit its educational program offerings. Originally developed by the United States Olympic Committee, the curriculum enrichment project tied a number of academic fields to the Olympic Games. The curriculum program from kindergarten through grade six was carried out by the New York State Department of Education. The program for students in grades seven through nine was conducted by Georgia State University with the cooperation of the Georgia State Department of Education. Once the materials were field tested in both states in 1980, the information was revised and edited into a uniform style and format.

Whereas the United States Olympic Committee had printed only 5,000 copies of the old curriculum materials, the LAOOC was able to take the tested information, revise it slightly, reprint it and provide a helpful classroom edition in a relatively short time. The LAOOC had more than 50,000 copies of the materials printed, and in 1983, the project expanded to include grade levels ten through twelve (ages 16–18).

The curriculum program was designed to assist the teacher who had limited time for research into Olympic matters. It offered a practical application of Olympism as an educational program designed to capture the values inherent in competitive activity while enhancing the regular instructional objectives of the classroom.

In addition to the curriculum guides, other background materials were provided to educators who requested them. Items such as pamphlets describing the history of the Games, newsletters, venue maps, art packets, posters and media guides were mailed to more than 16,000 teachers and librarians in the United States and abroad during the 1983–1984 school year.

To introduce educational materials to teachers and administrators, the LAOOC sponsored eight "Olympic Curriculum Workshops" in cooperation with the offices of the superintendents of the Los Angeles County, Los Angeles Unified, Orange County and Ventura County School

Districts. Offered during the 1983–1984 school year, the workshops were designed to enrich studies in art, health education, language arts, mathematics, music, physical education, science and social studies.

The workshops were led by local curriculum specialists and youth program staff members, and sessions often included remarks by former Olympians and audio-visual presentations. All sessions of the workshops were offered at no charge, and participants received individual packages of Olympic information supplied by the LAOOC. A total of 1,750 school personnel attended the curriculum workshops.

38.04.2 Olympic Youth Handbook

After two and one-half years of preparation, the Official 1984 Olympic Youth Handbook became available in January 1984. Designed as a student's personal guide to the Games, the publication was distributed to fourth through eighth graders (ages 9–13) in Los Angeles, Orange and Ventura counties.

The handbook was a joint venture of the Junior League of Los Angeles and the LAOOC. It offered youngsters a glimpse into the origin of each Olympic sport, the basic rules of play, description of the necessary equipment and suggestions on how to become involved in each sport.

The Junior League was responsible for researching and writing the handbook. The LAOOC performed final editing duties and arranged for Jeffries Banknote to print more than 500,000 copies. Teachers' guides for different grade levels were also developed and published. These guides tied the curricula of history, science, math and physical education into the Olympic Games.

The 170-page handbook was also sent to public libraries in Los Angeles, Orange and Ventura counties for reference use and for normal lending distribution.

38.04.3 Olympic Encounter Program

In 1982, the LAOOC established the Olympic Encounter Program designed for junior and senior high school students. While visiting 100 schools, 1960 Olympic decathlon gold medalist Bill Toomey and 1972 British Olympic decathlete Barry King emphasized the excitement of the Olympic Games as well as an appreciation of the events that would dominate the summer of 1984. Toomey and King also informed the students about the on-going youth program activities and how they could become involved.

The program proved premature in its efforts to educate and excite the youth of Los Angeles about the Olympics. Most of the students knew the events were going to take place, but since the Games were two years away, the program had no real impact.

After the 1982–1983 school year, the Olympic Encounter Program was fused with the Grow With the Olympics program which proved to be very successful.

6 A youngster breaks the tape at one of the LAOOC's youth athletic competitions.

Youth Programs

38.04.4

Academic decathlon competitions

In a program designed to test intellectual strength on the high school level, the LAOOC co-sponsored Academic Decathlon competitions within the Los Angeles Unified School District. In 1981, the first year of competition, 36 Los Angeles high school teams competed in 10 categories. These included: conversation, expository composition, formal speech, career education and consumer awareness, English and literature, fine arts, mathematics, social sciences, physical and life sciences and a super quiz on energy.

Participation in the second Academic Decathlon, held in 1982, increased to 46 schools. The contest determined the Los Angeles Unified School District's representative to the California State Academic Decathlon. The LAOOC also sponsored the first Academic Decathlon for Los Angeles county schools the same year.

With the strong desire to involve as many youth in Olympic-style competition as possible, the LAOOC and Coca-Cola aided the school districts once again in 1983. In the largest Academic Decathlon ever held; all 51 schools in the Los Angeles Unified School District participated. Los Angeles County had 35 high schools participate and, for the first time, 15 Ventura County schools competed. The 1983 competition featured a super quiz on the subject of the "Olympic Games." All three districts sent winners to the California State Academic Decathlon. During the three years of competition, the programs involved more than 2,300 high school students.

38.05

Sports programs

During the period of 1981 through 1984, the Los Angeles Olympic Organizing Committee and its commercial sponsors staged instructional and competitive opportunities in 14 youth sports.

The basic goal of the Youth Sports Program was to expose young people to sports as they are played in the Olympic Games. Many of the sports were familiar to Southern California youth, but others such as team handball were introduced for the first time.

The programs served more than 485,000 young people who were involved in archery, athletics, basketball, boardsailing, boxing, football, gymnastics, team handball, judo, sailing, swimming, synchronized swimming, tennis and volleyball through local or national programming.

A majority of the sports offered instruction and competition for youth 12-17, although some sports offerings were for children as young as seven. All of the programs were designed for both boys and girls.

The basic format of all the programs provided for a registration or enrollment period for each sport. In most cases, the children could enroll independently or through a local recreation center. A period of instruction was followed by actual competition. All programs were offered at no charge.

The athletics, basketball and football (soccer) programs offered national competition. Most of the programs, however, were regional or local in nature. All of the sports programs were offered on a seasonal basis except judo, gymnastics and archery which were offered year-round.

Most of the programs offered instruction and competition at decentralized sites throughout Los Angeles and then scheduled major tournaments which all participants were encouraged to attend. Youngsters were given one hour of instruction for every two hours of instructional tournament play.

T-shirts and certificates or patches were given to all participants in each sports program. At tournaments or meets, youngsters competed for gold, silver and bronze medals in each age group. Olympians were often present at major competitions to address the young participants and award medals.

Youth participation by sport varied greatly. In the sports of judo, sailing and archery, the total participants in each numbered in the hundreds, since the programs were only offered in Southern California, and the sports were not traditionally popular. In the sport of football, however, activities were national in scope. In one tournament during the summer of 1983, 22,000 players participated.

In addition to providing youth with opportunities for sports involvement, the LAOOC was able to leave the Southern California communities with significant amounts of sports equipment. In archery, two new ranges were constructed with help from Easton Aluminum. Other equipment included 300 new basketballs donated mostly to YMCAS, 30 sailboards given to recreation and parks departments, 700 judo mats and 320 judogi to Girls and Boys Clubs and recreation areas, 40 small boats and three whalers with outboard motors to three recreation departments, and assorted other sports equipment to local schools and agencies.

The following is a short description of each of the youth sports programs:

Archery

The Easton Aluminum Olympic Archery Program was designed to expand the level of archery participation as it is practiced in the Olympic Games. The program provided free instruction and equipment to approximately 7,000 young participants. Started in 1981, the program provided youth archers with practice facilities and meets at two newly constructed ranges in Southern California at distances from 18 to 90 meters. The program also provided for the training and development of adult coaches.

Athletics

Youth interested in athletics were able to participate in the ARCO Jesse Owens Games from 1981 through 1984. The program was co-sponsored by the LAOOC. Preliminary competition began in the spring in metropolitan areas throughout the country and ended in late summer with a championship meet to which all regional winners were invited. In the summer of 1984, the championship meet took place in San Diego at the same time the Olympics were being held in Los Angeles. One of the largest and most successful of the youth programs, the Jesse Owens Games, attracted more than 300,000 youngsters up to the age of 15.

Basketball

The Converse Olympic Youth Basketball Tournaments consisted of three-on-three competition for boys and girls ages 12-17. The program previously had used a five-on-five player format, but with the LAOOC's recommendation, Converse changed it. After the change, the tournament attracted more participants since it became easier to form teams. The youth basketball program was one of five sports which did not provide instruction to the participants. Each team consisted of four players, only two of whom could represent the same school. Tournaments were held from 1981 to 1984, involving approximately 65,000 youngsters.

Football

The LAOOC and Coca-Cola sponsored one of the world's largest football tournaments in 1983. The tournament took place during the entire month of August with nearly 750 teams competing in Southern California and another 450 teams entered in Northern California. After three years of competition in California, the program expanded to include two East Coast sites in 1984. The tournaments were held for existing teams only and for players ages 7-19.

The program brought together for the first time teams from the American Youth Soccer Organization and the California Youth Soccer Association. It was a very successful association, under the sanction of the United States Soccer Federation, that benefited both the players and the organizations.

Gymnastics

The American Express Olympic Youth gymnastics program began in 1983 with beginning and intermediate instruction at six gymnastics centers in Southern California. Girls, ages 8-17, were given instruction on the balance beam, uneven parallel bars, vault and floor exercise area. Boys ages, 11-17, learned basic gymnastics routines on the rings, vaulting horse, pommel horse, horizontal bar and floor exercise. Highlights of the program were the local and regional meets where the students competed against their peers for Olympic medals. Gymnastics was perhaps the most popular of the youth programs offered since the classes quickly filled. During the two years of instruction, approximately 1,000 youngsters participated.

Team Handball

The Arthur Young Olympic Youth Team Handball Program posed possibly the largest obstacle to the LAOOC staff. Not well known in America, handball was initially introduced to physical education instructors from Los Angeles Unified School district junior high schools. The workshops were conducted by LAOOC handball staff members for five consecutive weeks, beginning in October of 1983, and were designed to provide instructors with the rules and fundamentals of the game.

As a result of the instruction program, three of the five schools incorporated handball into their school's physical education curriculum. By 1984, the program expanded to include schools in Los Angeles, Orange and Ventura counties. At that time, 19 junior high schools, five senior high schools and two Boys and Girls Clubs were competing.

Besides the instruction for coaches and referees, the program also provided each school with the necessary equipment. It is estimated that more than 8,000 students learned and participated in the game of handball during the program.

Judo

The Maruchan Olympic Youth Judo program began in 1983 at six sites in Los Angeles and Orange counties. The year-round program was oriented toward the beginning judoka. The programs began with the presentation of a judogi to the student after good attendance records had been achieved. The program emphasized basic judo fundamentals for boys and girls, ages 7-17, and offered the youngsters the opportunity to participate in periodic tournaments. Excelling in the tournaments helped the youth advance in belt degrees.

All regularly attending students were registered by U.S. Judo, Incorporated and California Judo, Incorporated in order to be eligible to compete in tournaments. In the first Maruchan Olympic Youth Tournament, open to all club teams and novice judoka, 44 of the 300 participants were novices from the Maruchan program. During the 18 months of the program, 7,000 student were enrolled.

Swimming

The McDonald's Olympic Youth Swim Meet was held annually from 1981 to 1984. The LAOOC was successful in its attempt to bring together six different swimming organizations to work together and stage one large swim meet at the end of each summer.

Each year the championship meet attracted 1,000 recreational-level swimmers competing in freestyle, breaststroke, backstroke and butterfly, as well as freestyle and medley relays. The competition was open to boys and girls in five age divisions ranging from eight and under to 15-17. To enter the meet, students had to meet certain qualifying times in summer swimming activities at local pools.

The 1983 competition was held in the new Olympic Swim Stadium, site of the swimming and diving competition during the 1984 Olympic Games. The meet drew 3,500 spectators.

The program involved more than 35,000 swimmers during the four years. The Buick Motors Synchronized Swimming Meets were held in 1983 and 1984 as part of two multi sport Olympic Youth Sports Festivals. Competition was held for solo, duo and trio routines for synchronized swimmers, with more than 1,500 young swimmers participating during the two-year time span.

Tennis

The Transamerica Olympic Youth Tennis Program was offered to boys and girls, ages 9-17, during the spring and summer of 1984. All participants were taught the basic fundamentals of the game and special clinics were available on strategy and competition. The students met three hours per week.

At the end of the six-week session, a championship tournament was held. All participants also received free membership in the United States Tennis Association, including a one-year subscription to *World Tennis Magazine*. The membership enabled each student to continue playing in tournaments year-round. The tennis program enrolled approximately 1,500 boys and girls.

Volleyball

The Atari Olympic Youth Volleyball Program was established for beginning- and intermediate-level volleyball players ages 12-17. Play was conducted at 17 different sites throughout Southern California. The program attracted young persons from Santa Barbara to San Diego and, in one instance, included teams from Northern California.

7

The program format consisted of individual instruction, six-person team instructional leagues and tournaments. The beginning/intermediate tournaments brought together the winners from each site in each of the three age divisions in both boys' and girls' classifications. The program's culminating activity was the Atari Olympic Youth Volleyball Championship which brought together teams in both instructional and open-league competition. The program exceeded the original estimate of 2,000 participants, with approximately 5,500 young persons involved in the volleyball activities.

Yachting

The United Airlines Olympic Youth Sailing Program provided instruction including: safety terms and precautions, boat handling and navigation techniques and introduction to competitive sailing to youths between the ages of 12-17. The program ran successfully for three summers and, in 1984, also included boardsailing instruction.

The courses were organized into five-day sessions which took place at three water sites in the Los Angeles and Long Beach areas. Each summer the most promising young sailors from each site who had received at least 15 hours of sailing and water safety instruction were eligible to be selected as one of 60 participants in the final regatta. The 1983 sailing competition was held on a modified Olympic Triangle Course in Long Beach, site of the 1984 Olympic Yachting competition.

7 The United Airlines Youth Sailing Program provides instruction in boat handling and navigation techniques to young sailors.

Youth festivals

Besides offering competition and instruction in the individual and team sports, the Youth Programs Department held three Olympic Youth Sports Festivals to expose the youth of Southern California to the festival-type atmosphere of the Olympic Games. Each year the festival was held over a two-day period at a single site and involved up to five different sports. The event was usually held in late summer as a culminating activity to months of instruction and competition.

Each festival included a complete opening ceremony with a parade of athletes as well as awards ceremonies for each individual sport. The program offered different sports each year depending on the facilities available at the site chosen. Athletics competition was offered every year, with a combination of basketball, synchronized swimming, gymnastics, archery, football and judo offered when facilities permitted.

The festivals were for boys and girls, ages 7–18, and attracted as many as 3,000 youths who participated in a single festival and approximately 7,000 youngsters altogether.

The LAOOC youth sports offerings proved to be very popular with the youngsters of Southern California. The LAOOC combined popular sports with the less popular sports in its effort to have the Olympic Games touch as many young people as possible.

The sports offerings were a mix of existing programs managed by established youth organizations and new programs which were initiated by the LAOOC. Most of the sports programs included some instruction and all were offered to boys and girls. Oftentimes the sports included tournament play so the youngsters could experience the competitive ideals of the Olympic Games.

The program successfully accomplished all of its goals with the exception of starting youth sports activities in all 23 Olympic sports. The program did, however, offer some sports over a four-year span which contributed to the tremendous number of youngsters reached overall in the program.

38.06 Special projects

The LAOOC's Youth Programs Department was involved in a number of special projects from 1981–1984. Included in this group were the area beautification projects, the Olympic Youth Liaison Council and the highly successful Grow With the Olympics Program. The goals of each of the special projects were to continue to expose the youth of Southern California to different facets of the Olympic Games as well as to ready the Los Angeles area to receive athletes from all over the world.

38.06.1 Area Beautification Program

The Area Beautification Program was initiated with an agreement between the LAOOC and Los Angeles Beautiful, a community-based beautification organization. Los Angeles Beautiful, along with Armstrong Nurseries, owned the rights to the "Olympiad", the official rose of the 1984 Olympic Games. The beautification program was funded by royalties and other proceeds from the sale of the roses.

The sale of the roses did not generate the revenue that LA Beautiful and the LAOOC had expected to support the beautification project. With what they did have, however, Los Angeles Beautiful planted roses at various venues and training sites. Unfortunately, the roses were red in color, which did not blend with the Festive Federalism colors of the Games.

The Los Angeles Beautiful/LAOOC coalition was more successful at organizing community groups to clean up various parts of Los Angeles. Aimed at beautifying the neighborhoods around the competition and training sites, the group organized local youth and adults to pick up trash and paint over graffiti twice a month.

In the months preceding the Games, Los Angeles Beautiful was instrumental in getting Los Angeles-based businesses and groups to hire local youth to beautify the area. In East Los Angeles, the Coca-Cola Company hired local youth to clean up the neighborhood and outfitted them in Coca-Cola T-shirts and caps for the duration of the project.

The LAOOC assisted Los Angeles Beautiful's effort by meeting with the appropriate groups to suggest various neighborhoods and sites to clean up. The LAOOC was also able to involve many of the community schools in the beautification effort by suggesting that they start individual campus clean-up projects on their own.

38.06.2 Olympic Youth Liaison Council

The Olympic Youth Liaison Council had three main goals when it was established in 1983. First, members of the council served as liaison with the LAOOC to provide their peers with information about the Olympics and continuous updates on the preparations for staging the Games.

The second purpose of the council was to provide and develop student members for service as volunteers for the needed support functions before and during the Games. The third purpose was to provide important leadership and educational experiences for the students as well as meaningful interaction between the schools and the LAOOC.

The program involved 180 high schools in Los Angeles, Ventura and Orange counties. The schools were encouraged to select one male and one female student and alternates to serve from 1983 to the close of the Games in 1984. In making the selections, the schools were urged to use the following criteria: the students should be active in service clubs or athletics, show poise, maturity and dependability and have academic accomplishments. The schools were asked to provide the liaisons with access to student government, service clubs and athletic groups, as well as school publications.

The LAOOC communicated with the liaisons by inviting them to attend Olympic workshops and mailing LAOOC newsletters and press releases to each. Council members were also encouraged to become youth volunteers before and during the Games.

Each liaison also had the opportunity to arrange Olympic speakers and films for presentation at their respective schools.

38.06.3 Grow With the Olympics Student Program

The Grow With the Olympics Student Program (GWOSP) was one of the most ambitious undertakings of the Youth Programs Department. The basic concept behind the program was to provide a mechanism through which as many as 100,000 deserving young people, senior citizens and physically challenged individuals could be escorted to the Games. At the same time, the goal was to have the youngsters earn their opportunity to attend the Games.

The Grow With the Olympics Student Program was a continuation of the effort of the Youth Programs Department to involve as many youngsters as possible in an Olympic sport, cultural or educational program, free of charge.

The GWOSP included 106 schools from six counties, including Los Angeles, Orange, Ventura, Santa Barbara, San Bernardino and Riverside. The major objective was to include children attending junior high school, ages 12–14, who would have been unable to attend the Games due to their families' inability to afford tickets.

The schools chosen, therefore, had the highest percentage of students whose families received aid to families with dependent children or state welfare. Once a school was chosen, every student in the school was eligible to compete for the opportunity to see an Olympic event.

Most of the tickets provided to the GWOSP were made available through the LAOOC Patron Ticket Program. The minimum patron contribution was \$25,000. In return, each patron received two tickets per day to the Olympic event of his choice, including Opening and Closing Ceremonies. Each patron program sold also paid for the admission and transportation of 50 GWOSP students, senior citizens or physically challenged individuals. The Patron Ticket Program was not able to fund the GWOSP tickets altogether, however, so the additional tickets had to be provided from the LAOOC Ticketing Department.

The success of the Grow With the Olympics Student Program depended upon cooperation and support from the five county school districts. With the objective to motivate students in the schools in the areas of citizenship, attendance and physical health, the students were informed that they would be tested twice for physical performance, with an emphasis on improvement. Additionally, the citizenship, grades and attendance of the students would be monitored. The criteria for selecting students, with the value carried by each in parentheses, were as follows:

- Physical performance (40 percent). The California Assessment Physical Performance Tests are normally administered to students in the fifth, seventh and tenth grades. In the GWOSP, however, the test was administered to students in the seventh, eighth and ninth grades twice during the school year. Improvement was determined by comparing the results of the two testings.
- Attendance (30 percent). Calculated by comparing the number of school days attended by each student to others within the same school.
- Citizenship (30 percent). Generally defined as "desirable behavior," citizenship was categorized as above satisfactory, satisfactory and unsatisfactory.

12

12 The ARCO/Jesse Owens Games drew large crowds and more than 300,000 youngsters up to the age of 15 at its preliminary competitions held throughout the United States.

Physical fitness was included because athletic excellence is most often associated with the Olympic Games. The tests were not skill oriented, so all students had an equal chance to improve. Good attendance and citizenship were also consistent with the Olympic ideals.

Student awards were based on performance in the above-mentioned criteria. Each criterion was assigned a point value. The point system was structured to reward the student with a history of performing well in the three areas as well as those who improved due to the incentive the program provided.

The GWOSP also made it possible for 10,000 local senior citizens to attend the Games. Initially, public service announcements and advisory letters were prepared calling attention to Olympic Games ticket availabilities. A cross section of approximately 200 responding agencies, showing proof of activity as a legitimate organization, met the LAOOC ticket requirements. Tickets were awarded on a first-come, first-served basis.

Approximately 5,000 physically challenged persons were also guests of the LAOOC at the Olympic Games. Half of the total number were persons who had participated in the Special Olympics, chosen because of its history in physically competitive activities. The other 2,500 persons came from other organizations such as veterans' groups.

In the fall of 1983, participating students from the GWOSP schools were asked to perform six physical tests: the standing long jump, the bent knee sit-up, the chair push-up, the side step, the pull-up or flexed-arm handstand (optional for girls) and the timed jog or walk. The support and administration of this phase of the program was conducted by each school's physical education staff.

The test results were submitted to and computerized by the LAOOC. After the final physical performance tests were given in the spring of 1984, the data was finalized and each student was ranked by performance. The citizenship and attendance data was added, and the top 22 percent of the students received gold patches. The next 20 percent received silver patches, with bronze patches awarded to the third group of 20 percent. All students who participated in the program were given certificates.

At the same time, during the 1983–1984 school year, the Olympic Games had become an integral part of the curriculum of the 106 GWOSP schools. Students were treated to school assemblies featuring Olympians and *Sam the Olympic Eagle*, and each school was appointed a volunteer adult liaison to assist the LAOOC in disseminating information. Liaisons, who were generally recommended by the principal, were usually PTA officers, school/community liaisons, college students, and in some cases, administrators, teachers or parent volunteers. A competent and motivated liaison generally meant good response from the school. All teachers in GWOSP schools were invited to Olympic seminars, and the entire student body at all schools received individual copies of the *“Official Olympic Youth Handbook”*. In many classes, daily Olympic assignments were given.

The basic timeframe of the Grow With the Olympics Student Program was divided into three phases:

Phase One, October—December 1983:

- Administration of first physical performance test
- Monitoring of attendance and citizenship marks begin
- School assemblies featuring Olympians begin
- Regional curriculum workshops conducted
- Periodic Olympic publications delivered to schools
- Volunteer groups contacted regarding assistance in support activities

Phase Two, January—March 1984:

- Balance of school assemblies conducted
- Youth Handbook distributed
- Olympic publications continue to be distributed to schools

Phase Three, April—May 1984:

- Second physical performance test administered
- Olympic publications continue
- Results from attendance and citizenship records compiled
- Total points for each student calculated
- Certificates, patches distributed

In early June, schools were notified of their allotted number of Olympic tickets. An average of approximately 65 percent of the students at each of the selected schools were awarded tickets. A total of 98,493 tickets were available. Unfortunately, one of the greatest obstacles in working with the schools was the lack of ticket allocation information. Vital information, crucial to the recruitment of escorts and operational plans for coordinating the number of students, was not available until very late in the operation. Consequently, some schools received allocations they were not fully prepared to handle and other schools were unable to carry on to the end of the program.

An eight-to-one student-to-adult escort ratio was selected for the trips to the Games. The escorts were volunteers selected and screened by the LAOOC staff. The function of the escort was to make sure the students arrived at the pick-up location on time, were escorted during the visit to the Olympic venue and were brought home safely.

A bus supervisor was appointed to accompany each busload of students, and a venue youth coordinator was named for each of the venues which were visited by a group of students, senior citizens or physically challenged individuals. The venue youth coordinators were in charge of the groups while they were at the venues and were also responsible for distribution of the event tickets after the groups arrived at the venue.

A total of 250 Olympians volunteered to accompany various student trips. They explained the sport to be viewed and remained with the youngsters throughout the day. During the period 29 July to 11 August, a total of more than 80,000 students, senior citizens and physically challenged individuals were escorted to the Games.

All but three of the Olympic venues (judo, modern pentathlon and swimming) were visited. Football and hockey were the two venues with the highest number of GWOSP visitors, with 36,000 and 15,000 respectively. These were followed by baseball (8,000), basketball and equestrian (5,000 each), boxing (4,000) and athletics (3,000).

The participants sat in special reserved sections at each venue, and the students wore distinctive white Amateur Athletic Foundation T-shirts. The accompanying adults wore white caps.

At several of the venues, including boxing and hockey, the GWOSP participants were acknowledged by the competing athletes by waving or offering to sign autographs.

The transportation system consisted of a combination of 1,725 vans, buses (transit and non-transit) and wheelchair equipped units. All vehicles were chartered by the LAOOC. During the days of venue visits, the transportation system was in operation from 0600 to 2400 hours.

Besides reaching youngsters in Southern California, the GWOSP included students who were transported to preliminary football matches in Northern California and on the East Coast. These programs were made possible by the sponsorship of Crown Zellerbach and United Airlines.

The Grow With the Olympics Student Program was a success because its original objectives were clearly met. The Youth Programs Department successfully implemented the program in 106 Southern California schools and was able to involve 106,000 students, senior citizens and physically challenged persons.

The program was not without its difficulties, however. The actual implementation of the activities, including recruiting interested personnel and the pre- and post-testing of the students, created many logistical and communication problems. It proved difficult, in some cases, to get school personnel or volunteers to complete the time-consuming tasks required. Other schools started with the program but were unable to follow through with all the requirements so the students could be eligible for Games tickets. The uncertainties surrounding the exact number and the exact time of the ticket distribution for each school was the most unsettling element of the program.

For those individuals who were able to participate in the program from beginning to end, which includes the

vast majority, the experience proved most rewarding. The LAOOC was able to provide a once-in-a-lifetime opportunity for many people who otherwise would never have been able to attend the Games. The youngsters in the program were actually able to "grow with the Olympics", as each worked hard throughout the 1983-1984 school year in the areas of fitness, citizenship and attendance to earn his or her place as a spectator at the Games of the XXIIIrd Olympiad.

38.07 Summary

The LAOOC made the decision in 1980 that involvement for youth in the Games should be more extensive than the traditional three-week youth camp that had been organized in previous Games. The concept was approved by the IOC the same year which paved the way for more than one million youth to participate in academic, cultural and sports offerings.

The legacy for youth left after four years of programs far outweighed the benefits that a youth camp organized during the time of the Games could have brought to the citizens of Los Angeles. The original goal to involve 500,000 local youth aged 7-18 in some type of Olympic activity and give the young people of Los Angeles an opportunity to learn about the Games was substantially exceeded.

The Youth Programs Department involved not only young athletes, but also young artists, band and drill-team members and Academic Decathlon participants.

The program carefully used commercial sponsors to support the majority of its offerings so that virtually all activities were self-supporting. The partnership matched a program with a sponsor in hopes that the agreement could be kept after the Games.

The department was successful in bringing together existing youth sports organizations to work toward the enrichment of youth activities in Southern California while also starting new programs such as team handball, judo, sailing and archery. The LAOOC also left a legacy for future youth sports enthusiasts by donating facilities and equipment to schools, youth groups, municipal recreation departments and private organizations.

In its effort to inject everyone with the Olympic spirit, the Youth Programs Department provided many resources for local teachers to use in their classrooms. The teachers were able to involve youngsters through curriculum materials, printed matter from the LAOOC and their encouragement to become involved in one or many of the youth program offerings.

Through the Olympic Games, the Youth Programs Department planned activities in 14 Olympic sports and in a similar number of academic and cultural programs. The LAOOC was able to double its goal by reaching more than one million young people during 1981-1984.

LAOOC youth activities, 1981-1984

Activity	Sponsor	Year	Total no. of participants
Archery	Easton	1981-1984	7,000
Athletics	ARCO	1981-1984	300,000
Basketball	Converse	1981-1984	65,000
Football	Coca-Cola	1981-1984	47,000
Gymnastics	American Express	1982-1984	1,000
Handball	Arthur Young	1983-1984	8,000
Judo	Maruchan	1982-1984	7,000
Sailing	United Airlines	1982-1984	3,500
Swimming	McDonald's	1981-1984	35,000
Synchronized Swimming	Buick	1983-1984	1,500
Tennis	Transamerica	1984	1,500
Volleyball	Atari	1982-1984	5,500
Youth Art	First Interstate	1983-1984	10,000
Academic Decathlon	Coca-Cola	1982-1984	2,300
Band and Drill	LAOOC	1983-1984	8,600
Beautification Program	L.A. Beautiful	1983-1984	1,000
Children's Art	Levi Strauss	1982-1984	70,000
Curriculum Guide	LAOOC	1982-1984	52,000
Grow With The Olympics	Amateur Athletic Foundation	1983-1984	106,000
Olympic Encounter	LAOOC	1983	18,000
Teacher Workshops	LAOOC	1982-1984	1,750
Youth Handbook	Jeffries	1983-1984	500,000
Youth Jamborees	Coca-Cola	1984	3,000
Total			1,254,650

Summary of the Patron Youth Tickets Program

Event	Total number of tickets available	Total number of tickets actually used	Breakdown of tickets used		
			Students	Elderly	Disabled
Archery	4,000	398	340	0	58
Athletics	3,339	2,888	2,174	153	561

Wrestling	1,900	1,628	1,241	100	287
Totals	102,093	81,065	64,906	7,971	8,188

Youth Programs

Given its success, however, the department was not without a few shortcomings. The original plan called for programs to be started in all 23 Olympic sports, but only 14 programs were actually started.

The Grow With the Olympics Student Program was a massive undertaking of testing and motivating youngsters to earn a ticket to the Games. The enormity of the project, along with the uncertainty surrounding the actual number of tickets, provided for a sometimes tense relationship between the LAOOC, the schools and the parents. The timeframe allotted for completion of the entire program proved too tight for some schools.

It is recommended that future Olympic organizers adopt a youth program concept that will allow for great numbers of youth participation during the years preceding and including the Olympic Games. This concept assists the organizers by providing a solid base of interest, enthusiasm and care among the citizens of the host city. A community that embraces and understands the Games is one that will serve as a good host. A diversified youth program of sports, educational and cultural activities held over the course of a few years will serve the host city for many more years to come by introducing and encouraging participation in all facets of the Olympic ideals.

Community improvements provided by LAOOC Youth Services

- Archery equipment; two archery ranges
- Basketball equipment; three hundred basketballs to 17 parks and YMCAs (an average of 15 to each)
- Boardsailing; thirty Windsurfer sailboards and riggings to two municipal recreation and park departments
- Boxing equipment; twenty headgear, 20 standard protection cups, five finishing tapes, 20 jump ropes, five pull ropes, 20 basketballs, 20 sets gymnasium boxing gloves (four gloves per set) provided to Community Youth Gang Services Project
- Judo equipment; one hundred judo mats and 40 judogi to three judo clubs and recreation centers and two Boys Clubs and a dressing locker to a local judo club
- Gymnastics equipment; two complete gymnastic equipment sets including mats, pommel and vaulting horses, uneven parallel bars, parallel bars, balance beam and rings to one junior college and one Boys and Girls Club
- Team handball equipment; balls, goals and nets (one set of two to 28 junior high schools)
- Sailing equipment; 40 Sabot boats and rigging to three municipal recreation departments; three Whaler (15-foot) boats with outboard motors to three municipal recreation departments
- Soccer equipment; three portable goal posts to one university and two local parks; seven permanent goal posts to two municipal parks; 19 linemarkers, 82 goal nets and 31 lineman flags to various youth soccer associations in Northern and Southern California; 500 balls, an average of 10 each to 28 municipal recreation departments
- Tennis equipment; two hundred and fifty tennis rackets, 25 each to two colleges, five parks and three Foundations
- Volleyball equipment; seven sets of volleyball standards and nets and balls to one high school, two YMCAs and two Boys and Girls Clubs; 300 volleyballs to 17 high schools (average of 15 to each)

From the translator:

"The French version of the
"Official Report of the
Games of the XXIIIrd
Olympiad" has been
translated from the English.
Our work was inspired by
the desire to remain faithful
to the original and to
achieve clarity of expres-
sion. It seemed to us that
the heart of our task lay in
conveying to the vast
French-speaking public the
combination of intelligence,
talent and hard work which
help to explain the success
of the Los Angeles Games."

French text in the headings
and footnotes of the results
summaries in Volume II are
presented as produced by
the LAOOC's results system
and were not re-translated
for this Report.

The following chapters
were authored by those
noted below:

1: Reflections

Richard B. Perelman

Text in Volume II

Greg Harney and Bruce Tenen

Poetry preceding the text of
each volume was reprinted
from "Leaners in the Wind"
by Paul T. Owens. Illustrated
and designed by Claudia J.
Sobel and published by
Tobias Jane Publishers, 1976.
Reprinted with the kind
permission of the author.

Notes on the digitized version of the Official Report of the Games of the XXIII Olympiad, Los Angeles, 1984
Volume 1: Organization and Planning

The digital version of the Official Report of the Games of the XXIII Olympiad was created with the intention of producing the closest possible replica of the original printed document. These technical notes are intended to describe the differences between the digital and printed documents and the technical details of the digital document.

The original document

The original paper version of the 1984 Official Report has dimensions of 10 ½ ” x 15 ¾ ” (28 x 40cm). The cover is of purple cloth with a gold logo. The book’s title, “Official Report of the Games of the XXIII Olympiad, Los Angeles, 1984, Volume 1: Organization and Planning,” are printed on the spine in white lettering.

The book is 888 numbered pages, plus 22 unnumbered pages of front matter. One sheet blue heavy bond, and one sheet parchment, appear inside each of the covers. The primary font used in the book is Helvetica.

Special features of the digital version:

- * The back cover and the binding are not included in the digital version.
- * Blank pages at the front and back of the book are not represented in the digital version.
- * The cover, illustrations and photos in landscape format were rotated from vertical to horizontal to make viewing easier.
- * The digital version includes a bookmark list, which functions as a hyperlinked table of contents. Selecting a topic heading will take you to the corresponding section in the document.

Profile of the digital version:

File name:	1984s.pdf
File size:	61,664 KB
Format:	Adobe Acrobat Portable document Format (PDF), Version 3.0
Source document:	Official Report of the Games of the XXIII Olympiad, Los Angeles, 1984; Volume 1: Organization and Planning. Los Angeles Olympic Organizing Committee. Richard B. Perelman, editor-in-chief. 1985. ISBN #0961451203
Creation Platform:	Windows 95
Conversion Software:	Adobe Capture, Adobe Acrobat 3.0, EnFocus Pitstop
Image Resolution:	72 dpi and higher for color and grayscale images
Digital Fonts:	Helvetica
Conversion Services:	Glyphica, 2224 Old Middlefield Way, Mountain View, CA 94043 www.glyphica.com
